As already described in the Section 29.1.3.1.3, PWMSS1_TBCLKEN through PWMSS3_TBCLKEN bits in the CTRL_CORE_CONTROL_IO_2 register of the device Core Control Module can be used to individually control or globally synchronize the time-base clocks of all enabled ePWM modules on a device. When all PWMSSN_TBCLKEN (where n = 1 to 3) bits are set to 0b0, the time-base clocks of all ePWMx (where x = 1 to 3) modules are stopped (default). When all PWMSSn_TBCLKEN bits are simultaneously set in SW to 0b1, all ePWMx modules (x = 1 to 3) time-base clocks are started with the rising edge of TBCLK aligned. For perfectly synchronized TBCLKs, the prescaler bits in the EPWM_TBCTL register of each ePWM module must be set identically. The proper procedure for enabling the ePWM clocks is as follows:

1. Enable the ePWM module clocks.
2. Set PWMSSn_TBCLKEN = 0. This will stop the time-base clock within any enabled ePWMx module.
3. Configure the prescaler values and desired ePWM modes per each involved ePWMx.
4. Simultaneously set bits PWMSSn_TBCLKEN to 0b1 (where n = 1 to 3) 1.

29.2.2.3.5 ePWM Time-Base Counter Modes and Timing Waveforms

The time-base counter operates in one of four modes:

- Up-count mode which is asymmetrical.
- Down-count mode which is asymmetrical.
- Up-down-count which is symmetrical.
- Frozen where the time-base counter is held constant at the current value.

To illustrate the operation of the first three modes, Figure 29-12 to Figure 29-15 show when events are generated and how the time-base responds to an EPWMxSYNCI signal.

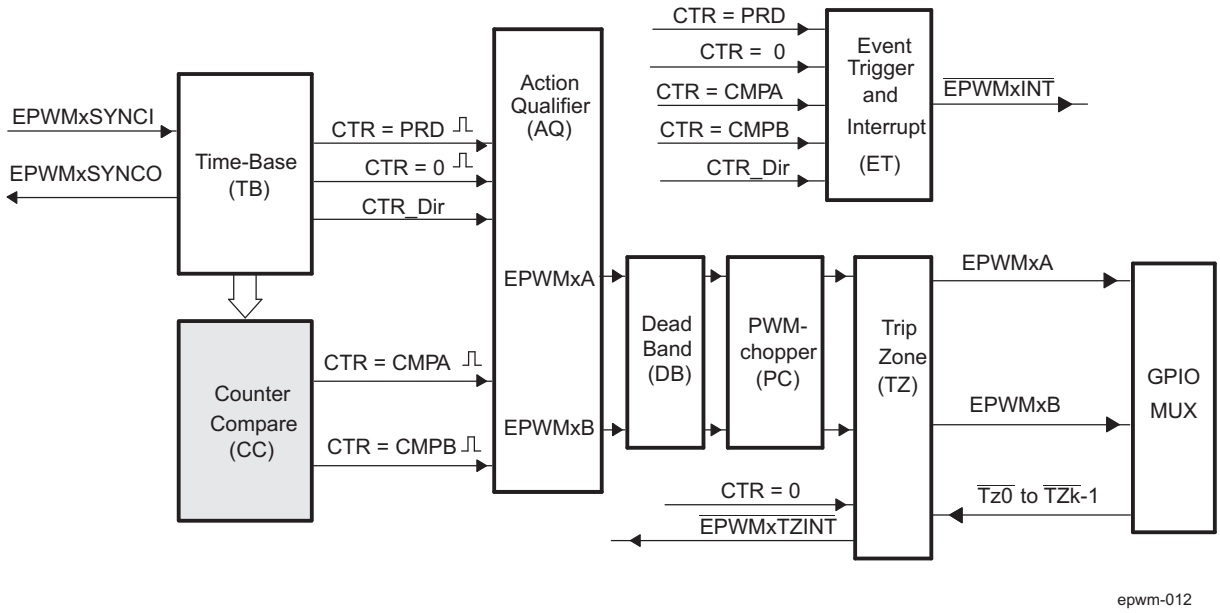
29.2.2.4 ePWM Counter-Compare (CC) Submodule

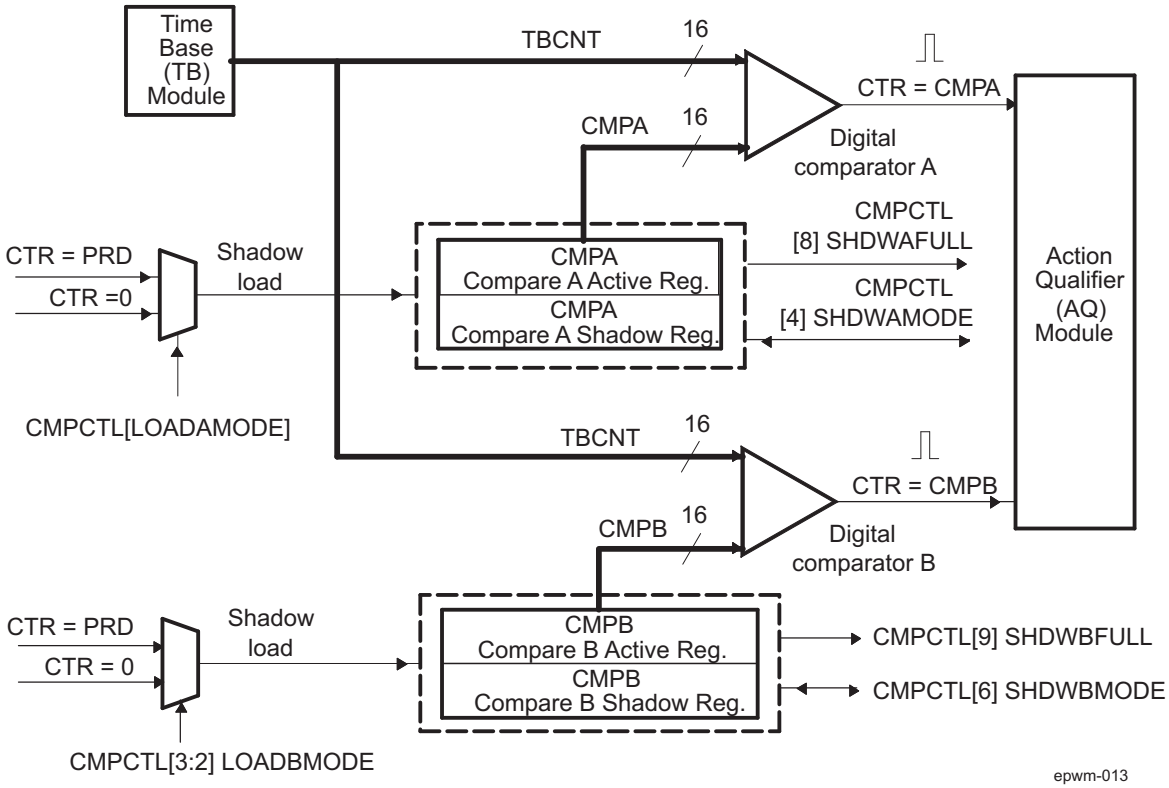
Figure 29-16 illustrates the counter-compare submodule within the ePWM. Figure 29-17 shows the basic structure of the counter-compare submodule.

Figure 29-16. ePWM Counter-Compare Submodule



Copyright © 2015–2017, Texas Instruments Incorporated

Figure 29-17. ePWM Counter-Compare Submodule Signals and Registers



29.2.2.4.1 Purpose of the ePWM Counter-Compare Submodule

The counter-compare submodule takes as input the time-base counter value. This value is continuously compared to the counter-compare A (EPWM_CMPA) and counter-compare B (EPWM_CMPB) registers. When the time-base counter is equal to one of the compare registers, the counter-compare unit generates an appropriate event.

The counter-compare submodule:

- Generates events based on programmable time stamps using the EPWM_CMPA and EPWM_CMPB registers
  - TBCNT = CMPA: Time-base counter equals counter-compare A register (TBCNT = CMPA).
  - TBCNT = CMPB: Time-base counter equals counter-compare B register (TBCNT = CMPB)
- Controls the PWM duty cycle if the action-qualifier submodule is configured appropriately
- Shadows new compare values to prevent corruption or glitches during the active PWM cycle

29.2.2.4.2 Controlling and Monitoring the ePWM Counter-Compare Submodule

Table 29-22 lists the registers used to control and monitor the counter-compare submodule. Table 29-23 lists the key signals associated with the counter-compare submodule.

Table 29-22. ePWM Counter-Compare Submodule Registers

Acronym	Register Description	Address Offset	Shadowed
EPWM_CMPCTL	Counter-Compare Control Register.	Eh	No
HRPWM_CMPAHR	HRPWM Counter-Compare A Extension Register (1)	10h	Yes
EPWM_CMPA	Counter-Compare A Register	12h	Yes

(1) This register is available only on ePWM modules with the high-resolution extension (HRPWM). On ePWM modules that do not include the HRPWM, this location is reserved. See Section 29.1.3 to determine which ePWM instances include this feature.

Table 29-22. ePWM Counter-Compare Submodule Registers (continued)

Acronym	Register Description	Address Offset	Shadowed
EPWM_CMPB	Counter-Compare B Register	14h	Yes

Table 29-23. ePWM Counter-Compare Submodule Key Signals

Signal	Description of Event	Register Bitfields Compared
TBCNT = CMPA	Time-base counter equal to the active counter-compare A value	TBCNT = CMPA
TBCNT = CMPB	Time-base counter equal to the active counter-compare B value	TBCNT = CMPB
TBCNT = PRD	Time-base counter equal to the active period. Used to load active counter-compare A and B registers from the shadow register	TBCNT = TBPRD
TBCNT = 0	Time-base counter equal to zero. Used to load active counter-compare A and B registers from the shadow register	TBCNT = 0000h

Copyright © 2015–2017, Texas Instruments Incorporated

29.2.2.4.3 Operational Highlights for the ePWM Counter-Compare Submodule

The counter-compare submodule is responsible for generating two independent compare events based on two compare registers:

1. TBCNT = CMPA: Time-base counter equal to counter-compare A register (EPWM_TBCNT = EPWM_CMPA).
2. TBCNT = CMPB: Time-base counter equal to counter-compare B register (TBCNT = CMPB).

For up-count or down-count mode, each event occurs only once per cycle. For up-down-count mode each event occurs twice per cycle, if the compare value is between 0000h and TBPRD; and occurs once per cycle, if the compare value is equal to 0000h or equal to TBPRD. These events are fed into the action-qualifier submodule where they are qualified by the counter direction and converted into actions if enabled. Refer to Section 29.2.2.5.1 for more details.

The counter-compare registers EPWM_CMPA and EPWM_CMPB each have an associated shadow register. Shadowing provides a way to keep updates to the registers synchronized with the hardware. When shadowing is used, updates to the active registers only occurs at strategic points. This prevents corruption or spurious operation due to the register being asynchronously modified by software. The memory address of the active register and the shadow register is identical. Which register is written to or read from is determined by the EPWM_CMPCTL[4] SHDWAMODE and EPWM_CMPCTL[6] SHDWBMODE bits. These bits enable and disable the EPWM_CMPA shadow register and EPWM_CMPB shadow register respectively. The behavior of the two load modes is described below:

- **Shadow Mode:** The shadow mode for the EPWM_CMPA is enabled by clearing the EPWM_CMPCTL[4] SHDWAMODE bit and the shadow register for CMPB is enabled by clearing the EPWM_CMPCTL[6] SHDWBMODE bit. Shadow mode is enabled by default for both EPWM_CMPA and EPWM_CMPB.

  If the shadow register is enabled then the content of the shadow register is transferred to the active register on one of the following events:

  – TBCNT = PRD: Time-base counter equal to the period (TBCNT = TBPRD).
  – TBCNT = 0: Time-base counter equal to zero (TBCNT = 0000h)
  – Both TBCNT = PRD and TBCNT = 0

  Which of these three events is specified by the EPWM_CMPCTL[1:0] LOADAMODE and EPWM_CMPCTL[3:2] LOADBMODE register bits. Only the active register contents are used by the counter-compare submodule to generate events to be sent to the action-qualifier.
- **Immediate Load Mode:** If immediate load mode is selected (EPWM_TBCTL[4] SHDWAMODE = 1 or EPWM_TBCTL[6] SHDWBMODE = 1), then a read from or a write to the register will go directly to the active register.

29.2.2.4.4 ePWM Count Mode Timing Waveforms

The counter-compare module can generate compare events in all three count modes:

- Up-count mode: used to generate an asymmetrical PWM waveform.
- Down-count mode: used to generate an asymmetrical PWM waveform.
- Up-down-count mode: used to generate a symmetrical PWM waveform.

To best illustrate the operation of the first three modes, the timing diagrams in Figure 29-18 to Figure 29-21 show when events are generated and how the EPWMxSYNCI signal interacts.

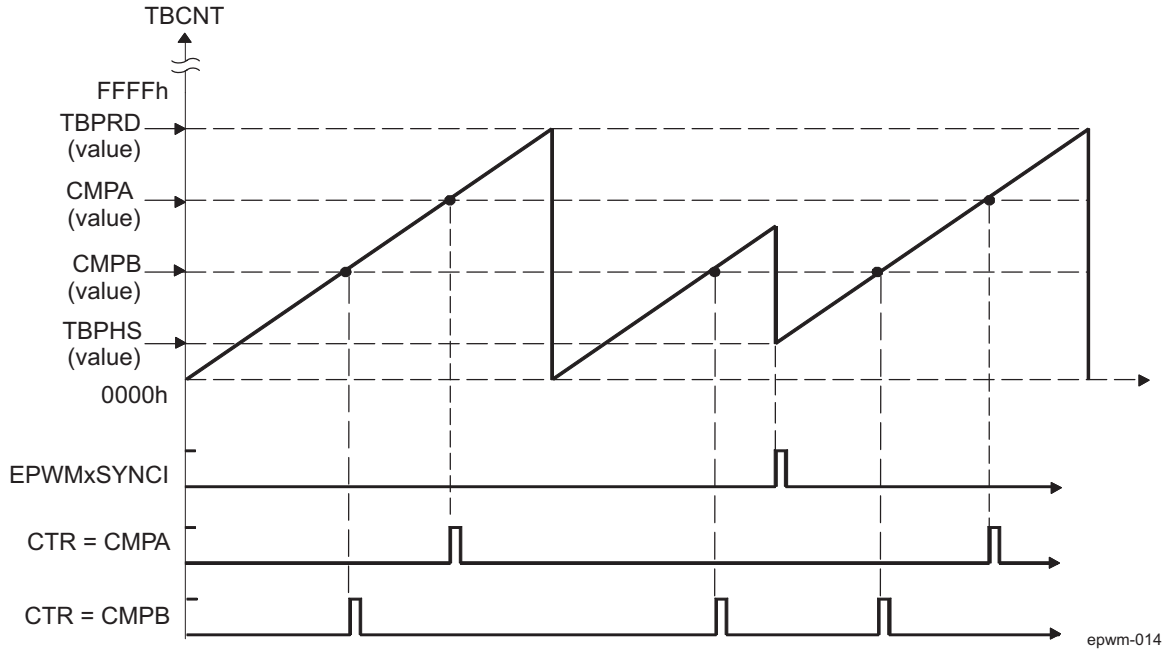
Figure 29-18. ePWM Counter-Compare Event Waveforms in Up-Count Mode



NOTE: An EPWMxSYNCI external synchronization event can cause a discontinuity in the TBCNT count sequence. This can lead to a compare event being skipped. This skipping is considered normal operation and must be taken into account.

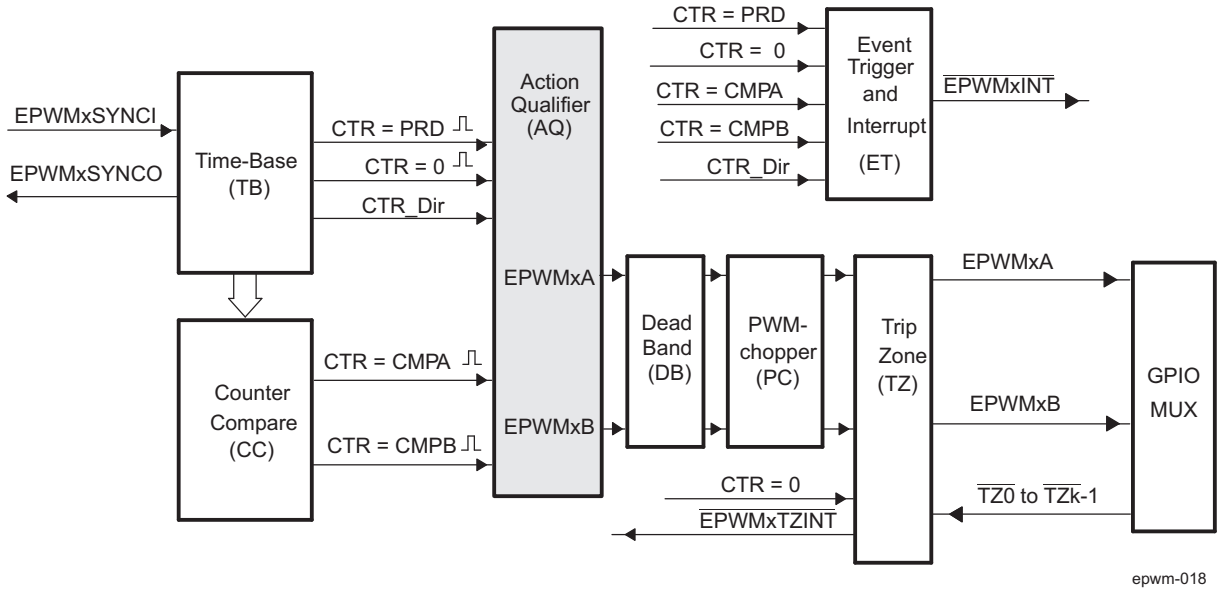
29.2.2.5 ePWM Action-Qualifier (AQ) Submodule

Figure 29-22 shows the action-qualifier (AQ) submodule (see shaded block) in the ePWM system. The action-qualifier submodule has the most important role in waveform construction and PWM generation. It decides which events are converted into various action types, thereby producing the required switched waveforms at the EPWMxA and EPWMxB outputs.

Figure 29-22. ePWM Action-Qualifier Submodule



29.2.2.5.1 Purpose of the ePWM Action-Qualifier Submodule

The action-qualifier submodule is responsible for the following:

- Qualifying and generating actions (set, clear, toggle) based on the following events:
  - TBCNT = PRD: Time-base counter equal to the period (TBCNT = TBPRD)
  - TBCNT = 0: Time-base counter equal to zero (TBCNT = 0000h)
  - TBCNT = CMPA: Time-base counter equal to the counter-compare A register (TBCNT = CMPA)
  - TBCNT = CMPB: Time-base counter equal to the counter-compare B register (TBCNT = CMPB)
- Managing priority when these events occur concurrently
- Providing independent control of events when the time-base counter is increasing and when it is decreasing.

29.2.2.5.2 Controlling and Monitoring the ePWM Action-Qualifier Submodule

Table 29-24 lists the registers used to control and monitor the action-qualifier submodule.

Table 29-24. Action-Qualifier Submodule Registers

Acronym	Register Description	Address Offset	Shadowed
EPWM_AQCTLA	Action-Qualifier Control Register For Output A (EPWMxA)	16h	No
EPWM_AQCTLB	Action-Qualifier Control Register For Output B (EPWMxB)	18h	No
EPWM_AQSFRC	Action-Qualifier Software Force Register	1Ah	No
EPWM_AQCSFRC	Action-Qualifier Continuous Software Force	1Ch	Yes

Copyright © 2015–2017, Texas Instruments Incorporated

The action-qualifier submodule is based on event-driven logic. It can be thought of as a programmable cross switch with events at the input and actions at the output, all of which are software controlled via the set of registers shown in Figure 29-23. The possible input events are summarized again in Table 29-25.

Figure 29-23. ePWM Action-Qualifier Submodule Inputs and Outputs

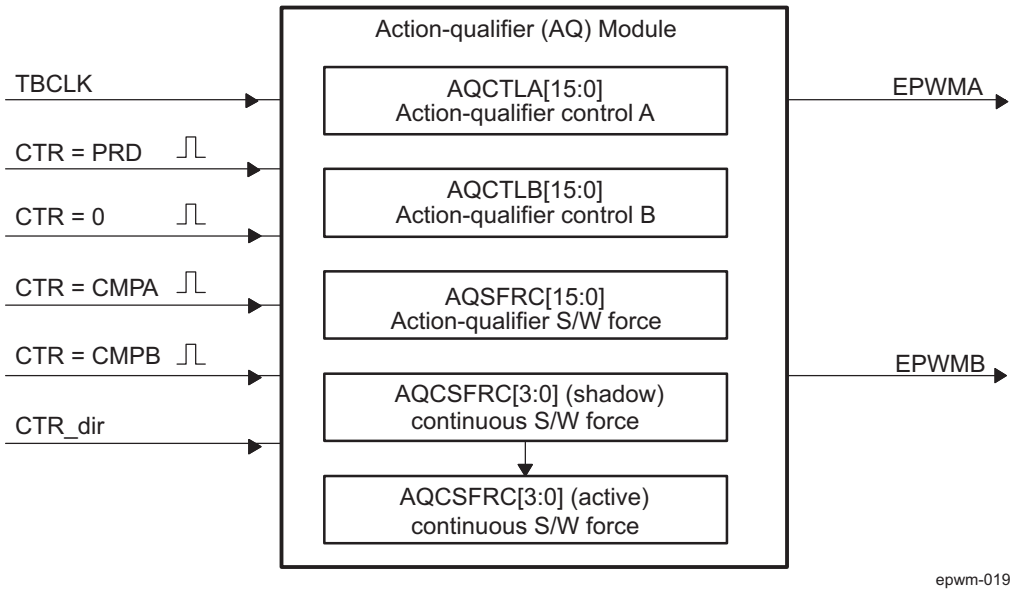


Table 29-25. ePWM Action-Qualifier Submodule Possible Input Events

Signal	Description	Register Bitfield Compared
TBCNT = PRD	Time-base counter equal to the period value	TBCNT = TBPRD
TBCNT = 0	Time-base counter equal to zero	TBCNT = 0000h
TBCNT = CMPA	Time-base counter equal to the counter-compare A	TBCNT = CMPA
TBCNT = CMPB	Time-base counter equal to the counter-compare B	TBCNT = CMPB
Software forced event	Asynchronous event initiated by software	

The software forced action is a useful asynchronous event. This control is handled by registers EPWM_AQSFRC and EPWM_AQCSFRC.

The action-qualifier submodule controls how the two outputs EPWMxA and EPWMxB behave when a particular event occurs. The event inputs to the action-qualifier submodule are further qualified by the counter direction (up or down). This allows for independent action on outputs on both the count-up and count-down phases.

The possible actions imposed on outputs EPWMxA and EPWMxB are:

- **Set High:** Set output EPWMxA or EPWMxB to a high level.
- **Clear Low:** Set output EPWMxA or EPWMxB to a low level.
- **Toggle:** If EPWMxA or EPWMxB is currently pulled high, then pull the output low. If EPWMxA or EPWMxB is currently pulled low, then pull the output high.
- **Do Nothing:** Keep outputs EPWMxA and EPWMxB at same level as currently set. Although the "Do Nothing" option prevents an event from causing an action on the EPWMxA and EPWMxB outputs, this event can still trigger interrupts. See the event-trigger submodule description in Section 29.2.2.9 for details.

Copyright © 2015–2017, Texas Instruments Incorporated

Actions are specified independently for either output (EPWMxA or EPWMxB). Any or all events can be configured to generate actions on a given output. For example, both TBCNT = CMPA and TBCNT = CMPB can operate on output EPWMxA. All qualifier actions are configured via the control registers found at the end of this section.

For clarity, the drawings in this chapter use a set of symbolic actions. These symbols are summarized in Figure 29-24. Each symbol represents an action as a marker in time. Some actions are fixed in time (zero and period) while the CMPA and CMPB actions are moveable and their time positions are programmed via the counter-compare A and B registers, respectively. To turn off or disable an action, use the "Do Nothing option"; it is the default at reset.

Figure 29-24. Possible Action-Qualifier Actions for EPWMxA and EPWMxB Outputs

S/W force	TB Counter equals:				Actions
	Zero	Comp A	Comp B	Period	
SW ×	Z ×	CA ×	CB ×	P ×	Do Nothing
SW ↓	Z ↓	CA ↓	CB ↓	P ↓	Clear Low
SW ↑	Z ↑	CA ↑	CB ↑	P ↑	Set High
SW T	Z T	CA T	CB T	P T	Toggle

29.2.2.5.3 ePWM Action-Qualifier Event Priority

It is possible for the ePWM action qualifier to receive more than one event at the same time. In this case events are assigned a priority by the hardware. The general rule is events occurring later in time have a higher priority and software forced events always have the highest priority. The event priority levels for up-down-count mode are shown in Table 29-26. A priority level of 1 is the highest priority and level 7 is the lowest. The priority changes slightly depending on the direction of TBCNT.

Table 29-26. ePWM Action-Qualifier Event Priority for Up-Down-Count Mode

Priority Level	Event if TBCNT is Incrementing TBCNT = 0 up to TBCNT = TBPRD	Event if TBCNT is Decrementing TBCNT = TBPRD down to TBCNT = 1
1 (Highest)	Software forced event	Software forced event
2	Counter equals CMPB on up-count (CBU)	Counter equals CMPB on down-count (CBD)
3	Counter equals CMPA on up-count (CAU)	Counter equals CMPA on down-count (CAD)
4	Counter equals zero	Counter equals period (TBPRD in EPWM_TBPRD active register)
5	Counter equals CMPB on down-count (CBD) (1)	Counter equals CMPB on up-count (CBU) (1)
6 (Lowest)	Counter equals CMPA on down-count (CAD) (1)	Counter equals CMPA on up-count (CBU) (1)

(1) To maintain symmetry for up-down-count mode, both up-events (CAU/CBU) and down-events (CAD/CBD) can be generated for TBPRD. Otherwise, up-events can occur only when the counter is incrementing and down-events can occur only when the counter is decrementing.

Table 29-27 shows the action-qualifier priority for up-count mode. In this case, the counter direction is always defined as up and thus down-count events will never be taken.

Table 29-27. ePWM Action-Qualifier Event Priority for Up-Count Mode

Priority Level	Event
1 (Highest)	Software forced event
2	Counter equal to period (TBPRD)
3	Counter equal to CMPB on up-count (CBU)
4	Counter equal to CMPA on up-count (CAU)
5 (Lowest)	Counter equal to Zero

Table 29-28 shows the action-qualifier priority for down-count mode. In this case, the counter direction is always defined as down and thus up-count events will never be taken.

Table 29-28. ePWM Action-Qualifier Event Priority for Down-Count Mode

Priority Level	Event
1 (Highest)	Software forced event
2	Counter equal to Zero
3	Counter equal to CMPB on down-count (CBD)
4	Counter equal to CMPA on down-count (CAD)
5 (Lowest)	Counter equal to period (TBPRD)

Copyright © 2015–2017, Texas Instruments Incorporated

It is possible to set the compare value greater than the period. In this case the action will take place as shown in Table 29-29.

Table 29-29. Behavior if CMPA/CMPB is Greater than the Period

Counter Mode	Compare on Up-Count Event CAU/CBU	Compare on Down-Count Event CAU/CBU
Up-Count Mode	If CMPA/CMPB ≤ TBPRD period, then the event occurs on a compare match (TBCNT = CMPA or CMPB). If CMPA/CMPB > TBPRD, then the event will not occur.	Never occurs.
Down-Count Mode	Never occurs.	If CMPA/CMPB < TBPRD, the event will occur on a compare match (TBCNT = CMPA or CMPB). If CMPA/CMPB ≥ TBPRD, the event will occur on a period match (TBCNT = TBPRD).
Up-Down-Count Mode	If CMPA/CMPB < TBPRD and the counter is incrementing, the event occurs on a compare match (TBCNT = CMPA or CMPB). If CMPA/CMPB is ≥ TBPRD, the event will occur on a period match (TBCNT = TBPRD).	If CMPA/CMPB < TBPRD and the counter is decrementing, the event occurs on a compare match (TBCNT = CMPA or CMPB). If CMPA/CMPB ≥ TBPRD, the event occurs on a period match (TBCNT = TBPRD).

29.2.2.5.4 Waveforms for Common ePWM Configurations

NOTE: The waveforms in this chapter show the ePWMs behavior for a static compare register value. In a running system, the active compare registers (EPWM_CMPA and EPWM_CMPB) are typically updated from their respective shadow registers once every period. The user specifies when the update will take place; either when the time-base counter reaches zero or when the time-base counter reaches period. There are some cases when the action based on the new value can be delayed by one period or the action based on the old value can take effect for an extra period. Some PWM configurations avoid this situation. These include, but are not limited to, the following:

Use up-down-count mode to generate a symmetric PWM:

- If you load EPWM_CMPA/EPWM_CMPB on zero, then use EPWM_CMPA/EPWM_CMPB values greater than or equal to 1.
- If you load EPWM_CMPA/EPWM_CMPB on period, then use EPWM_CMPA/EPWM_CMPB values less than or equal to TBPRD - 1.

  This means there will always be a pulse of at least one TBCLK cycle in a PWM period which, when very short, tend to be ignored by the system.

Use up-down-count mode to generate an asymmetric PWM:

- To achieve 50%-0% asymmetric PWM use the following configuration: Load EPWM_CMPA/EPWM_CMPB on period and use the period action to clear the PWM and a compare-up action to set the PWM. Modulate the compare value from 0 to TBPRD to achieve 50%-0% PWM duty.

When using up-count mode to generate an asymmetric PWM:

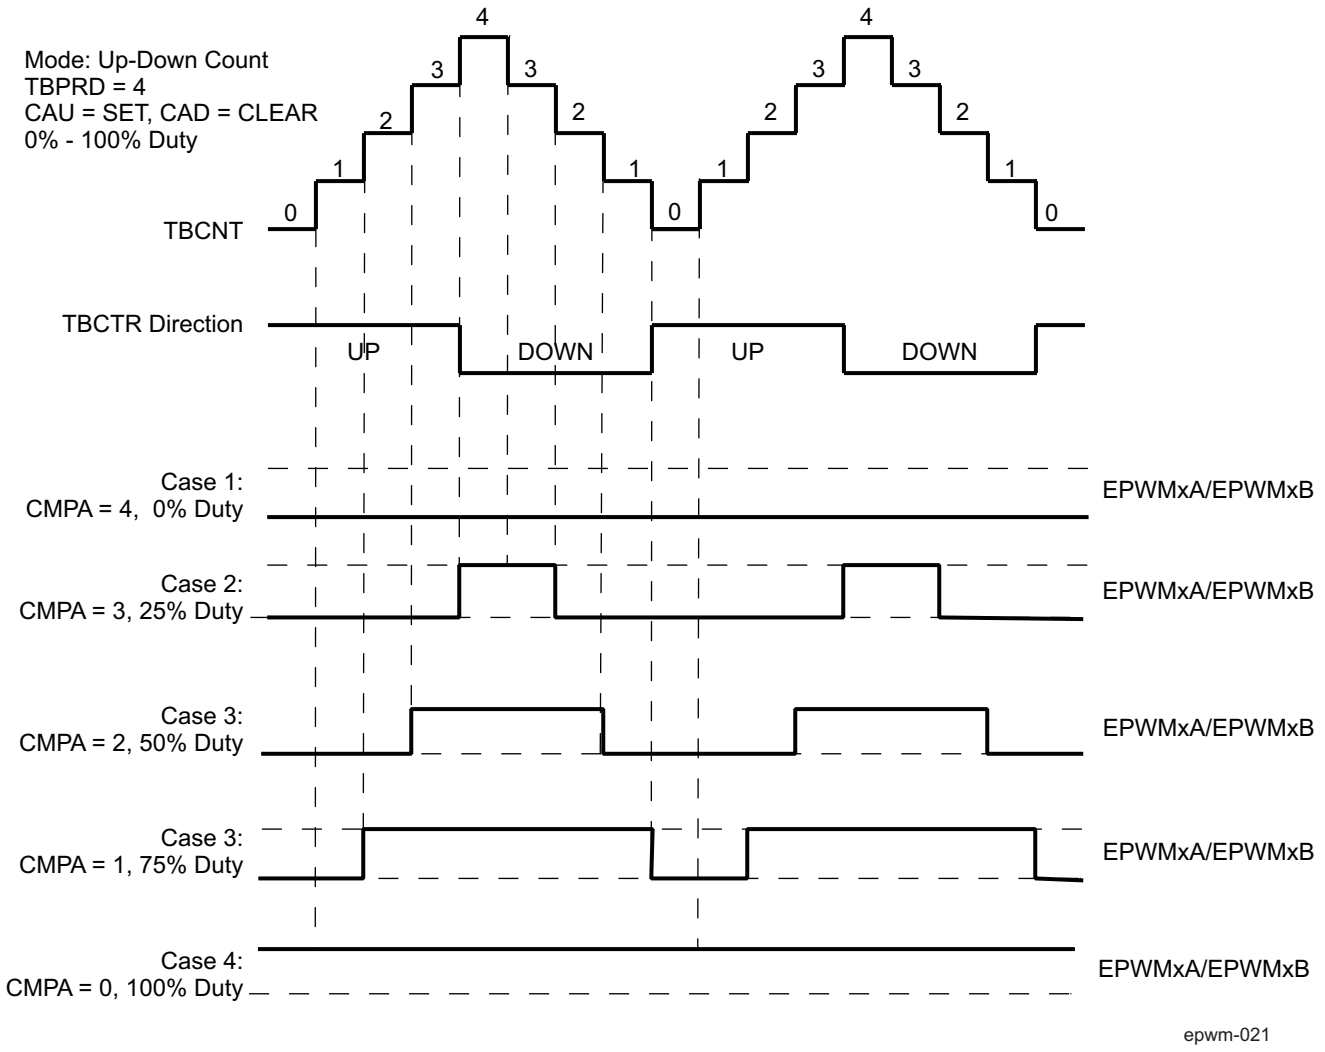
- To achieve 0-100% asymmetric PWM use the following configuration: Load EPWM_CMPA/EPWM_CMPB on TBPRD. Use the Zero action to set the PWM and a compare-up action to clear the PWM. Modulate the compare value from 0 to TBPRD+1 to achieve 0-100% PWM duty.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 29-25 shows how a symmetric PWM waveform can be generated using the up-down-count mode of the TBCNT. In this mode 0%-100% DC modulation is achieved by using equal compare matches on the up count and down count portions of the waveform. In the example shown, CMPA is used to make the comparison. When the counter is incrementing the CMPA match will pull the PWM output high. Likewise, when the counter is decrementing the compare match will pull the PWM signal low. When CMPA = 0, the PWM signal is low for the entire period giving the 0% duty waveform. When EPWM_CMPA = EPWM_TBPRD, the PWM signal is high achieving 100% duty.

When using this configuration in practice, if you load CMPA/CMPB on zero, then use CMPA/CMPB values greater than or equal to 1. If you load CMPA/CMPB on period, then use CMPA/CMPB values less than or equal to TBPRD-1. This means there will always be a pulse of at least one TBCLK cycle in a PWM period which, when very short, tend to be ignored by the system.

Figure 29-25. ePWM Up-Down-Count Mode Symmetrical Waveform



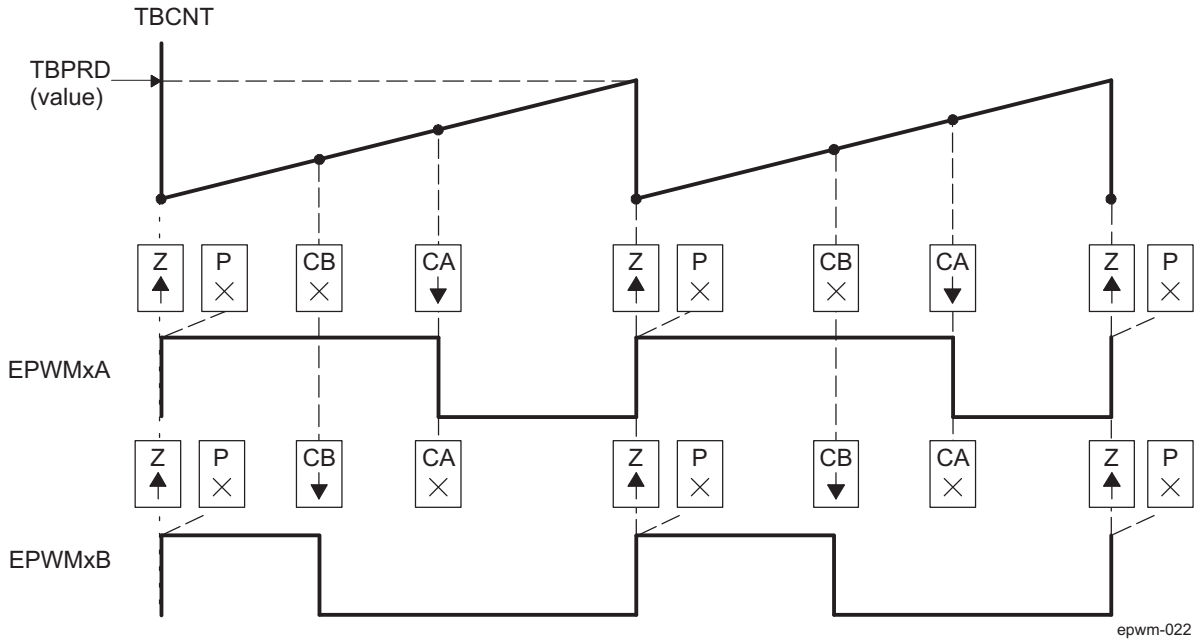
Copyright © 2015–2017, Texas Instruments Incorporated

The PWM waveforms in Figure 29-26 through Figure 29-31 show some common action-qualifier configurations. Some conventions used in the figures are as follows:

- TBPRD, CMPA, and CMPB refer to the value written in their respective registers (EPWM_TBPRD, EPWM_CMPA, and EPWM_CMPB). The active register, not the shadow register, is used by the hardware.
- CMPx, refers to either CMPA or CMPB.
- EPWMxA and EPWMxB refer to the output signals from ePWMx
- Up-Down means Count-up-and-down mode, Up means up-count mode and Dwn means down-count mode
- Sym = Symmetric, Asym = Asymmetric

Table 29-30 and Table 29-31 contains initialization and runtime register configurations for the waveforms in Figure 29-26.

Figure 29-26. Up, Single Edge Asymmetric Waveform, With Independent Modulation on EPWMxA and EPWMxB—Active High



(1) PWM period = (TBPRD + 1) × T_{TBCLK}

(2) Duty modulation for EPWMxA is set by CMPA, and is active high (that is, high time duty proportional to CMPA).

(3) Duty modulation for EPWMxB is set by CMPB and is active high (that is, high time duty proportional to CMPB).

(4) The "Do Nothing" actions (X) are shown for completeness, but will not be shown on subsequent diagrams.

(5) Actions at zero and period, although appearing to occur concurrently, are actually separated by one TBCLK period. TBCNT wraps from period to 0000h.

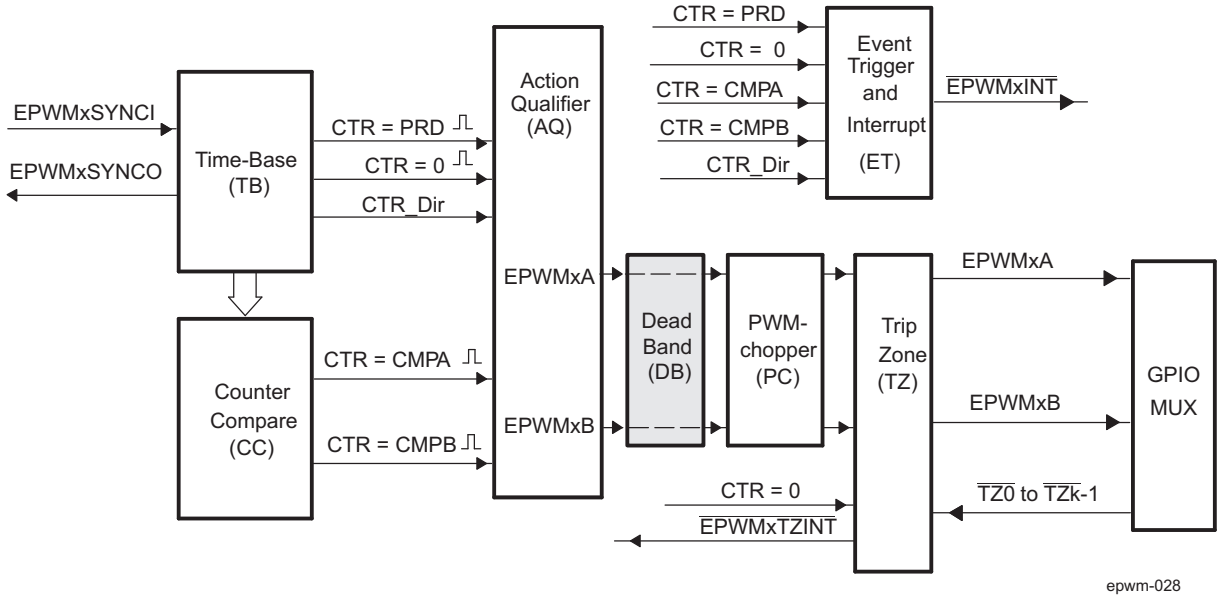
29.2.2.6 ePWM Dead-Band Generator (DB) Submodule

Figure 29-32 illustrates the dead-band generator submodule within the ePWM module.

Figure 29-32. Dead-Band Generator Submodule



29.2.2.6.1 Purpose of the ePWM Dead-Band Submodule

The "Action-qualifier (AQ) Module" section discussed how it is possible to generate the required dead-band by having full control over edge placement using both the CMPA and CMPB resources of the ePWM module. However, if the more classical edge delay-based dead-band with polarity control is required, then the dead-band generator submodule should be used.

The key functions of the dead-band generator submodule are:

- Generating appropriate signal pairs (EPWMxA and EPWMxB) with dead-band relationship from a single EPWMxA input
- Programming signal pairs for:
  - Active high (AH)
  - Active low (AL)
  - Active high complementary (AHC)
  - Active low complementary (ALC)
- Adding programmable delay to rising edges (RED)
- Adding programmable delay to falling edges (FED)
- Can be totally bypassed from the signal path (note dotted lines in diagram)

29.2.2.6.2 Controlling and Monitoring the ePWM Dead-Band Submodule

The dead-band generator submodule operation is controlled and monitored via the following registers:

Table 29-42. Dead-Band Generator Submodule Registers

Acronym	Register Description	Address Offset	Shadowed
EPWM_DBCTL	Dead-Band Control Register	1Eh	No
EPWM_DBRED	Dead-Band Rising Edge Delay Count Register	20h	No
EPWM_DBFED	Dead-Band Falling Edge Delay Count Register	22h	No

Copyright © 2015–2017, Texas Instruments Incorporated

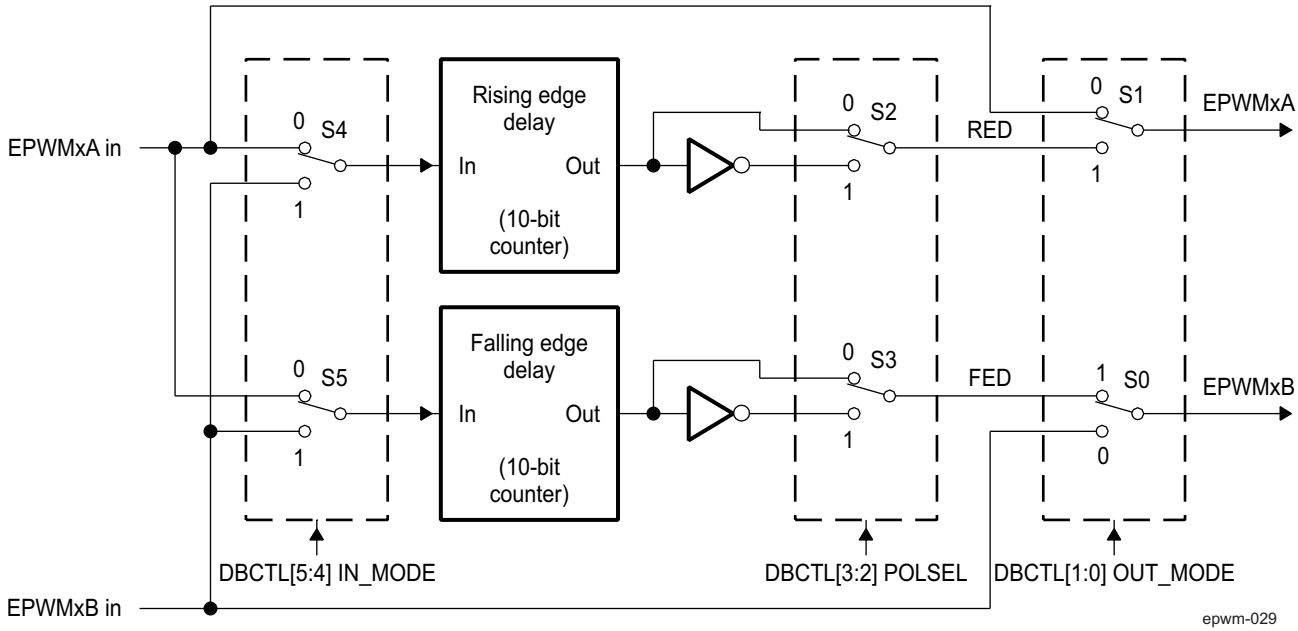
29.2.2.6.3 Operational Highlights for the ePWM Dead-Band Generator Submodule

The following sections provide the operational highlights.

The dead-band submodule has two groups of independent selection options as shown in Figure 29-33.

- **Input Source Selection:** The input signals to the dead-band module are the EPWMxA and EPWMxB output signals from the action-qualifier. In this section they will be referred to as EPWMxA In and EPWMxB In. Using the EPWM_DBCTL[5:4] IN_MODE control bits, the signal source for each delay, falling-edge or rising-edge, can be selected:
  - EPWMxA In is the source for both falling-edge and rising-edge delay. This is the default mode.
  - EPWMxA In is the source for falling-edge delay, EPWMxB In is the source for rising-edge delay.
  - EPWMxA In is the source for rising edge delay, EPWMxB In is the source for falling-edge delay.
  - EPWMxB In is the source for both falling-edge and rising-edge delay.
- **Output Mode Control:** The output mode is configured by way of the EPWM_DBCTL[1:0] OUT_MODE bits. These bits determine if the falling-edge delay, rising-edge delay, neither, or both are applied to the input signals.
- **Polarity Control:** The polarity control (EPWM_DBCTL[3:2] POLSEL) allows you to specify whether the rising-edge delayed signal and/or the falling-edge delayed signal is to be inverted before being sent out of the dead-band submodule.

Figure 29-33. Configuration Options for the ePWM Dead-Band Generator Submodule



Copyright © 2015–2017, Texas Instruments Incorporated

Although all combinations are supported, not all are typical usage modes. Table 29-43 lists some classical dead-band configurations. These modes assume that the EPWM_DBCTL[5:4] IN_MODE is configured such that EPWMxA In is the source for both falling-edge and rising-edge delay. Enhanced, or non-traditional modes can be achieved by changing the input signal source. The modes shown in Table 29-43 fall into the following categories:

- **Mode 1: Bypass both falling-edge delay (FED) and rising-edge delay (RED)** Allows you to fully disable the dead-band submodule from the PWM signal path.
- **Mode 2-5: Classical Dead-Band Polarity Settings** These represent typical polarity configurations that should address all the active high/low modes required by available industry power switch gate drivers. The waveforms for these typical cases are shown in Figure 29-34. Note that to generate equivalent waveforms to Figure 29-34, configure the action-qualifier submodule to generate the signal as shown for EPWMxA.
- **Mode 6: Bypass rising-edge-delay and Mode 7: Bypass falling-edge-delay** Finally the last two entries in Table 29-43 show combinations where either the falling-edge-delay (FED) or rising-edge-delay (RED) blocks are bypassed.

Table 29-43. Classical Dead-Band Operating Modes

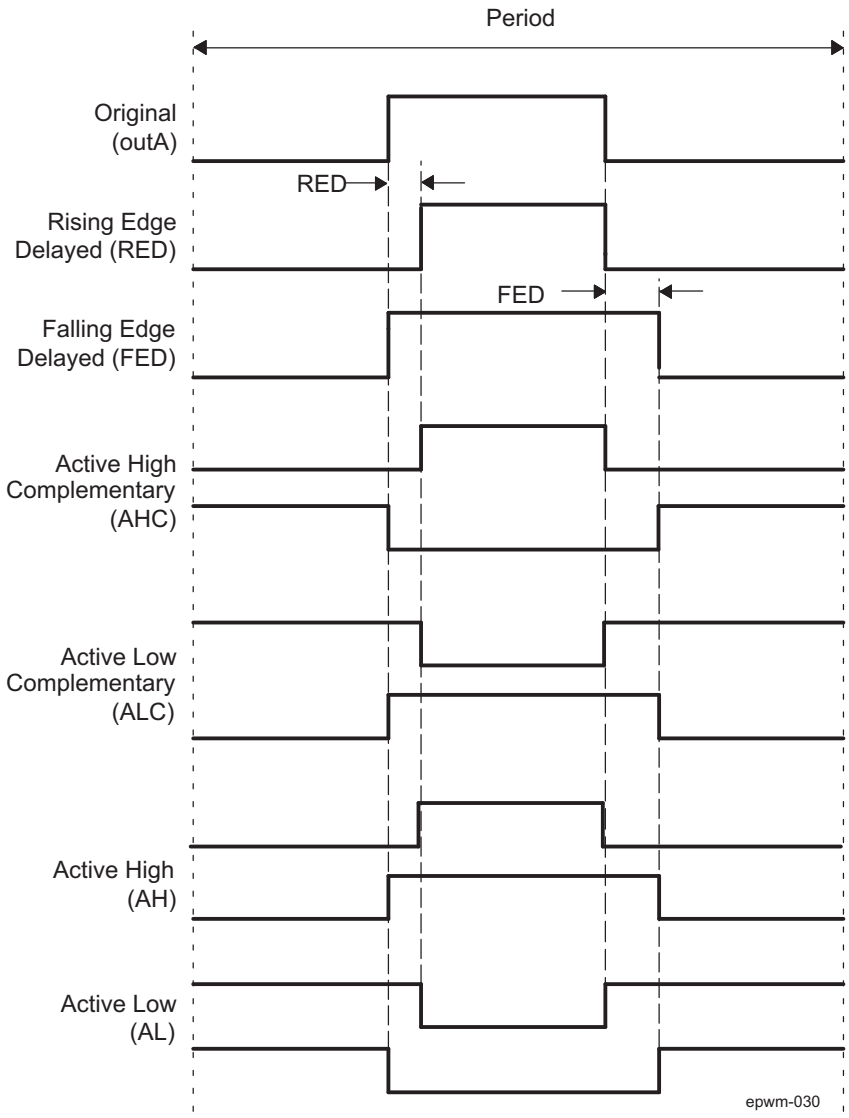
		EPWM_DBCTL[3:2] POLSEL		EPWM_DBCTL[1:0] OUT_MODE	
Mode	Mode Description [1]	S3	S2	S1	S0
1	EPWMxA and EPWMxB Passed Through (No Delay)	x	x	0	0
2	Active High Complementary (AHC)	1	0	1	1
3	Active Low Complementary (ALC)	0	1	1	1
4	Active High (AH)	0	0	1	1
5	Active Low (AL)	1	1	1	1
6	EPWMxA Out = EPWMxA In (No Delay) EPWMxB Out = EPWMxA In with Falling Edge Delay	0 or 1	0 or 1	0	1
7	EPWMxA Out = EPWMxA In with Rising Edge Delay EPWMxB Out = EPWMxB In with No Delay	0 or 1	0 or 1	1	0

(1) These are classical dead-band modes and assume that EPWM_DBCTL[5:4] IN_MODE = 0b00. That is, EPWMxA in is the source for both the falling-edge and rising-edge delays. Enhanced, non-traditional modes can be achieved by changing the IN_MODE configuration.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 29-34 shows waveforms for typical cases where 0% < duty < 100%.

Figure 29-34. Dead-Band Waveforms for Typical Cases (0% < Duty < 100%)



The dead-band submodule supports independent values for rising-edge (RED) and falling-edge (FED) delays. The amount of delay is programmed using the EPWM_DBRED and EPWM_DBFED registers. These are 10-bit registers and their value represents the number of time-base clock, TBCLK, periods a signal edge is delayed by. For example, the formula to calculate falling-edge-delay and rising-edge-delay are:

FED = EPWM_DBFED × T_{TBCLK}

RED = EPWM_DBRED × T_{TBCLK}

Where T_{TBCLK} is the period of TBCLK, the prescaled version of SYSCLKOUT.

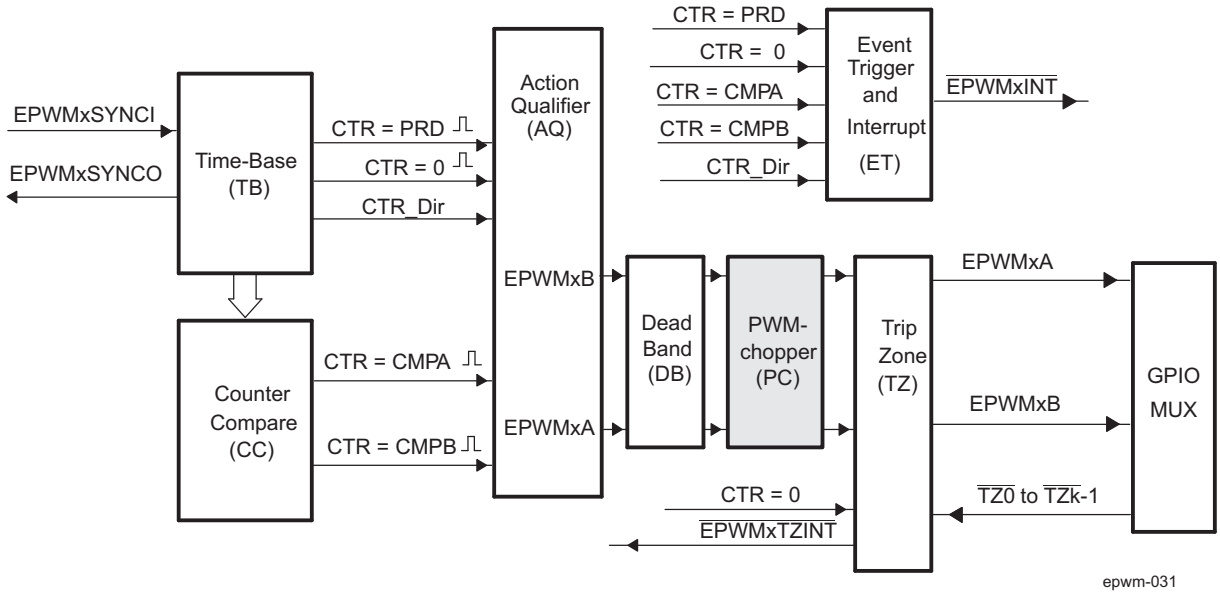
29.2.2.7 PWM-Chopper (PC) Submodule

Figure 29-35 illustrates the PWM-chopper (PC) submodule within the ePWM module. The PWM-chopper submodule allows a high-frequency carrier signal to modulate the PWM waveform generated by the action-qualifier and dead-band submodules. This capability is important if you need pulse transformer-based gate drivers to control the power switching elements.

Figure 29-35. PWM-Chopper Submodule



29.2.2.7.1 Purpose of the PWM-Chopper Submodule

The key functions of the PWM-chopper submodule are:

- Programmable chopping (carrier) frequency
- Programmable pulse width of first pulse
- Programmable duty cycle of second and subsequent pulses
- Can be fully bypassed if not required

29.2.2.7.2 Controlling the PWM-Chopper Submodule

The PWM-chopper submodule operation is controlled via the register in Table 29-44.

Table 29-44. PWM-Chopper Submodule Registers

Acronym	Register Description	Address Offset	Shadowed
EPWM_PCCTL	PWM-chopper Control Register	3Ch	No

Copyright © 2015–2017, Texas Instruments Incorporated

29.2.2.7.3 Operational Highlights for the PWM-Chopper Submodule

Figure 29-36 shows the operational details of the PWM-chopper submodule. The carrier clock is derived from SYSCLKOUT. Its frequency and duty cycle are controlled via the CHPFREQ and CHPDUTY bits in the EPWM_PCCTL register. The one-shot block is a feature that provides a high energy first pulse to ensure hard and fast power switch turn on, while the subsequent pulses sustain pulses, ensuring the power switch remains on. The one-shot width is programmed via the OSHTWTH bits. The PWM-chopper submodule can be fully disabled (bypassed) via the CHPEN bit.

Figure 29-36. PWM-Chopper Submodule Signals and Registers

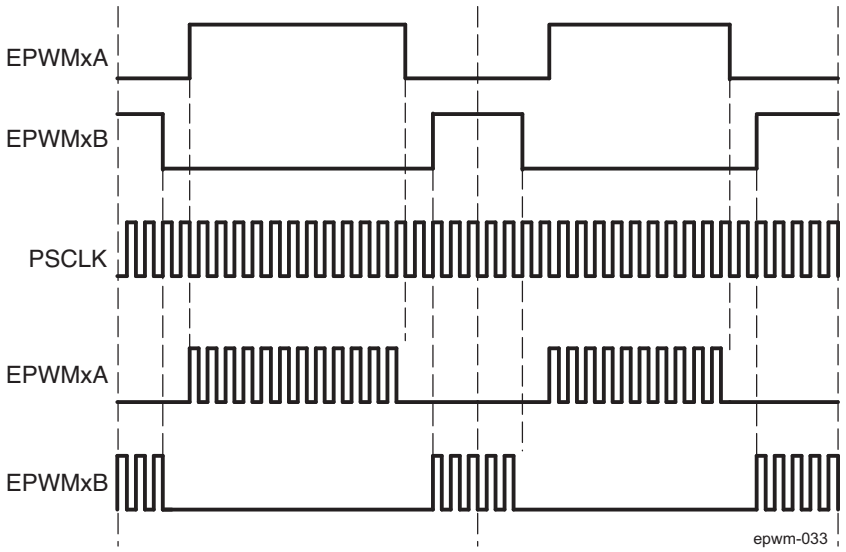
29.2.2.7.4 PWM Chopper Waveforms

Figure 29-37 shows simplified waveforms of the chopping action only; one-shot and duty-cycle control are not shown. Details of the one-shot and duty-cycle control are discussed in the following sections.

Figure 29-37. Simple PWM-Chopper Submodule Waveforms Showing Chopping Action Only



29.2.2.7.4.1 PWM-Chopper One-Shot Pulse

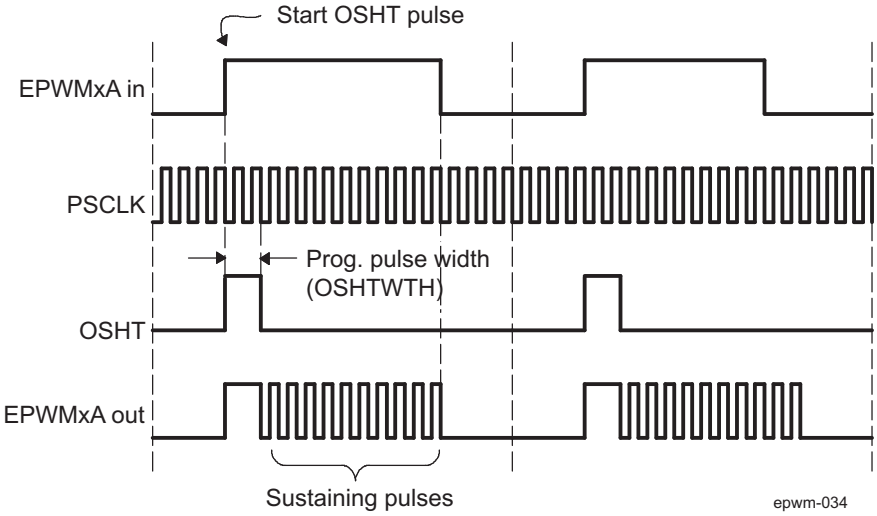
The width of the first pulse can be programmed to any of 16 possible pulse width values. The width or period of the first pulse is given by:

$T_{1stpulse} = T_{SYSCLKOUT} \times 8 \times OSHTWTH$

Where $T_{SYSCLKOUT}$ is the period of the system clock (SYSCLKOUT) and OSHTWTH is the four control bits (value from 1 to 16)

Figure 29-38 shows the first and subsequent sustaining pulses.

Figure 29-38. PWM-Chopper Submodule Waveforms Showing the First Pulse and Subsequent Sustaining Pulses



Copyright © 2015–2017, Texas Instruments Incorporated

29.2.2.7.4.2 PWM-Chopper Duty Cycle Control

Pulse transformer-based gate drive designs need to comprehend the magnetic properties or characteristics of the transformer and associated circuitry. Saturation is one such consideration. To assist the gate drive designer, the duty cycles of the second and subsequent pulses have been made programmable. These sustaining pulses ensure the correct drive strength and polarity is maintained on the power switch gate during the on period, and hence a programmable duty cycle allows a design to be tuned or optimized via software control.

Figure 29-39 shows the duty cycle control that is possible by programming the CHPDUTY bits. One of seven possible duty ratios can be selected ranging from 12.5% to 87.5%.

Figure 29-39. PWM-Chopper Submodule Waveforms Showing the Pulse Width (Duty Cycle) Control of Sustaining Pulses

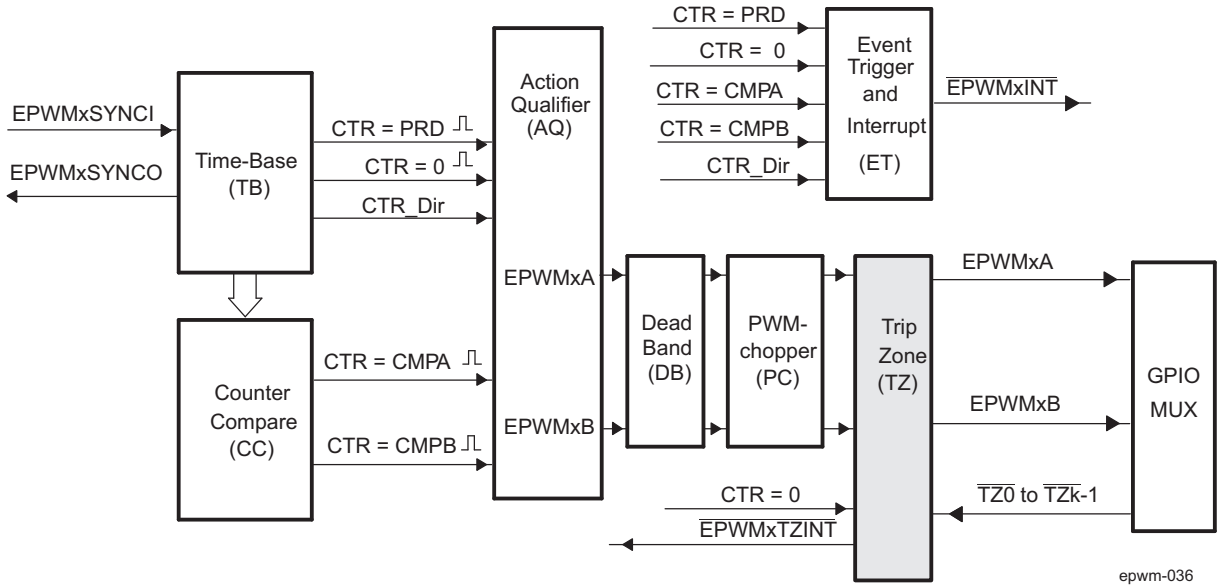
29.2.2.8 ePWM Trip-Zone (TZ) Submodule

Figure 29-40 shows how the trip-zone (TZ) submodule fits within the ePWM module. Each ePWM module is connected to every $\overline{TZ}$ signal that are sourced from the GPIO MUX. These signals indicates external fault or trip conditions, and the ePWM outputs can be programmed to respond accordingly when faults occur. See Section 29.1.3 to determine the number of trip-zone pins available for the device.

Figure 29-40. ePWM Trip-Zone Submodule



29.2.2.8.1 Purpose of the ePWM Trip-Zone Submodule

The key functions of the trip-zone submodule are:

- Trip inputs $\overline{TZ0}$ to $\overline{TZk\text{-}1}$ can be flexibly mapped to any ePWM module.
- Upon a fault condition, outputs EPWMxA and EPWMxB can be forced to one of the following:
  - High
  - Low
  - High-impedance
  - No action taken
- Support for one-shot trip (OSHT) for major short circuits or over-current conditions.
- Support for cycle-by-cycle tripping (CBC) for current limiting operation.
- Each trip-zone input pin can be allocated to either one-shot or cycle-by-cycle operation.
- Interrupt generation is possible on any trip-zone pin.
- Software-forced tripping is also supported.
- The trip-zone submodule can be fully bypassed if it is not required.

NOTE: For each ePWMx, from the tripzone inputs $\overline{EPWM_TRIP_TZ[5:0]}$, ONLY the $\overline{EPWM_TRIP_TZ[0]}$ input of ePWM tripzone is chip accessible and usable, i.e. k=1.

Copyright © 2015–2017, Texas Instruments Incorporated

29.2.2.8.2 Controlling and Monitoring the ePWM Trip-Zone Submodule

The trip-zone submodule operation is controlled and monitored through the following registers:

Table 29-45. ePWM Trip-Zone Submodule Registers

Acronym	Register Description	Address Offset	Shadowed
EPWM_TZSEL	Trip-Zone Select Register	24h	No
EPWM_TZCTL	Trip-Zone Control Register	28h	No
EPWM_TZEINT	Trip-Zone Enable Interrupt Register	2Ah	No
EPWM_TZFLG	Trip-Zone Flag Register	2Ch	No
EPWM_TZCLR	Trip-Zone Clear Register	2Eh	No
EPWM_TZFRC	Trip-Zone Force Register	30h	No

29.2.2.8.3 Operational Highlights for the ePWM Trip-Zone Submodule

The following sections describe the operational highlights and configuration options for the trip-zone submodule.

The trip-zone signals at pin $\overline{TZ0}$ to $\overline{TZk\text{-}1}$ is an active-low input signal. When the pin goes low, it indicates that a trip event has occurred. Each ePWM module can be individually configured to ignore or use each of the trip-zone pins. Which trip-zone pins are used by a particular ePWM module is determined by the EPWM_TZSEL register for that specific ePWM module. The trip-zone signal may or may not be synchronized to the system clock (SYSCLKOUT). A minimum of 1 SYSCLKOUT low pulse on the $\overline{TZ}$ $\overline{n}$ inputs is sufficient to trigger a fault condition in the ePWM module. The asynchronous trip makes sure that if clocks are missing for any reason, the outputs can still be tripped by a valid event present on the $\overline{TZk}$ inputs.

NOTE: Only the TZ[0] input is accessible at chip level (i.e. k=1).

The $\overline{TZk}$ input can be individually configured to provide either a cycle-by-cycle or one-shot trip event for a ePWM module. The configuration is determined by the EPWM_TZSEL[7:0] CBCk and EPWM_TZSEL[15:8] OSHTk bits (where k corresponds to the trip pin) respectively.

- **Cycle-by-Cycle (CBC):** When a cycle-by-cycle trip event occurs, the action specified in the EPWM_TZCTL register is carried out immediately on the EPWMxA and/or EPWMxB output. Table 29-46 lists the possible actions. In addition, the cycle-by-cycle trip event flag (EPWM_TZFLG[1] CBC) is set and a EPWMxTZINT interrupt is generated if it is enabled in the EPWM_TZEINT register.

  The specified condition on the pins is automatically cleared when the ePWM time-base counter reaches zero (EPWM_TBCNT bitfield TBCNT = 0000h) if the trip event is no longer present. Therefore, in this mode, the trip event is cleared or reset every PWM cycle. The EPWM_TZFLG[1] CBC flag bit will remain set until it is manually cleared by writing to the EPWM_TZCLR[1] CBC bit. If the cycle-by-cycle trip event is still present when the EPWM_TZFLG[1] CBC bit is cleared, then it will again be immediately set.
- **One-Shot (OSHT):** When a one-shot trip event occurs, the action specified in the EPWM_TZCTL register is carried out immediately on the EPWMxA and/or EPWMxB output. Table 29-46 lists the possible actions. In addition, the one-shot trip event flag (EPWM_TZFLG[2] OST) is set and a EPWMxTZINT interrupt is generated if it is enabled in the EPWM_TZEINT register. The one-shot trip condition must be cleared manually by writing to the EPWM_TZCLR[2] OST bit.

The action taken when a trip event occurs can be configured individually for each of the ePWM output pins by way of the EPWM_TZCTL[1:0] TZA and EPWM_TZCTL[3:2] TZB register bits. One of four possible actions, shown in Table 29-46, can be taken on a trip event.

Copyright © 2015–2017, Texas Instruments Incorporated

Table 29-46. Possible Actions On an ePWM Trip Event

EPWM_TZCTL[1:0] TZA and/or EPWM_TZCTL[3:2] TZB	EPWMxA and/or EPWMxB	Comment
0	High-Impedance	Tripped
1h	Force to High State	Tripped
2h	Force to Low State	Tripped
3h	No Change	Do Nothing. No change is made to the output.

Example 29-2. ePWM Trip-Zone Configurations

Scenario A:
A one-shot trip event on $\overline{TZ0}$ pulls both EPWM1A, EPWM1B low and also forces EPWM2A and EPWM2B high.

- Configure the ePWM1 registers as follows:
  - EPWM_TZSEL[8] OSHT1 = 1: enables $\overline{TZ}$ as a one-shot event source for ePWM1
  - EPWM_TZCTL[1:0] TZA = 2: EPWM1A will be forced low on a trip event.
  - EPWM_TZCTL[3:2] TZB = 2: EPWM1B will be forced low on a trip event.
- Configure the ePWM2 registers as follows:
  - EPWM_TZSEL[8] OSHT1 = 1: enables $\overline{TZ}$ as a one-shot event source for ePWM2
  - EPWM_TZCTL[1:0] TZA = 1: EPWM2A will be forced high on a trip event.
  - EPWM_TZCTL[3:2] TZB = 1: EPWM2B will be forced high on a trip event.

29.2.2.8.4 Generating ePWM Trip Event Interrupts

Figure 29-41 and Figure 29-42 illustrate the trip-zone submodule control and interrupt logic, respectively.

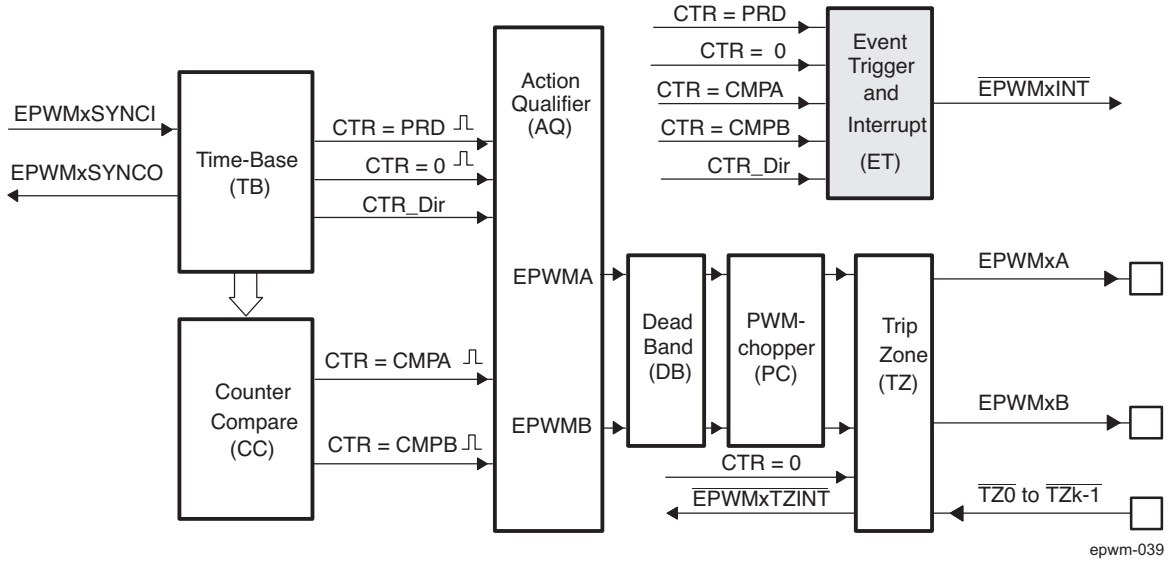
29.2.2.9 ePWM Event-Trigger (ET) Submodule

Figure 29-43 shows the event-trigger (ET) submodule in the ePWM system. The event-trigger submodule manages the events generated by the time-base submodule and the counter-compare submodule to generate an aggregated interrupt request.

NOTE: The ePWMx ET interrupt request output is further routed via the device IRQ_CROSSBAR, to different device host interrupt controllers, located outside PWMSSn. For more details on interrupt event routing outside the ePWM, refer to the Section 29.1.3.

Figure 29-43. ePWM Event-Trigger Submodule



29.2.2.9.1 Purpose of the ePWM Event-Trigger Submodule

The key functions of the event-trigger submodule are:

- Receives event inputs generated by the time-base and counter-compare submodules
- Uses the time-base direction information for up/down event qualification
- Uses prescaling logic to issue interrupt requests at:
  - Every event
  - Every second event
  - Every third event
- Provides full visibility of event generation via event counters and flags

29.2.2.9.2 Controlling and Monitoring the ePWM Event-Trigger Submodule

The key registers used to configure the event-trigger submodule are shown in Table 29-47:

Table 29-47. Event-Trigger Submodule Registers

Acronym	Register Description	Address Offset	Shadowed
EPWM_ETSEL	Event-Trigger Selection Register	32h	No
EPWM_ETPS	Event-Trigger Prescale Register	34h	No
EPWM_ETFLG	Event-Trigger Flag Register	36h	No

Copyright © 2015–2017, Texas Instruments Incorporated

Table 29-47. Event-Trigger Submodule Registers (continued)

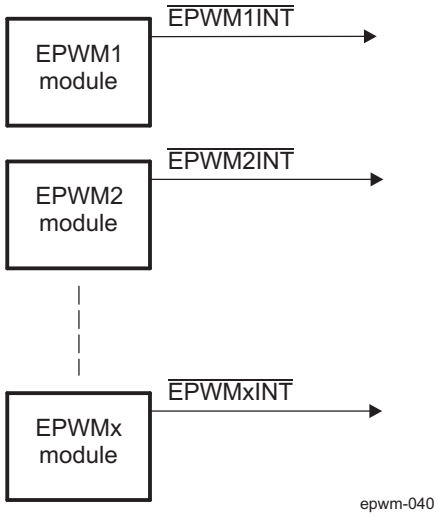
Acronym	Register Description	Address Offset	Shadowed
EPWM_ETCLR	Event-Trigger Clear Register	38h	No
EPWM_ETFRC	Event-Trigger Force Register	3Ah	No

29.2.2.9.3 Operational Overview of the ePWM Event-Trigger Submodule

The following sections describe the event-trigger submodule's operational highlights.

Each ePWM module has one interrupt request line as shown in Figure 29-44. Mapping interrupt lines to device host interrupt controllers is device specific and is covered in the Section 29.1.3.

Figure 29-44. ePWM Event-Trigger Submodule Inter-Connectivity to Interrupt Controller

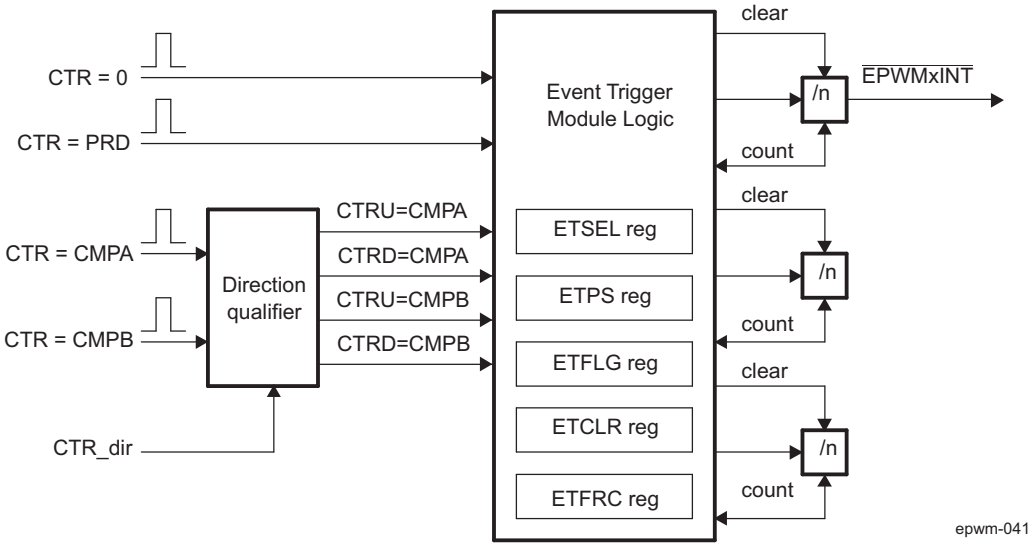


The event-trigger submodule monitors various event conditions (the left side inputs to event-trigger submodule shown in Figure 29-45) and can be configured to prescale these events before issuing an Interrupt request. The event-trigger prescaling logic can issue Interrupt requests at:

- Every event
- Every second event
- Every third event

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 29-45. ePWM Event-Trigger Submodule Showing Event Inputs and Prescaled Outputs



Copyright © 2015–2017, Texas Instruments Incorporated

- ETSEL—This selects which of the possible events will trigger an interrupt.
- ETPS—This programs the event prescaling options previously mentioned.
- ETFLG—These are flag bits indicating status of the selected and prescaled events.
- ETCLR—These bits allow you to clear the flag bits in the EPWM_ETFLG register via software.
- ETFRC—These bits allow software forcing of an event. Useful for debugging or software intervention.

A more detailed look at how the various register bits interact with the Interrupt is shown in Figure 29-46.

Figure 29-46 shows the event-trigger's interrupt generation logic. The interrupt-period (EPWM_ETPS[1:0] INTPRD) bits specify the number of events required to cause an interrupt pulse to be generated. The choices available are:

- Do not generate an interrupt
- Generate an interrupt on every event
- Generate an interrupt on every second event
- Generate an interrupt on every third event

An interrupt cannot be generated on every fourth or more events.

Which event can cause an interrupt is configured by the interrupt selection (EPWM_ETSEL[2:0] INTSEL) bits. The event can be one of the following:

- Time-base counter equal to zero (EPWM_TBCNT bitfield TBCNT = 0000h).
- Time-base counter equal to period (EPWM_TBCNT bitfield TBCNT = TBPRD value in EPWM_TBPRD active register).
- Time-base counter equal to the compare A register (EPWM_CMPA) when the timer is incrementing.
- Time-base counter equal to the compare A register (EPWM_CMPA) when the timer is decrementing.
- Time-base counter equal to the compare B register (EPWM_CMPB) when the timer is incrementing.
- Time-base counter equal to the compare B register (EPWM_CMPB) when the timer is decrementing.

The number of events that have occurred can be read from the interrupt event counter (EPWM_ETPS[3:2] INTCNT) register bits. That is, when the specified event occurs the EPWM_ETPS[3:2] INTCNT bits are incremented until they reach the value specified by EPWM_ETPS[1:0] INTPRD. When EPWM_ETPS[3:2] INTCNT = EPWM_ETPS[1:0] INTPRD the counter stops counting and its output is set. The counter is only cleared when an interrupt is sent to the interrupt controller.

When EPWM_ETPS[3:2] INTCNT reaches EPWM_ETPS[1:0] INTPRD, one of the following behaviors will occur:

- If interrupts are enabled, EPWM_ETSEL[3] INTEN = 1 and the interrupt flag is clear, EPWM_ETFLG[0] INT = 0, then an interrupt pulse is generated and the interrupt flag is set, EPWM_ETFLG[0] INT = 1, and the event counter is cleared EPWM_ETPS[3:2] INTCNT = 0. The counter will begin counting events again.
- If interrupts are disabled, EPWM_ETSEL[3] INTEN = 0, or the interrupt flag is set, EPWM_ETFLG[0] INT = 1, the counter stops counting events when it reaches the period value EPWM_ETPS[3:2] INTCNT = EPWM_ETPS[1:0] INTPRD.
- If interrupts are enabled, but the interrupt flag is already set, then the counter will hold its output high until the ENTFLG[0] INT flag is cleared. This allows for one interrupt to be pending while one is serviced.

Writing to the INTPRD bits will automatically clear the counter INTCNT = 0 and the counter output will be reset (so no interrupts are generated). Writing a 1 to the EPWM_ETFRC[0] INT bit will increment the event counter INTCNT. The counter will behave as described above when INTCNT = INTPRD. When INTPRD = 0, the counter is disabled and hence no events will be detected and the EPWM_ETFRC[0] INT bit is also ignored.

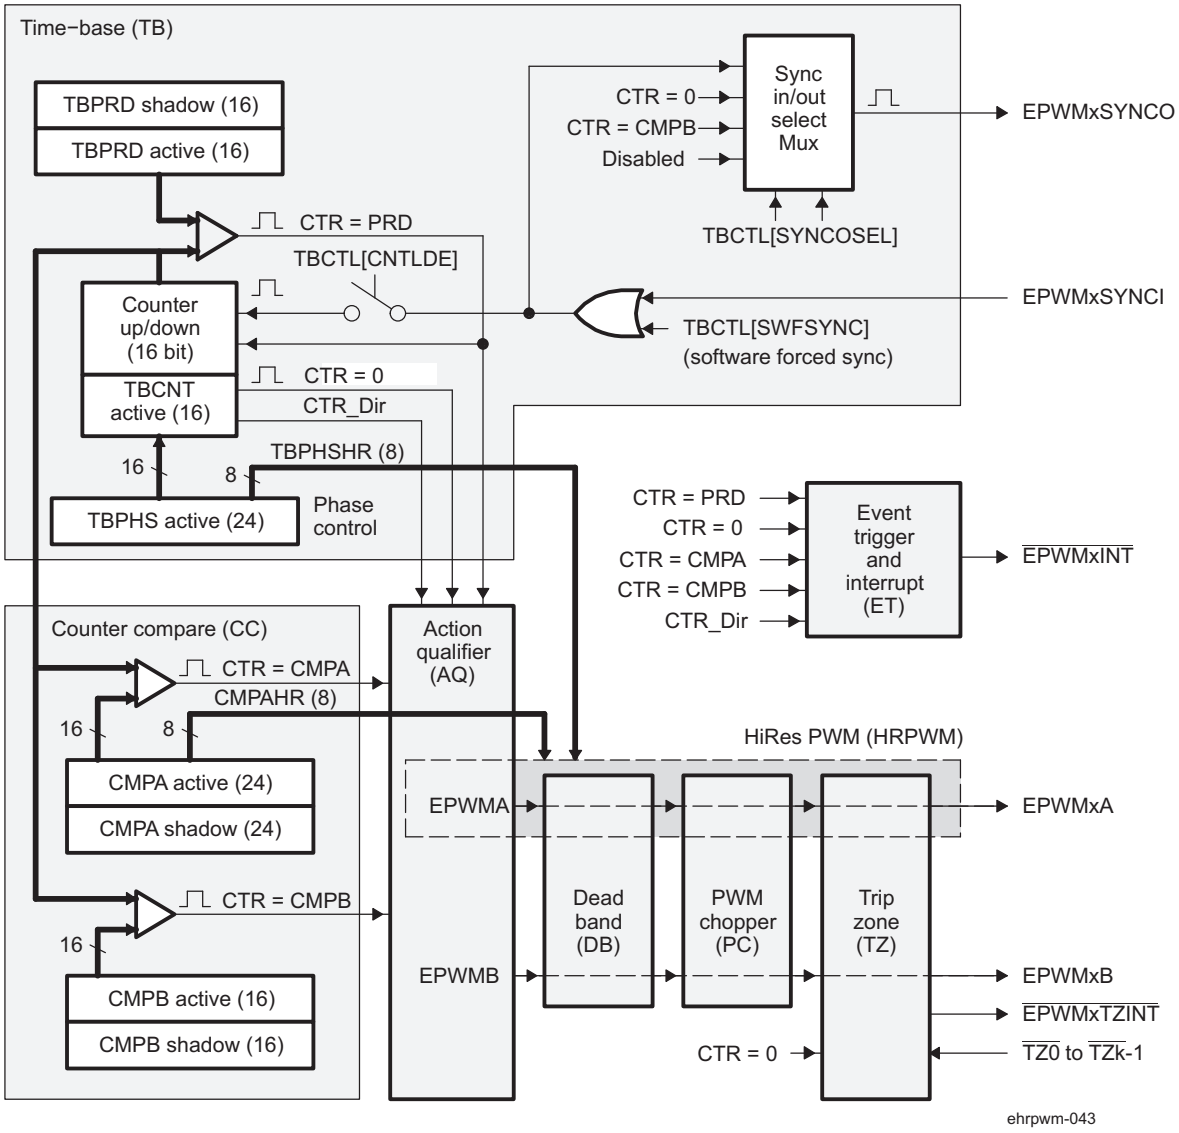
29.2.2.10 High-Resolution PWM (HRPWM) Submodule

Figure 29-47 shows the high-resolution PWM (HRPWM) submodule in the ePWM system. Some devices include the high-resolution PWM submodule, see Section 29.1.3 to determine which ePWM instances include this feature.

Figure 29-47. HRPWM System Interface



Copyright © 2015–2017, Texas Instruments Incorporated

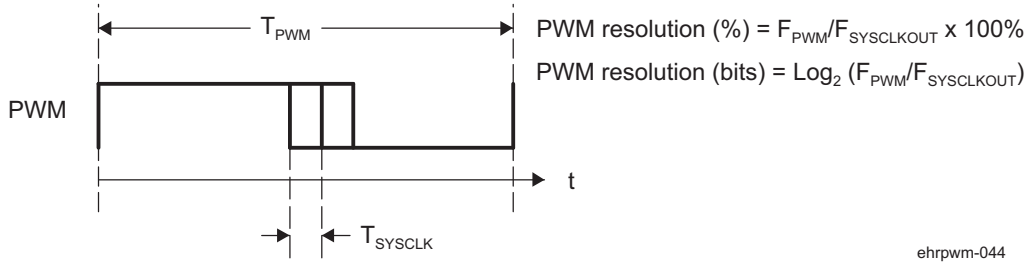
29.2.2.10.1 Purpose of the High-Resolution PWM Submodule

The enhanced high-resolution pulse-width modulator (eHRPWM) extends the time resolution capabilities of the conventionally derived digital pulse-width modulator (PWM). HRPWM is typically used when PWM resolution falls below ~9-10 bits. The key features of HRPWM are:

- Extended time resolution capability
- Used in both duty cycle and phase-shift control methods
- Finer time granularity control or edge positioning using extensions to the Compare A and Phase registers
- Implemented using the A signal path of PWM, that is, on the EPWMxA output. **EPWMxB output has conventional PWM capabilities**

The ePWM peripheral is used to perform a function that is mathematically equivalent to a digital-to-analog converter (DAC). As shown in Figure 29-48, the effective resolution for conventionally generated PWM is a function of PWM frequency (or period) and system clock frequency.

Figure 29-48. Resolution Calculations for Conventionally Generated PWM



If the required PWM operating frequency does not offer sufficient resolution in PWM mode, you may want to consider HRPWM. As an example of improved performance offered by HRPWM, Table 29-48 shows resolution in bits for various PWM frequencies. Table 29-48 values assume a MEP step size of 180 ps. See your device-specific data manual for typical and maximum performance specifications for the MEP.

Table 29-48. Resolution for PWM and HRPWM

	Regular Resolution (PWM)		High Resolution (HRPWM)	
PWM Frequency (kHz)	Bits	%	Bits	%
20	12.3	0.0	18.1	0.000
50	11.0	0.0	16.8	0.001
100	10.0	0.1	15.8	0.002
150	9.4	0.2	15.2	0.003
200	9.0	0.2	14.8	0.004
250	8.6	0.3	14.4	0.005
500	7.6	0.5	13.8	0.007
1000	6.6	1.0	12.4	0.018
1500	6.1	1.5	11.9	0.027
2000	5.6	2.0	11.4	0.036

Although each application may differ, typical low-frequency PWM operation (below 250 kHz) may not require HRPWM. HRPWM capability is most useful for high-frequency PWM requirements of power conversion topologies such as:

- Single-phase buck, boost, and flyback
- Multi-phase buck, boost, and flyback
- Phase-shifted full bridge
- Direct modulation of D-Class power amplifiers

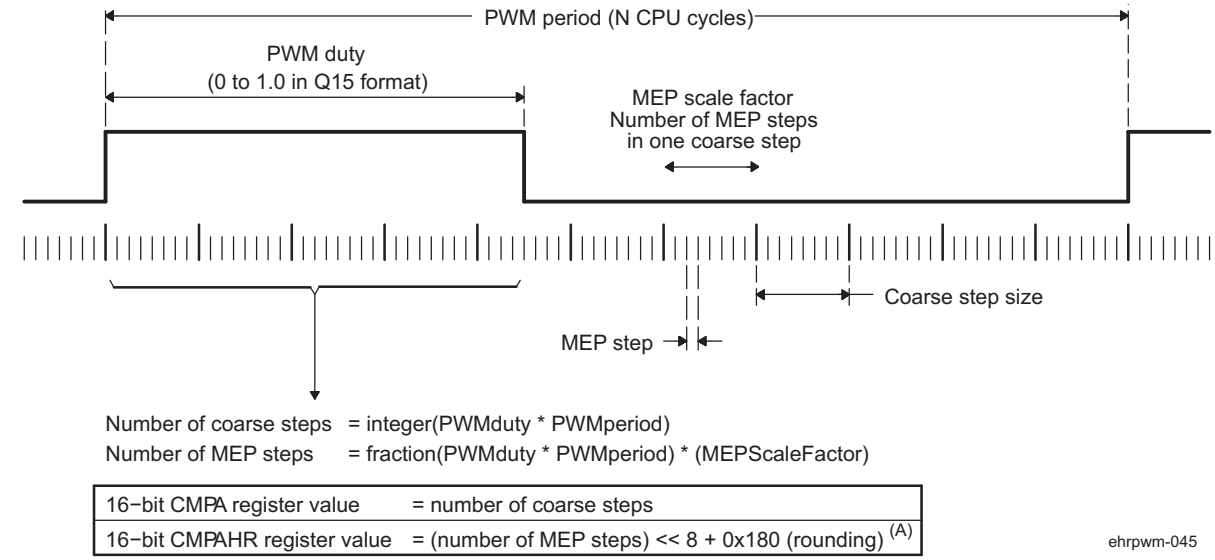
29.2.2.10.2 Architecture of the High-Resolution PWM Submodule

The HRPWM is based on micro edge positioner (MEP) technology. MEP logic is capable of positioning an edge very finely by sub-dividing one coarse system clock of a conventional PWM generator. The time step accuracy is on the order of 150 ps. The HRPWM also has a self-check software diagnostics mode to check if the MEP logic is running optimally, under all operating conditions.

Figure 29-49 shows the relationship between one coarse system clock and edge position in terms of MEP steps, which are controlled via an 8-bit field in the Compare A extension register (HRPWM_CMPAHR).

Figure 29-49. Operating Logic Using MEP



A For MEP range and rounding adjustment.

To generate an HRPWM waveform, configure the TBM, CCM, and AQM registers as you would to generate a conventional PWM of a given frequency and polarity. The HRPWM works together with the TBM, CCM, and AQM registers to extend edge resolution, and should be configured accordingly. Although many programming combinations are possible, only a few are needed and practical.

29.2.2.10.3 Controlling and Monitoring the High-Resolution PWM Submodule

The MEP of the HRPWM is controlled by two extension registers, each 8-bits wide. These two HRPWM registers are concatenated with the 16-bit EPWM_TBPHS and EPWM_CMPA registers used to control PWM operation.

- HRPWM_TBPHSHR - Time-Base Phase High-Resolution Register
- HRPWM_CMPAHR - Counter-Compare A High-Resolution Register

Table 29-49 lists the registers used to control and monitor the high-resolution PWM submodule.

Table 29-49. HRPWM Submodule Registers

Acronym	Register Description	Address Offset	Shadowed
HRPWM_TBPHSHR	Extension Register for HRPWM Phase	4h	No
HRPWM_CMPAHR	Extension Register for HRPWM Duty	10h	Yes
HRPWM_HRCTL	HRPWM Configuration Register	1040h	No

Copyright © 2015–2017, Texas Instruments Incorporated

29.2.2.10.4 Configuring the High-Resolution PWM Submodule

Once the ePWM has been configured to provide conventional PWM of a given frequency and polarity, the HRPWM is configured by programming the HRPWM_HRCTL register located at offset address 1040h. This register provides configuration options for the following key operating modes:

- **Edge Mode:** The MEP can be programmed to provide precise position control on the rising edge (RE), falling edge (FE), or both edges (BE) at the same time. FE and RE are used for power topologies requiring duty cycle control, while BE is used for topologies requiring phase shifting, for example, phase shifted full bridge.
- **Control Mode:** The MEP is programmed to be controlled either from the HRPWM_CMPAHR register (duty cycle control) or the HRPWM_TBPHSHR register (phase control). RE or FE control mode should be used with HRPWM_CMPAHR register. BE control mode should be used with HRPWM_TBPHSHR register.
- **Shadow Mode:** This mode provides the same shadowing (double buffering) option as in regular PWM mode. This option is valid only when operating from the HRPWM_CMPAHR register and should be chosen to be the same as the regular load option for the CMPA register. If HRPWM_TBPHSHR is used, then this option has no effect.

29.2.2.10.5 Operational Highlights for the High-Resolution PWM Submodule

The MEP logic is capable of placing an edge in one of 255 (8 bits) discrete time steps, each of which has a time resolution on the order of 150 ps. The MEP works with the TBM and CCM registers to be certain that time steps are optimally applied and that edge placement accuracy is maintained over a wide range of PWM frequencies, system clock frequencies and other operating conditions. Table 29-50 shows the typical range of operating frequencies supported by the HRPWM.

Table 29-50. Relationship Between MEP Steps, PWM Frequency and Resolution

System (MHz)	MEP Steps Per SYSCLKOUT(1) (2) (3)	PWM Minimum (Hz)(4)	PWM Maximum (MHz)	Resolution at Maximum (Bits)(5)
50.0	111	763	2.50	11.1
60.0	93	916	3.00	10.9
70.0	79	1068	3.50	10.6
80.0	69	1221	4.00	10.4
90.0	62	1373	4.50	10.3
100.0	56	1526	5.00	10.1

(1) System frequency = SYSCLKOUT, that is, CPU clock. TBCLK = SYSCLKOUT
(2) Table data based on a MEP time resolution of 180 ps (this is an example value)
(3) MEP steps applied = $T_{SYSCLKOUT}$/180 ps in this example.
(4) PWM minimum frequency is based on a maximum period value, TBPRD = 65 535. PWM mode is asymmetrical up-count.
(5) Resolution in bits is given for the maximum PWM frequency stated.

29.2.2.10.5.1 HRPWM Edge Positioning

In a typical power control loop (switch modes, digital motor control (DMC), uninterruptible power supply (UPS)), a digital controller (PID, 2pole/2zero, lag/lead, etc.) issues a duty command, usually expressed in a per unit or percentage terms.

In the following example, assume that for a particular operating point, the demanded duty cycle is 0.405 or 40.5% on-time and the required converter PWM frequency is 1.25 MHz. In conventional PWM generation with a system clock of 100 MHz, the duty cycle choices are in the vicinity of 40.5%. In Figure 29-50, a compare value of 32 counts (duty = 40%) is the closest to 40.5% that you can attain. This is equivalent to an edge position of 320 ns instead of the desired 324 ns. This data is shown in Table 29-51.

By utilizing the MEP, you can achieve an edge position much closer to the desired point of 324 ns. Table 29-51 shows that in addition to the CMPA value, 22 steps of the MEP (HRPWM_CMPAHR register) will position the edge at 323.96 ns, resulting in almost zero error. In this example, it is assumed that the MEP has a step resolution of 180 ns.

Figure 29-50. Required PWM Waveform for a Requested Duty = 40.5%

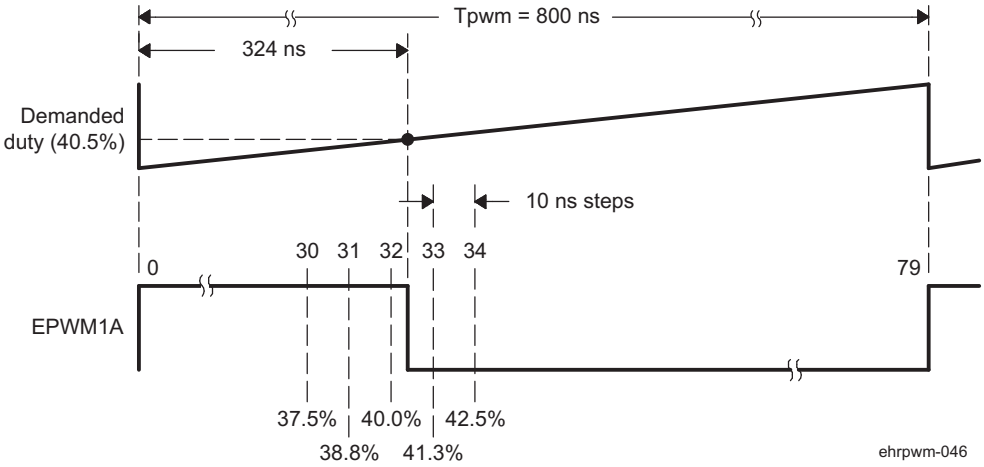

Table 29-51. CMPA vs Duty (left), and [CMPA:CMPAHR] vs Duty (right)

CMPA (count)[1] [2] [3]	DUTY (%)	High Time (ns)	CMPA (count)	CMPAHR (count)	Duty (%)	High Time (ns)
28	35.0	280	32	18	40.405	323.24
29	36.3	290	32	19	40.428	323.42
30	37.5	300	32	20	40.450	323.60
31	38.8	310	32	21	40.473	323.78
32	40.0	320	32	22	40.495	323.96
33	41.3	330	32	23	40.518	324.14
34	42.5	340	32	24	40.540	324.32
			32	25	40.563	324.50
Required			32	26	40.585	324.68
32.40	40.5	324	32	27	40.608	324.86

(1) System clock, SYSCLKOUT and TBCLK = 100 MHz, 10 ns
(2) For a PWM Period register value of 80 counts, PWM Period = 80 × 10 ns = 800 ns, PWM frequency = 1/800 ns = 1.25 MHz
(3) Assumed MEP step size for the above example = 180 ps

29.2.2.10.5.2 HRPWM Scaling Considerations

The mechanics of how to position an edge precisely in time has been demonstrated using the resources of the standard (EPWM_CMPA) and MEP (HRPWM_CMPAHR) registers. In a practical application, however, it is necessary to seamlessly provide the CPU a mapping function from a per-unit (fractional) duty cycle to a final integer (non-fractional) representation that is written to the [CMPA:CMPAHR] register combination.

To do this, first examine the scaling or mapping steps involved. It is common in control software to express duty cycle in a per-unit or percentage basis. This has the advantage of performing all needed math calculations without concern for the final absolute duty cycle, expressed in clock counts or high time in ns. Furthermore, it makes the code more transportable across multiple converter types running different PWM frequencies.

To implement the mapping scheme, a two-step scaling procedure is required.

Assumptions for this example:

System clock, SYSCLKOUT	=	10 ns (100 MHz)
PWM frequency	=	1.25 MHz (1/800 ns)
Required PWM duty cycle, **PWMDuty**	=	0.405 (40.5%)
PWM period in terms of coarse steps, **PWMperiod** (800 ns/10 ns)	=	80
Number of MEP steps per coarse step at 180 ps (10 ns/180 ps), **MEP_SF**	=	55
Value to keep CMPAHR within the range of 1-255 and fractional rounding constant (default value)	=	180h

Step 1: Percentage Integer Duty value conversion for EPWM_CMPA register

EPWM_CMPA register value	=	int(**PWMDuty** × **PWMperiod**); int means integer part
	=	int(0.405 × 80)
	=	int(32.4)
EPWM_CMPA register value	=	32 (20h)

Step 2: Fractional value conversion for HRPWM_CMPAHR register

HRPWM_CMPAHR register value	=	(frac(**PWMDuty** × **PWMperiod**) × **MEP_SF**) << 8) + 180h; frac means fractional part
	=	(frac(32.4) × 55 <<8) + 180h; Shift is to move the value as CMPAHR high byte
	=	((0.4 × 55) <<8) + 180h
	=	(22 <<8) + 180h
	=	22 × 256 + 180h ; Shifting left by 8 is the same multiplying by 256.
	=	5632 + 180h
	=	1600h + 180h
HRPWM_CMPAHR value	=	1780h; HRPWM_CMPAHR value = 1700h, lower 8 bits will be ignored by hardware.

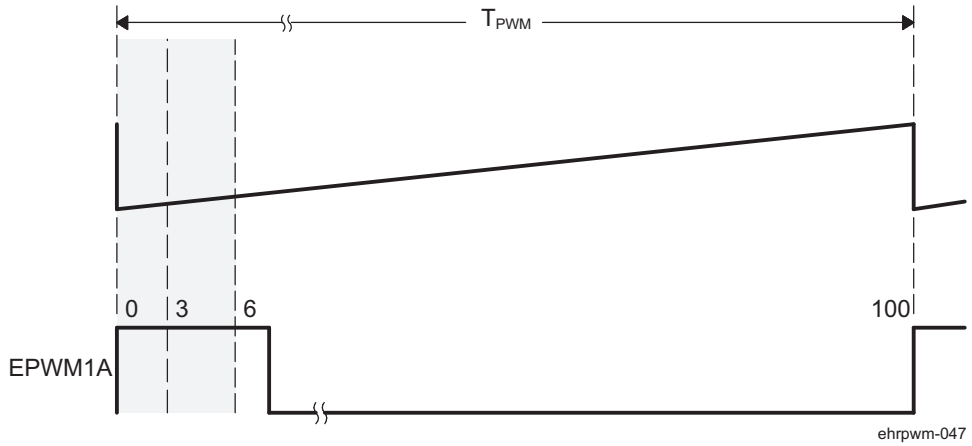
29.2.2.10.5.3 HRPWM Duty Cycle Range Limitation

In high resolution mode, the MEP is not active for 100% of the PWM period. It becomes operational 3 SYSCLKOUT cycles after the period starts.

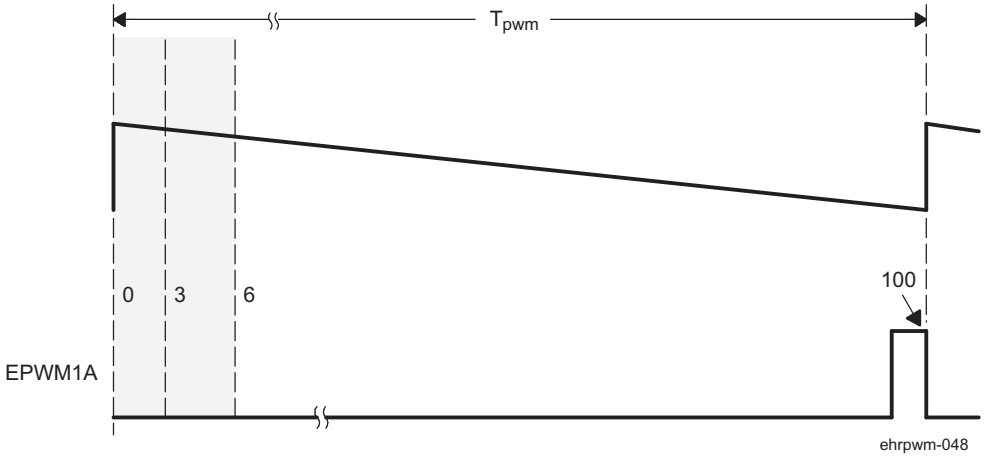
Duty cycle range limitations are illustrated in Figure 29-51. This limitation imposes a lower duty cycle limit on the MEP. For example, precision edge control is not available all the way down to 0% duty cycle. Although for the first 3 or 6 cycles, the HRPWM capabilities are not available, regular PWM duty control is still fully operational down to 0% duty. In most applications this should not be an issue as the controller regulation point is usually not designed to be close to 0% duty cycle.

Figure 29-51. Low % Duty Cycle Range Limitation Example When PWM Frequency = 1 MHz



If the application demands HRPWM operation in the low percent duty cycle region, then the HRPWM can be configured to operate in count-down mode with the rising edge position (REP) controlled by the MEP. This is illustrated in Figure 29-52. In this case low percent duty limitation is no longer an issue.

Figure 29-52. High % Duty Cycle Range Limitation Example when PWM Frequency = 1 MHz



29.2.2.11 eHRPWM Functional Register Groups

The Table 29-52 lists the groups of ePWM and the high-resolution PWM module registers according to their functionalities.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FREE_SOFT		PHSDIR	CLKDIV			HSPCLKDIV		SWFSYNC	SYNCOSEL			PRDLD	PHSEN	CTRMODE	

Bits	Field Name	Description	Type	Reset
15:14	FREE_SOFT	Emulation Mode Bits. These bits select the behavior of the ePWM time-base counter during emulation events: 0x0 = Stop after the next time-base counter increment or decrement 0x1 = Stop when counter completes a whole cycle. (a) Up-count mode: stop when the time-base counter = period (EPWM_TBCNT bitfield TBCNT = TBPRD in EPWM_TBPRD active register). (b) Down-count mode: stop when the time-base counter = 0000 (EPWM_TBCNT bitfield TBCNT = 0000h). (c) Up-down-count mode: stop when the time-base counter = 0000 (EPWM_TBCNT bitfield TBCNT = 0000h). 0x2 = Free run 0x3 = Free run	RW	0x0
13	PHSDIR	Phase Direction Bit. This bit is only used when the time-base counter is configured in the up-down-count mode. The PHSDIR bit indicates the direction the time-base counter (EPWM_TBCNT) will count after a synchronization event occurs and a new phase value is loaded from the phase (EPWM_TBPHS) register. This is irrespective of the direction of the counter before the synchronization event.. In the up-count and down-count modes this bit is ignored. 0x0 = Count down after the synchronization event. 0x1 = Count up after the synchronization event.	RW	0x0
12:10	CLKDIV	Time-base Clock Prescale Bits. These bits determine part of the time-base clock prescale value. TBCLK = SYSCLKOUT/(HSPCLKDIV x CLKDIV) 0x0 = /1 (default on reset) 0x1 = /2 0x2 = /4 0x3 = /8 0x4 = /16 0x5 = /32 0x6 = /64 0x7 = /128	RW	0x0

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
9:7	HSPCLKDIV	High-Speed Time-base Clock Prescale Bits. These bits determine part of the time-base clock prescale value. TBCLK = SYSCLKOUT/(HSPCLKDIV x CLKDIV). This divisor emulates the HSPCLK in the TMS320x281x system as used on the Event Manager (EV) peripheral. 0x0 = /1 0x1 = /2 (default on reset) 0x2 = /4 0x3 = /6 0x4 = /8 0x5 = /10 0x6 = /12 0x7 = /14	RW	0x0
6	SWFSYNC	Software Forced Synchronization Pulse. 0x0 = Writing a 0 has no effect and reads always return a 0. 0x1 = Writing a 1 forces a one-time synchronization pulse to be generated. This event is ORed with the EPWMxSYNCI input of the ePWM module. SWFSYNC is valid (operates) only when EPWMxSYNCI is selected by SYNCOSEL = 00.	RW	0x0
5:4	SYNCOSEL	Synchronization Output Select. These bits select the source of the EPWMxSYNCO signal. 0x0 = EPWMxSYNC: 0x1 = TBCNT = 0: Time-base counter equal to zero (EPWM_TBCNT bitfield TBCNT= 0000h) 0x2 = TBCNT = CMPB : Time-base counter equal to counter-compare B (EPWM_TBCNT bitfield TBCNT = CMPB bitfield in EPWM_CMPB) 0x3 = Disable EPWMxSYNCO signal	RW	0x0
3	PRDLD	Active Period Register Load From Shadow Register Select 0x0 = The period register (EPWM_TBPRD) is loaded from its shadow register when the time-base counter, TBCNT, is equal to zero. A write or read to the EPWM_TBPRD register accesses the shadow register. 0x1 = Load the EPWM_TBPRD register immediately without using a shadow register. A write or read to the EPWM_TBPRD register directly accesses the active register.	RW	0x0
2	PHSEN	Counter Register Load From Phase Register Enable 0x0 = Do not load the time-base counter (EPWM_TBCNT) from the time-base phase register (EPWM_TBPHS) 0x1 = Load the time-base counter with the phase register when an EPWMxSYNCI input signal occurs or when a software synchronization is forced by the SWFSYNC bit.	RW	0x0
1:0	CTRMODE	Counter Mode. The time-base counter mode is normally configured once and not changed during normal operation. If you change the mode of the counter, the change will take effect at the next TBCLK edge and the current counter value shall increment or decrement from the value before the mode change. These bits set the time-base counter mode of operation as follows: 0x0 = Up-count mode 0x1 = Down-count mode 0x2 = Up-down-count mode 0x3 = Stop-freeze counter operation (default on reset)	RW	0x0

RESERVED													CTRMAX	SYNCI	CTRDIR

Bits	Field Name	Description	Type	Reset
15:3	RESERVED		R	0x0000
2	CTRMAX	Time-Base Counter Max Latched Status Bit. 0x0 = Reading a 0 indicates the time-base counter never reached its maximum value. Writing a 0 will have no effect. 0x1 = Reading a 1 on this bit indicates that the time-base counter reached the max value 0xFFFF. Writing a 1 to this bit will clear the latched event.	RW1C	0x0
1	SYNCI	Input Synchronization Latched Status Bit. 0x0 = Writing a 0 will have no effect. Reading a 0 indicates no external synchronization event has occurred. 0x1 = Reading a 1 on this bit indicates that an external synchronization event has occurred (EPWMxSYNCI). Writing a 1 to this bit will clear the latched event.	RW1C	0x0
0	CTRDIR	Time-Base Counter Direction Status Bit. At reset, the counter is frozen, therefore, this bit has no meaning. To make this bit meaningful, you must first set the appropriate mode via EPWM_TBCTL[1:0] CTRMODE. 0x0 = Time-Base Counter is currently counting down. 0x1 = Time-Base Counter is currently counting up.	R	0x0

Bits	Field Name	Description	Type	Reset
15:0	CMPA	The value in the active EPWM_CMPA register is continuously compared to the time-base counter (register EPWM_TBCNT). When the values are equal, the counter-compare module generates a "time-base counter equal to counter compare A" event. This event is sent to the action-qualifier where it is qualified and converted it into one or more actions. These actions can be applied to either the EPWMxA or the EPWMxB output depending on the configuration of the EPWM_AQCTLA and EPWM_AQCTLB registers. The actions that can be defined in the EPWM_AQCTLA and EPWM_AQCTLB registers include the following. (a) Do nothing the event is ignored. (b) Clear: Pull the EPWMxA and/or EPWMxB signal low. (c) Set: Pull the EPWMxA and/or EPWMxB signal high. (d) Toggle the EPWMxA and/or EPWMxB signal. Shadowing of this register is enabled and disabled by the EPWM_CMPCTL[4] SHDWAMODE bit. By default this register is shadowed. (a) If EPWM_CMPCTL[4] SHDWAMODE = 0, then the shadow is enabled and any write or read will automatically go to the shadow register. In this case, the EPWM_CMPCTL[1:0] LOADAMODE bit field determines which event will load the active register from the shadow register. (b) Before a write, the EPWM_CMPCTL[8] SHDWAFULL bit can be read to determine if the shadow register is currently full. (c) If EPWM_CMPCTL[4] SHDWAMODE = 1, then the shadow register is disabled and any write or read will go directly to the active register, that is the register actively controlling the hardware. (d) In either mode, the active and shadow registers share the same memory map address.	RW	0x0

Table 29-83. EPWM_DBCTL

Address offset	0x1E		
Physical Address	0x4843 E21E 0x4844 021E 0x4844 221E	**Instance**	PWMSS1_EPWM PWMSS2_EPWM PWMSS3_EPWM
Description			
Type	RW		

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED										IN_MODE		POLSEL		OUT_MODE	

Bits	Field Name	Description	Type	Reset
15:6	RESERVED		R	0x0
5:4	IN_MODE	Dead Band Input Mode Control. Bit 5 controls the S5 switch and bit 4 controls the S4 switch. This allows you to select the input source to the falling-edge and rising-edge delay. To produce classical dead-band waveforms, the default is EPWMxA In is the source for both falling and rising-edge delays. 0x0 = EPWMxA In (from the action-qualifier) is the source for both falling-edge and rising-edge delay. 0x1 = EPWMxB In (from the action-qualifier) is the source for rising-edge delayed signal. EPWMxA In (from the action-qualifier) is the source for falling-edge delayed signal. 0x2 = EPWMxA In (from the action-qualifier) is the source for rising-edge delayed signal. EPWMxB In (from the action-qualifier) is the source for falling-edge delayed signal. 0x3 = EPWMxB In (from the action-qualifier) is the source for both rising-edge delay and falling-edge delayed signal.	RW	0x0
3:2	POLSEL	Polarity Select Control. Bit 3 controls the S3 switch and bit 2 controls the S2 switch. This allows you to selectively invert one of the delayed signals before it is sent out of the dead-band submodule. The following descriptions correspond to classical upper/lower switch control as found in one leg of a digital motor control inverter. These assume that EPWM_DBCTL[1:0] OUT_MODE = 0b11 and EPWM_DBCTL[5:4] IN_MODE = 0b00. Other enhanced modes are also possible, but not regarded as typical usage modes. 0x0 = Active high (AH) mode. Neither EPWMxA nor EPWMxB is inverted (default). 0x1 = Active low complementary (ALC) mode. EPWMxA is inverted. 0x2 = Active high complementary (AHC). EPWMxB is inverted. 0x3 = Active low (AL) mode. Both EPWMxA and EPWMxB are inverted.	RW	0x0

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
1:0	OUT_MODE	Dead-band Output Mode Control. Bit 1 controls the S1 switch and bit 0 controls the S0 switch. This allows you to selectively enable or bypass the dead-band generation for the falling-edge and rising-edge delay. 0x0 = Dead-band generation is bypassed for both output signals. In this mode, both the EPWMxA and EPWMxB output signals from the action-qualifier are passed directly to the PWM-chopper submodule. In this mode, the POLSEL and IN_MODE bits have no effect. 0x1 = Disable rising-edge delay. The EPWMxA signal from the action-qualifier is passed straight through to the EPWMxA input of the PWM-chopper submodule. The falling-edge delayed signal is seen on output EPWMxB. The input signal for the delay is determined by EPWM_DBCTL[5:4] IN_MODE. 0x2 = Disable falling-edge delay. The EPWMxB signal from the action-qualifier is passed straight through to the EPWMxB input of the PWM-chopper submodule. The rising-edge delayed signal is seen on output EPWMxA. The input signal for the delay is determined by EPWM_DBCTL[5:4] IN_MODE. 0x3 = Dead-band is fully enabled for both rising-edge delay on output EPWMxA and falling-edge delay on output EPWMxB. The input signal for the delay is determined by EPWM_DBCTL[5:4] IN_MODE.	RW	0x0

Bits	Field Name	Description	Type	Reset
15:4	RESERVED		R	0x0
3:2	INTCNT	ePWM Interrupt Event (EPWMx_INT) Counter Register. These bits indicate how many selected EPWM_ETSEL[2:0] INTSEL events have occurred. These bits are automatically cleared when an interrupt pulse is generated. If interrupts are disabled, EPWM_ETSEL[0] INT = 0 or the interrupt flag is set, EPWM_ETFLG[0] INT = 1, the counter will stop counting events when it reaches the period value EPWM_ETPS[3:2] INTCNT = EPWM_ETPS[1:0] INTPRD. 0x0 = No events have occurred. 0x1 = 1 event has occurred. 0x2 = 2 events have occurred. 0x3 = 3 events have occurred.	R	0x0
1:0	INTPRD	ePWM Interrupt (EPWMx_INT) Period Select. These bits determine how many selected EPWM_ETSEL[2:0] INTSEL events need to occur before an interrupt is generated. To be generated, the interrupt must be enabled (EPWM_ETSEL[0] INT = 1). If the interrupt status flag is set from a previous interrupt (EPWM_ETFLG[0] INT = 1) then no interrupt will be generated until the flag is cleared via the EPWM_ETCLR[0] INT bit. This allows for one interrupt to be pending while another is still being serviced. Once the interrupt is generated, the EPWM_ETPS[3:2] INTCNT bits will automatically be cleared. Writing a INTPRD value that is the same as the current counter value will trigger an interrupt if it is enabled and the status flag is clear. Writing a INTPRD value that is less than the current counter value will result in an undefined state. If a counter event occurs at the same instant as a new zero or non-zero INTPRD value is written, the counter is incremented. 0x0 = Disable the interrupt event counter. No interrupt will be generated and EPWM_ETFRC[0] INT is ignored. 0x1 = Generate an interrupt on the first event INTCNT = 01 (first event) 0x2 = Generate interrupt on EPWM_ETPS[3:2] INTCNT = 0b10 (second event) 0x3 = Generate interrupt on EPWM_ETPS[3:2] INTCNT = 0b11 (third event)	RW	0x0

29.3 Enhanced Capture (eCAP) Module

29.3.1 eCAP Overview

29.3.1.1 Purpose of the eCAP Peripheral

Uses for eCAP include:

- Sample rate measurements of audio inputs
- Speed measurements of rotating machinery (for example, toothed sprockets sensed via Hall sensors)
- Elapsed time measurements between position sensor pulses
- Period and duty cycle measurements of pulse train signals
- Decoding current or voltage amplitude derived from duty cycle encoded current/voltage sensors

29.3.1.2 eCAP Features

The eCAP module includes the following features:

- 32-bit time base counter
- 4-event time-stamp registers (each 32 bits)
- Edge polarity selection for up to four sequenced time-stamp capture events
- Interrupt on either of the four events
- Single shot capture of up to four event time-stamps
- Continuous mode capture of time-stamps in a four-deep circular buffer
- Absolute time-stamp capture
- Difference (Delta) mode time-stamp capture
- All above resources dedicated to a single input pin
- When not used in capture mode, the ECAP module can be configured as a single channel PWM output

Copyright © 2015–2017, Texas Instruments Incorporated

29.3.2 eCAP Functional Description

The eCAP module represents one complete capture channel that can be instantiated multiple times depending on the target device. In the context of this guide, one eCAP channel has the following independent key resources:

- Dedicated input capture pin
- 32-bit time base counter
- 4 × 32-bit time-stamp capture registers (PWMSS_ECAP_CAP1-PWMSS_ECAP_CAP4)
- 4-stage sequencer (Modulo4 counter) that is synchronized to external events, ECAP pin rising/falling edges.
- Independent edge polarity (rising/falling edge) selection for all 4 events
- Input capture signal prescaling (from 2-62)
- One-shot compare register (2 bits) to freeze captures after 1 to 4 time-stamp events
- Control for continuous time-stamp captures using a 4-deep circular buffer (PWMSS_ECAP_CAP1-PWMSS_ECAP_CAP4) scheme
- Interrupt capabilities on any of the 4 capture events

Multiple identical eCAP modules can be contained in a system as shown in Figure 29-53. For actual number of eCAP modules integrated in the device, refer to the Section 29.1.3. As already described in Section 29.1.3, the letter x within a signal or module name is used to indicate a generic eCAP instance on a device. For example, output interrupt request, ECAP1INT belongs to eCAP1, ECAP2INT belongs to eCAP2, etc.

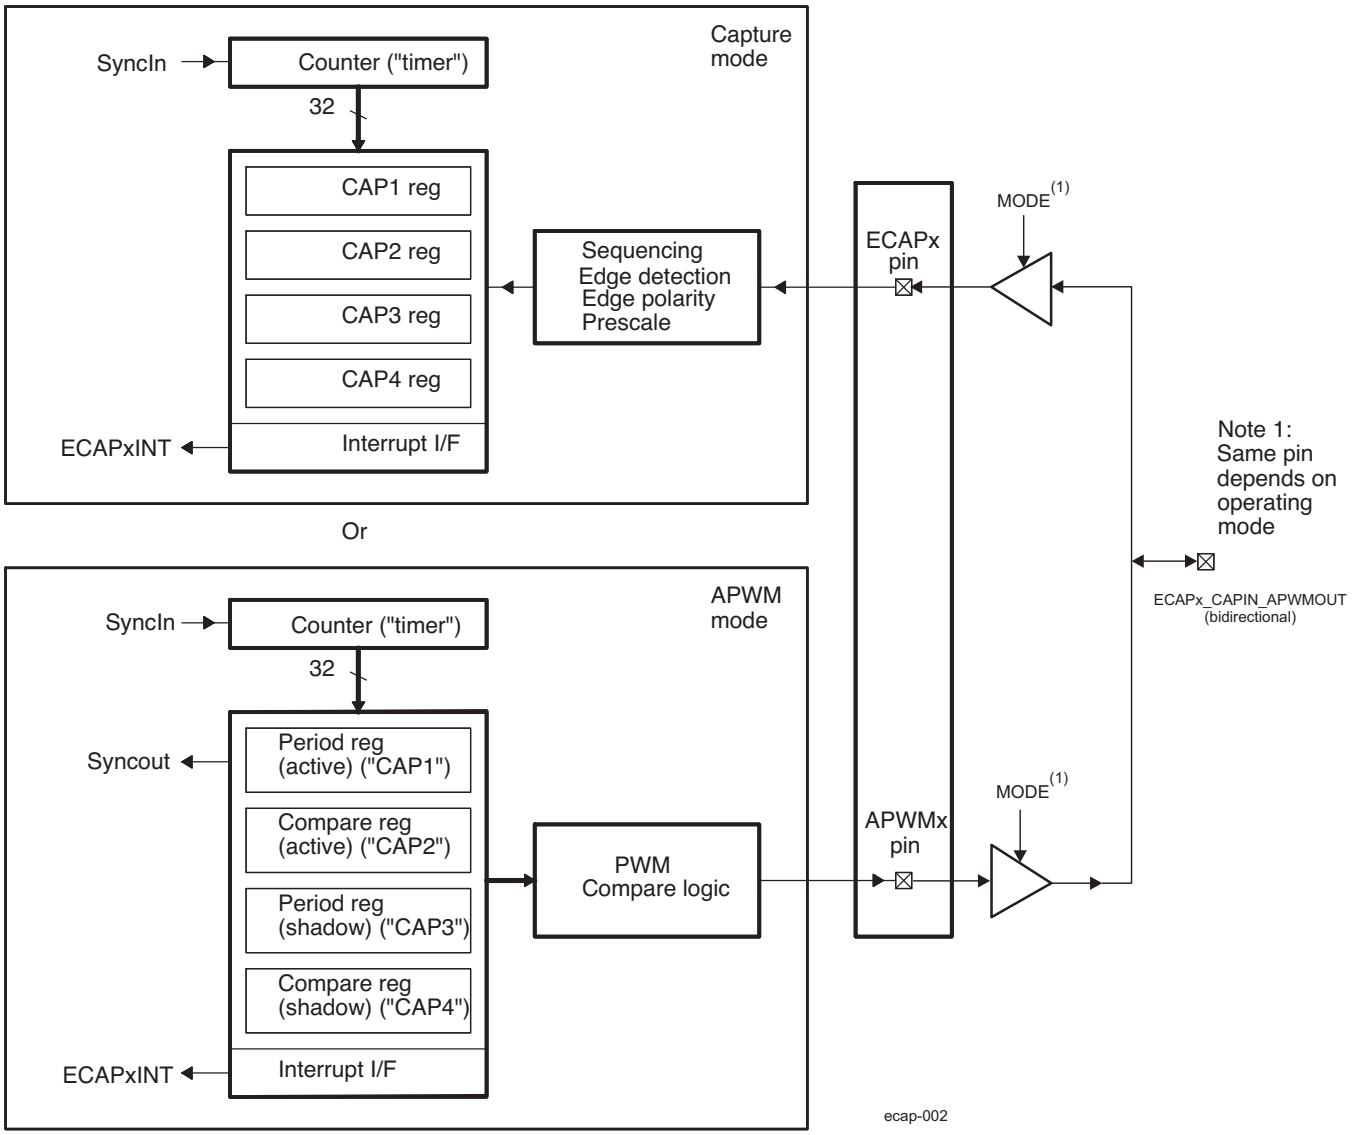
29.3.2.1 Capture and APWM Operating Mode

The eCAP module resources can be used to implement a single-channel PWM generator (with 32 bit capabilities) when it is not being used for input captures. The counter operates in count-up mode, providing a time-base for asymmetrical pulse width modulation (PWM) waveforms. The PWMSS_ECAP_CAP1 and PWMSS_ECAP_CAP2 registers become the active period and compare registers, respectively, while PWMSS_ECAP_CAP3 and PWMSS_ECAP_CAP4 registers become the period and capture shadow registers, respectively. Figure 29-54 is a high-level view of both the capture and auxiliary pulse-width modulator (APWM) modes of operation.

Figure 29-54. Capture and APWM Modes of Operation



(1) A single pin is shared between CAP and APWM functions. In capture mode, it is an input; in APWM mode, it is an output.

(2) In APWM mode, writing any value to PWMSS_ECAP_CAP1/PWMSS_ECAP_CAP2 active registers also writes the same value to the corresponding shadow registers PWMSS_ECAP_CAP3/PWMSS_ECAP_CAP4. This emulates immediate mode. Writing to the shadow registers PWMSS_ECAP_CAP3/PWMSS_ECAP_CAP4 invokes the shadow mode.

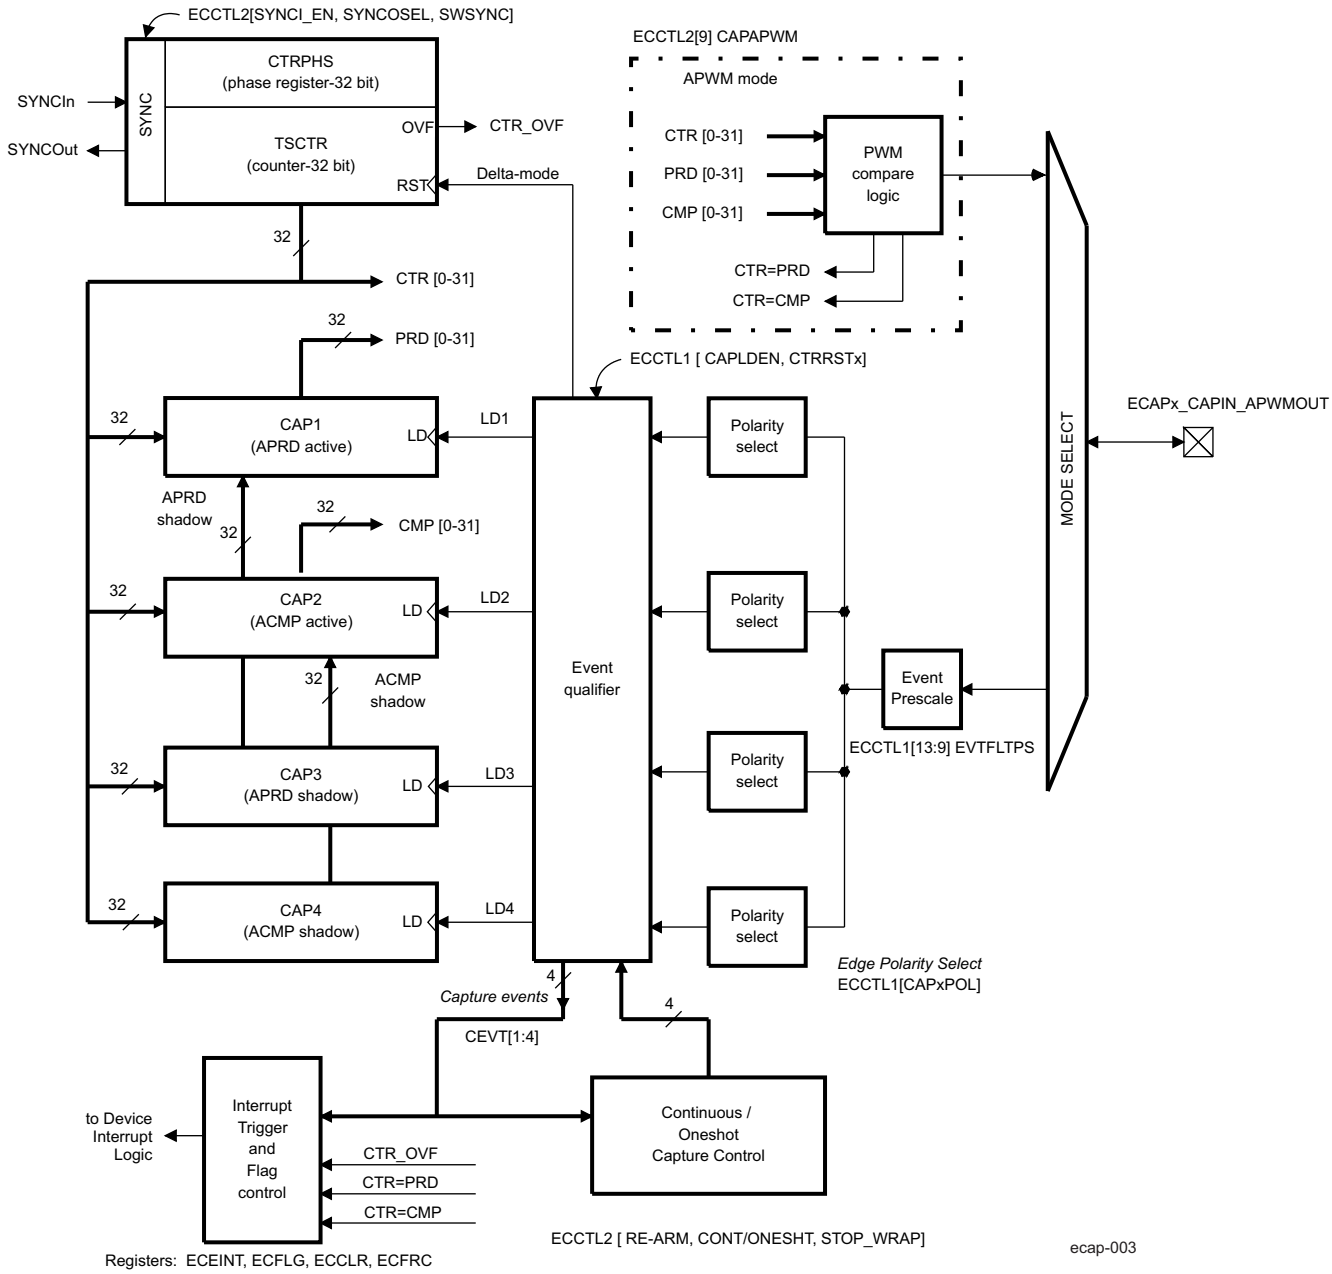
29.3.2.2 eCAP Capture Mode Description

Figure 29-55 shows the various components that implement the capture function.

Figure 29-55. Capture Function Diagram

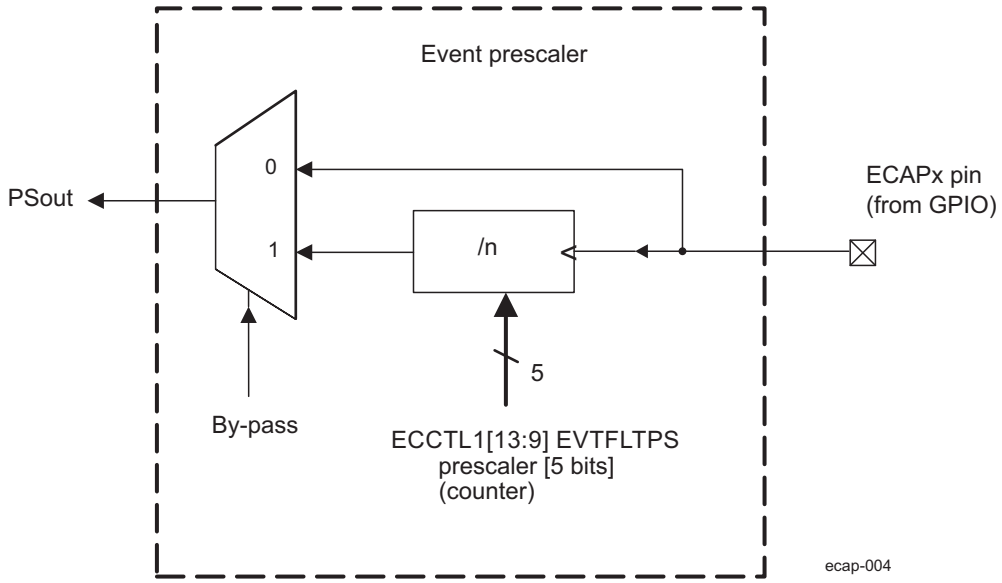


Copyright © 2015–2017, Texas Instruments Incorporated

29.3.2.2.1 eCAP Event Prescaler

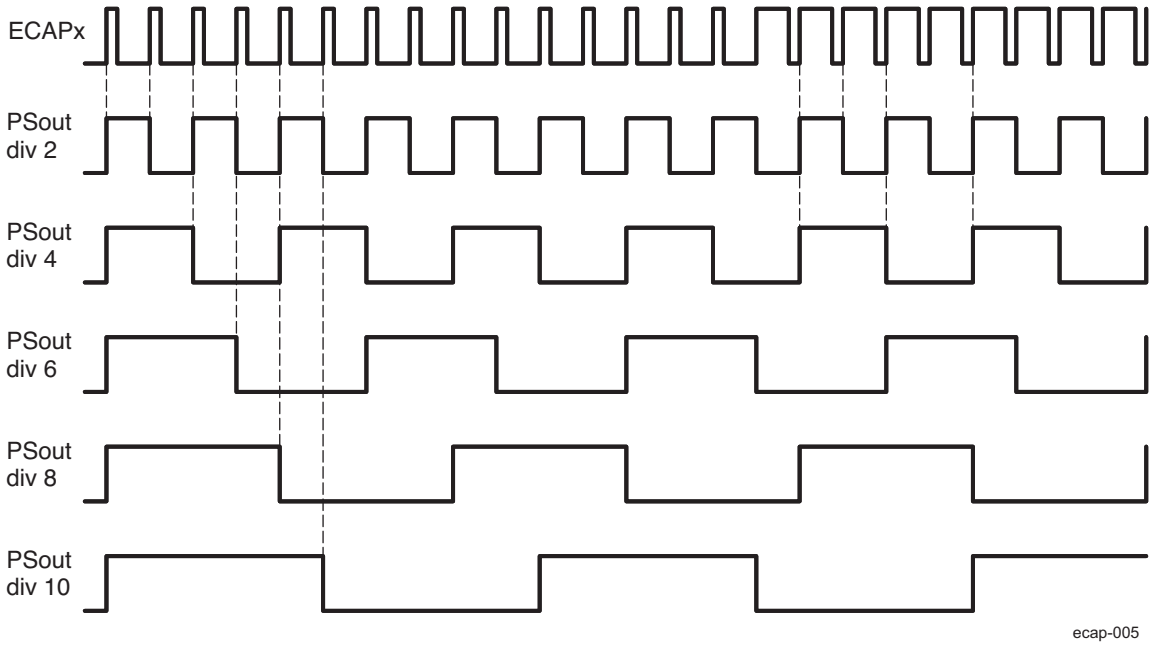
An input capture signal (pulse train) can be prescaled by N = 2-62 (in multiples of 2) or can bypass the prescaler. This is useful when very high frequency signals are used as inputs. Figure 29-56 shows a functional diagram and Figure 29-57 shows the operation of the prescale function.

Figure 29-56. Event Prescale Control



(1) When a prescale value of 1 is chosen (PWMSS_ECAP_ECCTL1[13:9] EVTFLTPS = 0b0000) the input capture signal by-passes the prescale logic completely.

Figure 29-57. Prescale Function Waveforms



Copyright © 2015–2017, Texas Instruments Incorporated

29.3.2.2.2 eCAP Edge Polarity Select and Qualifier

- Four independent edge polarity (rising edge/falling edge) selection multiplexers are used, one for each capture event.
- Each edge (up to 4) is event qualified by the Modulo4 sequencer.
- The edge event is gated to its respective CAP*n* register by the Mod4 counter. The CAP*n* register is loaded on the falling edge.

29.3.2.2.3 eCAP Continuous/One-Shot Control

- The Mod4 (2 bit) counter is incremented via edge qualified events (CEVT1-CEVT4).
- The Mod4 counter continues counting (0->1->2->3->0) and wraps around unless stopped.
- A 2-bit stop register is used to compare the Mod4 counter output, and when equal stops the Mod4 counter and inhibits further loads of the PWMSS_ECAP_CAP1-PWMSS_ECAP_CAP4 registers. This occurs during one-shot operation.

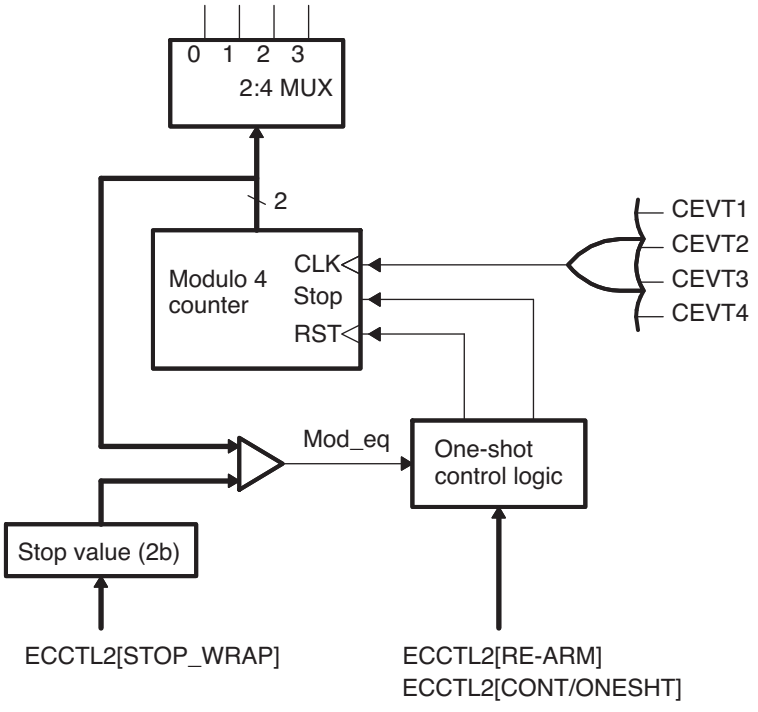
The continuous/one-shot block (Figure 29-58) controls the start/stop and reset (zero) functions of the Mod4 counter via a mono-shot type of action that can be triggered by the stop-value comparator and re-armed via software control.

Once armed, the eCAP module waits for 1-4 (defined by stop-value) capture events before freezing both the Mod4 counter and contents of PWMSS_ECAP_CAP1-4 registers (time-stamps).

Re-arming prepares the eCAP module for another capture sequence. Also re-arming clears (to zero) the Mod4 counter and permits loading of PWMSS_ECAP_CAP1-4 registers again, providing the CAPLDEN bit is set.

In continuous mode, the Mod4 counter continues to run (0->1->2->3->0, the one-shot action is ignored, and capture values continue to be written to PWMSS_ECAP_CAP1-4 in a circular buffer sequence.

Figure 29-58. eCAP Continuous/One-shot Block Diagram



Copyright © 2015–2017, Texas Instruments Incorporated

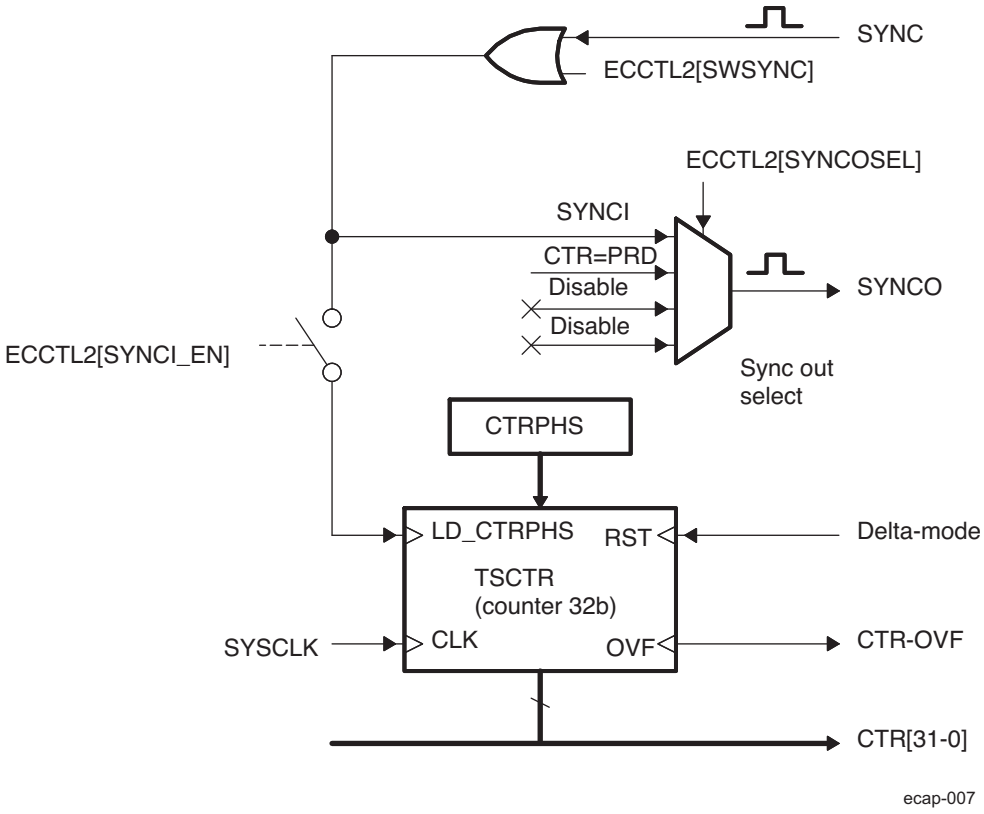
29.3.2.2.4 eCAP 32-Bit Counter and Phase Control

This counter (Figure 29-59) provides the time-base for event captures, and is clocked via the system clock.

A phase register is provided to achieve synchronization with other counters, via a hardware and software forced sync. This is useful in APWM mode when a phase offset between modules is needed.

On any of the four event loads, an option to reset the 32-bit counter is given. This is useful for time difference capture. The 32-bit counter value is captured first, then it is reset to 0 by any of the LD1-LD4 signals.

Figure 29-59. eCAP Counter and Synchronization Block Diagram



Copyright © 2015–2017, Texas Instruments Incorporated

29.3.2.2.5 CAP1-CAP4 Registers

These 32-bit registers are fed by the 32-bit counter timer bus, CTR[0-31] and are loaded (capture a time-stamp) when their respective LD inputs are strobed.

Loading of the capture registers can be inhibited via control bit CAPLDEN. During one-shot operation, this bit is cleared (loading is inhibited) automatically when a stop condition occurs, StopValue = Mod4.

PWMSS_ECAP_CAP1 and PWMSS_ECAP_CAP2 registers become the active period and compare registers, respectively, in APWM mode.

PWMSS_ECAP_CAP3 and PWMSS_ECAP_CAP4 registers become the respective shadow registers (APRD and ACMP) for PWMSS_ECAP_CAP1 and PWMSS_ECAP_CAP2 during APWM operation.

29.3.2.2.6 eCAP Interrupt Control

An Interrupt can be generated on capture events (CEVT1-CEVT4, CNTOVF) or APWM events (TSCNT = PRD, TSCNT = CMP). See Figure 29-60.

A counter overflow event (FFFF FFFFh->0000 0000h) is also provided as an interrupt source (CNTOVF).

The capture events are edge and sequencer qualified (that is, ordered in time) by the polarity select and Mod4 gating, respectively.

One of these events can be selected as the interrupt source (from the eCAP*n* module) going to the interrupt controller.

Seven interrupt events (CEVT1, CEVT2, CEVT3, CEVT4, CNTOVF, TSCNT = PRD, TSCNT = CMP) can be generated. The interrupt enable register (PWMSS_ECAP_ECEINT) is used to enable/disable individual interrupt event sources. The interrupt flag register (PWMSS_ECAP_ECFLG) indicates if any interrupt event has been latched and contains the global interrupt flag bit (INT). An interrupt pulse is generated to the interrupt controller only if any of the interrupt events are enabled, the flag bit is 1, and the INT flag bit is 0. The interrupt service routine must clear the global interrupt flag bit and the serviced event via the interrupt clear register (PWMSS_ECAP_ECCLR) before any other interrupt pulses are generated. You can force an interrupt event via the interrupt force register (PWMSS_ECAP_ECFRC). This is useful for test purposes.

29.3.2.2.7 eCAP Shadow Load and Lockout Control

In capture mode, this logic inhibits (locks out) any shadow loading of PWMSS_ECAP_CAP1 or PWMSS_ECAP_CAP2 from APRD and ACMP registers, respectively.

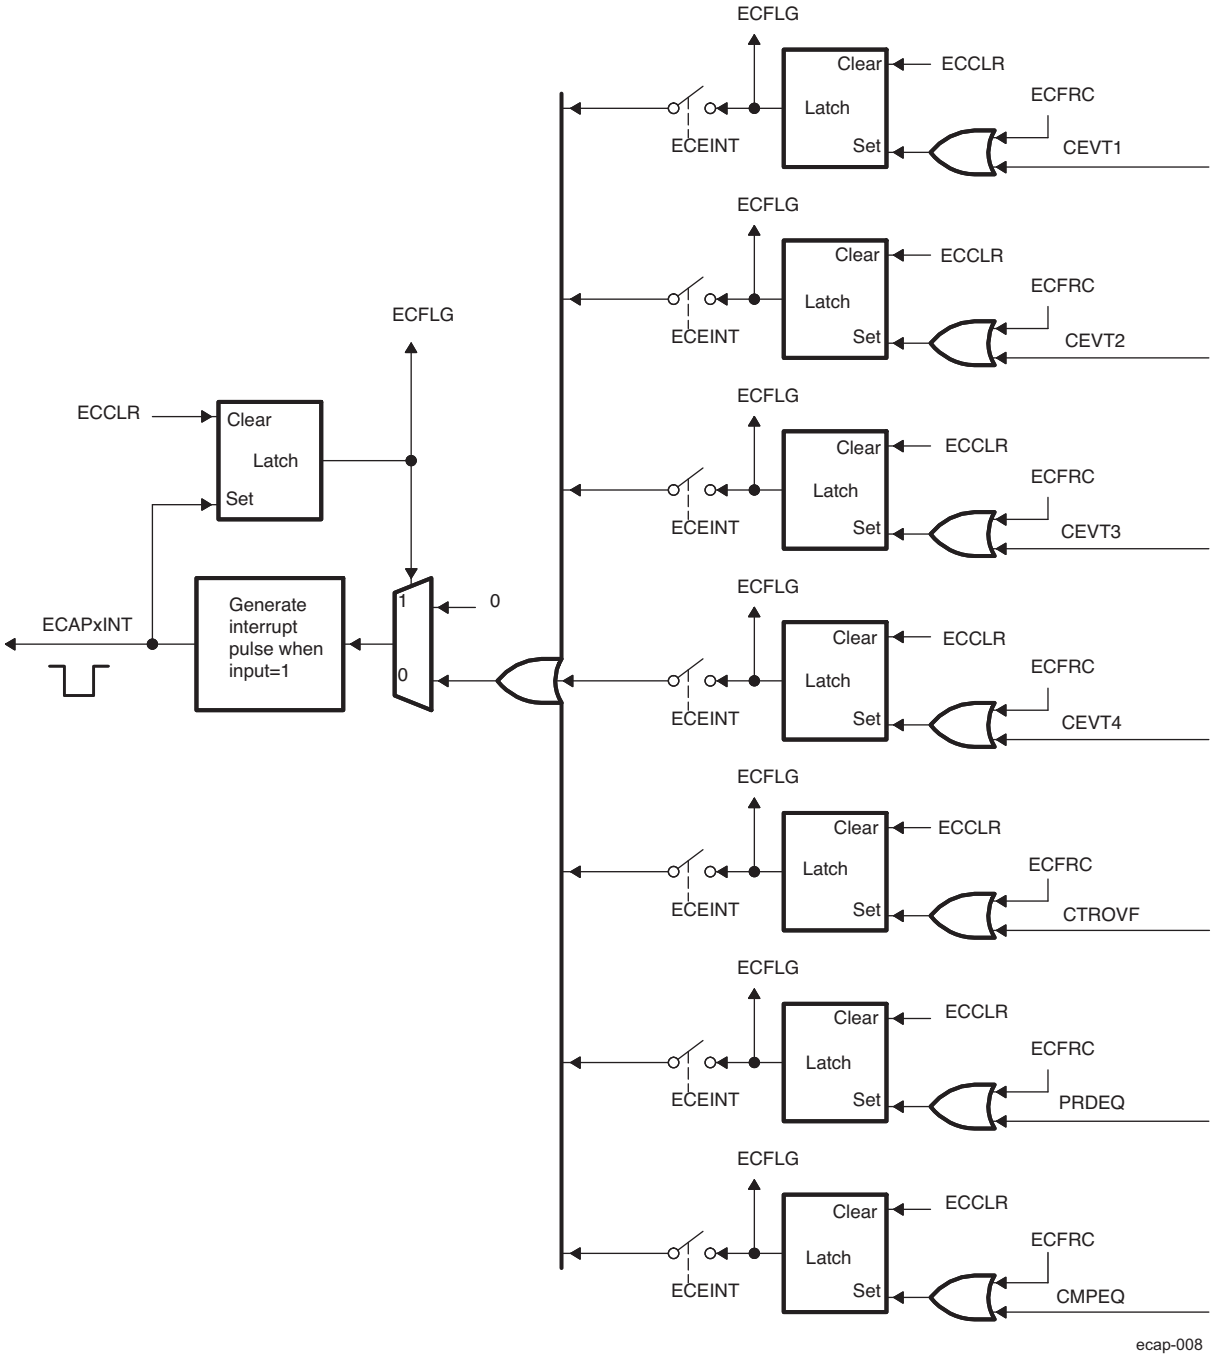
In APWM mode, shadow loading is active and two choices are permitted:

- Immediate - APRD or ACMP are transferred to PWMSS_ECAP_CAP1 or PWMSS_ECAP_CAP2 immediately upon writing a new value.
- On period equal, CTR[31:0] = PRD[31:0]

NOTE: The CEVT1, CEVT2, CEVT3, CEVT4 flags are only active in capture mode (PWMSS_ECAP_ECCTL2[9] CAPAPWM == 0). The TSCNT = PRD, TSCNT = CMP flags are only valid in APWM mode (PWMSS_ECAP_ECCTL2[9] CAPAPWM == 1). CNTOVF flag is valid in both modes.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 29-60. Interrupts in eCAP Module



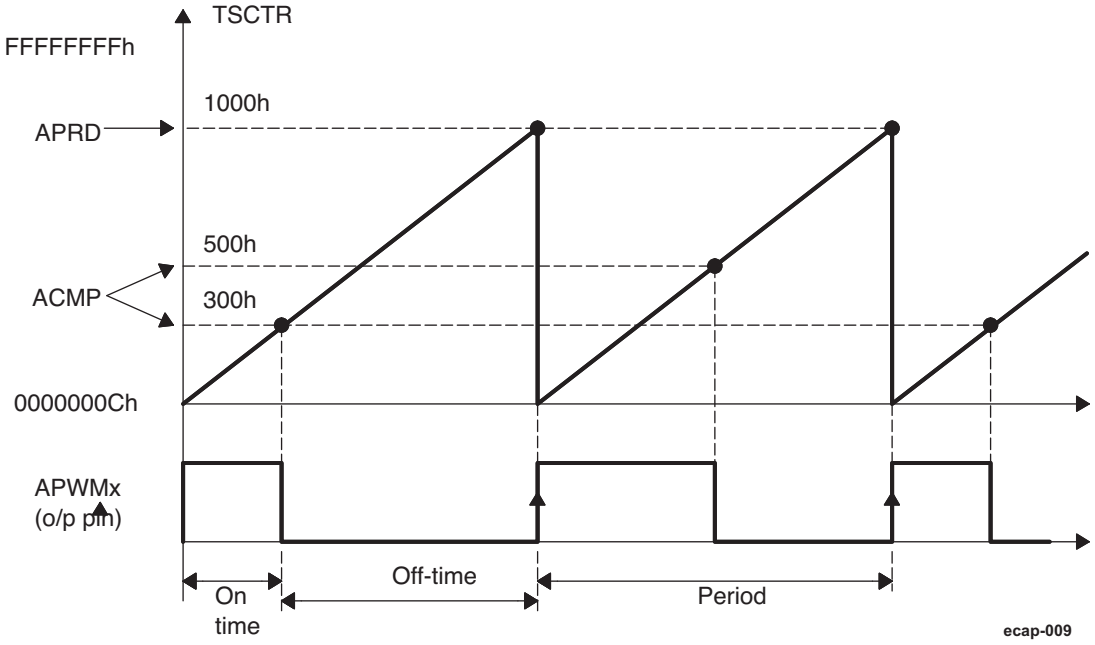
Copyright © 2015–2017, Texas Instruments Incorporated

29.3.2.2.8 eCAP Module APWM Mode Operation

Main operating highlights of the APWM section:

- The time-stamp counter bus is made available for comparison via 2 digital (32-bit) comparators.
- When PWMSS_ECAP_CAP1/2 registers are not used in capture mode, their contents can be used as Period and Compare values in APWM mode.
- Double buffering is achieved via shadow registers APRD and ACMP (PWMSS_ECAP_CAP3/4). The shadow register contents are transferred over to PWMSS_ECAP_CAP1/2 registers either immediately upon a write, or on a TSCNT = PRD trigger.
- In APWM mode, writing to PWMSS_ECAP_CAP1/PWMSS_ECAP_CAP2 active registers will also write the same value to the corresponding shadow registers PWMSS_ECAP_CAP3/PWMSS_ECAP_CAP4. This emulates immediate mode. Writing to the shadow registers PWMSS_ECAP_CAP3/PWMSS_ECAP_CAP4 will invoke the shadow mode.
- During initialization, you must write to the active registers for both period and compare. This automatically copies the initial values into the shadow values. For subsequent compare updates, during run-time, you only need to use the shadow registers.

Figure 29-61. PWM Waveform Details Of eCAP APWM Mode Operation



The behavior of APWM active-high mode (APWMPOL == 0) is:

```
CMP = 0x00000000, output low for duration of period (0% duty)
CMP = 0x00000001, output high 1 cycle
CMP = 0x00000002, output high 2 cycles
CMP = PERIOD, output high except for 1 cycle (<100% duty)
CMP = PERIOD+1, output high for complete period (100% duty)
CMP > PERIOD+1, output high for complete period
```

The behavior of APWM active-low mode (APWMPOL == 1) is:

```
CMP = 0x00000000, output high for duration of period (0% duty)
CMP = 0x00000001, output low 1 cycle
CMP = 0x00000002, output low 2 cycles
CMP = PERIOD, output low except for 1 cycle (<100% duty)
```

Copyright © 2015–2017, Texas Instruments Incorporated

```
CMP = PERIOD+1, output low for complete period (100% duty)
CMP > PERIOD+1, output low for complete period
```

29.3.2.3 Summary of eCAP Functional Registers

Table 29-115 shows the eCAP module control and status register set. All 32-bit registers are aligned on even address boundaries and are organized in little-endian mode. The 16 least-significant bits of a 32-bit register are located on lowest address (even address).

NOTE: In APWM mode, writing to PWMSS_ECAP_CAP1/PWMSS_ECAP_CAP2 active registers also writes the same value to the corresponding shadow registers PWMSS_ECAP_CAP3/PWMSS_ECAP_CAP4. This emulates immediate mode. Writing to the shadow registers PWMSS_ECAP_CAP3/PWMSS_ECAP_CAP4 invokes the shadow mode.

CNTPHS																															

Bits	Field Name	Description	Type	Reset
31:0	CNTPHS	Counter phase value register that can be programmed for phase lag/lead. This register shadows TSCNT and is loaded into PWMSS_ECAP_TSCNT upon either a SYNCI event or S/W force via a control bit. Used to achieve phase control synchronization with respect to other eCAP and EPWM time-bases.	RW	0x0

CAP3																															

Bits	Field Name	Description	Type	Reset
31:0	CAP3	In CMP mode, this is a time-stamp capture register. In APWM mode, this is the period shadow (APRD) register. User SW updates the PWM period value through this register. In this mode, CAP3 shadows CAP1.	RW	0x0

Table 29-132. PWMSS_ECAP_ECCTL2

Address Offset	0x0000 002A		
Physical Address	0x4843 E12A 0x4844 012A 0x4844 212A	**Instance**	PWMSS1_ECAP PWMSS2_ECAP PWMSS3_ECAP
Description	ECAP Control Register 2		
Type	RW		

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED					APWMPOL	CAPAPWM	SWSYNC	SYNCO_SEL		SYNCI_EN	TSCNTSTP	REARMRESET	STOPVALUE		CONTONESHT

Bits	Field Name	Description	Type	Reset
15:11	RESERVED		R	0x0
10	APWMPOL	APWM output polarity select. This is applicable only in APWM operating mode 0x0 = Output is active high (Compare value defines high time) 0x1 = Output is active low (Compare value defines low time)	RW	0x0
9	CAPAPWM	CAP/APWM operating mode select **0x0 = ECAP module operates in capture mode. This mode forces the following configuration.** (a) Inhibits TSCNT resets via TSCNT = PRD event. (b) Inhibits shadow loads on PWMSS_ECAP_CAP1 and PWMSS_ECAP_CAP2 registers. (c) Permits user to enable PWMSS_ECAP_CAP1-PWMSS_ECAP_CAP4 register load. (d) ECAP input/APWM output pin operates as a capture input. **0x1 = ECAP module operates in APWM mode. This mode forces the following configuration.** (a) Resets TSCNT on TSCNT = PRD event (period boundary). (b) Permits shadow loading on PWMSS_ECAP_CAP1 and PWMSS_ECAP_CAP2 registers. (c) Disables loading of time-stamps into PWMSS_ECAP_CAP1 - PWMSS_ECAP_CAP4 registers. (d) ECAP input/APWM ouput pin operates as a APWM output.	RW	0x0
8	SWSYNC	Software-forced Counter (TSCNT) Synchronizing. This provides a convenient software method to synchronize some or all ECAP time bases. In APWM mode, the synchronizing can also be done via the TSCNT = PRD event. Note: Selection TSCNT = PRD is meaningful only in APWM mode. However, you can choose it in CAP mode if you find doing so useful. 0x0 = Writing a zero has no effect. Reading always returns a zero 0x1 = Writing a one forces a TSCNT shadow load of current ECAP module and any ECAP modules down-stream providing the SYNCO_SEL bits are 0b00. After writing a 1, this bit returns to a zero.	RW	0x0

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
7:6	SYNCO_SEL	Sync-Out Select 0x0 = Select sync-in event to be the sync-out signal (pass through) 0x1 = Select TSCNT = PRD event to be the sync-out signal 0x2 = Disable sync out signal 0x3 = Disable sync out signal	RW	0x0
5	SYNCI_EN	Counter (TSCNT) Sync-In select mode 0x0 = Disable sync-in option 0x1 = Enable counter (TSCNT) to be loaded from PWMSS_ECAP_CNTPHS register upon either a SYNCI signal or a S/W force event.	RW	0x0
4	TSCNTSTP	Time Stamp (TSCNT) Counter Stop (freeze) Control 0x0 = TSCNT stopped 0x1 = TSCNT free-running	RW	0x0
3	REARMRESET	One-Shot Re-Arming Control, that is, wait for stop trigger. Note: The re-arm function is valid in one shot or continuous mode. 0x0 = Has no effect (reading always returns a 0) 0x1 = Arms the one-shot sequence as follows: 1) Resets the Mod4 counter to zero. 2) Unfreezes the Mod4 counter. 3) Enables capture register loads.	RW	0x0
2:1	STOPVALUE	Stop value for one-shot mode. This is the number (between 1 and 4) of captures allowed to occur before the CAP (1 through 4) registers are frozen, that is, capture sequence is stopped. Wrap value for continuous mode. This is the number (between 1 and 4) of the capture register in which the circular buffer wraps around and starts again. Notes: STOPVALUE is compared to Mod4 counter and, when equal, the following two actions occur. (1) Mod4 counter is stopped (frozen). (2) Capture register loads are inhibited. In one-shot mode, further interrupt events are blocked until re-armed. 0x0 = Stop after Capture Event 1 in one-shot mode. Wrap after Capture Event 1 in continuous mode. 0x1 = Stop after Capture Event 2 in one-shot mode. Wrap after Capture Event 2 in continuous mode. 0x2 = Stop after Capture Event 3 in one-shot mode. Wrap after Capture Event 3 in continuous mode. 0x3 = Stop after Capture Event 4 in one-shot mode. Wrap after Capture Event 4 in continuous mode.	RW	0x3
0	CONTONESHT	Continuous or one-shot mode control (applicable only in capture mode) 0x0 = Operate in continuous mode 0x1 = Operate in one-shot mode	RW	0x0

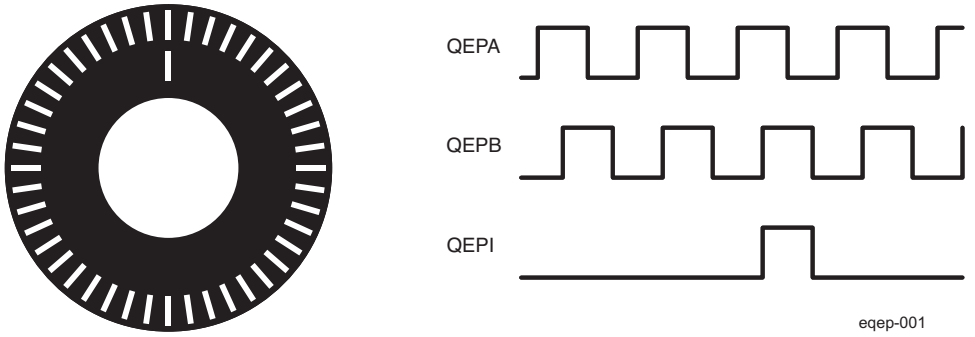
29.4 Enhanced Quadrature Encoder Pulse (eQEP) Module

29.4.1 eQEP Overview

A single track of slots patterns the periphery of an incremental encoder disk, as shown in Figure 29-62. These slots create an alternating pattern of dark and light lines. The disk count is defined as the number of dark/light line pairs that occur per revolution (lines per revolution). As a rule, a second track is added to generate a signal that occurs once per revolution (index signal: QEPI), which can be used to indicate an absolute position. Encoder manufacturers identify the index pulse using different terms such as index, marker, home position, and zero reference.

Figure 29-62. Optical Encoder Disk

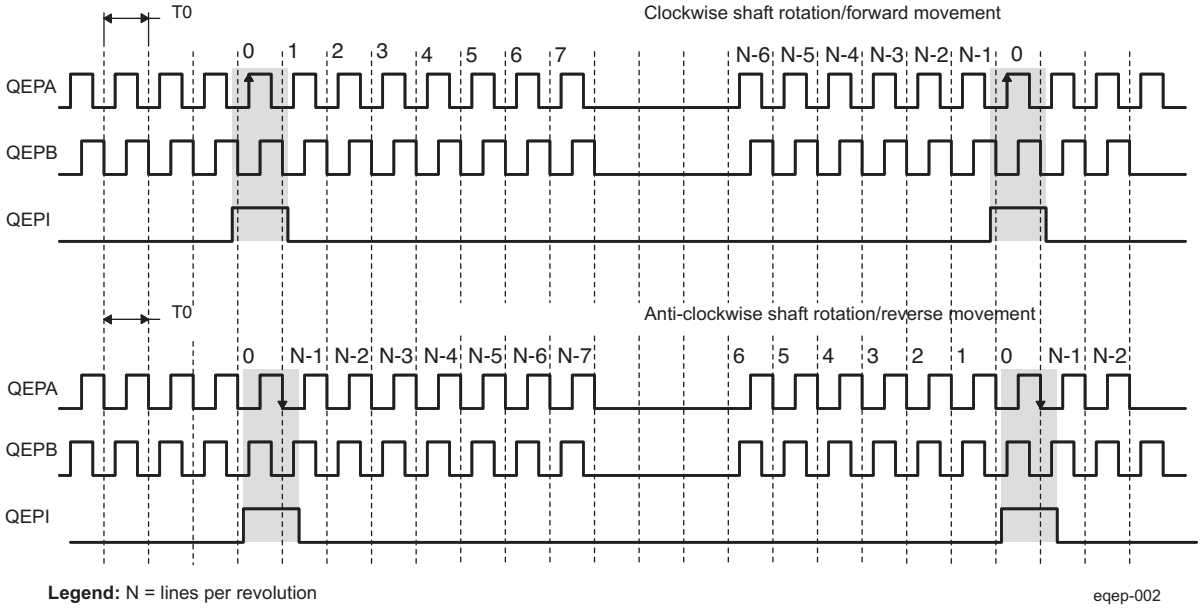


To derive direction information, the lines on the disk are read out by two different photo-elements that "look" at the disk pattern with a mechanical shift of 1/4 the pitch of a line pair between them. This shift is realized with a reticle or mask that restricts the view of the photo-element to the desired part of the disk lines. As the disk rotates, the two photo-elements generate signals that are shifted 90 degrees out of phase from each other. These are commonly called the quadrature QEPA and QEPB signals. The clockwise direction for most encoders is defined as the QEPA channel going positive before the QEPB channel and vise versa as shown in Figure 29-63.

The encoder wheel typically makes one revolution for every revolution of the motor or the wheel may be at a geared rotation ratio with respect to the motor. Therefore, the frequency of the digital signal coming from the QEPA and QEPB outputs varies proportionally with the velocity of the motor. For example, a 2000-line encoder directly coupled to a motor running at 5000 revolutions per minute (rpm) results in a frequency of 166.6 KHz, so by measuring the frequency of either the QEPA or QEPB output, the processor can determine the velocity of the motor.

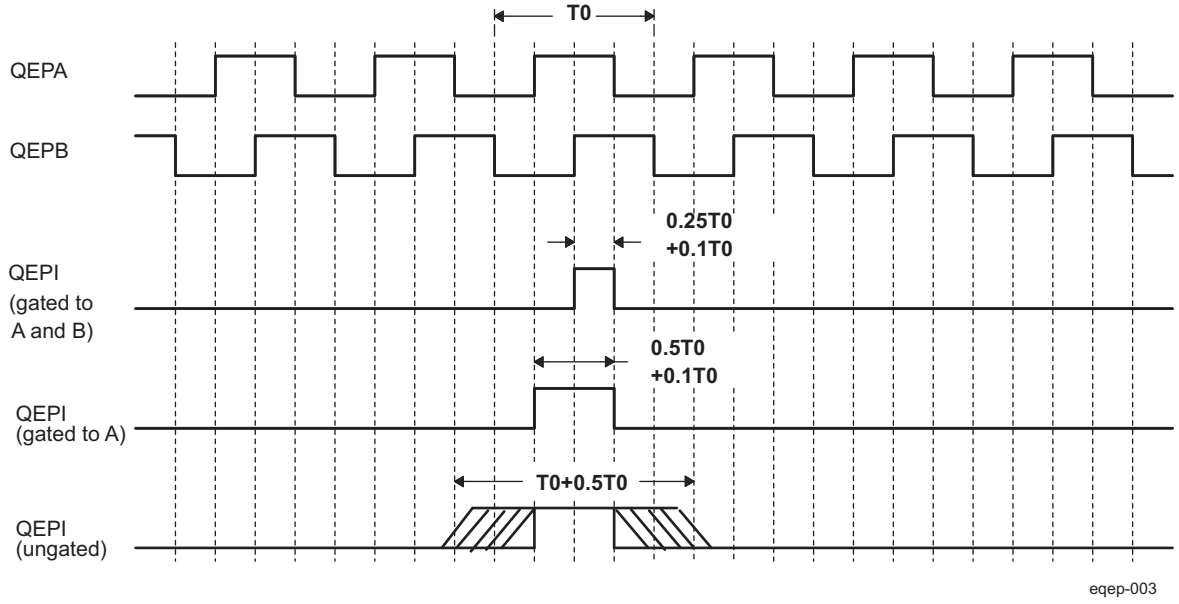
Copyright © 2015–2017, Texas Instruments Incorporated

Figure 29-63. QEP Encoder Output Signal for Forward/Reverse Movement



Quadrature encoders from different manufacturers come with two forms of index pulse (gated index pulse or ungated index pulse) as shown in Figure 29-64. A nonstandard form of index pulse is ungated. In the ungated configuration, the index edges are not necessarily coincident with A and B signals. The gated index pulse is aligned to any of the four quadrature edges and width of the index pulse and can be equal to a quarter, half, or full period of the quadrature signal.

Figure 29-64. Index Pulse Example



Copyright © 2015–2017, Texas Instruments Incorporated

Some typical applications of shaft encoders include robotics and even computer input in the form of a mouse. Inside your mouse you can see where the mouse ball spins a pair of axles (a left/right, and an up/down axle). These axles are connected to optical shaft encoders that effectively tell the computer how fast and in what direction the mouse is moving.

General Issues: Estimating velocity from a digital position sensor is a cost-effective strategy in motor control. Two different first order approximations for velocity may be written as:

$$V(k) \approx \frac{X(k) - X(k-1)}{T} = \frac{\Delta X}{T} \quad \text{eqep-004} \tag{8}$$

$$V(k) \approx \frac{X}{t(k) - t(k-1)} = \frac{X}{\Delta T} \quad \text{eqep-005} \tag{9}$$

where

v(k): Velocity at time instant k

x(k): Position at time instant k

x(k-1): Position at time instant k - 1

T: Fixed unit time or inverse of velocity calculation rate

ΔX: Incremental position movement in unit time

t(k): Time instant "k"

t(k-1): Time instant "k - 1"

X: Fixed unit position

ΔT: Incremental time elapsed for unit position movement.

Equation 8 is the conventional approach to velocity estimation and it requires a time base to provide unit time event for velocity calculation. Unit time is basically the inverse of the velocity calculation rate.

The encoder count (position) is read once during each unit time event. The quantity [x(k) - x(k-1)] is formed by subtracting the previous reading from the current reading. Then the velocity estimate is computed by multiplying by the known constant 1/T (where T is the constant time between unit time events and is known in advance).

Estimation based on Equation 8 has an inherent accuracy limit directly related to the resolution of the position sensor and the unit time period T. For example, consider a 500-line per revolution quadrature encoder with a velocity calculation rate of 400 Hz. When used for position the quadrature encoder gives a four-fold increase in resolution, in this case, 2000 counts per revolution. The minimum rotation that can be detected is therefore 0.0005 revolutions, which gives a velocity resolution of 12 rpm when sampled at 400 Hz. While this resolution may be satisfactory at moderate or high speeds, for example, 1% error at 1200 rpm, it would clearly prove inadequate at low speeds. In fact, at speeds below 12 rpm, the speed estimate would erroneously be zero much of the time.

At low speed, Equation 9 provides a more accurate approach. It requires a position sensor that outputs a fixed interval pulse train, such as the aforementioned quadrature encoder. The width of each pulse is defined by motor speed for a given sensor resolution. Equation 9 can be used to calculate motor speed by measuring the elapsed time between successive quadrature pulse edges. However, this method suffers from the opposite limitation, as does Equation 8. A combination of relatively large motor speeds and high sensor resolution makes the time interval ΔT small, and thus more greatly influenced by the timer resolution. This can introduce considerable error into high-speed estimates.

For systems with a large speed range (that is, speed estimation is needed at both low and high speeds), one approach is to use Equation 9 at low speed and have the software switch over to Equation 8 when the motor speed rises above some specified threshold.

29.4.2 eQEP Module Functional Description

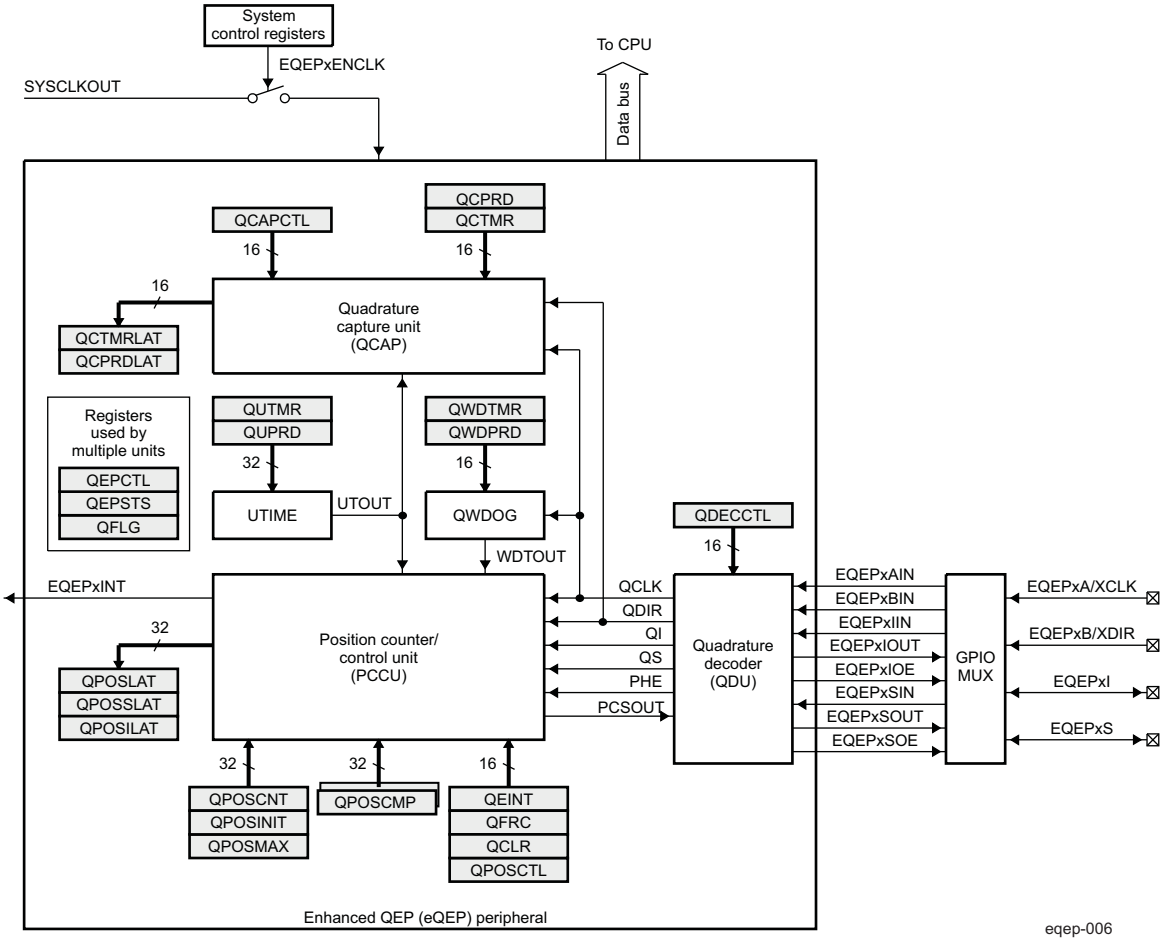
This section provides the eQEP functional description and corrsponding functional details about EQEPx inputs .

NOTE: Multiple identical eQEP modules can be contained in a system. For actual number of eQEP modules integrated in the device, refer to the Section 29.1.3. The letter x within a signal or module name is used to indicate a generic eQEP instance on a device. For example, output interrupt request, EQEP1A belongs to eQEP1, EQEP2A belongs to eQEP2, etc.

The eQEP peripheral contains the following major functional units (as shown in Figure 29-65):

- Programmable input qualification for each pin (part of the GPIO MUX)
- Quadrature decoder unit (QDU)
- Position counter and control unit for position measurement (PCCU)
- Quadrature edge-capture unit for low-speed measurement (QCAP)
- Unit time base for speed/frequency measurement (UTIME)
- Watchdog timer for detecting stalls (QWDOG)

Figure 29-65. Functional Block Diagram of the eQEP Peripheral



29.4.2.1 eQEP Inputs

The eQEP inputs include two pins for quadrature-clock mode or direction-count mode, an index (or 0 marker), and a strobe input.

- QEPA/XCLK and QEPB/XDIR: These two pins can be used in quadrature-clock mode or direction-

Copyright © 2015–2017, Texas Instruments Incorporated

count mode.

  - Quadrature-clock Mode: The eQEP encoders provide two square wave signals (A and B) 90 electrical degrees out of phase whose phase relationship is used to determine the direction of rotation of the input shaft and number of eQEP pulses from the index position to derive the relative position information. For forward or clockwise rotation, QEPA signal leads QEPB signal and vice versa. The quadrature decoder uses these two inputs to generate quadrature-clock and direction signals.
  - Direction-count Mode: In direction-count mode, direction and clock signals are provided directly from the external source. Some position encoders have this type of output instead of quadrature output. The QEPA pin provides the clock input and the QEPB pin provides the direction input.

- QEPI: Index or Zero Marker: The eQEP encoder uses an index signal to assign an absolute start position from which position information is incrementally encoded using quadrature pulses. This pin is connected to the index output of the eQEP encoder to optionally reset the position counter for each revolution. This signal can be used to initialize or latch the position counter on the occurrence of a desired event on the index pin.
- QEPS: Strobe Input: This general-purpose strobe signal can initialize or latch the position counter on the occurrence of a desired event on the strobe pin. This signal is typically connected to a sensor or limit switch to notify that the motor has reached a defined position.

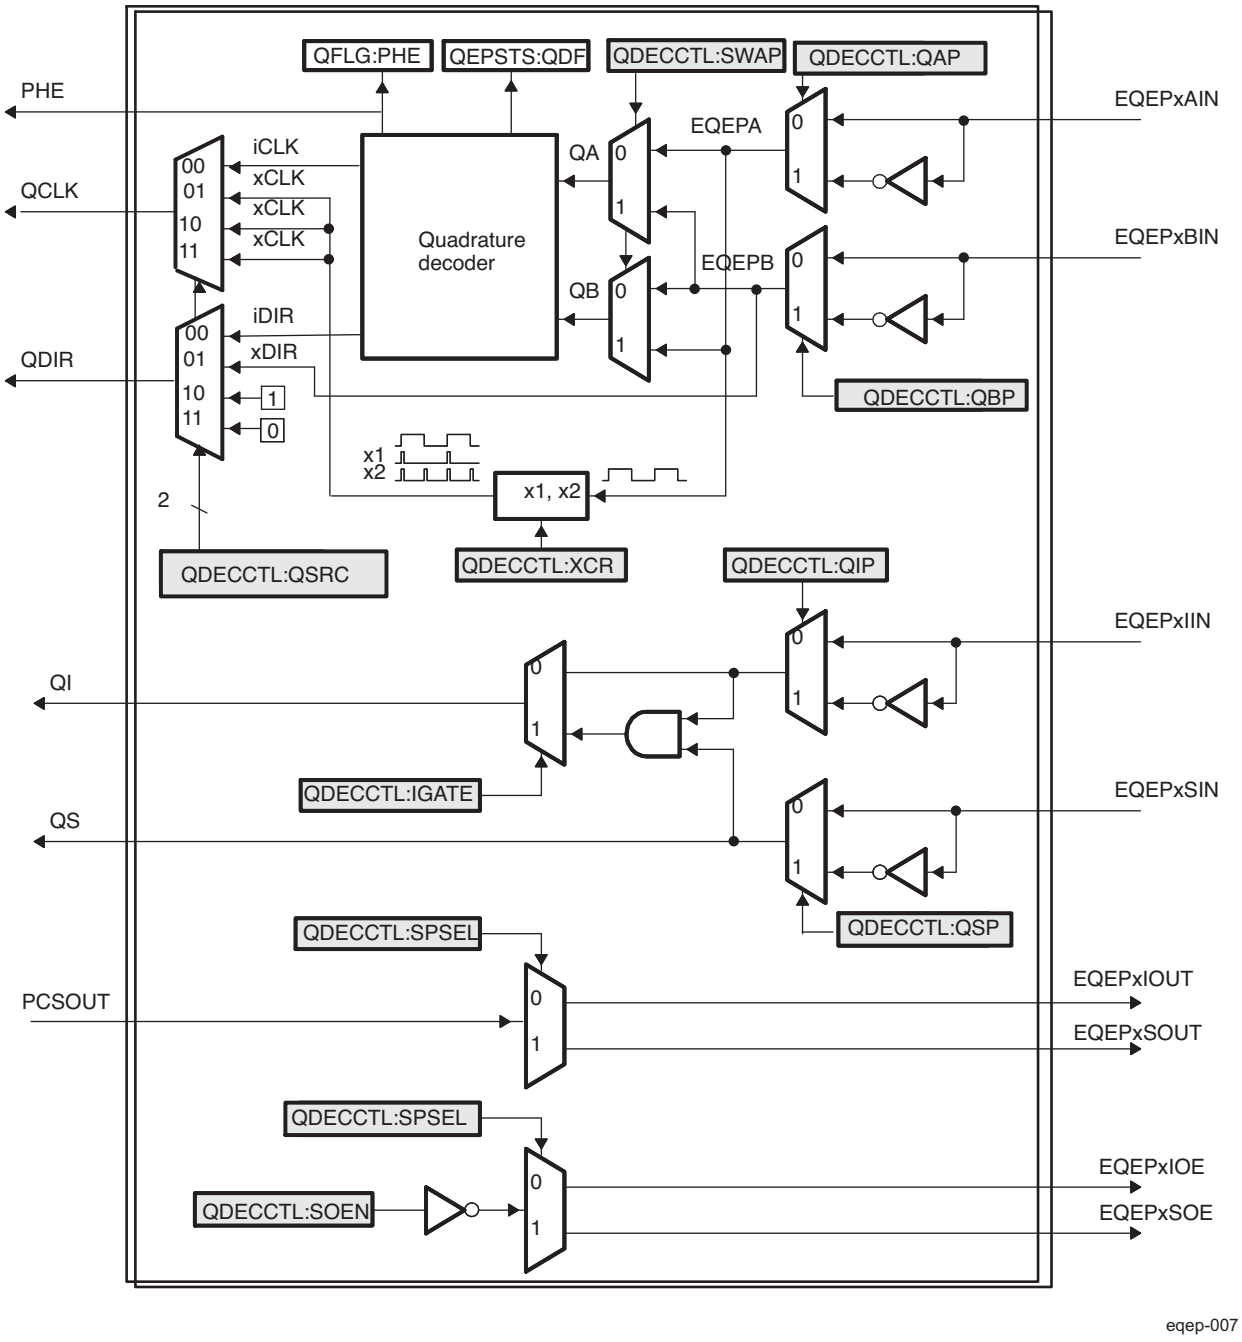
29.4.2.2 eQEP Quadrature Decoder Unit (QDU)

Figure 29-66 shows a functional block diagram of the QDU.

Figure 29-66. Functional Block Diagram of Decoder Unit



Copyright © 2015–2017, Texas Instruments Incorporated

29.4.2.2.1 eQEP Position Counter Input Modes

Clock and direction input to position counter is selected using the QSRC bit in the eQEP decoder control register (EQEP_QDECCTL), based on interface input requirement as follows:

- Quadrature-count mode
- Direction-count mode
- UP-count mode
- DOWN-count mode

29.4.2.2.1.1 Quadrature Count Mode

The quadrature decoder generates the direction and clock to the position counter in quadrature count mode.

Direction Decoding— The direction decoding logic of the eQEP circuit determines which one of the sequences (QEPA, QEPB) is the leading sequence and accordingly updates the direction information in the QDF bit in the eQEP status register (EQEP_QEPSTS). Table 29-144 and Figure 29-67 show the direction decoding logic in truth table and state machine form. Both edges of the QEPA and QEPB signals are sensed to generate count pulses for the position counter. Therefore, the frequency of the clock generated by the eQEP logic is four times that of each input sequence. Figure 29-68 shows the direction decoding and clock generation from the eQEP input signals.

Phase Error Flag— In normal operating conditions, quadrature inputs QEPA and QEPB will be 90 degrees out of phase. The phase error flag (PHE) is set in the EQEP_QFLG register when edge transition is detected simultaneously on the QEPA and QEPB signals to optionally generate interrupts. State transitions marked by dashed lines in Figure 29-67 are invalid transitions that generate a phase error.

Count Multiplication— The eQEP position counter provides 4x times the resolution of an input clock by generating a quadrature-clock (QCLK) on the rising/falling edges of both eQEP input clocks (QEPA and QEPB) as shown in Figure 29-68.

Reverse Count— In normal quadrature count operation, QEPA input is fed to the QA input of the quadrature decoder and the QEPB input is fed to the QB input of the quadrature decoder. Reverse counting is enabled by setting the SWAP bit in the eQEP decoder control register (EQEP_QDECCTL). This will swap the input to the quadrature decoder thereby reversing the counting direction.

Table 29-144. Quadrature Decoder Truth Table

29.4.2.2.1.2 eQEP Direction-count Mode

Some position encoders provide direction and clock outputs, instead of quadrature outputs. In such cases, direction-count mode can be used. QEPA input will provide the clock for position counter and the QEPB input will have the direction information. The position counter is incremented on every rising edge of a QEPA input when the direction input is high and decremented when the direction input is low.

29.4.2.2.1.3 eQEP Up-Count Mode

The counter direction signal is hard-wired for up count and the position counter is used to measure the frequency of the QEPA input. Setting of the XCR bit in the eQEP decoder control register (EQEP_QDECCTL) enables clock generation to the position counter on both edges of the QEPA input, thereby increasing the measurement resolution by 2× factor.

29.4.2.2.1.4 eQEP Down-Count Mode

The counter direction signal is hardwired for a down count and the position counter is used to measure the frequency of the QEPA input. Setting of the XCR bit in the eQEP decoder control register (EQEP_QDECCTL) enables clock generation to the position counter on both edges of a QEPA input, thereby increasing the measurement resolution by 2× factor.

29.4.2.2.2 eQEP Input Polarity Selection

Each eQEP input can be inverted using the in the eQEP decoder control register (EQEP_QDECCTL[8:5]) control bits. As an example, setting of the QIP bit in EQEP_QDECCTL inverts the index input.

29.4.2.2.3 eQEP Position-Compare Sync Output

The eQEP peripheral includes a position-compare unit that is used to generate the position-compare sync signal on compare match between the position counter register (EQEP_QPOSCNT) and the position-compare register (EQEP_QPOSCMP). This sync signal can be output using an index pin or strobe pin of the EQEP peripheral.

Setting the SOEN bit in the eQEP decoder control register (EQEP_QDECCTL) enables the position-compare sync output and the SPSEL bit in EQEP_QDECCTL selects either an eQEP index pin or an eQEP strobe pin.

29.4.2.3 eQEP Position Counter and Control Unit (PCCU)

The position counter and control unit provides two configuration registers (EQEP_QEPCTL and EQEP_QPOSCTL) for setting up position counter operational modes, position counter initialization/latch modes and position-compare logic for sync signal generation.

29.4.2.3.1 eQEP Position Counter Operating Modes

Position counter data may be captured in different manners. In some systems, the position counter is accumulated continuously for multiple revolutions and the position counter value provides the position information with respect to the known reference. An example of this is the quadrature encoder mounted on the motor controlling the print head in the printer. Here the position counter is reset by moving the print head to the home position and then position counter provides absolute position information with respect to home position.

In other systems, the position counter is reset on every revolution using index pulse and position counter provides rotor angle with respect to index pulse position.

Position counter can be configured to operate in following four modes

- Position Counter Reset on Index Event
- Position Counter Reset on Maximum Position
- Position Counter Reset on the first Index Event
- Position Counter Reset on Unit Time Out Event (Frequency Measurement)

Copyright © 2015–2017, Texas Instruments Incorporated

In all the above operating modes, position counter is reset to 0 on overflow and to QPOSMAX bifield value in EQEP_QPOSMAX register on underflow. Overflow occurs when the position counter counts up after QPOSMAX value. Underflow occurs when position counter counts down after "0". Interrupt flag is set to indicate overflow/underflow in EQEP_QFLG register.

29.4.2.3.1.1 eQEP Position Counter Reset on Index Event (EQEP_QEPCTL[31:12] PCRM] = 0b00)

If the index event occurs during the forward movement, then position counter is reset to 0 on the next eQEP clock. If the index event occurs during the reverse movement, then the position counter is reset to the value in the EQEP_QPOSMAX register on the next eQEP clock.

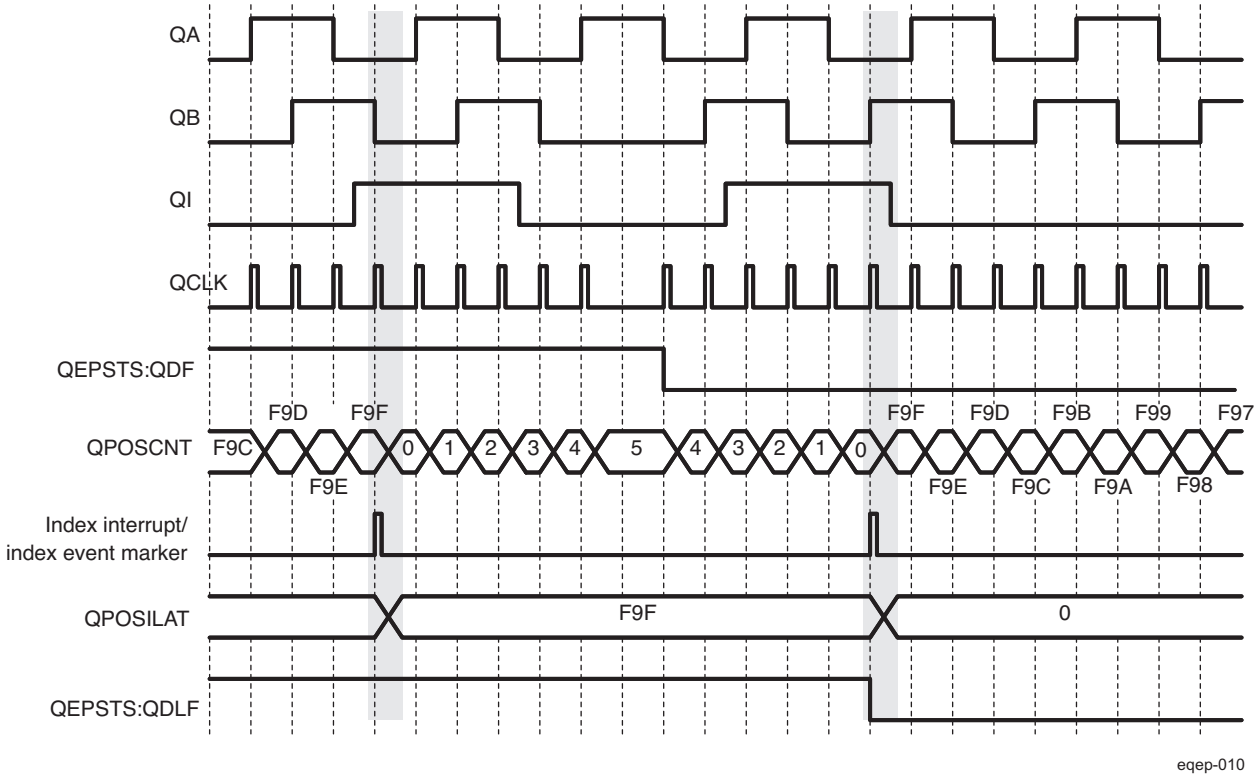
First index marker is defined as the quadrature edge following the first index edge. The eQEP peripheral records the occurrence of the first index marker (EQEP_QEPSTS[FIMF]) and direction on the first index event marker (EQEP_QEPSTS[FIDF]) in EQEP_QEPSTS registers, it also remembers the quadrature edge on the first index marker so that same relative quadrature transition is used for index event reset operation.

For example, if the first reset operation occurs on the falling edge of QEPB during the forward direction, then all the subsequent reset must be aligned with the falling edge of QEPB for the forward rotation and on the rising edge of QEPB for the reverse rotation as shown in Figure 29-69.

The position-counter value is latched to the EQEP_QPOSILAT register and direction information is recorded in the EQEP_QEPSTS[QDLF] bit on every index event marker. The position-counter error flag (EQEP_QEPSTS[PCEF]) and error interrupt flag (EQEP_QFLG[PCE]) are set if the latched value is not equal to 0 or QPOSMAX. The position-counter error flag (EQEP_QEPSTS[PCEF]) is updated on every index event marker and an interrupt flag (EQEP_QFLG[PCE]) will be set on error that can be cleared only through software.

The index event latch configuration EQEP_QEPCTL[5:4] IEL bits are ignored in this mode and position counter error flag/interrupt flag are generated only in index event reset mode.

Figure 29-69. Position Counter Reset by Index Pulse for 1000 Line Encoder (QPOSMAX = 3999 or F9Fh)



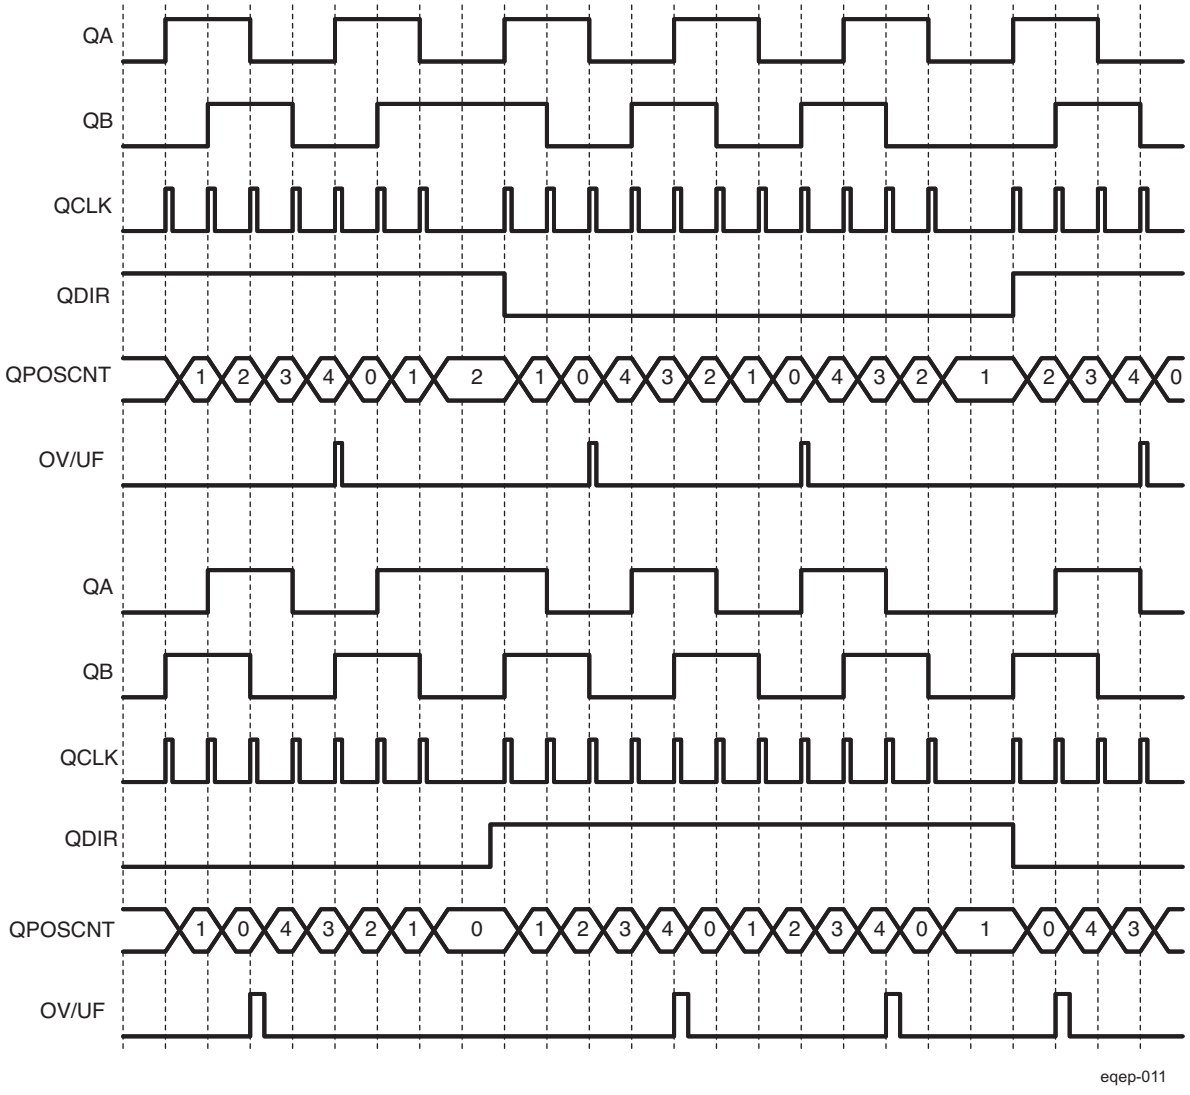
Copyright © 2015–2017, Texas Instruments Incorporated

29.4.2.3.1.2 eQEP Position Counter Reset on Maximum Position (EQEP_QEPCTL[13:12] PCRM=0b01)

If the position counter is equal to QPOSMAX (in EQEP_QPOSMAX register), then the position counter is reset to 0 on the next eQEP clock for forward movement and position counter overflow flag is set. If the position counter is equal to ZERO, then the position counter is reset to QPOSMAX on the next QEP clock for reverse movement and position counter underflow flag is set. Figure 29-70 shows the position counter reset operation in this mode.

First index marker is defined as the quadrature edge following the first index edge. The eQEP peripheral records the occurrence of the first index marker (EQEP_QEPSTS[FIMF]) and direction on the first index event marker (EQEP_QEPSTS[FIDF]) in the EQEP_QEPSTS registers; it also remembers the quadrature edge on the first index marker so that the same relative quadrature transition is used for the software index marker (EQEP_QEPCTL[5:4] IEL=0b11).

Figure 29-70. Position Counter Underflow/Overflow (QPOSMAX = 4)



Copyright © 2015–2017, Texas Instruments Incorporated

29.4.2.3.1.3 Position Counter Reset on the First Index Event (EQEP_QEPCTL[13:12] PCRM = 0b10)

If the index event occurs during forward movement, then the position counter is reset to 0 on the next eQEP clock. If the index event occurs during the reverse movement, then the position counter is reset to the value in the EQEP_QPOSMAX register on the next eQEP clock. Note that this is done only on the first occurrence and subsequently the position counter value is not reset on an index event; rather, it is reset based on maximum position as described in Section 29.4.2.3.1.2.

First index marker is defined as the quadrature edge following the first index edge. The eQEP peripheral records the occurrence of the first index marker (EQEP_QEPSTS[FIMF]) and direction on the first index event marker (EQEP_QEPSTS[FIDF]) in EQEP_QEPSTS registers. It also remembers the quadrature edge on the first index marker so that same relative quadrature transition is used for software index marker (EQEP_QEPCTL[5:4] IEL= 0b11).

29.4.2.3.1.4 Position Counter Reset on Unit Time out Event (EQEP_QEPCTL[13:12] PCRM = 0b11)

In this mode, the QPOSCNT value is latched to the EQEP_QPOSLAT register and then the QPOSCNT field is reset (to 0 or the QPOSMAX value in the EQEP_QPOSMAX register, depending on the direction mode selected by EQEP_QDECCTL[QSRC] bits on a unit time event). This is useful for frequency measurement.

29.4.2.3.2 eQEP Position Counter Latch

The eQEP index and strobe input can be configured to latch the position counter QPOSCNT (EQEP_QPOSCNT) into QPOSILAT (EQEP_QPOSILAT register) and QPOSSLAT (EQEP_QPOSSLAT register) bitfields, respectively, on occurrence of a definite event on these pins.

29.4.2.3.2.1 Index Event Latch

In some applications, it may not be desirable to reset the position counter on every index event and instead it may be required to operate the position counter in full 32-bit mode (EQEP_QEPCTL[13:12] PCRM = 0b01 and EQEP_QEPCTL[13:12] PCRM = 0b10 modes).

In such cases, the eQEP position counter can be configured to latch on the following events and direction information is recorded in the EQEP_QEPSTS[QDLF] bit on every index event marker.

- Latch on Rising edge (EQEP_QEPCTL[5:4] IEL = 0b01)
- Latch on Falling edge (EQEP_QEPCTL[5:4] IEL = 0b10)
- Latch on Index Event Marker (EQEP_QEPCTL[5:4] IEL = 0b11)

This is particularly useful as an error checking mechanism to check if the position counter accumulated the correct number of counts between index events. As an example, the 1000-line encoder must count 4000 times when moving in the same direction between the index events.

The index event latch interrupt flag (EQEP_QFLG[IEL]) is set when the position counter is latched to the EQEP_QPOSILAT register. The index event latch configuration bits (QEPCTZ[IEL]) are ignored when EQEP_QEPCTL[13:12] PCRM = 0b00.

Latch on Rising Edge (EQEP_QEPCTL[5:4] IEL = 0b01)— The position counter value (QPOSCNT) is latched to the EQEP_QPOSILAT register on every rising edge of an index input.

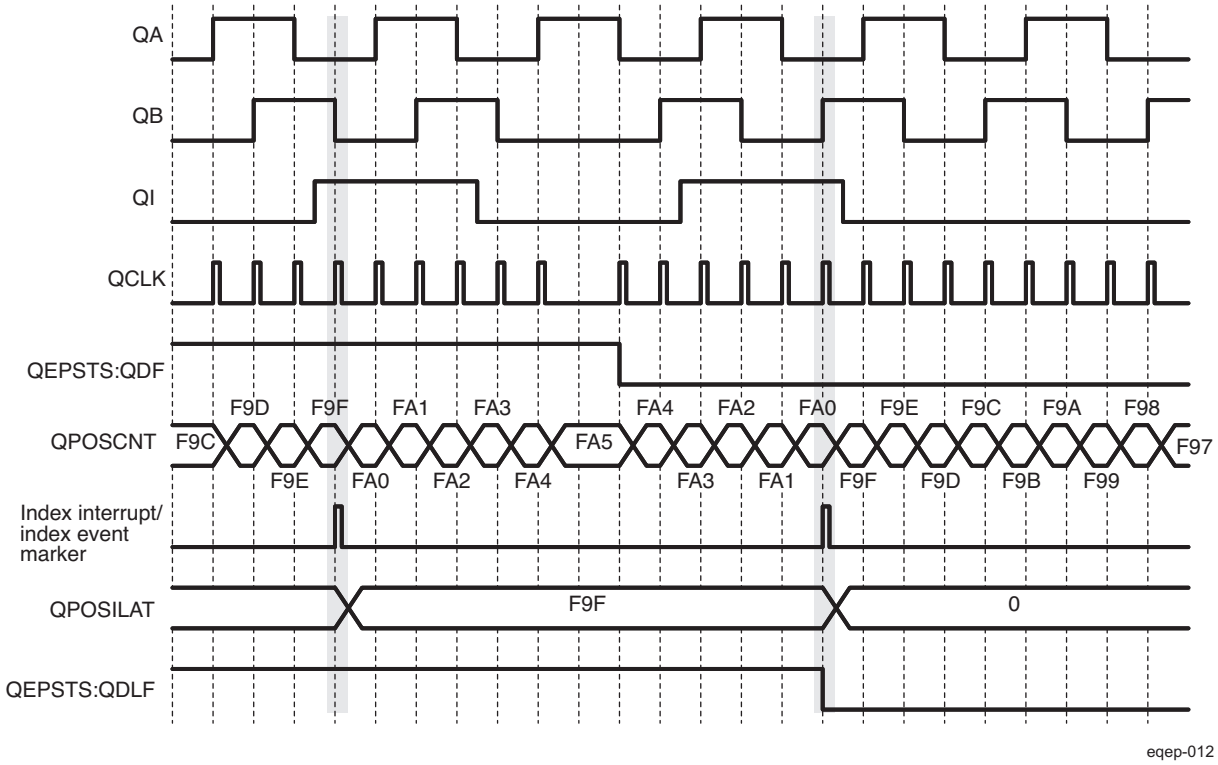
Latch on Falling Edge (EQEP_QEPCTL[5:4] IEL = 0b10)— The position counter value (QPOSCNT) is latched to the EQEP_QPOSILAT register on every falling edge of index input.

Latch on Index Event Marker/Software Index Marker (EQEP_QEPCTL[5:4] IEL = 0b11)— The first index marker is defined as the quadrature edge following the first index edge. The eQEP peripheral records the occurrence of the first index marker (EQEP_QEPSTS[FIMF]) and direction on the first index event marker (EQEP_QEPSTS[FIDF]) in the EQEP_QEPSTS registers. It also remembers the quadrature edge on the first index marker so that same relative quadrature transition is used for latching the position counter (EQEP_QEPCTL[5:4] IEL = 0b11).

Figure 29-71 shows the position counter latch using an index event marker.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 29-71. Software Index Marker for 1000-line Encoder (EQEP_QEPCTL[5:4] IEL = 0b01)



Copyright © 2015–2017, Texas Instruments Incorporated

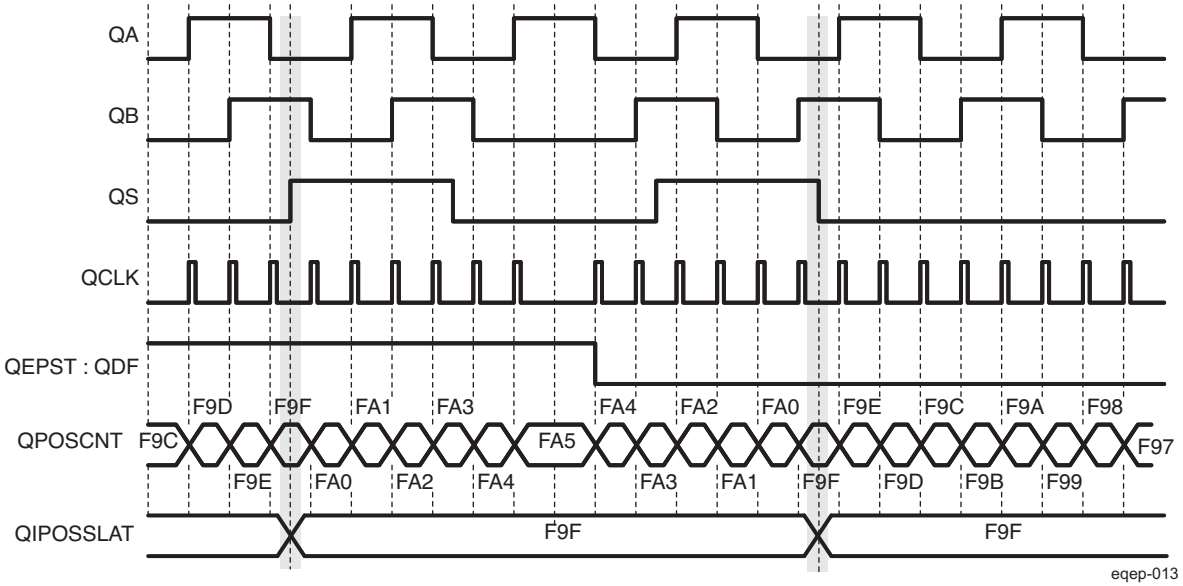
29.4.2.3.2.2 eQEP Strobe Event Latch

The position-counter value is latched to the EQEP_QPOSSLAT register on the rising edge of the strobe input by clearing the EQEP_QEPCTL[6] SEL bit.

If the EQEP_QEPCTL[6] SEL bit is set, then the position counter value is latched to the EQEP_QPOSSLAT register on the rising edge of the strobe input for forward direction and on the falling edge of the strobe input for reverse direction as shown in Figure 29-72.

The strobe event latch interrupt flag (EQEP_QFLG[SEL]) is set when the position counter is latched to the EQEP_QPOSSLAT register.

Figure 29-72. eQEP Strobe Event Latch (EQEP_QEPCTL[6] SEL = 0b1)



Copyright © 2015–2017, Texas Instruments Incorporated

29.4.2.3.3 eQEP Position Counter Initialization

The position counter can be initialized using following events:

- Index event
- Strobe event
- Software initialization

Index Event Initialization (IEI)— The QEPI index input can be used to trigger the initialization of the position counter at the rising or falling edge of the index input.

If the EQEP_QEPCTL[9:8] IEI bits are 0b10, then the position counter (EQEP_QPOSCNT) is initialized with a value in the EQEP_QPOSINIT register on the rising edge of strobe input for forward direction and on the falling edge of strobe input for reverse direction.

The index event initialization interrupt flag (EQEP_QFLG[IEI]) is set when the position counter is initialized with a value in the EQEP_QPOSINIT register.

Strobe Event Initialization (SEI)— If the EQEP_QEPCTL[11:10] SEI bits are 0b10, then the position counter is initialized with a value in the EQEP_QPOSINIT register on the rising edge of strobe input.

If the EQEP_QEPCTL[11:10] SEI bits are 0b11, then the position counter (EQEP_QPOSCNT) is initialized with a value in the EQEP_QPOSINIT register on the rising edge of strobe input for forward direction and on the falling edge of strobe input for reverse direction.

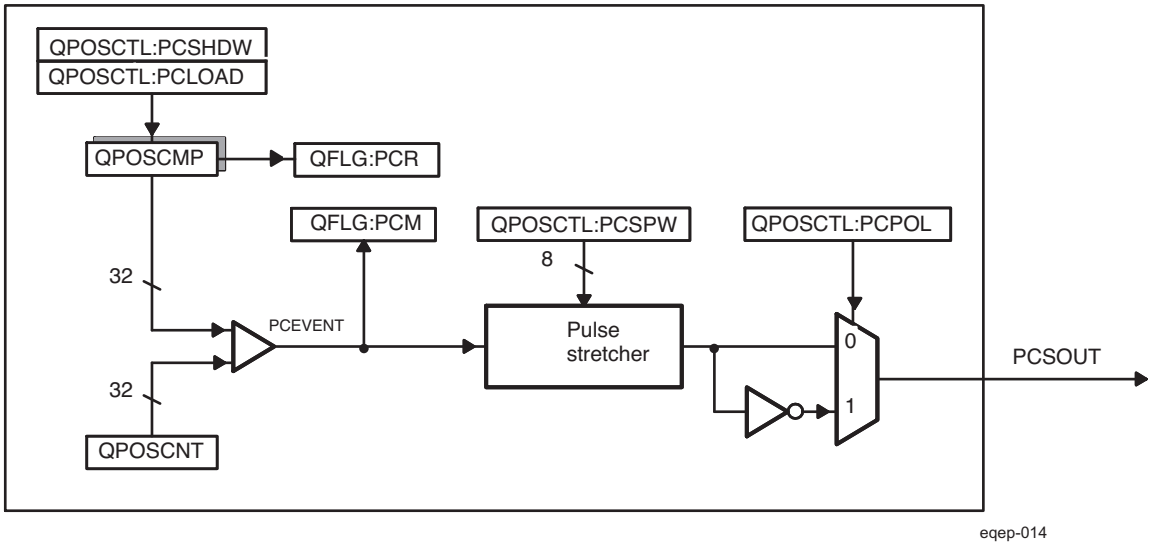
The strobe event initialization interrupt flag (EQEP_QFLG[SEI]) is set when the position counter is initialized with a value in the EQEP_QPOSINIT register.

Software Initialization (SWI)— The position counter can be initialized in software by writing a '1' to the EQEP_QEPCTL[7] SWI bit, which will automatically be cleared after initialization.

29.4.2.3.4 eQEP Position-Compare Unit

The eQEP peripheral includes a position-compare unit that is used to generate a sync output and/or interrupt on a position-compare match. Figure 29-73 shows a diagram. The position-compare (EQEP_QPOSCMP) register is shadowed and shadow mode can be enabled or disabled using the EQEP_QPOSCTL[PSSHDW] bit. If the shadow mode is not enabled, the CPU writes directly to the active position compare register.

Figure 29-73. eQEP Position-compare Unit



In shadow mode, you can configure the position-compare unit (EQEP_QPOSCTL[PCLOAD]) to load the shadow register value into the active register on the following events and to generate the position-compare ready (EQEP_QFLG[PCR]) interrupt after loading.

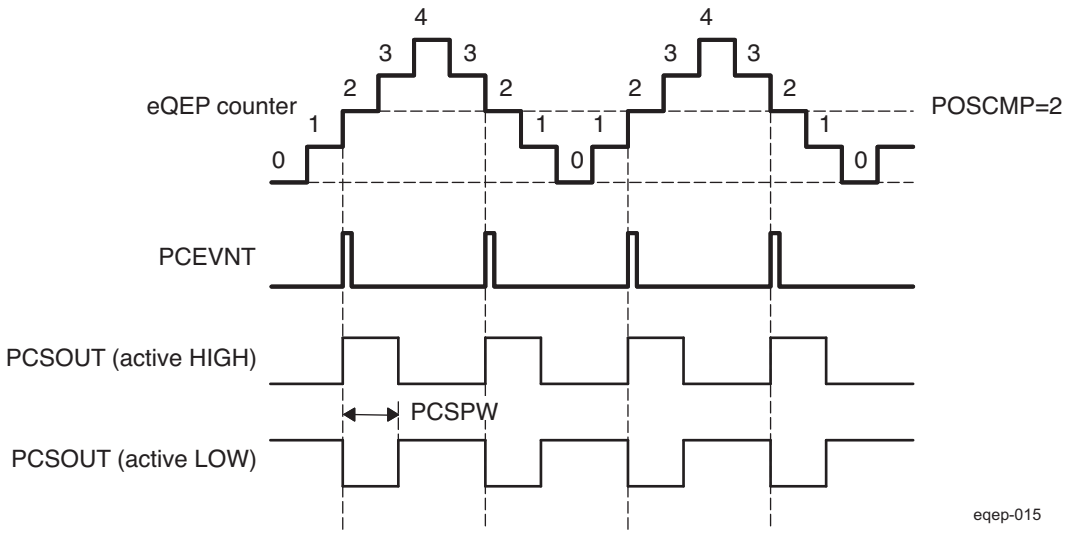
Copyright © 2015–2017, Texas Instruments Incorporated

- Load on compare match
- Load on position-counter zero event

The position-compare match (EQEP_QFLG[PCM]) is set when the position-counter value (QPOSCNT) matches with the active position-compare register (EQEP_QPOSCMP) and the position-compare sync output of the programmable pulse width is generated on compare match to trigger an external device.

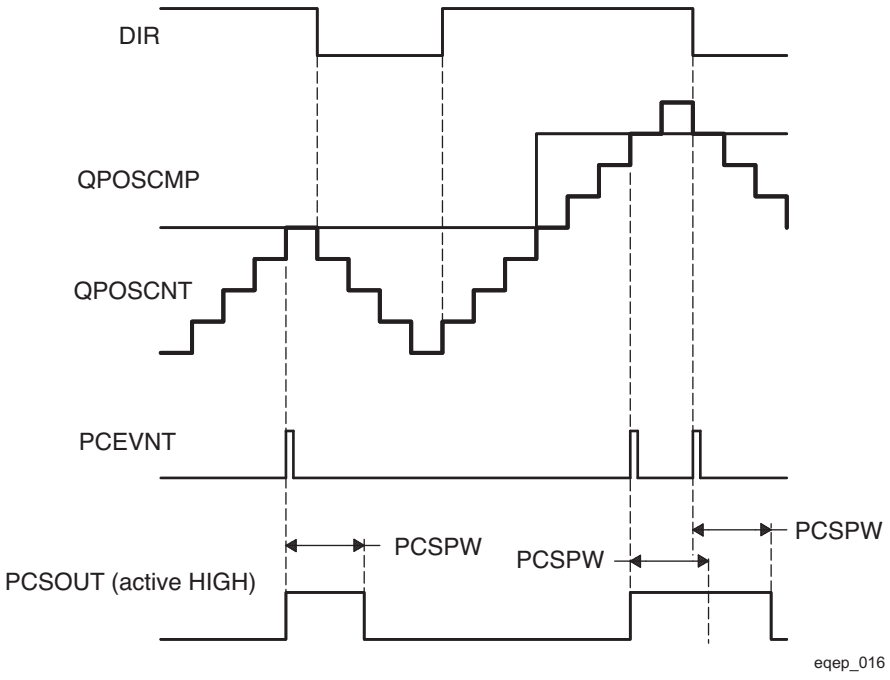
For example, if EQEP_QPOSCMP bitfield QPOSCMP = 0x2, the position-compare unit generates a position-compare event on 1 to 2 transitions of the eQEP position counter for forward counting direction and on 3 to 2 transitions of the eQEP position counter for reverse counting direction (see Figure 29-74).

Figure 29-74. eQEP Position-compare Event Generation Points



The pulse stretcher logic in the position-compare unit generates a programmable position-compare sync pulse output on the position-compare match. In the event of a new position-compare match while a previous position-compare pulse is still active, then the pulse stretcher generates a pulse of specified duration from the new position-compare event as shown in Figure 29-75.

Figure 29-75. eQEP Position-compare Sync Output Pulse Stretcher



Copyright © 2015–2017, Texas Instruments Incorporated

29.4.2.4 eQEP Edge Capture Unit

The eQEP peripheral includes an integrated edge capture unit to measure the elapsed time between the unit position events as shown in Figure 29-76. This feature is typically used for low speed measurement using the following equation:

$$V(k) = \frac{X}{t(k) - t(k-1)} = \frac{X}{\Delta T} \quad \text{eqep-017} \qquad (10)$$

where,

- X - Unit position is defined by integer multiple of quadrature edges (see Figure 29-77)
- ΔT - Elapsed time between unit position events
- v(k) - Velocity at time instant "k"

The eQEP capture timer (QCTMR bitfield in EQEP_QCTMR register) runs from prescaled SYSCLKOUT and the prescaler is programmed by the EQEP_QCAPCTL[CCPS] bits. The capture timer QCTMR value is latched into the capture period register (EQEP_QCPRD) on every unit position event and then the capture timer is reset, a flag is set in EQEP_QEPSTS[UPEVNT] to indicate that new value is latched into the EQEP_QCPRD register. Software can check this status flag before reading the period register for low speed measurement and clear the flag by writing 1.

NOTE: The system clock - SYSCLKOUT is the eQEP functional clock derived from the PWMSS n gateable interface and functional clock PWMSSn_GICLK, described in Section 29.1.3.

Time measurement (ΔT) between unit position events will be correct if the following conditions are met:

- No more than 65,535 counts have occurred between unit position events.
- No direction change between unit position events.

The capture unit sets the eQEP overflow error flag (EQEP_QEPSTS[COEF]) in the event of capture timer overflow between unit position events. If a direction change occurs between the unit position events, then an error flag is set in the status register (EQEP_QEPSTS[CDEF]).

Capture Timer (EQEP_QCTMR register) and Capture period register (EQEP_QCPRD) can be configured to latch on following events.

- CPU read of EQEP_QPOSCNT register
- Unit time-out event

If the EQEP_QEPCTL[2] QCLM bit is cleared, then the capture timer and capture period values are latched into the EQEP_QCTMRLAT and EQEP_QCPRDLAT registers, respectively, when the CPU reads the position counter in EQEP_QPOSCNT.

If the EQEP_QEPCTL[2] QCLM bit is set, then the position counter, capture timer, and capture period values are latched into the EQEP_QPOSLAT, EQEP_QCTMRLAT and EQEP_QCPRDLAT registers, respectively, on unit time out.

Figure 29-78 shows the capture unit operation along with the position counter.

NOTE: The EQEP_QCAPCTL register should not be modified dynamically (such as switching CAPCLK prescaling mode from QCLK/4 to QCLK/8). The capture unit must be disabled before changing the prescaler.

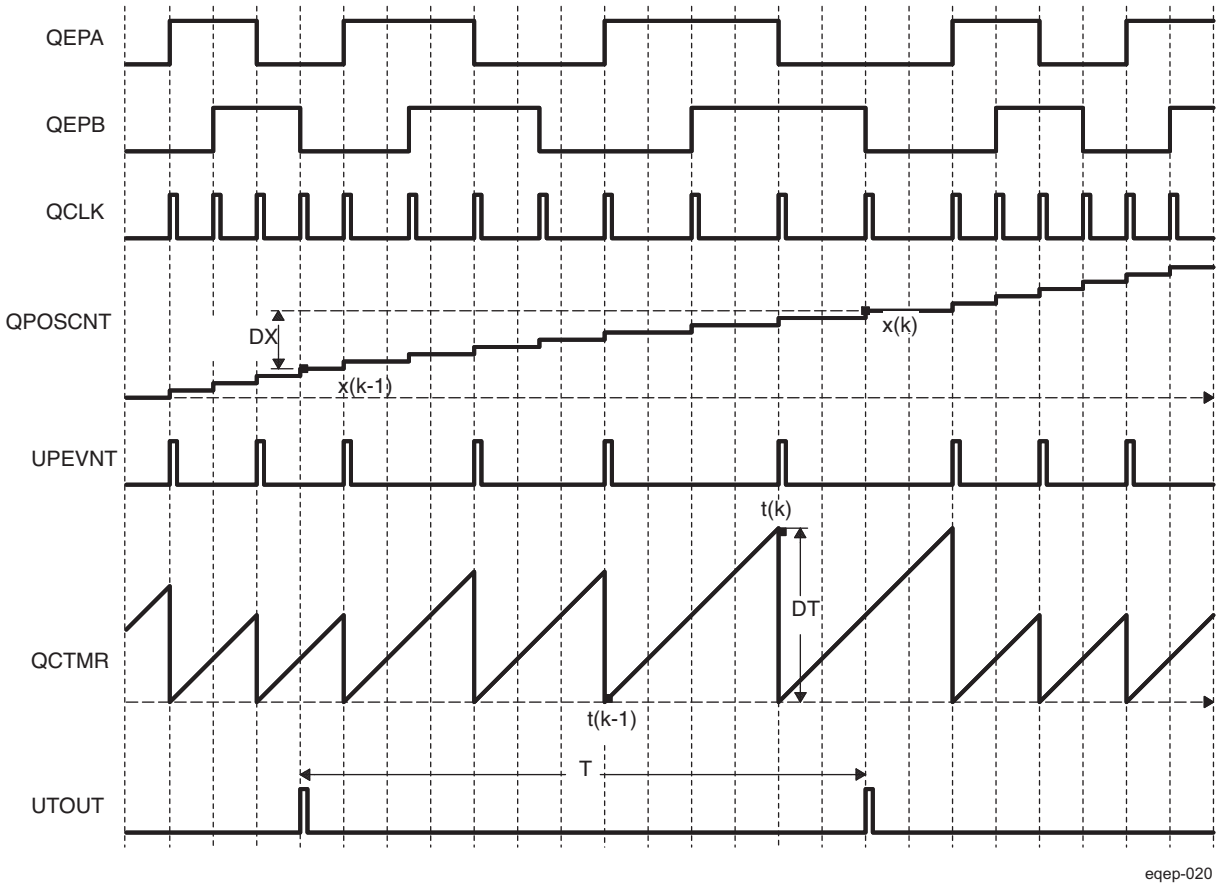
Figure 29-78. eQEP Edge Capture Unit - Timing Details



Velocity Calculation Equations:

$$V(k) = \frac{x(k) - x(k-1)}{T} = \frac{\Delta X}{T} \quad \text{eqep_021} \qquad (11)$$

where

v(k): Velocity at time instant k

x(k): Position at time instant k

x(k-1): Position at time instant k - 1

T: Fixed unit time or inverse of velocity calculation rate

ΔX: Incremental position movement in unit time

X: Fixed unit position

ΔT: Incremental time elapsed for unit position movement

t(k): Time instant "k"

t(k-1): Time instant "k - 1"

Unit time (T) and unit period (X) are configured using the EQEP_QUPRD and EQEP_QCAPCTL[UPPS] registers. Incremental position output and incremental time output is available in the EQEP_QPOSLAT and EQEP_QCPRDLAT registers.

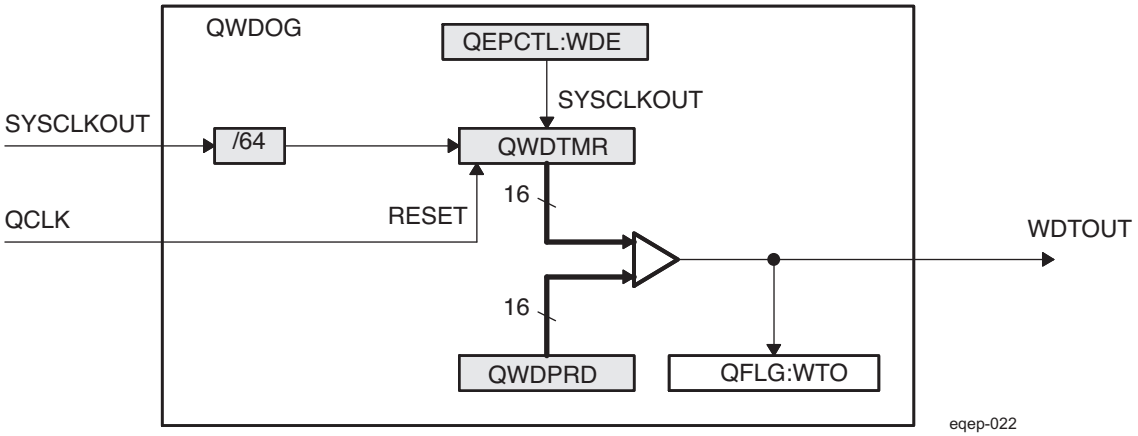
Copyright © 2015–2017, Texas Instruments Incorporated

Parameter	Relevant Register to Configure or Read the Information
T	Unit Period Register (EQEP_QUPRD)
ΔX	Incremental Position = QPOSLAT(k) - QPOSLAT(K - 1)
X	Fixed unit position defined by sensor resolution and ZCAPCTL[UPPS] bits
ΔT	Capture Period Latch (QCPRDLAT)

29.4.2.5 eQEP Watchdog

The eQEP peripheral contains a 16-bit watchdog timer that monitors the quadrature-clock to indicate proper operation of the motion-control system. The eQEP watchdog timer is clocked from SYSCLKOUT/64 and the quadrate clock event (pulse) resets the watchdog timer. If no quadrature-clock event is detected until a period match (QWDPRD = QWDTMR), then the watchdog timer will time out and the watchdog interrupt flag will be set (EQEP_QFLG[WTO]). The time-out value is programmable through the watchdog period register (EQEP_QWDPRD).

Figure 29-79. eQEP Watchdog Timer



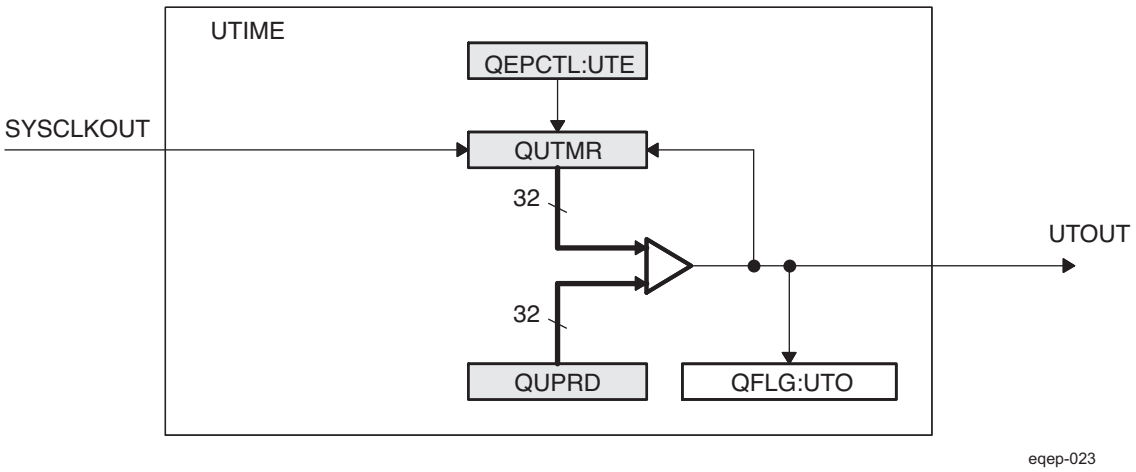
Copyright © 2015–2017, Texas Instruments Incorporated

29.4.2.6 Unit Timer Base

The eQEP peripheral includes a 32-bit timer (QUTMR) that is clocked by SYSCLKOUT to generate periodic interrupts for velocity calculations. The unit time out interrupt is set (EQEP_QFLG[UTO]) when the unit timer (QUTMR) matches the unit period register (EQEP_QUPRD).

The eQEP peripheral can be configured to latch the position counter, capture timer, and capture period values on a unit time out event so that latched values are used for velocity calculation as described in Section 29.4.2.4.

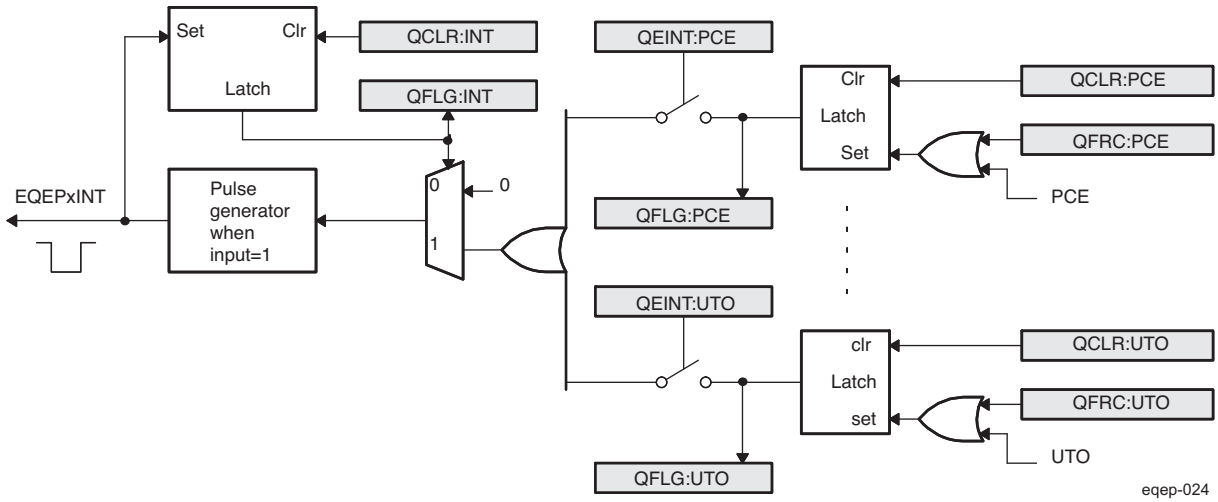
Figure 29-80. eQEP Unit Time Base



29.4.2.7 eQEP Interrupt Structure

Figure 29-81 shows how the interrupt mechanism works in the EQEP module.

Figure 29-81. EQEP Interrupt Generation



Eleven interrupt events (PCE, PHE, QDC, WTO, PCU, PCO, PCR, PCM, SEL, IEL, and UTO) can be generated. The interrupt control register (EQEP_QEINT) is used to enable/disable individual interrupt event sources. The interrupt flag register (EQEP_QFLG) indicates if any interrupt event has been latched and contains the global interrupt flag bit (INT). An interrupt pulse is generated only to the interrupt controller if any of the interrupt events is enabled, the flag bit is 1 and the INT flag bit is 0. The interrupt service routine will need to clear the global interrupt flag bit and the serviced event, via the interrupt clear register (EQEP_QCLR), before any other interrupt pulses are generated. You can force an interrupt event by way of the interrupt force register (EQEP_QFRC), which is useful for test purposes.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FREE_SOFT		PCRM		SEI		IEI		SWI	SEL	IEL		PHEN	QCLM	UTE	WDE

Bits	Field Name	Description	Type	Reset
15:14	FREE_SOFT	Emulation Control Bits. In the values 0 through 3 listed below, x is different for the four following behaviors. EQEP_QPOSCNT behavior, x refers to the Position counter. QWDTMR behavior, x refers to the Watchdog counter. QUTMR behavior, x refers to the Unit timer. QCTMR behavior, x refers to the Capture timer. 0x0 = x stops immediately. For QPOSCNT behavior, the stop is on emulation suspend. 0x1 = x continues to count until the rollover. 0x2 = x is unaffected by emulation suspend. 0x3 = x is unaffected by emulation suspend.	RW	0x0

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
13:12	PCRM	Position counter reset mode 0x0 = Position counter reset on an index event 0x1 = Position counter reset on the maximum position 0x2 = Position counter reset on the first index event 0x3 = Position counter reset on a unit time event	RW	0x0
11:10	SEI	Strobe event initialization of position counter 0x0 = Does nothing (action disabled) 0x1 = Does nothing (action disabled) 0x2 = Initializes the position counter on rising edge of the QEPS signal 0x3 = Clockwise Direction: Initializes the position counter on the rising edge of QEPS strobe. Counter Clockwise Direction: Initializes the position counter on the falling edge of QEPS strobe	RW	0x0
9:8	IEI	Index event initialization of position counter 0x0 = Do nothing (action disabled) 0x1 = Do nothing (action disabled) 0x2 = Initializes the position counter on the rising edge of the QEPI signal (QPOSCNT = QPOSINIT) 0x3 = Initializes the position counter on the falling edge of QEPI signal (QPOSCNT = QPOSINIT)	RW	0x0
7	SWI	Software initialization of position counter 0x0 = Do nothing (action disabled) 0x1 = Initialize position counter, this bit is cleared automatically	RW	0x0
6	SEL	Strobe event latch of position counter 0x0 = The position counter is latched on the rising edge of QEPS strobe (QPOSSLAT = POSCCNT). Latching on the falling edge can be done by inverting the strobe input using the QSP bit in the EQEP_QDECCTL register. 0x1 = Clockwise Direction: Position counter is latched on rising edge of QEPS strobe. Counter Clockwise Direction: Position counter is latched on falling edge of QEPS strobe.	RW	0x0
5:4	IEL	Index event latch of position counter (software index marker) 0x0 = Reserved 0x1 = Latches position counter on rising edge of the index signal 0x2 = Latches position counter on falling edge of the index signal 0x3 = Software index marker. Latches the position counter and quadrature direction flag on index event marker. The position counter is latched to the EQEP_QPOSILAT register and the direction flag is latched in the EQEP_QEPSTS[QDLF] bit. This mode is useful for software index marking.	RW	0x0
3	PHEN	Quadrature position counter enable/software reset 0x0 = Reset the eQEP peripheral internal operating flags/read-only registers. Control/configuration registers are not disturbed by a software reset. 0x1 = eQEP position counter is enabled	RW	0x0
2	QCLM	eQEP capture latch mode 0x0 = Latch on position counter read by CPU. Capture timer and capture period values are latched into EQEP_QCTMRLAT and EQEP_QCPRDLAT registers when CPU reads the EQEP_QPOSCNT register. 0x1 = Latch on unit time out. Position counter, capture timer and capture period values are latched into EQEP_QPOSLAT, EQEP_QCTMRLAT and EQEP_QCPRDLAT registers on unit time out.	RW	0x0
1	UTE	eQEP unit timer enable 0x0 = Disable eQEP unit timer 0x1 = Enable unit timer	RW	0x0

30.1 PRU-ICSS Overview

The Programmable Real-Time Unit Subsystem and Industrial Communication Subsystem (PRU-ICSS) consists of:

- Two 32-bit load/store RISC CPU cores - Programmable Real-Time Units (PRU0 and PRU1)
- Data RAMs per PRU core
- Instruction RAMs per PRU core
- Shared RAM
- Peripheral modules
- Interrupt controller (PRUSS_INTC)

The programmable nature of the PRU cores, along with their access to pins, events and all device resources, provides flexibility in implementing fast real-time responses, specialized data handling operations, custom peripheral interfaces, and in offloading tasks from the other processor cores of the device.

The device has integrated two identical PRU subsystems (PRU-ICSS1 and PRU-ICSS2). The PRUs have access to all resources on the device through a master port on the L3_MAIN interconnect, and vice versa, the external host processors can access the PRU-ICSS resources through a L3_MAIN slave port.

The PRU-ICSS L2 interconnect, provides access to the various internal and external masters to the resources inside the PRU-ICSS. A subsystem local Interrupt Controller - PRUSS_INTC handles system input events and posts events back to the device-level host CPUs.

The PRU cores are programmed with a small, deterministic instruction set. Each PRU can operate independently or in coordination with each other and can also work in coordination with the device-level host CPU. This interaction between processors is determined by the nature of the firmware loaded into the PRU's instruction memory.

Figure 30-1 shows an overview of the PRU subsystem.

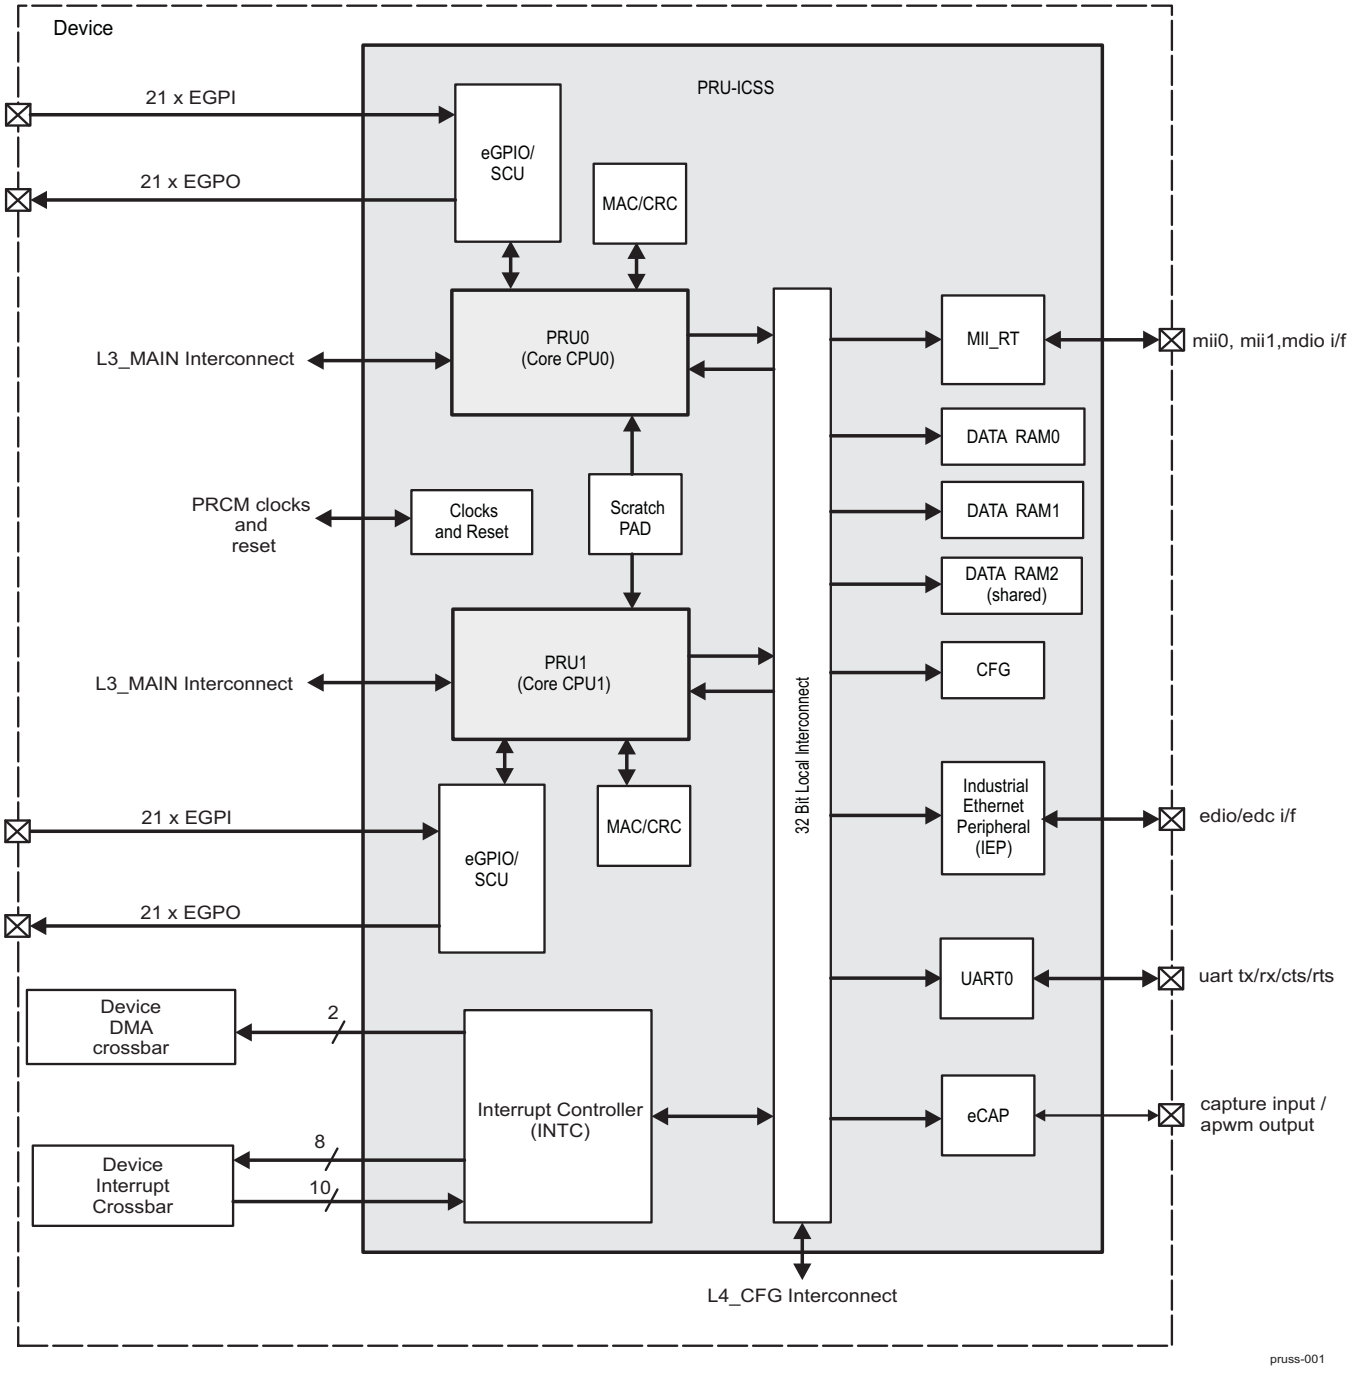
Figure 30-1. PRU-ICSS Overview



NOTE: PRU-ICSS2 UART and eCAP are not supported on the AM570x family of devices.

PRU-ICSS2 IEP I/Os are not pinned out on AM570x. However, some internal features (such as the IEP timer) are still supported.

Also, some PRU-ICSS2 GPI/GPOs are not pinned out on AM570x. See Table 30-2 for details.

30.1.1 PRU-ICSS Key Features

The PRU subsystem includes the following main features:

- Two PRU CPUs
  - 21 Enhanced General-Purpose Inputs (EGPI) and 21 Enhanced General-Purpose Outputs (EGPO)
  - Asynchronous capture [Serial Capture Unit (SCU)] with EnDat 2.2 protocol and Sigma-Delta demodulation support
  - Multiplier with optional accumulation (MAC)
  - CRC16/CRC32
  - 12-KiB program RAM per PRU CPU (signified IRAM0 for PRU0 and IRAM1 for PRU1)
  - 8-KiB data RAM per PRU CPU (signified RAM0 for PRU0 and RAM1 for PRU1)
  - Two high-performance master (initiator) ports on the L3_MAIN interconnect - one per PRU
- 32-KiB general purpose memory RAM (signified RAM2) shared between PRU0 and PRU1
- One Scratch-Pad (SPAD) memory
  - 3 Banks of 30 × 32-bit registers
- Broadside direct connect between PRU cores within subsystem. Optional address translation for PRU transaction to External Host
- 16 software events generated by two PRUs
- One Ethernet MII_RT module (PRUSS_MII_RT_CFG) with two MII ports and configurable connections to PRUs
- MDIO Port (PRUSS_MII_MDIO) to control extenal Ethernet PHY
- Industrial Ethernet Peripheral (IEP) to manage/generate Industrial Ethernet functions
- 16550-compatible UART with a dedicated 192-MHz clock to support 12-Mbps PROFIBUS
- Industrial Ethernet timer with 7/9 capture and 16 compare events
- Enhanced Capture Module (ECAP)
- Interrupt Controller (PRUSS_INTC)
  - Up to 64 input events supported
  - Interrupt mapping to 10 interrupt channels via an interrupt crossbar
  - 10 Host interrupts (2 to PRU0 and PRU1, 8 outputs to device level)
  - Each system event can be enabled and disabled
  - Each host event can be enabled and disabled
  - Hardware prioritization of events
  - Two level-sensitive DMA requests generated by the local PRUSS INTC to the device DMA Crossbar
- One Slave (target) port for memory mapped register and internal memories access through device L3_MAIN
- Two (master and slave) 32-bit ports for low-latency interface between PRU-ICSS subsystems
- Flexible power management support
- Integrated 32-bit interconnect
- Parity control supported by all memories

NOTE: Use of IEP Sync and WatchDog features are only supported via the TI Industrial software development kit (SDK).

NOTE: There is no Sigma-Delta modulator inside the PRU. However, Sigma-Delta support is enabled through digital filtering hardware in the PRU to perform Sinc filtering.

PRU-ICSS unsupported features:

Copyright © 2015–2017, Texas Instruments Incorporated

- PR1_PRU0 GPI and GPO signals are not pinned out
- Only 8 bits are supported of the 32-bit ECAT Digital Data Input
- Only 8 bits are supported of the 32-bit ECAT Digital Data Output
- UART Modem interface is not supported

30.2 PRU-ICSS Environment

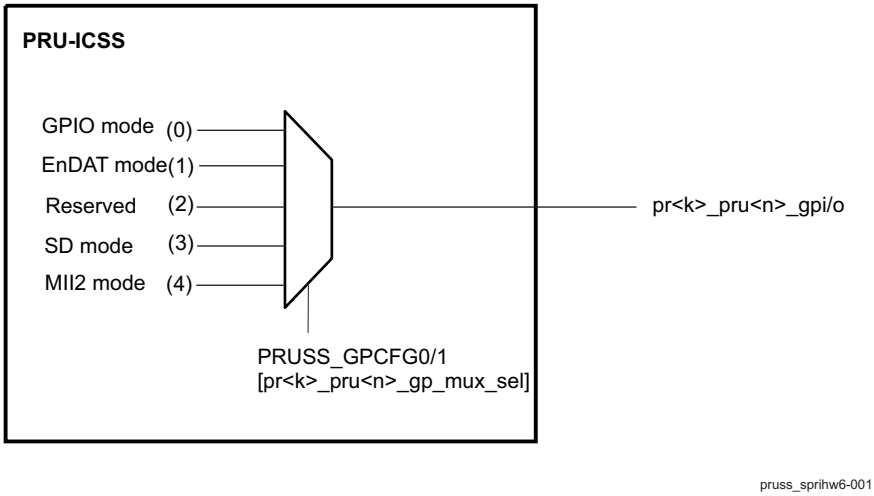
This section specifies the PRU-ICSS subsystem (top) interface signals to the device environment components.

30.2.1 PRU-ICSS I/O Interface

The PRU-ICSS1 and PRU-ICSS2 external interface signals are described in Table 30-1 and Table 30-2, respectively. The PRU-ICSS has a large number of available I/O signals. Most of these are multiplexed with other functional signals at the device level.

The PRU-ICSS1 and PRU-ICSS2 also support an internal wrapper multiplexing that expands the device top-level multiplexing. This wrapper multiplexing is controlled by the PRUSS_GPCFGx register in the PRU-ICSS CFG register space and allows MII_RT, EnDAT, and Sigma Delta functionality to be muxed with the PRU GPI/O device signals, as shown in Figure 30-2. The PRU-ICSS wrapper multiplexing is described with the device-level signals in Table 30-1 and Table 30-2. Note that the device top-level muxing has higher priority over the internal wrapper muxing.

Figure 30-2. PRU-ICSS Internal Wrapper Multiplexing



NOTE: Additionally to PRU-ICSS wrapper multiplexing the device I/O logic maps the PRU-ICSS signals to the different device pads by programming in the Control Module. For more information, refer to the Section 18.4.6.1.1, *Pad Configuration Registers* in the Chapter 18, *Control Module*.

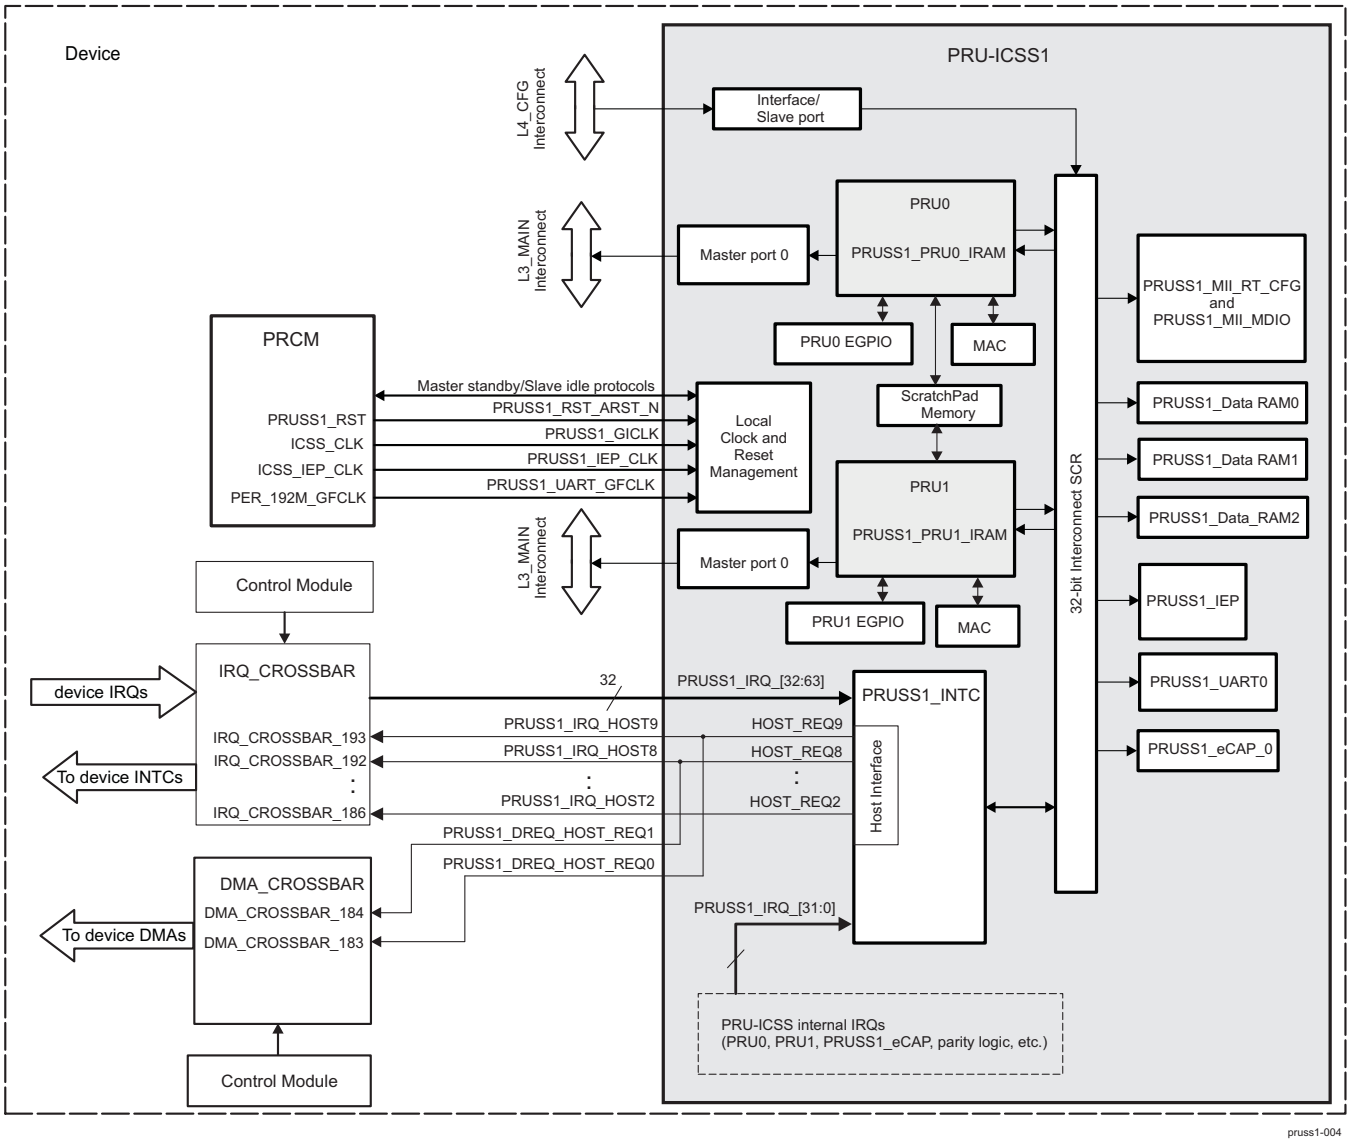
30.3 PRU-ICSS Integration

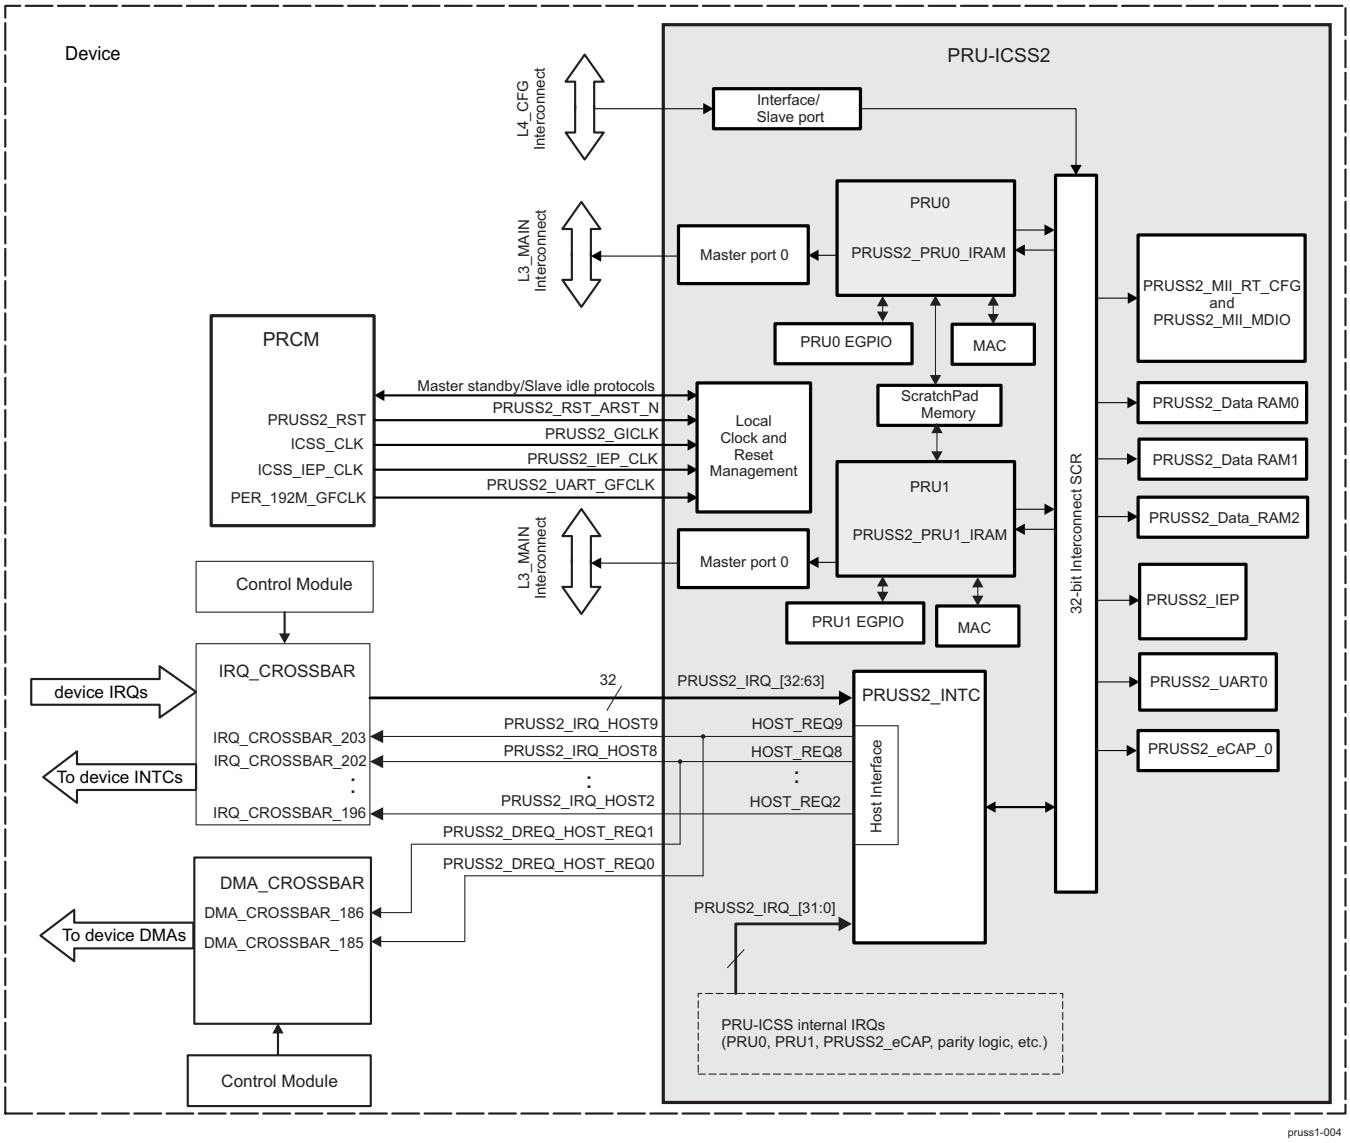
The PRU-ICSS1 and PRU-ICSS2 subsystems integration in the device is shown in Figure 30-5 and Figure 30-6, respectively.

Figure 30-5. PRU-ICSS1 Integration in the Device



Copyright © 2015–2017, Texas Instruments Incorporated

Figure 30-6. PRU-ICSS2 Integration in the Device



NOTE: PRU-ICSS2 UART and eCAP are not supported on the AM570x family of devices.

PRU-ICSS2 IEP I/Os are not pinned out on AM570x. However, some internal features (such as the IEP timer) are still supported.

The PRU-ICSS1 and PRU-ICSS2 integration in the device features:

- PD_L4PER power domain instantiation
- two master ports (PRU0 and PRU1 core initiators) on the device L3_MAIN interconnect
- Non-wakeup capable - smart Standby protocol with the device PRCM
- Software assertion of a standby request "MStandby" (for master port clock disable) with local (PRU-ICSS) monitoring of the PRCM "MWait" acknowledge.
- one slave (configuration) port on the L3_MAIN interconnect for device hosts (MPU, DSP1, etc.) to access various memories and registers of PRU-ICSS
- Non-wakeup capable - smart Idle protocol with the device PRCM
- 10 output interrupt events from local interrupt controller - PRUSS_INTC:

Copyright © 2015–2017, Texas Instruments Incorporated

  - 2 events to each PRU core (events 0 and 1)
  - 8 events mapped to the device IRQ_CROSSBAR which further remaps them to device interrupt controllers (events 2 through 9)
  - 2 events mapped to the device DMA_CROSSBAR, that remaps them to device DMA controllers (events 8 and 9)
- 32 external interrupts are mapped via the device IRQ_CROSSBAR to the local PRUSS_INTC
- A local software gating of clocks to several modules within PRU subsystem (local clock management protocol), as follows:
  - PRUSS_IEP
  - PRUSS_eCAP_0
  - PRUSS_UART0
  - PRUSS_INTC
  - PRUSS_PRU0
  - PRUSS_PRU1
- 3 input clocks obtained from device PRCM:
  - a PRU-ICSS top level gatable interface clock
  - a PRUSS IEP functional clock
  - a PRUSS UART0
- No memory/register retention is supported
- One hardware non-retention (level sensitive) reset

Table 30-3 through Table 30-5 summarize the integration of the module in the device.

Table 30-3. PRU-ICSS Integration Attributes

Module Instance	Attributes	
	Power Domain	Interconnect

NOTE: For more information about the IRQ_CROSSBAR module, see Section 18.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 18, *Control Module*.

For more information about the DMA_CROSSBAR module, see Section 18.4.6.5, *DMA_CROSSBAR Module Functional Description*, in Chapter 18, *Control Module*.

For more information about the device interrupt controllers, see Chapter 17, *Interrupt Controllers*.

For more information about the device SDMA module, see Section 16.1, *System DMA*.

For more information about the device EDMA module, see Section 16.2, *Enhanced DMA*.

30.4 PRU-ICSS Level Resources Functional Description

This section provides functional description of the device integrated PRU Subsystems modules.

30.4.1 PRU-ICSS Reset Management

An individual PRCM cold and warm hardware reset is available per PRU-ICSS1 (PRUSS1_RST) and PRU-ICSS2 (PRUSS2_RST). It is asserted by the PRCM upon cold reset and warm reset events.

For more details on the PRU-ICSS resets mapping, see also the Section 30.3.

NOTE: A hardware reset event (PRUSS_RST_MAIN_ARST_N input assertion) forces the PRU-ICSS to go to an IDLE and STANDBY state. For more details on PRU-ICSS clock management defined states refer to the Section 30.4.2.

NOTE: No global software reset is available at the PRU-ICSS top level.

30.4.2 PRU-ICSS Power and Clock Management

The PRU-ICSS supports 2 levels of clock gating. First level gates all clocks inside the PRU-ICSS when it is placed into IDLE and STANDBY state. The second level allows user software to enable/disable clocks in the clock gating register PRUSS_CGR to some internal modules, as follows:

- PRUSS1_IEP
- PRUSS1_eCAP_0
- PRUSS1_UART0
- PRUSS1_INTC
- PRUSS1_PRU0_Control /PRUSS1_PRU0_IRAM
- PRUSS1_PRU1_Control/PRUSS1_PRU1_IRAM
- PRUSS2_IEP
- PRUSS2_eCAP_0
- PRUSS2_UART0
- PRUSS2_INTC
- PRUSS2_PRU0_Control /PRUSS2_PRU0_IRAM
- PRUSS2_PRU1_Control/PRUSS2_PRU1_IRAM

NOTE: PRU-ICSS2 UART and eCAP are not supported on the AM570x family of devices.

PRU-ICSS2 IEP I/Os are not pinned out on AM570x. However, some internal features (such as the IEP timer) are still supported.

The appropriate configuration registers block controls its local module set inside PRU-ICSS.

Copyright © 2015–2017, Texas Instruments Incorporated

30.4.2.1 PRU-ICSS Idle and Standby States

The below Table 30-6 lists the clock management settings applicable at PRU-ICSS subsystem level (first level of local power management).

NOTE: For more details on the slave idle protocol (slave port) and master standby protocol (master port) between PRU-ICSS and device PRCM, refer to the Section 3.1.1.1.2, *Module-Level Clock Management* in the Chapter 3, *Power, Reset and Clock Management*.

Table 30-6. PRU-ICSS Idle/Standby Support

IDLE/STANDBY Mode	Comments
NO IDLE	
SMART IDLE	Default State
Wake-up capable SMART IDLE	NOT supported
FORCE IDLE	
NO STANDBY	
SMART STANDBY	Default State
Wake-up capable SMART STANDBY	NOT supported
FORCE STANDBY	

NOTE: Not all of the PRU-ICSS outputs meet the IDLE state. Only the power protocol and L3_MAIN signals are Idled with all functional and interface clocks being shut-down.

A transition from an ACTIVE/Normal state to an IDLE (L3_MAIN slave) + STANDBY (L3_MAIN masters) state is performed as per the sequence:

1. The host (i.e. device MPU, DSP1, etc.) requests that the PRU firmware goes into IDLE state and waits for acknowledgement.
2. The host issues Clock Stop Request in register PRUSS_CGR to modules with gateable clocks defined at second power management level (see Section 30.4.2)
3. The host initiates MStandby via assertion to HIGH of the bit: PRUSS_SYSCFG [4] STANDBY_INIT (PRU-ICSS clock management configuration register).
4. The host software gets the device PRCM to issue an IDLE Request (SidleReq) towards the PRU-ICSS slave port. This is done via writing to device PRCM clock management registers dedicated to PRU-ICSS: CM_L4PER2_PRUSS1_CLKCTRL and CM_L4PER2_PRUSS2_CLKCTRL in Section 3.11, *PRCM Register Manual* of the Chapter 3,*Power Reset and Clock Management*.
5. The PRU-ICSS acknowledges IDLE Request and enters the IDLE+STANDBY state.

A transition from an IDLE + STANDBY state to an ACTIVE/ Normal state is performed as per the sequence:

1. The host (i.e. device MPU, DSP1, etc.) software gets the PRCM to de-assert IDLE Request - This is done via writing to device PRCM clock management registers dedicated to PRU-ICSS: CM_L4PER2_PRUSS1_CLKCTRLand CM_L4PER2_PRUSS2_CLKCTRL in Section 3.11, *PRCM Register Manual* of the Chapter 3,*Power Reset and Clock Management*.
2. The host CPU de-asserts the ClockStopReq to modules with gateable clocks defined at second power management level, and wait for the ClockStopAck to be asserted. This is done via PRU-ICSS host writing/reading the PRUSS_CGR.
3. The host CPU enables "NO STANDBY" via assertion of the PRUSS_SYSCFG[3:2] STANDBY_MODE to 0x1.

Copyright © 2015–2017, Texas Instruments Incorporated

30.4.2.2 Module Clock Configurations at PRU-ICSS Top Level

IEP functional clock source selection: The clock source selection between PRUSS_IEP_CLK (default) and PRUSS_GICLK to the IEP module is done in register PRUSS_IEPCLK[0] OCP_EN in the PRUSS_CFG location. For more information on these PRU-ICSS level input clocks from PRCM, refer to the Section 30.3.

Enhanced GPIO clock divider settings: In certain sample/shift clock settings of the PRU0 and PRU1 EGPIOs (when enabled in serial mode) two cascaded fractional dividers are done in the PRUSS_CFG top level configuration registers PRUSS_GPCFG0 and PRUSS_GPCFG1. In addition, EGPIO clock active edge selection control can be exerted via the bit PRU0_GPI_CLK_MODE for PRU0_EGPIO and PRU1_GPI_CLK_MODE for the PRU1_EGPIO.

- For the serial PRU0's EGPOs:
  - PRUSS_GPCFG0 [24:20]PRU0_GPO_DIV1
  - PRUSS_GPCFG0 [19:15]PRU0_GPO_DIV0
- For the serial PRU0's EGPIs:
  - PRUSS_GPCFG0 [12:8]PRU0_GPI_DIV1
  - PRUSS_GPCFG0 [7:3]PRU0_GPI_DIV0
- For the serial PRU1's EGPOs:
  - PRUSS_GPCFG1 [24:20]PRU1_GPO_DIV1
  - PRUSS_GPCFG1 [19:15]PRU1_GPO_DIV0
- For the serial PRU1's EGPIs:
  - PRUSS_GPCFG1 [12:8]PRU1_GPI_DIV1
  - PRUSS_GPCFG1 [7:3]PRU1_GPI_DIV0

30.4.3 Other PRU-ICSS Module Functional Registers at Subsystem Level

Enhanced GPIO. The other functional mode setting for PRUs EGPIOs at PRU-ICSS top registers level are:

- PRUSS_GPCFG0/PRUSS_GPCFG1 [14] PRU1_GPO_MODE - to select between direct or serial EGPO output mode of operation.
- PRUSS_GPCFG0/PRUSS_GPCFG1 [25] PRU1_GPO_SH_SEL - to select between the EGPO shadow registers 0 and 1 used for output shifting. For more details, refer to the Section 30.5.2.2.3.4, *Enhanced General-Purpose Module Outputs (R30)*.
- PRUSS_GPCFG0/PRUSS_GPCFG1 [1:0] PRU1_GPI_MODE - selects the EGPI input mode of operation (selects between direct input, parallel capture, 28-bit shift or MII_RT modes).
- PRUSS_GPCFG0/PRUSS_GPCFG1 [13] PRU1_GPI_SB - **start bit event status for 28-bit EGPI input shift mode**. For more details, refer to the Section 30.5.2.2.3, *Enhanced General-Purpose Module Inputs (R31)*.

PRU 0/1 cores IRAM and DRAM parity error events: PRUSS_ISRP (raw status), PRUSS_ISP (interrupt status) and PRUSS_IESP (interrupt enable) and PRUSS_IECP (interrupt clear) registers.

PRU 0/1 cores IRAM and DRAM parity error events: PRUSS_ISRP (raw status), PRUSS_ISP (interrupt status) and PRUSS_IESP (interrupt enable) and PRUSS_IECP (interrupt clear) registers.

Enable address offset ("-0x0008_0000") feature individually per PRU0 and PRU1 master ports in the PRUSS_PMAO register in case of accessing peripherals located in the PRU-ICSS space.

PRUSS_MII_RT_CFG interrupts mapping to PRUSS_INTC is enabled in the PRUSS_MII_RT register

PRUs scratchpad (SPAD) memory priority and configuration related bits are located in the PRUSS_SPP register.

Copyright © 2015–2017, Texas Instruments Incorporated

30.4.4 PRU-ICSS Memory Maps

The PRU-ICSS comprises various distinct addressable regions that are mapped to both a local and global memory map. The local memory maps are maps with respect to the PRU point of view. The global memory maps are maps with respect to the Host point of view, but can also be accessed by the PRU-ICSS.

30.4.4.1 PRU-ICSS Local Memory Map

The PRU-ICSS memory map is documented in Table 30-7 (Instruction Space) and in Table 30-8 (Data Space). Note that these two memory maps are implemented inside the PRU-ICSS and are local to the components of the PRU-ICSS.

30.4.4.1.1 PRU-ICSS Local Instruction Memory Map

Each PRU has a dedicated 12 KiB of Instruction Memory (PRUSS_PRU0_IRAM and PRUSS_PRU1_IRAM respectively) that must be initialized by an external to PRU-ICSS host processor before a PRU core CPU executes any instructions.

CAUTION

The PRUSS_PRU0/1_IRAM regions are ONLY accessible to PRU-ICSS masters (external hosts like MPU Cortex-A15, DSP1, etc.) when the PRU0/PRU1 is NOT running. The access is via PRU-ICSS slave port on the device L3_MAIN interconnect

Table 30-7. PRU-ICSS Local Instruction Memory Map

Start Address	PRU0	PRU1
0x0000_0000	12 KiB IRAM	12 KiB IRAM

30.4.4.1.2 PRU-ICSS Local Data Memory Map

The local data memory map in Table 30-8 allows each PRU core to access the PRU-ICSS addressable regions and the external host's memory map.

The PRU accesses the external Host memory map through the device L3_MAIN interconnect Interface Master port (System OCP_HP0/1) starting at address 0x0008_0000. By default, memory addresses between 0x0000_0000 – 0x0007_FFFF will correspond to the PRU-ICSS local address in Table 30-8. To access an address between 0x0000_0000–0x0007_FFFF of the external host map, the address offset of " – 0x0008_0000" feature is enabled through the PRUSS_PMAO[1] PMAO_PRU1 (for PRU1 CPU) and PRUSS_PMAO[0] PMAO_PRU0 (for PRU0 CPU) bits in the PRUSS_CFG subsystem level register space.

Table 30-8. PRU-ICSS Local Data Memory Map

0x0008_0000	PRU-ICSS master port 0 on device L3_MAIN interconnect (OCP_HP0)(2)	PRU-ICSS master port 1 on device L3_MAIN interconnect (OCP_HP1)(2)

(2) For details see Section 2.7, *PRU-ICSS Memory Map.*

NOTE: PRU-ICSS2 UART and eCAP are not supported on the AM570x family of devices.

PRU-ICSS2 IEP I/Os are not pinned out on AM570x. However, some internal features (such as the IEP timer) are still supported.

30.4.4.2 PRU-ICSS Global Memory Map

The global view of the PRU-ICSS internal memories and control ports is shown in Table 30-9. The offset addresses of each region are implemented inside the PRU-ICSS but the global device **L3_MAIN memory mapping** places the PRU-ICSS slave port in the address range shown in the external PRU-ICSS host L3_MAIN memory map.

The global memory map is with respect to the Host point of view (i.e. device MPU Cortex-A15, DSP1, etc. view of PRU-ICSS1/PRU-ICSS2 in the L3_MAIN memory space), but it can also be accessed by the PRU-ICSS1/PRU-ICSS2 itself. This is implemented via L3_MAIN redirecting PRU-ICSS master port traffic in the address range (0x0008_0000 - 0x000B_FFFF) to the PRU-ICSS slave port when PMAO_PRU0/PMAO_PRU1 = '0b1'. Note that PRU0 and PRU1 can use either the local or global addresses to access their internal memories, but using the local addresses provides access time several cycles faster than using the global addresses. This is because when accessing via the global address the access has to be routed through the L3_MAIN switch fabric outside PRU-ICSS and back in through the PRU-ICSS slave port.

Example 1: PRU1 accesses its own data RAM - Data_RAM1 in the global space:

- The PRU1 CPU sets the PRUSS_PMAO[1] PMAO_PRU1 to 1 (using PRU1 local CFG address: 0x0002_6028 of that register) and generates destination address 0x0008_2000. Thus, traffic passes through master port 1 towards PRU-ICSS1 slave port over L3_MAIN to reach Data_RAM1 (location 0x0008_2000 - 0x0008_0000 = 0x0000_2000 in the Table 30-9).

Example 2: PRU1 accesses PRU0 data RAM - Data_RAM0 in the global space:

- The PRU1 CPU sets the PRUSS_PMAO[1] PMAO_PRU1 to 1 (using PRU1 local CFG MMR address: 0x0002_6028 of that register) and generates destination address 0x0008_0000. Thus traffic passes through master port 1 towards PRU-ICSS1 slave port over L3_MAIN to reach Data_RAM0.

Example 3: DSP1 accesses the PRU0_IRAM in the global memory space to load instructions to be executed by the PRU0 upon boot time:

- Because the DSP1 is an external host to PRU-ICSS1, it has to target at first place the PRU-ICSS configuration and memory space in the L3_MAIN space. For PRU-ICSS1, slave port the base address

Copyright © 2015–2017, Texas Instruments Incorporated

is 0x4B20_0000.

- According to the Table 30-9, the PRU0_PRUSS1_PRU0_IRAM_TARG offset is 0x0003_4000. Hereby the physical address that DSP1 must use to store the PRU0 booting instructions to PRU0_IRAM is 0x4B23_4000.

Example 4: PRU0 accesses a non-PRU-ICSS peripheral in the global space (address offset >= 0x2000_0000):

- To access the McASP1 config space the PRU0 keeps PRUSS_PMAO[0] PMAO_PRU0 at 0b0 and generates the McASP1 cfg slave base address 0x4580_0000. Thus traffic passes through master port 0 and reaches McASP1 config MMRs over L3_MAIN.

Example 5: PRUSS1_PRU1 host configures the PRU-ICSS2 module PRUSS2_MII_RT:

- Note that in case of PRUSS1_PRU0 accessing a PRU-ICSS2 peripheral, it must again disable the PMAO feature (writing at 0x0002_6028 PRUSS_PMAO[1] PMAO_PRU1 =0b0) and generate the physical address through its master port (1) adding global memory space offset of the IEP (0x0002_E000 from the Table 30-9) to the PRU-ICSS2 L3_MAIN base address (0x4B28_0000). The physical address generated from PRU-ICSS1 PRU1 therefore equals 0x4B2A E000).

Each of the PRU cores can access the rest of the device memory (including memory mapped peripheral and configuration registers) using the global memory space addresses. For details on the L3_MAIN base address of the PRU-ICSS slave configuration memory space, refer to the Chapter 2, *Memory Mapping*.

Table 30-9. PRU-ICSS Global Memory Map

Offset Address	Target
0x0000_0000	Data 8 KiB RAM0
0x0000_2000	Data 8 KiB RAM1
0x0001_0000	Data 32 KiB RAM2 (shared)
0x0002_0000	PRUSS_INTC
0x0002_2000	PRU0 Control
0x0002_2400	PRU0 Debug
0x0002_4000	PRU1 Control
0x0002_4400	PRU1 Debug
0x0002_6000	CFG
0x0002_8000	UART0
0x0002_A000	Reserved
0x0002_C000	Reserved
0x0002_E000	IEP
0x0003_0000	eCAP0
0x0003_2000	MII_RT_CFG
0x0003_2400	MII_MDIO
0x0003_4000	PRU0 12 KiB IRAM
0x0003_8000	PRU1 12 KiB IRAM
0x0004_0000	External PRU-ICSS

NOTE: PRU-ICSS2 UART and eCAP are not supported on the AM570x family of devices.

PRU-ICSS2 IEP I/Os are not pinned out on AM570x. However, some internal features (such as the IEP timer) are still supported.

NOTE: The 0x0008_0000-offset-subtraction feature must be enabled only in case of PRU global accesses (0x0008_0000 - 0x000B_FFFF) to resources within the PRU subsystem. The PMAO feature must be disabled when accessing PRU-ICSS external locations.

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
31:2	RESERVED		R	0x0
1	XFR_SHIFT_EN	Enables XIN XOUT shift functionality. When enabled, R0[4:0] (internal to PRU) defines the 32-bit offset for XIN and XOUT operations with the scratch pad. 0x0 = Disabled. 0x1 = Enabled.	RW	0x0
0	PRU1_PAD_HP_EN	Defines which PRU wins write cycle arbitration to a common scratch pad bank. The PRU which has higher priority will always perform the write cycle with no wait states. The lower PRU will get stalled wait states until higher PRU is not performing write cycles. If the lower priority PRU writes to the same byte has the higher priority PRU, then the lower priority PRU will over write the bytes. 0x0 = PRU0 has highest priority. 0x1 = PRU1 has highest priority.	RW	0x0

30.5 PRU-ICSS PRU Cores

This section describes the functionality of the two Programmable Real-time Unit (PRU) processors (PRU0 and PRU1) integrated in each of the device PRUSS.

30.5.1 PRU Cores Overview

The PRU is a processor optimized for performing embedded tasks that require manipulation of packed memory mapped data structures, handling of system events that have tight real-time constraints and interfacing with systems external to the SoC. The PRU is both very small and very efficient at handling such tasks.

The major attributes of the PRU are in Table 30-65.

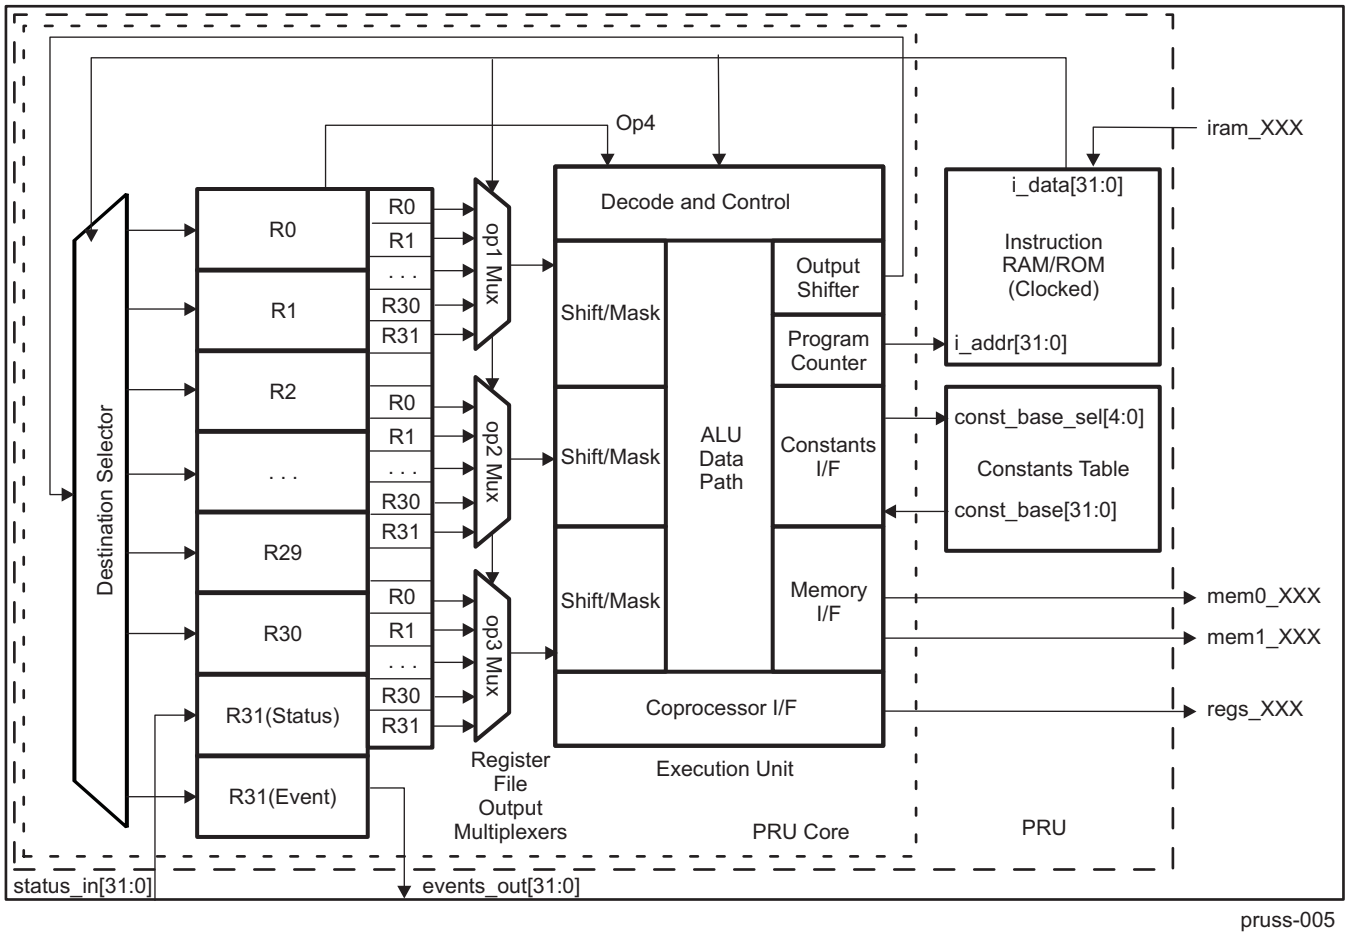
Table 30-65. PRU Features

Attribute	Value
IO Architecture	Load/Store
Data Flow Architecture	Register to Register
Core Level Bus Architecture	
Type	4-Bus Harvard (1 Instruction, 3 Data)
Instruction I/F	32-Bit
Memory I/F 0	32-Bit
Memory I/F 1	32-Bit
Execution Model	
Issue Type	Scalar
Pipelining	None (Purposefully)
Ordering	In Order
ALU Type	Unsigned Integer
Registers	
General Purpose (GP)	30 (R1 – R30)
External Status	1 (R31)
GP/Indexing	1 (R0)
Addressability in Instruction	Bit, Byte (8-bit), Half-word (16-bit), Word (32-bit), Pointer
Addressing Modes	
Load Immediate	16-bit Immediate
Load/Store – Memory	Register Base + Register Offset
	Register Base + 8-bit Immediate Offset
	Register Base with auto increment/decrement
	Constant Table Base + Register Offset
	Constant Table Base + 8-bit Immediate Offset
	Constant Table Base with auto increment/decrement
Data Path Width	32-bit
Instruction Width	32-bit
Accessibility to Internal PRU Structures	Provides 32-bit slave with three regions: • Instruction RAM • Control/Status registers • Debug access to internal registers (R0-R31) and constant table

Copyright © 2015–2017, Texas Instruments Incorporated

The processor is based on a four-bus architecture which allows instructions to be fetched and executed concurrently with data transfers. In addition, an input is provided in order to allow external status information to be reflected in the internal processor status register. Figure 30-7 shows a block diagram of the processing element and the associated instruction RAM/ROM that contains the code that is to be executed.

Figure 30-7. PRU Block Diagram



30.5.2 PRU Cores Functional Description

This section describes the PRU cores supported functionality by describing the constant table, module interface and enhanced GPIOs.

30.5.2.1 PRUs Constant Table

The PRU Constants Table is a structure of hard-coded memory addresses for commonly used peripherals and memories. The constants table exists to more efficiently load/store data to these commonly accessed addresses by:

- Reduce a PRU instruction by not needing to pre-load an address into the internal register file before loading/storing data to memory address.
- Maximizing the usage of the PRU register file for embedded processing applications by moving many of the commonly used constant or deterministically calculated base addresses from the internal register file to an external table.

NOTE: PRU-ICSS2 UART and eCAP are not supported on the AM570x family of devices.

PRU-ICSS2 IEP I/Os are not pinned out on AM570x. However, some internal features (such as the IEP timer) are still supported.

NOTE: The addresses in constants entries 24–31 are partially programmable. Their programmable bit field (for example, c24_blk_index[3:0]) is programmable through the PRU CTRL register space. As a general rule, the PRU should configure this field before using the partially programmable constant entries.

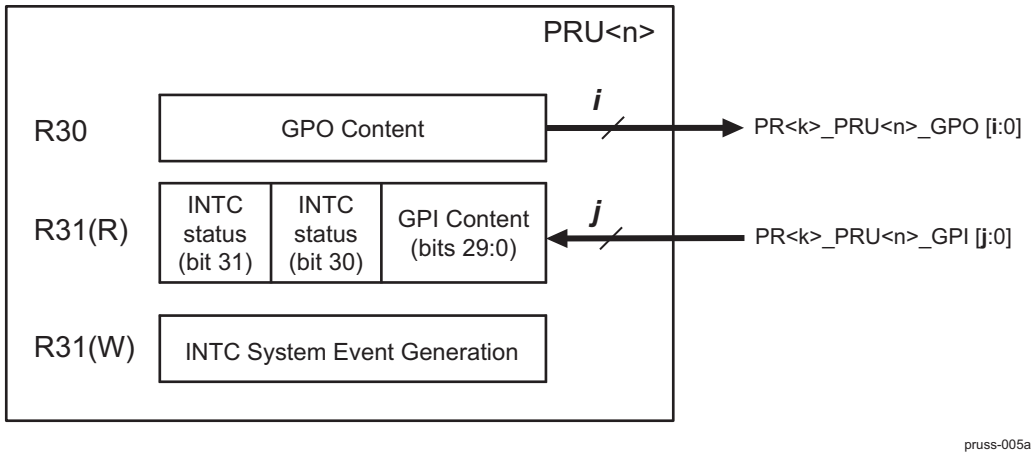
30.5.2.2 PRU Module Interface

The PRU module interface consists of the PRU internal registers 30 and 31 (R30 and R31). Figure 30-8 shows the PRU module interface and the functionality of R30 and R31. The register R31 serves as an interface with the dedicated PRU general purpose input (GPI) pins and PRUSS_INTC. Reading R31 returns status information from the GPI pins and PRUSS_INTC via the PRU Real Time Status Interface. Writing to R31generates PRU system events via the PRU Event Interface. The register R30 serves as an interface with the dedicated PRU general purpose output (GPO) pins.

NOTE: The below sections cover different functional modes of the PRUn cores, (where n=0,1), enhanced GPIO (EGPIO) interface. The register bits which control EGPIO functionalities are part of the (PRUSS1_CFG and PRUSS2_CFG) space. For descriptions of these EGPIO register bitfield controls, refer to the Section 30.4.3.

Figure 30-8. PRU Module Interface



30.5.2.2.1 Real-Time Status Interface Mapping (R31): Interrupt Events Input

The PRU Real Time Status Interface directly feeds information into register 31 (R31) of the PRU's internal register file. The firmware on the PRU uses the status information to make decisions during execution. The status interface is comprised of signals from different modules inside of the PRU-ICSS which require some level of interaction with the PRU. More details on the Host interrupts imported into bit 30 and 31 of register R31 of both the PRUs is provided in the Section 30.6, *PRU-ICSS Local Interrupt Controller*.

Table 30-67. Real-Time Status Interface Mapping (R31) Field Descriptions

Bit	Field	Description
31	pru_intr_in[1]	PRU Host Interrupt 1 from local PRUSS_INTC
30	pru_intr_in[0]	PRU Host Interrupt 0 from local PRUSS_INTC
29:0	prun_r31_status[29:0]	Status inputs from primary input via Enhanced GPI port

30.5.2.2.2 Event Interface Mapping (R31): PRU System Events

This PRU Event Interface directly feeds pulsed event information out of the PRU's internal ALU. These events are exported out of the PRU-ICSS and need to be connected to the system interrupt controller at the SoC level. The event interface can be used by the firmware to create software interrupts from the PRU to the Host processor.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 30-9. Event Interface Mapping (R31)

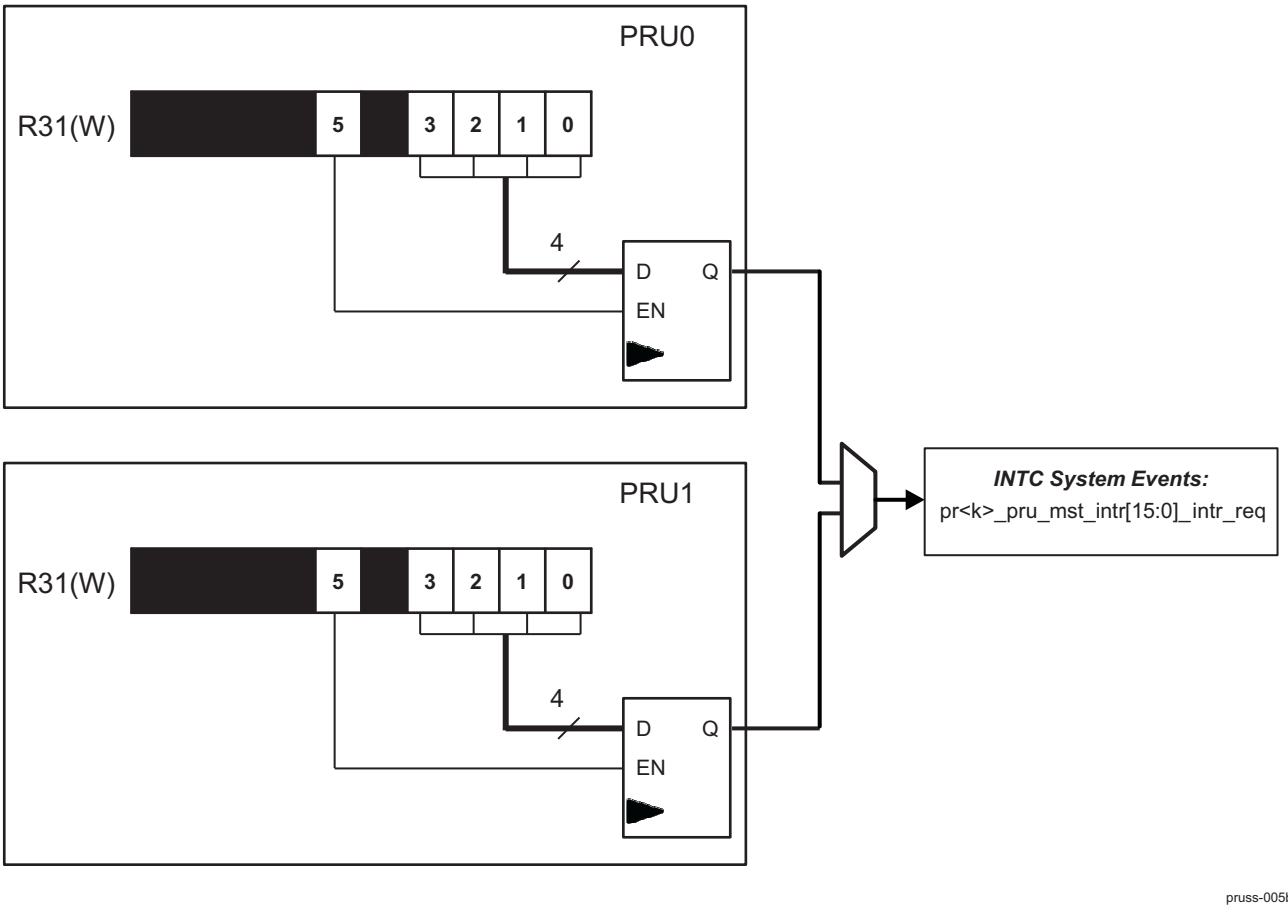


Table 30-68. Event Interface Mapping (R31) Field Descriptions

Bit	Field	Description
31:6	Reserved	
5	prun_r31_vec_valid	Valid strobe for vector output
4	Reserved	
3:0	prun_r31_vec[3:0]	Vector output

Simultaneously writing a '1' to prun_r31_vec_valid (R31 bit 5) and a channel number from 0 to 15 to prun_r31_vec[3:0] (R31 bits 3:0) creates a pulse on the output of the corresponding prk_pru_mst_intr[x]_intr_req INTC system event. For example, writing '100000' will generate a pulse on prk_pru_mst_intr[0]_intr_req, writing '100001' will generate a pulse on prk_pru_mst_intr[1]_intr_req, and so on to where writing '101111' will generate a pulse on prk_pru_mst_intr[15]_intr_req and writing '0xxxxx' will not generate any system event pulses. The output values from both PRU cores in a subsystem are ORed together.

The output channels 0-15 are connected to the PRUSS_INTC system events 16-31, respectively. This allows the PRU to assert one of the system events 16-31 by writing to its own R31 register. The system event is used to either post a completion event to one of the host CPUs (ARM) or to signal the other PRU. The host to be signaled is determined by the system interrupt to interrupt channel mapping (programmable). The 16 events are named as prk_pru_mst_intr<15:0>_intr_req. See the Section 30.6.4, *PRU-ICSS Interrupt Requests Mapping* , in the section, *PRU-ICSS Local Interrupt Controller*, for more details.

30.5.2.2.3 General-Purpose Inputs (R31): Enhanced PRU GP Module

The PRU-ICSS implements an enhanced General Purpose Input/Output (GPIO) module with SCU that supports the following general-purpose input modes: direct input, 16-bit parallel capture, 28-bit serial shift in. Register R31 serves as an interface with the general-purpose inputs. Table 30-69 describes the input modes in detail.

NOTE: Each PRU core can only be configured for one GPI mode at a time. Each mode uses the same R31 signals and internal register bits for different purposes. A summary is found in Table 30-70.

NOTE: The PRUSS_GPCFG0/1 register, bit PR1_PRUn_GP_MUX_SEL in the PRU-ICSS CFG register space needs to be set to 0x0 for GP mode. For a given PRU core, the following IO modes are mutually exclusive: GP mode, Sigma Delta mode, and 3 channel Peripheral I/F mode.

Table 30-69. PRU R31 (GPI) Modes

Mode	Function	Configuration
Direct input	GPI[20:0] feeds directly into the PRU R31	Default state
16-bit parallel capture	DATAIN[0:15] is captured by the posedge or negedge of CLOCKIN	• Enabled by CFG_GPCFGn register • CLOCKIN edge selected by CFG_GPCFGn register
28-bit shift in	DATAIN is sampled and shifted into a 28-bit shift register. Shift Counter (Cnt_16) feature uses … • Shift Counter (Cnt_16) feature is mapped to pru<n>_r31_status[28]. • SB (Start Bit detection) feature is mapped to pru<n>_r31_status[29].	• Enabled by CFG_GPCFGn register • Cnt_16 is self clearing and is connected to the PRU INTC • Start Bit (SB) is cleared by CFG_GPCFGn register

Table 30-70. PRU GPI Signals and Configurations[1]

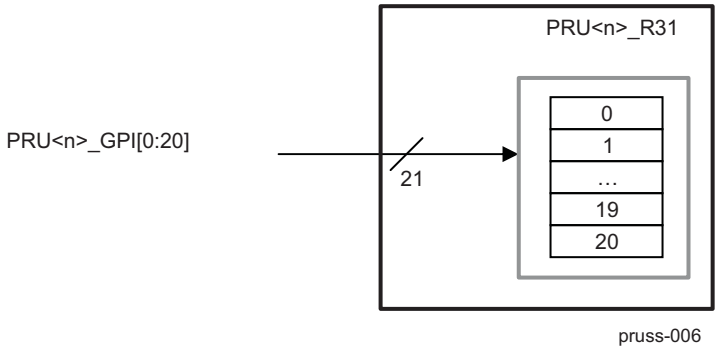
pr<k>_pru<n>_gpi20	GPI20		

NOTE: See Section 30.2 for pin limitations on the AM570x family of devices.

30.5.2.2.3.1 PRU EGPIs Direct Input

The prun_r31_status [0:20] bits of the internal PRU register file are mapped to device-level, general purpose input pins (PRUn_GPI [0:20]). In GPI Direct Input mode, PRUn_GPI [0:20] feeds directly to prun_r31_status [0:20]. Each PRU of the PRU-ICSS has a separate mapping to device input signals - pr1_pru0_gpi[20:0] / pr2_pru0_gpi[20:0] for the PRUSS1/ PRUSS2 PRU0 core and pr1_pru1_gpi[20:0] / pr2_pru1_gpi[20:0] for the PRUSS1 / PRUSS2 PRU1 core so that there are 42 total general purpose inputs to the PRUSS1 / PRUSS2. For more details, refer also to the Section 30.2. See the device's system reference guide or datasheet for device specific pin mapping.

Figure 30-10. PRU R31 (EGPI) Direct Input Mode Block Diagram



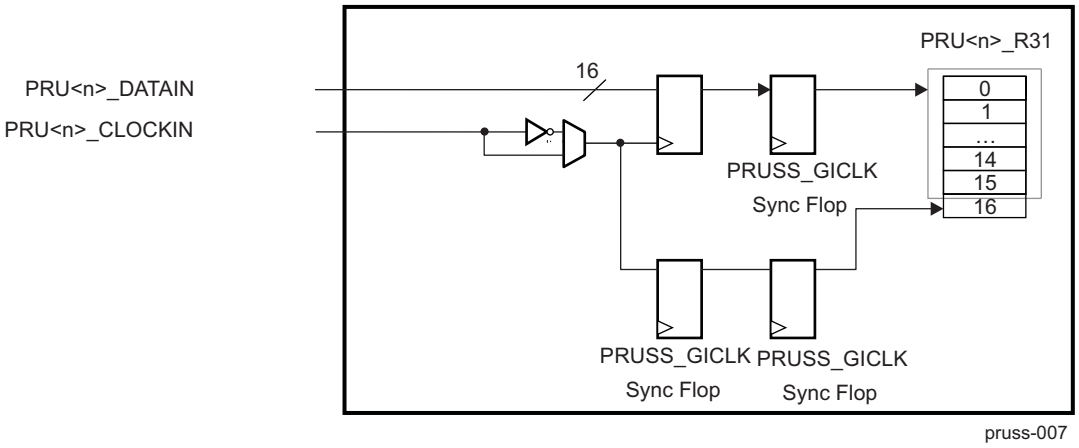
30.5.2.2.3.2 PRU EGPIs 16-Bit Parallel Capture

The prun_r31_status [0:15] and prun_r31_status [16] bits of the internal PRU register file mapped to device-level, general purpose input pins (PRUn_DATAIN [0:15] and PRUn_CLOCKIN, respectively). PRUn_CLOCKIN is designated for an external strobe clock, and is used to capture PRUn_DATAIN [0:15].

The PRUn_DATAIN can be captured either by the positive or the negative edge of PRUn_CLOCK, programmable through the PRU-ICSS CFG register space. If the clocking is configured through the PRUICSS CFG register to be positive, then it will equal PRU<n>_CLOCK; however, if the clocking is configured to be negative, then it will equal PRU<n>_CLOCK inverted.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 30-11. PRU R31 (EGPI) 16-Bit Parallel Capture Mode Block Diagram



30.5.2.2.3.3 PRU EGPIs 28-Bit Shift In

In 28-bit shift in mode, the device-level, general-purpose input pin PRUn_DATAIN is sampled and shifted into a 28-bit shift register on an internal clock pulse. The register fills in LSB order (from bit 0 to 27) and then overflows into a bit bucket. The 28-bit register is mapped to prun_r31_status [0:27] and can be cleared in software through the PRU-ICSS CFG register space.

Note, the PRU will continually capture and shift the DATAIN input when the GPI mode has been set to 28-bit shift in.

The shift rate is controlled by the effective divisor of two cascaded dividers applied to the 200-MHz clock. These cascaded dividers can each be configured through the PRU-ICSS CFG register space to a value of {1, 1.5, …, 16}. Table 30-71 shows sample effective clock values and the divisor values that can be used to generate these clocks.

Table 30-71. PRU EGPIs Effective Clock Values

Generated clock	PRUn_GPI_DIV0	PRUn_GPI_DIV1
8-MHz	12.5 (0x17)	2 (0x02)
10-MHz	10 (0x12)	2 (0x02)
16-MHz	16 (0x1e)	1 (0x00)
20-MHz	10 (0x12)	1 (0x00)

The 28-bit shift mode also supports the following features:

- SB (Start Bit detection) is mapped to prun_r31_status[29] and is set when the first 1 is captured on PRUn_DATAIN. The SB flag in pru<n>_r31_status[29] is cleared in software through the PRU-ICSS CFG register space.
- Cnt_16 (Shift Counter) is mapped to pru<n>_r31_status[28] and is set on every 16 shift clock samples after the Start Bit has been received. CNT_16 is self clearing and is connected to the PRUSS_INTC. See the PRU-ICSS Interrupt Controller (PRUSS_INTC) section for more details.

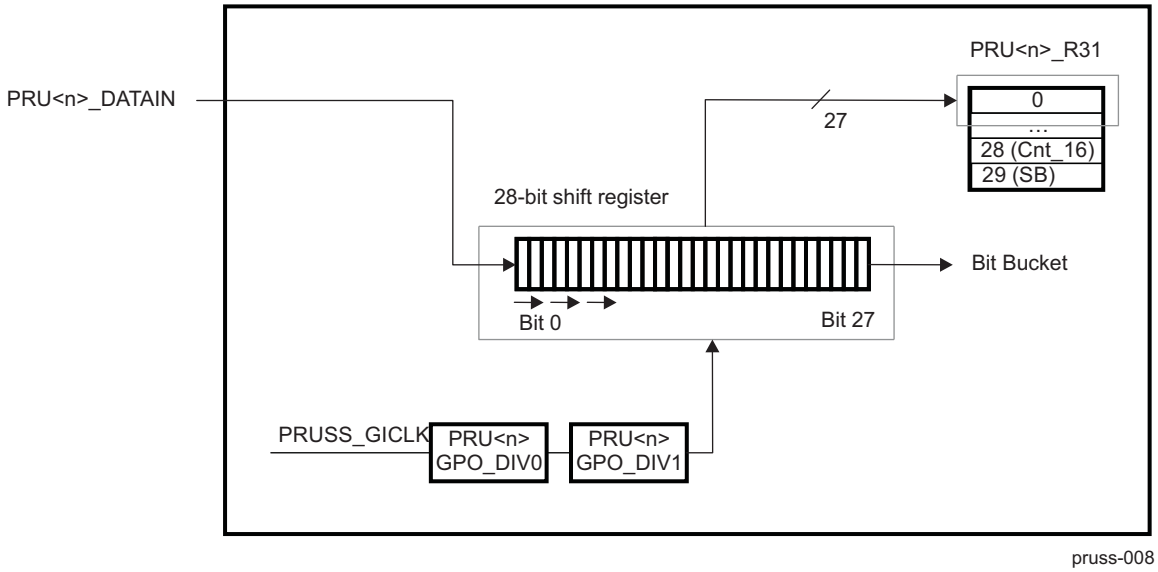
Figure 30-12. PRU R31 (EGPI) 28-Bit Shift Mode



30.5.2.2.3.4 General-Purpose Outputs (R30): Enhanced PRU GP Module

The PRU-ICSS implements an enhanced General Purpose Input/Output (GPIO) module that supports two general-purpose output modes: direct output and shift out.

Table 30-72 describes these modes in detail.

NOTE: Each PRU core can only be configured for one GPO mode at a time. Each mode uses the same R30 signals and internal register bits for different purposes. A summary is found in Table 30-72.

NOTE: The PRUSS_GPCFG0/1 register, bit PR1_PRU0_GP_MUX_SEL in the PRU-ICSS CFG register space needs to be set to 0x0 for GP mode. For a given PRU core, the following IO modes are mutually exclusive: GP mode, Sigma Delta mode, and 3 channel Peripheral I/F mode.

Table 30-72. PRU R30 (EGPO) Output Mode

Mode	Function	Configuration
Direct output	pru<n>_r30[20:0] feeds directly to GPO[20:0]	Default state
Shift out	• pru<n>_r30[0] is shifted out on DATAOUT on every rising edge of pru<n>_r30[1] (CLOCKOUT). • LOAD_GPO_SH0 (Load Shadow Register 0) is mapped to pru<n>_r30[29]. • LOAD_GPO_SH1 (Load Shadow Register 1) is mapped to pru<n>_r30[30]. • ENABLE_SHIFT is mapped to pru<n>_r30[31].	Enabled by CFG_GPCFGn register

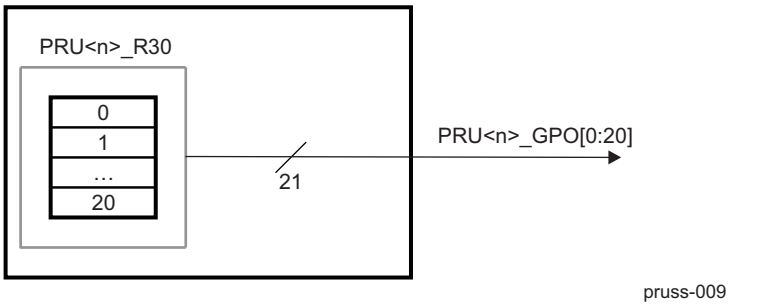
pr<k>_pru<n>_gpo18	GPO18	
pr<k>_pru<n>_gpo19	GPO19	
pr<k>_pru<n>_gpo20	GPO20	

NOTE: See Section 30.2 for pin limitations on the AM570x family of devices.

30.5.2.2.3.4.1 PRU EGPOs Direct Output

The prun_r30 [20:0] bits of the internal PRU register files are mapped to device-level, general-purpose output pins (PRUn_GPO[0:20]). In GPO Direct Output mode, prun_r30[0:20] feed directly to PRUn_GPO[0:20]. Each PRU of the PRU-ICSS has a separate mapping to pins, so that there are 42 total general-purpose outputs from the PRU-ICSS. See Section 30.2, *PRU-ICSS Environment*, and device Data Manual for device-specific pin mapping.

Figure 30-13. PRU R30 (EGPO) Direct Output Mode Block Diagram



NOTE: R30 is not initialized after reset. To avoid unintended output signals, R30 should be initialized before pinmux configuration of PRU signals.

Copyright © 2015–2017, Texas Instruments Incorporated

30.5.2.2.3.4.2 PRU EGPO Shift Out

In shift out mode, data is shifted out of prun_r30[0] (PRUn_DATAOUT) on every rising edge of prun_r30[1] (PRUn_CLOCK). The shift rate is controlled by the effective divisor of two cascaded dividers applied to the 200-MHz clock. These cascaded dividers can each be configured through the PRU-ICSS CFG register space to a value of {1, 1.5, …, 16}. Table 30-74 shows sample effective clock values and the divisor values that can be used to generate these clocks. Note that PRUn_CLOCKOUT is a free-running clock that starts when the PRU GPO mode is set to shift out mode.

Table 30-74. Effective Clock Values

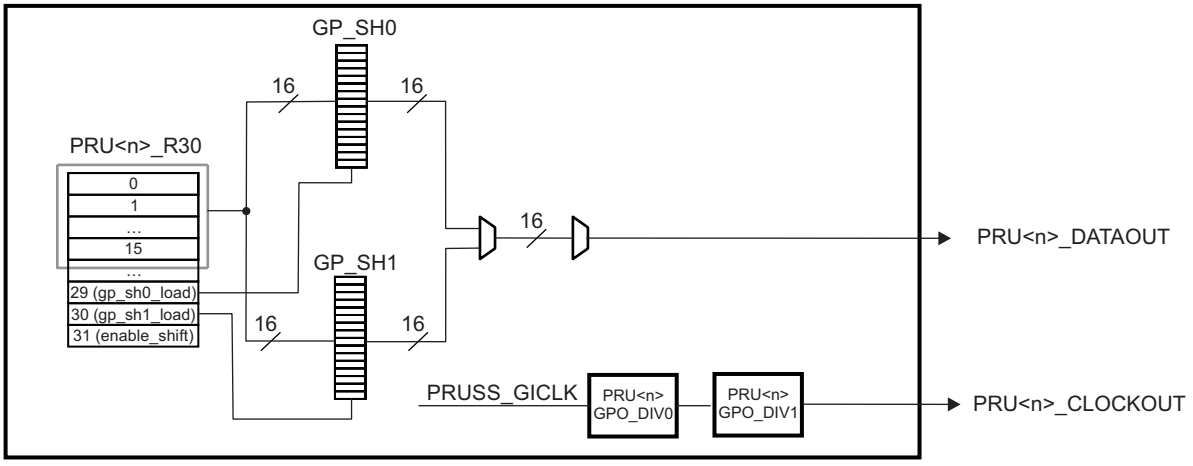
Generated Clock	PRUn_GPO_DIV0	PRUn_GPO_DIV1
8 MHz	12.5 (0x17)	2 (0x02)
10 MHz	10 (0x12)	2 (0x02)
16 MHz	16 (0x1e)	1 (0x00)
20 MHz	10 (0x12)	1 (0x00)

Shift out mode uses two 16-bit shadow registers (gpo_sh0 and gpo_sh1) to support ping-pong buffers. Each shadow register has independent load controls programmable through prun_r30[29:30] (PRUn_LOAD_GPO_SH [0:1]). While PRUn_LOAD_GPO_SH [0/1] is set, the contents of prun_r30[0:15] are loaded into gpo_sh0/1.

NOTE: If any device-level pins mapped to prun_r30[2:15] are configured for the prun_r30 [2:15] pinmux mode, then these pins will reflect the shadow register value written to prun_r30. Any pin configured for a different pinmux setting will not reflect the shadow register value written to prun_r30.

The data shift will start from the LSB of gpo_sh0 when prun_r30[31] (PRUn_ENABLE_SHIFT) is set. Note that if no new data is loaded into gpo_shnn after shift operation, the shift operation will continue looping and shifting out the pre-loaded data. When PRUn_ENABLE_SHIFT is cleared, the shift operation will finish shifting out the current shadow register, stop, and then reset.

Figure 30-14. PRU R30 (GPO) Shift Out Mode Block Diagram



Follow these steps to use the GPO shift out mode:

Step One: Initialization

1. Load 16-bits of data into gpo_sh0:
   (a) Set R30[29] = 1 (PRUn_LOAD_GPO_SH0)
   (b) Load data in R30[15:0]
   (c) Clear R30[29] to turn off load controller

Copyright © 2015–2017, Texas Instruments Incorporated

2. Load 16-bits of data into gpo_sh1:
   (a) Set R30[30] = 1 (PRUn_LOAD_GPO_SH1)
   (b) Load data in R30[15:0]
   (c) Clear R30[30] to turn off load controller
3. Start shift operation:
   (a) Set R30[31] = 1 (PRUn_ENABLE_SHIFT)

Step 2: Shift Loop

1. Monitor when a shadow register has finished shifting out data and can be loaded with new data:
   (a) Poll PRUn_GPI_SH_SEL bit of the PRUSS_GPCFG0/1 register
   (b) Load new 16-bits of data into gpo_sh0 if PRUn_GPI_SH_SEL = 1
   (c) Load new 16-bits of data into gpo_sh1 if PRUn_GPI_SH_SEL = 0
2. If more data to be shifted out, loop to Shift Loop
3. If no more data, exit loop

Step 3: Exit

1. End shift operation:
   (a) Clear R30[31] to turn off shift operation

NOTE: Until the shift operation is disabled, the shift loop will continue looping and shifting out the pre-loaded data if no new data has been loaded into gpo_shn.

30.5.2.2.3.5 Sigma Delta (SD) Decimation Filtering H/W

Sigma-delta Sinc filtering is achieved by the combination of PRU hardware and firmware. PRU hardware provides hardware integrators that do the accumulation part of Sinc filtering, while the differentiation part is done in firmware.

The integrator serves to count the number of 1's per clock event. Each channel has three cascaded counters, which are the accumulators for the Sinc3 filter. Each counter is 24 bits, giving a maximum count of 16,777,215. Each channel has a free running rollover clock counter. This sample counter updates the count value on the effective clock event for that channel. Each channel also contains a programmable counter compare block, and the compare register has a size of 8 bits. However, the minimum value is 4 and maximum value is 202 due to the 24-bit accumulator. Once sample counter compare value is reached, the shadow register copy is updated and the shadow register copy flag is set.

Features of the integrators in PRUs SD Demodulator:

- Up to nine channels with concurrent counting
- Flexible clock source configuration for each channel; option of independent clock source for each channel or one clock source for three channels
- Programmable, 8-bit sample counter compare register; used to set the OSR of Sinc filter
- Three 24-bit cascaded counters per channel for accumulation, only Sinc3 and Sinc2 modes supported
- Common channel enable (all channels are active or none are active)

30.5.2.2.3.5.1 Block Diagram and Signals

The Sigma Delta's I/Os are multiplexed with the PRU GPI/GPO signals, as shown in Table 30-75. Note the PR<k>_PRU<n>_GP_MUX_SEL bitfield in the PRUSS_GPCFG0/1 register must be set to 0x3 for configure the GPI/GPO signals for SD mode.

Copyright © 2015–2017, Texas Instruments Incorporated

Table 30-75. PRU GPI Signals and Configurations for Sigma Delta

Pad Names at Device Level[1][2]	Sigma Delta (SD) Mode (PRUSS_GPCFG0/1[PR1_PRUn_GP_MUX_SEL] = 0x3)
pr<k>_pru<n>_gpi0	SD0_CLK
pr<k>_pru<n>_gpi1	SD0_D
pr<k>_pru<n>_gpi2	SD1_CLK
pr<k>_pru<n>_gpi3	SD1_D
pr<k>_pru<n>_gpi4	SD2_CLK
pr<k>_pru<n>_gpi5	SD2_D

pr<k>_pru<n>_gpi26	
pr<k>_pru<n>_gpi27	
pr<k>_pru<n>_gpi28	
pr<k>_pru<n>_gpi29	

(1) Note these signals are shared with the GP and Peripheral I/Fs. To configure for Sigma Delta, PRUSS_GPCFG0/1 [PR1_PRUn_GP_MUX_SEL] needs to be set to 0x3 for SD mode.

(2) NOTE: Some devices may not pin out all 32 bits of R30. For which pins are available on this device, see , PRU-ICSS Pin List. See the device data sheet for device-specific pin mapping.

The pr<k>_pru0_gpo1 signal (muxed with SD0_D) can be used as SD_CLKOUT when PRU-ICSS generates clock. This is a trade-off as PRU application will lose one SD channel. SD_CLKOUT needs to go through a clock generator chip if driving multiple sigma delta modulators and also be looped back into PRU-ICSS as SD_CLKIN, typically pru_gpi16.

Note to output the SD clock on pr<k>_pru0_gpo1, this device requires that the PRU core be configured for both SD and shift out mode (PRUSS_GPCFG0/1 [PR1_PRU<n>_GP_MUX_SEL] = 0x3 and PRUSS_GPCFG0/1 [PRU<n>_GPO_MODE] = 0x1). Be sure to configure the shift out mode's clock divisors before enabling shift out mode (PRUSS_GPCFG0/1 [PRU<n>_GPO_MODE] = 0x1). Figure 30-15 shows a block diagram of the Sigma Delta implementation. Full description of the PRU R30 and R31 registers are shown in Table 30-77 and Table 30-78.

Table 30-76. External Clock Sources

PRU<n>_SD_CLK_SEL value	Clock Source
0	pr<k>_pru<n>_gpi[16]
1	pr<k>_pru<n>_sdi_clk
2	pr<k>_pru<n>_sd0_clk for sd0, sd1, and sd2; pr<k>_pru<n>_sd3_clk for sd3, sd4, and sd5; pr<k>_pru<n>_sd6_clk for sd6, sd7, and sd8

30.5.2.2.3.5.2 PRU R30 / R31 Interface

The PRU uses the R30 and R31 registers to interface with the Sigma Delta interface. Table 30-77 shows the R31 and R30 interface for the Sigma Delta mode. Note that only the parameters and data for one channel can be viewed at a time. The channel to be viewed is determined by the r30[29-26] (channel_select).

Table 30-77. PRU R31: SD Output Interface Delta Sigma PRU registers: R31

Bits	Field Name	Description
29-26	Reserved	
25	shadow_update_flag_ovf / shadow_update_flag_ovf_clr	Shadow update flag overflow, set when over sample count equals over sample size and shadow_update_flag is still set. Set this bit to clear the flag.
24	shadow_update_flag / shadow_update_flag_clr	Shadow update flag overflow, set when over sample count equals over sample size and shadow_update_flag is still set. Set this bit to clear the flag.
23	re_init/data_out[23]	re_init (write): Set to reset all counters, flags, and shadow copy. Updates over_sample_size based on the current PRUSS_SD_PRUn_SAMPLE_SIZE_REGISTERi register on the selected channel. data_out[23](read): most-significant bit of sample data
22-0	data_out[22:0]	Selected sample data excluding most-significant bit

Table 30-78. PRU R30: SD Input Interface Delta Sigma PRU registers: R30

Bits	Field Name	Description
31-30	Reserved	
29-26	channel_select[3:0]	Select Channel. 0x0 = Channel 0 ….. 0x8 = Channel 8 0x9-0xF = Unused
25	channel_en	Global Channel enable (effects all 9 channels). 0x0 = All channels disabled. Counters/flags are cleared. 0x1 = All channels enabled.
24-23	Reserved	
22	snoop	Enable snoop (i.e. fetch data) on the selected channel. 0x0 = acc2/acc3 shadow copy 0x1 = current acc2/acc3
21	sample_counter_select	Read sample counter. 0x0 = Not selected 0x1 = Sample count selected
20-0	Reserved

The PRU_ICSS CFG register space has have additional MMRs for controlling the SD demodulator module:

- PRUSS_SD_PRUn_CLK_SEL_REGISTERi[PRUn_SD_ACC2_SEL] - Selects accumulator 2 as source
- PRUSS_SD_PRUn_CLK_SEL_REGISTERi[PRUn_SD_CLK_INV] - Inverts clock
- PRUSS_SD_PRUn_CLK_SEL_REGISTERi[PRUn_SD_CLK_SEL] - Selects clock source
- PRUSS_SD_PRUn_SAMPLE_SIZE_REGISTERi[PRUn_SD_SAMPLE_SIZE] - Selects number of samples to read before giving output

30.5.2.2.3.5.3 Sigma Delta Description

Figure 30-16 shows a block diagram of the Sigma Delta hardware integrators and integration with the PRU R30 / R31 interface for a single channel.

Figure 30-16. Sigma Delta Hardware Integrators Block Diagram (snoop = 0)

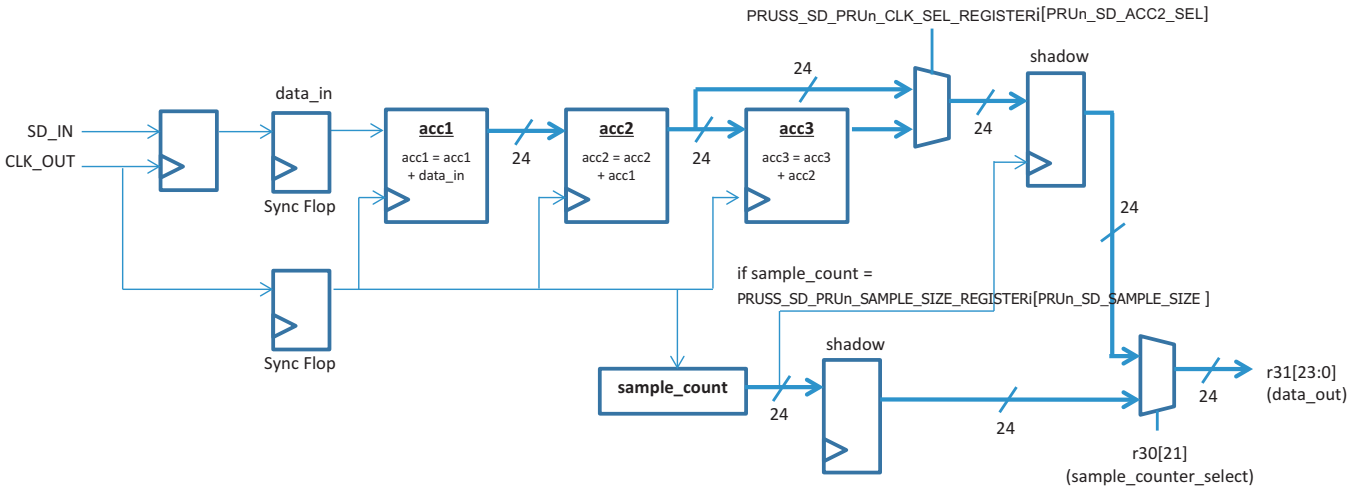

Figure 30-17. Sigma Delta Hardware Integrators Block Diagram (snoop = 1)

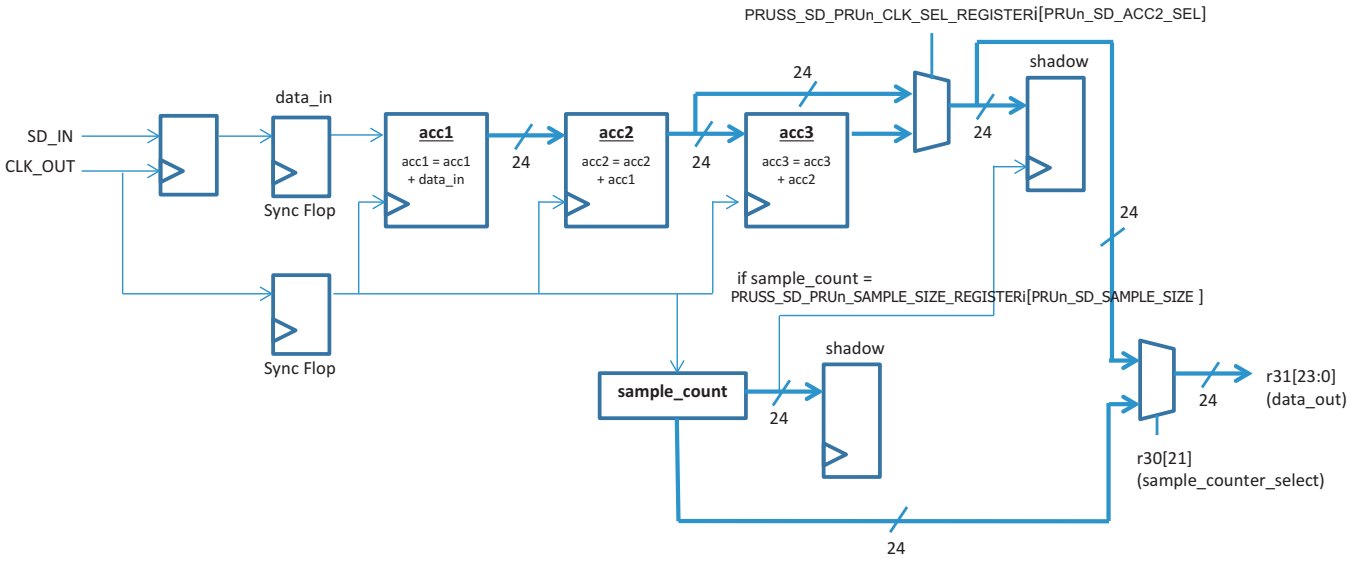

The three accumulators (acc1-acc3) for each channel are simple 24 bit adders. The input for acc1 is 1-bit, while the inputs for acc2 and acc3 are 24-bits. On each positive edge of the CLK_OUT, all three 24-bit counters (acc1-acc3) and the sample counter for each channel will get updated as follows:

```
acc1 = acc1 + data_in
acc2 = acc2 + acc1
acc3 = acc3 + acc2
```

Copyright © 2015–2017, Texas Instruments Incorporated

```
sample_count = sample_count + 1
```

Each accumulator will rollover at 0xFF_FFFF. For example if acc2 = 0x10 and acc3 = 0xFF_FFFF, then acc3 will update to 0x00_0000F on the next clock event. Sample_count will rollover when it equals the defined sample size (PRUSS_SD_PRUn_SAMPLE_SIZE_REGISTERi [PRUn_SD_SAMPLE_SIZE]).

Note that while the channels are not enabled , no operations are performed and all flags and counters are cleared. If a new sample size is to be loaded, the PRU firmware should assert re_init (r31[23]), and all stored count values are cleared to 0.

The Sigma Delta interface has two status flags:

- Shadow update flag (r31[24])
- Shadow update flag overflow (r31[25])

When sample_count equals the defined sample size (PRUSS_SD_PRUn_SAMPLE_SIZE_REGISTERi [PRUn_SD_SAMPLE_SIZE]), then the acc2/acc3 shadow register copy will be updated, the shadow_update_flag (r31[24]) will be set, and sample_count will rollover to 0. The PRU firmware can clear this flag by writing '1' to shadow_update_flag_clr (r31[24]). If sample_count equals the defined sample size and the shadow_update_flag is still set, then shadow_update_flag_ovf (r31[25]) will be set. Similarly, the PRU firmware can clear this flag by writing '1' to shadow_update_flag_ovf_clr (r31[25]). Note that the clear operation for both flags has a higher priority than the set event.

The PRU firmware can monitor the acc2/acc3 and sample_count values through data_out[23:0] (r31[23:0]). Table 30-79 shows the configuration options for data_out[23:0].

Table 30-79. Data_out[23:0] Configuration Options

snoop (r30[22])	sample_counter_select (r30[21])	data_out (r31[23:0])
0	0	Reads acc2/acc3 shadow register copy
1	0	Reads acc2/acc3 directly
0	1	Reads sample_count shadow register copy
1	1	Reads sample_count directly

30.5.2.2.3.5.4 Basic Programming Example

The following programming example assumes that the PRU is configured for Sigma Delta Mode (PRUSS_GPCFG0 / 1 [PR1_PRU<n>_GP_MUX_SEL] = 3).

1. Configure clock sources, accumulator source, and sample size:
   (a) PRUSS_SD_PRUn_CLK_SEL_REGISTERi[PRUn_SD_CLK_SEL] for clock source
   (b) PRUSS_SD_PRUn_CLK_SEL_REGISTERi[PRUn_SD_CLK_INV] for clock polarity
   (c) PRUSS_SD_PRUn_CLK_SEL_REGISTERi[PRUn_SD_ACC2_SEL] for accumulator source
   (d) PRUSS_SD_PRUn_SAMPLE_SIZE_REGISTERi[PRUn_SD_SAMPLE_SIZE] for sample size
2. Reinitialize all channels whose sample size was configured
   (a) Select channel by writing to channel_select (r30[29-26])
   (b) Delay at least 1 PRU cycle before executing re_int in step 2c.
   (c) Reinitialize selected channel by writing to re_init (r31[23])
   (d) Repeat steps 2a & 2b for all configured channels
3. Enable all channels by writing '1' to channel_en (r30[25])
4. Select channel by writing to channel_select (r30[29-26])
   (a) Poll shadow_update_flag (r31[24]) to detect when acc2/acc3 shadow register copy data is ready to be ready
   (b) Delay at least 1 PRU cycle before polling shadow_update_flag in Step 4c.
   (c) Read data_out[23:0] (r31[23:0])
   (d) Clear shadow_update_flag by writing '1' to r31[24]
5. Repeat step 4 for new channel

30.5.2.2.3.6 3 Channel Peripheral Interface

The 3 channel Peripheral Interface supports functionality for operations utilizing the EnDat 2.2 and BiSS protocols.

This module supports the following features:

- 3 channels with baud range from 100 kHz to 16 MHz
- PRUSSn_UART_GFCLK (default) or PRUSSn_GICLK master clock is an input to independent clock dividers to produce a 1X clock (ENDAT<m>_CLK) and oversampling clock
- Half-duplex (TX and RX are not supported concurrently)
- TX FIFO size of 32 bits
- RX FIFO size of 32 bits
- Configurable shift size/oversampling on RX
- Optional RX frame size auto shut off
- Programmable HW delay 1 (wire delay, controlling when the clock signal is first driven low) and delay 2 (test delay, controlling when the clock signal is first driven high) on TX operation
- Optional programmable TX termination
- Individual TX channel start trigger (tx_channel_go) or simultaneous TX start trigger for all channels (tx_global_go)
- Flexible HW assisted clock output generation to allow free running, stop high and stop low (after last RX data), or stop high (after last TX data) operation with optional software clock override feature
- Optional SW direct snoop of data input

30.5.2.2.3.6.1 Block Diagram and Signal Configuration

The Peripheral Interface's I/Os are multiplexed with the PRU GPI/GPO signals, as shown in Table 30-80. The PR<k>_PRU<n>_GP_MUX_SEL bitfield in the PRUSS_GPCFG0/1 register must be set to 0x1 for configure the GPI/GPO signals for Peripheral I/F mode.

Table 30-80. PRU GPI/GPO Signals and Configurations for Peripheral I/F(1)

(1) Usage of the Peripheral Interface signals are not restricted to only ENDAT interfaces.
(2) Note these signals are shared with the GP and Sigma Delta modes. To configure for Periph I/F, PRUSS_GPCFG0/ 1 [PR1_PRUn_GP_MUX_SEL] needs to be set to 0x1 for Periph I/F mode.
(3) Some devices may not pin out all 29 bits of R31 and all 32 bits of R30. See the device Data Manual for device-specific pin mapping.

A block diagram for the Peripheral I/F is included in Figure 30-18. As shown, each channel is composed of four I/Os:

- ENDAT<m>_IN - RX input data
- ENDAT<m>_CLK - Clock (CLK_OUT) generated by the 1x (or TX) clock. The default value is 1.
- ENDAT<m>_OUT - TX output data. The default value is 0.
- ENDAT<m>_OUT_EN - TX enable output (1 = TX mode, 0 = RX mode). The default value is 0. Note this signal is auto controlled by hardware.

30.5.2.2.3.6.2 PRU R30 and R31 Interface

The PRU uses the R30 and R31 registers to interface with the Peripheral I/F. Table 30-81 shows the R31 and R30 interface for the Peripheral I/F RX mode, and Table 30-81 shows the comparable interface for the TX mode.

Table 30-81. Peripheral I/F: RX

Register	Bits	Field Name	Description
R31	31-30	Reserved	PRU Host Interrupts 1/0 from local INTC
	29	ovf2	Overflow Flag for Channel 2. Write 1 to clear.
	28	ovf1	Overflow Flag for Channel 1. Write 1 to clear.
	27	ovf0	Overflow Flag for Channel 0. Write 1 to clear.
	26	val2	Valid Flag for Channel 2. Write 1 to clear.
	25	val1	Valid Flag for Channel 1. Write 1 to clear.
	24	val0	Valid Flag for Channel 0. Write 1 to clear.
	23-16	rx_data_out2	Oversampled Data Output for Channel 2. Note these bits are shared with the TX Interface. When TX_FIFO has stopped transmission, RX data will be selected.
	15-8	rx_data_out1	Oversampled Data Output for Channel 1. Note these bits are shared with the TX Interface. When TX_FIFO has stopped transmission, RX data will be selected.
	7-0	rx_data_out0	Oversampled Data Output for Channel 0. Note these bits are shared with the TX Interface. When TX_FIFO has stopped transmission, RX data will be selected.
R30	31-27	Reserved	
	26	rx_en2	RX Enable for Channel 2. 0: Channel not enabled, all counters/flags will get reset 1: Channel is enabled
	25	rx_en1	RX Enable for Channel 1. 0: Channel not enabled, all counters/flags will get reset 1: Channel is enabled
	24	rx_en0	RX Enable for Channel 0. 0: Channel not enabled, all counters/flags will get reset 1: Channel is enabled
	23-0	Reserved

Table 30-82. Peripheral I/F: TX

Register	Bits	Field Name	Description
R31	31-30	Reserved	
	29:22	Reserved	
	21	tx_global_reinit_active/busy2	Tx_global_reinit action has some latency do to clocking. This status shows if action is completed. 1 = Active 0 = Done For non reinit case, this bit states that last bit is on tx wire. It does not mean the clock is off. 1 = Last bit is not done 0 = Last bit on tx wire Note that by using rx auto arm feature, the observation is lost at rx enable. This can be used to determine when to enable rx during non-auto arm case.
	20	tx_global_go	TX global start of all channels. Note: FIFO must not be empty. If empty, transmit will not start.
	19	tx_global_reinit	Reinit all channels into default mode. This clears all flags and state machines for all channels. Note: Sequence should be assert tx_global_reinit then de-assert rx_en. This will ensure TX and RX are in reset/default state. User must assert this after the frame has been sent and TX is not busy.
	18	tx_channel_go	TX start the channel transmit (selected by tx_ch_sel). Note: FIFO must not be empty.
	17	unr2	Under Run Flag for Channel 2. This flag is only set when the tx_frame_count is nonzero and FIFO is empty at time to send data.
	16	ovr2	Over Run Flag for Channel 2
	15-14	Reserved	
	13	tx_global_reinit_active/busy1	Tx_global_reinit action has some latency do to clocking. This status shows if action is completed. 1 = Active 0 = Done For non reinit case, this bit states that last bit is on tx wire. It does not mean the clock is off. 1 = Last bit is not done 0 = Last bit on tx wire Note that by using rx auto arm feature, the observation is lost at rx enable. This can be used to determine when to enable rx during non-auto arm case.
	12:10	tx_fifo_sts1	TX FIFO occupancy status for Channel 1 0 = Empty 1 = 1 word 2 = 2 words 3 = 3 words 4 = Full 5-7 = Reserved
	9	unr1	Under Run Flag for Channel 1. This flag is only set when the tx_frame_count is nonzero and FIFO is empty at time to send data.
	8	ovr1	Over Run Flag for Channel 1
	7:6	Reserved

Table 30-82. Peripheral I/F: TX (continued)

Register	Bits	Field Name	Description
R31	5	tx_global_reinit_active/busy0	Tx_global_reinit action has some latency do to clocking. This status shows if action is completed. 1 = Active 0 = Done For non reinit case, this bit states that last bit is on tx wire. It does not mean the clock is off. 1 = Last bit is not done 0 = Last bit on tx wire Note that by using rx auto arm feature, the observation is lost at rx enable. This can be used to determine when to enable rx during non-auto arm case.
	4:2	tx_fifo_sts0	TX FIFO occupancy status for Channel 0 0 = Empty 1 = 1 word 2 = 2 words 3 = 3 words 4 = Full 5-7 = Reserved
	1	unr0	Under Run Flag. This flag is only set when the tx_frame_count is nonzero and FIFO is empty at time to send data.
	0	ovr0	Over Run Flag for Channel 0

Copyright © 2015–2017, Texas Instruments Incorporated

Table 30-82. Peripheral I/F: TX (continued)

Register	Bits	Field Name	Description
R30	31:21	Reserved	
	20:19	clk_mode	CLK_OUT mode. 0 = Free-running/stop-low. Clock will remain free-running until the receive module has received the number of bits indicated in rx_frame_counter and then the clock will stop low. 1 (default) = Free-running/stop-high. Clock will remain free-running until the receive module has received the number of bits indicated in rx_frame_counter and then the clock will stop high. Note this is the default/reset state, and a hardware reset or reinit will return clk_mode to this state. Note the initial state of the clock will be high, but the clock will not start until TX GO event. 2 = Free-run. NOTE: You must do a reinit to get out of this clock mode then you can update clk_mode to a different mode. Also if you do multiple TX GO, the 2nd go should have tst_delay and wire_delay zero since the clock is free running after the first go. 3= Stop high after transmit. Clock will run until the last TX bit is sent and stops high.
	18	Reserved	
	17:16	tx_ch_sel	TX channel select. 0 = Channel 0 1 = Channel 1 2 = Channel 2 3 = Reserved
	15:9	Reserved	
	7:0	tx_data	TX data for FIFO. Notes: FIFO transmits MSB first and is 32-bits deep. TX_FIFO_SWAP_BITS bit in the PRU-ICSS CFG register space can be used to flip the load order of bits. The FIFO has 2 modes of operation: 1. Preload and Go. This should be done for EnDAT and frames less than 32-bits. 2. Continuous mode. This should be done for frames bigger than 32-bits. In continuous mode, software needs to keep up with the line rate and ensure that the FIFO is never empty. When the FIFO is at 2 byte level, software needs to load the next 2 bytes. If software waits till the end of the empty state, it is possible to get the TX into a bad state. The FIFO state can be recovered via re-init.

Note the PRU-ICSS CFG register space has additional MMRs for controlling the Peripheral I/F module.

30.5.2.2.3.6.3 Clock Generation

30.5.2.2.3.6.3.1 Configuration

The Peripheral I/F module has two source clock options, PRUSSn_UART_GFCLK (default) and PRUSSn_GICLK. There are two independent clock dividers (div16) for the 1x and oversampling (OS) clocks, and each clock divider is configurable by two cascading dividers:

- PRUn_ED_TX_DIV_FACTOR and PRUn_ED_TX_DIV_FACTOR_FRAC for the 1x clock
- PRUn_ED_RX_DIV_FACTOR and PRUn_ED_RX_DIV_FACTOR_FRAC for the OS clock

The 1x clock is output on the ENDAT<m>_CLK signal. In TX mode, the output data is read from the TX FIFO at this 1x clock rate. The default value of this clock is high and the start and stop conditions for this clock are described in Section 30.5.2.2.3.6.3.2 and Section 30.5.2.2.3.6.3.5.

Copyright © 2015–2017, Texas Instruments Incorporated

In RX mode, the input data is sampled at the OS clock rate. Note the OS clock rate divided by the 1x clock rate must equal PRUn_ED_RX_SAMPLE_SIZE.

Example clock rates and divisor values relative to the 192-MHz PRUSSn_UART_GFCLK source are shown in Table 30-83.

Table 30-83. Clock Rate Examples for 192-MHz PRUSSn_UART_GFCLK Clock Source

TX_DIV_FACTOR	1x Clock	RX_DIV_FACTOR	RX_DIV_FACTOR_FRAC	OS Clock	Oversample Factor
12	16 MHz	1	1.5	128 MHz	8x
16	12 MHz	2	1	96 MHz	8x
24	8 MHz	3	1	64 MHz	8x
32	6 MHz	4	1	48 MHz	8x
48	4 MHz	6	1	32 MHz	8x
96	2 MHz	12	1	16 MHz	8x
192	1 MHz	24	1	8 MHz	8x

30.5.2.2.3.6.3.2 Clock Output Start Conditions

This section describes the configurable start conditions for the ENDAT<m>_CLK. The software can completely control via PRUSS_ED_PRUn_CHj_CFG0_REGISTER when PRUn_ED_CLK_OUT_OVR_EN = 1. By default however, the PRU hardware will control the clocks as described in the following sections.

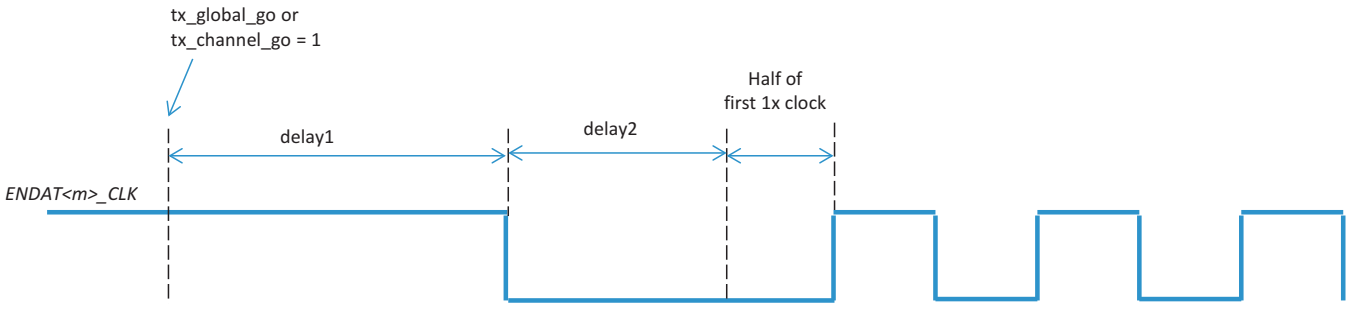
30.5.2.2.3.6.3.3 TX Mode (RX_EN = 0)

In TX mode, the ENDAT<m>_CLK begins after the firmware loads the TX FIFO and sets either r30[20] (tx_global_go) or r30[17:16] (tx_channel_go) to 1. After the “go” bit is set, the delay1 (wire delay) compensation counter for each channel begins. After delay1 is complete, ENDAT<m>_CLK is driven low and then the delay2 (tst) counter begins. After the delay2 counter expires, the ENDAT<m>>_CLK starts running (first low and then high). Therefore, first rising edge of ENDAT<m>_CLK (measured from the go bit) = delay1 (tx wire delay) + delay2 (tst_counter delay) + half of the 1x clock frequency (since the clock starts low).

Figure 30-19 shows the start condition for TX mode. As shown in the figure, the default value of clock is high. The PRU-ICSS CFG register space has additional MMRs for controlling the TX start timing delay values:

- Delay 1: PRUSS_ED_PRUn_CHj_CFG0_REGISTER [PRUn_ED_TX_WDLY]
- Delay 2: PRUSS_ED_PRUn_CHj_CFG0_REGISTER [PRUn_ED_TST_DELAY_COUNTER]

Figure 30-19. TX Mode Start Condition



30.5.2.2.3.6.3.4 RX Mode (RX_EN = 1)

In RX mode, the ENDAT<m>_CLK will start running whenever the RX_EN is set. Note that the PRU firmware in this mode is responsible for any delay conditions.

Copyright © 2015–2017, Texas Instruments Incorporated

The hardware can also auto-enable RX mode at the end of a TX transaction. The PRUSS_ED_PRUn_CHj_CFG1_REGISTER [PRUn_ED_RX_EN_COUNTER] is used to program a delay between the last TX bit sent and when the RX_EN is set.

30.5.2.2.3.6.3.5 Stop Conditions

The r30[20:19] (clk_mode[1:0]) value determines the stop condition for ENDAT<m>_CLK. There are 4 options available:

clk_mode_value	Description
0	Stop low on last RX frame
1	Stop high on last RX frame
2	Run continuously
3	Stop high on last TX bit

The last RX frame is configured by PRUSS_ED_PRUn_CHj_CFG0_REGISTER [PRUn_ED_RX_FRAME_SIZE], and the last TX bit is configured by PRUSS_ED_PRUn_CHj_CFG0_REGISTER [PRUn_ED_TX_FRAME_SIZE]. Each stop condition is shown in Figure 30-20 through Figure 30-23.

Figure 30-20. ENDAT<m>_CLK Stop High on Last RX Frame

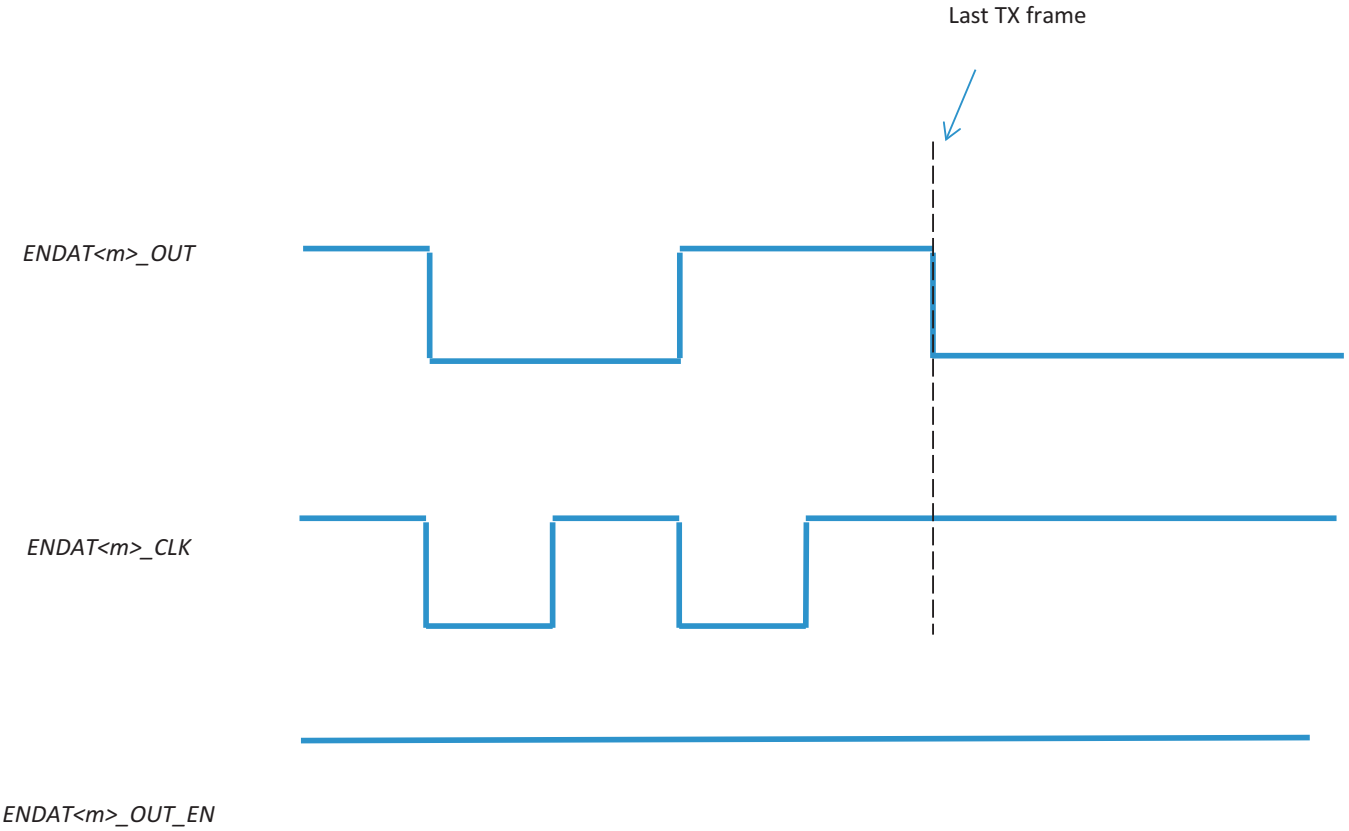
Figure 30-23. ENDAT<m>_CLK Stop High on Last TX Bit



30.5.2.2.3.6.4 Basic Programming Model

The following programming models assume that the PRU is configured for 3 Peripheral Mode (PRUSS_GPCFG0/1 [PR1_PRUn_GP_MUX_SEL] = 0x1).

30.5.2.2.3.6.4.1 Clock Generation

Follow these steps to configure Peripheral I/F clocks using the HW control of the clock:

1. Select TX and RX clock sources:
   (a) PRUSS_ED_PRUn_TX_CFG_REGISTER [PRUn_ED_TX_CLK_SEL] for the TX clock source
   (b) PRUSS_ED_PRUn_RX_CFG_REGISTER [PRUn_ED_RX_CLK_SEL] for the RX clock source
2. Configure the 1x (TX) clock frequency:
   (a) Write Division Factor to PRUSS_ED_PRUn_TX_CFG_REGISTER [PRUn_ED_TX_DIV_FACTOR]
   (b) Write Fraction division factor to PRUSS_ED_PRUn_TX_CFG_REGISTER [PRUn_ED_TX_DIV_FACTOR_FRAC]
3. Configure the oversampling (RX) frequency and oversample size:
   (a) Write Division Factor to PRUSS_ED_PRUn_RX_CFG_REGISTER [PRUn_ED_RX_DIV_FACTOR]
   (b) Write Fraction division factor to PRUSS_ED_PRUn_RX_CFG_REGISTER [PRUn_ED_RX_DIV_FACTOR_FRAC]
   (c) Write RX oversample size to PRUSS_ED_PRUn_RX_CFG_REGISTER [PRUn_ED_RX__SAMPLE_SIZE]
4. Select the clk_mode to configure how the ENDAT<m>_CLK signal ends after TX/RX:
   (a) Write to r30[20:19] (clk_mode). Note the clk_mode setting can also be changed per transaction.
5. Configure the wire, tst, and rx_en_counter delay values:

Copyright © 2015–2017, Texas Instruments Incorporated

(a) PRUSS_ED_PRUn_CHj_CFG0_REGISTER [PRUn_ED_TX_WDLY] for wire delay

(b) PRUSS_ED_PRUn_CHj_CFG1_REGISTER [PRUn_ED_TST_DELAY_COUNTER] for tst delay

(c) PRUSS_ED_PRUn_CHj_CFG1_REGISTER [PRUn_ED_RX_EN_COUNTER] for auto-delay between TX and RX

30.5.2.2.3.6.4.2 TX - Single Shot

Follow these steps to configure the Peripheral I/F channel(s) for a single shot transmission:

1. (Optional) Configure TX FIFO for MSB (default) or LSB:
   (a) PRUSS_ED_PRUn_CHj_CFG0_REGISTER [PRUn_ED_TX_FIFO_SWAP_BITS]
2. Pre-load TX FIFO:
   (a) Select TX channel by writing the desired channel number to R30[17:16] (tx_ch_sel)
   (b) Write 1-4 bytes of data to r30[7:0] (tx_data). At each r30[7:0] write, data will be pushed into the FIFO.
   (c) Repeat Steps 2a and 2b for all desired channels.
3. Configure TX frame size if less than 4 full bytes loaded into FIFO:
   (a) PRUSS_ED_PRUn_CHj_CFG0_REGISTER [PRUn_ED_TX_FRAME_SIZE]
4. Push TX FIFO data to ENDAT<m>_OUT (see Section 30.5.2.2.3.6.3.2 for the ENDAT<m>_CLK and ENDAT<m>_OUT start time relationship);
   (a) To start TX on all channels, set r31[20] = 1 (tx_global_go).
   (b) To start TX on individual channel:
      (i) Select TX channel by writing the desired channel number to R30[17:16] (tx_ch_sel)
      (ii) Set R31[18] = 1 (tx_channel_go)
5. If PRUSS_ED_PRUn_CHj_CFG0_REGISTER [PRUn_ED_RX_EN_COUNTER] > 0, then the channel will automatically switch into RX mode. See Section 30.5.2.2.3.6.4.4 for an example of how to program and configure RX content.
6. If PRUSS_ED_PRUn_CHj_CFG0_REGISTER [PRUn_ED_RX_EN_COUNTER] = 0, poll either r31[21, 13, or 5] (tx_global_reinit_active/busy[2,1,0]) or PRUSS_ED_PRUn_TX_CFG_REGISTER [PRUn_ED_BUSY_i] for when TX is complete

NOTE: The ENDAT<m>_CLK Peripheral I/F requires that ENDAT<m>_CLK be in a high state at the beginning of a new transaction. If the clock ended the single shot transmission in low state, then the clock needs to be reset before sending more data. The steps to reset ENDAT<m>_CLK are:

1. Set R31[19] = 1 (tx_global_reinit) to reset clock high
2. Wait until tx_busy<m> is cleared
3. Re-configure R30[20:19] (clk_mode), since reinit will reset the clk_mode to "Free-running/stop-high" mode

30.5.2.2.3.6.4.3 TX - Continuous FIFO Loading

Follow these steps to configure the Peripheral I/F channel(s) for a continuous loading transmission:

1. (Optional) Configure TX FIFO for MSB (default) or LSB:
   (a) PRUSS_ED_PRUn_CHj_CFG0_REGISTER [PRUn_ED_TX_FIFO_SWAP_BITS]
2. Pre-load TX FIFO:
   (a) Select TX channel by writing the desired channel number to r30[17:16] (tx_ch_sel)
   (b) Write 1-4 bytes of data to r30[7:0] (tx_data). At each r30[7:0] write, data will be pushed into the FIFO.
   (c) Repeat Steps 2a and 2b for all desired channels.
3. Configure TX frame size to continuously transmit the TX FIFO until empty:

Copyright © 2015–2017, Texas Instruments Incorporated

(a) Set PRUSS_ED_PRUn_CHj_CFG0_REGISTER [PRUn_ED_TX_FRAME_SIZE] = 0

4. Push TX FIFO data to ENDAT<m>_OUT (see Section 30.5.2.2.3.6.3.2 for the ENDAT<m>_CLK and ENDAT<m>_OUT start time relationship):
   (a) To start TX on all channels, set r31[20] = 1 (tx_global_go).
   (b) To start TX on individual channel:
      (i) Select TX channel by writing the desired channel number to r30[17:16] (tx_ch_sel)
      (ii) Set r31[18] = 1 (tx_channel_go)
5. Monitor line rate and reload FIFO:
   (a) Polling r31[xx, 12:10, 4:2] (tx_fifo_sts<m>)
   (b) When FIFO level is at 2 bytes, load next 2 bytes of data (see Step 2). Do not let the FIFO get close to 0. Once the FIFO runs empty, the hardware will assume the PRU has reached end of the last transmit. Any new writes to the FIFO will NOT be sent until the software sends another tx_channel_go bit. Note there are also underrun and overrun error flags that can be monitored.
6. To end TX operation, do not send any new data to FIFO.
   (a) If PRUSS_ED_PRUn_CHj_CFG1_REGISTER [PRUn_ED_RX_EN_COUNTER] > 0, then the channel will automatically switch into RX mode. See Section 30.5.2.2.3.6.4.4 for an example of how to program and configure RX content.
   (b) If PRUSS_ED_PRUn_CHj_CFG1_REGISTER [PRUn_ED_RX_EN_COUNTER] = 0, poll either r31[21, 13, or 5] (tx_global_reinit_active/busy[2,1,0]) or PRUSS_ED_PRUn_TX_CFG_REGISTER [PRUn_ED_BUSY_i] for when TX is complete

NOTE: The ENDAT<m>_CLK Peripheral I/F requires that ENDAT<m>_CLK be in a high state at the beginning of a new transaction. If the clock ended the continuous loading transmission in low state, then the clock needs to be reset before sending more data. The steps to reset ENDAT<m>_CLK are:

1. Set R31[19] = 1 (tx_global_reinit) to reset clock high
2. Wait until tx_busy<m> is cleared
3. Re-configure R30[20:19] (clk_mode), since reinit will reset the clk_mode to "Free-running/stop-high" mode

30.5.2.2.3.6.4.4 RX - Auto Arm or Non-Auto Arm

Follow these steps to configure the Peripheral I/F channel(s) to receive data:

1. Configure RX and frame size:
   (a) PRUSS_ED_PRUn_CHj_CFG0_REGISTER [PRUn_ED_RX_FRAME_SIZE]
2. To start ENDAT<m>_CLK:
   (a) For the non-auto arm use case, set r30[26, 25, 24] = 1 (rx_en<m>)
   (b) For the auto arm use case, rx_en<m> will be automatically enabled at the end of a TX operation when PRUSS_ED_PRUn_CHj_CFG1_REGISTER [PRUn_ED_RX_EN_COUNTER] > 0
3. RX FIFO will start filling on the first start bit (ENDAT<m>_IN = 1). The data will be captured on the positive edge of the ENDAT<m>_CLK and shifted into the LSB position of the 8-bit shadow register.
4. Poll for r31[26, 25, 24] (val<m>) assertion. The valid flag will be asserted when n bits of data (determined by PRUSS_ED_PRUn_RX_CFG_REGISTER [PRUn_ED_RX_SAMPLE_SIZE]) have been collected.
5. Fetch data by reading r31[23-16, 15-8, 7-0] (rx_data_out<m>). The data will remain constant for one data frame, and PRU must read data and clear valid flag within this time. Otherwise, an overflow will occur – r31[29, 28, 27] (ovf<m>) = 1 - indicating that val<m> has been continuously asserted for longer than one data frame.
6. The clock will be stopped based on the r30[20:19] (clk_mode) configured before the start of the RX operation.
7. Clear r30[26, 25, 24] (rx_en<m>) to disable RX mode. All counters and flags will be reset.

30.5.3 PRU Multiplier with Optional Accumulation (MPY/MAC)

This section describes the MAC (multiplier with optional accumulation) module integrated to PRU0 and PRU1 cores of PRU-ICSS1/PRU-ICSS2.

30.5.3.1 PRU MACs Overview

Each of the two PRU cores (PRU0 and PRU1) has a designated unsigned multiplier with optional accumulation (MPY/MAC). The MAC supports two modes of operation: Multiply Only and Multiply and Accumulate.

The MAC is directly connected with the PRU internal registers R25-R29 and uses the broadside load/store PRU interface and XFR instructions to both control and mode of the MAC and import the multiplication results into the PRU.

30.5.3.1.1 PRU MAC Key Features

The MPY/MAC instantiated separately to each PRU core (PRU0 and PRU1) features:

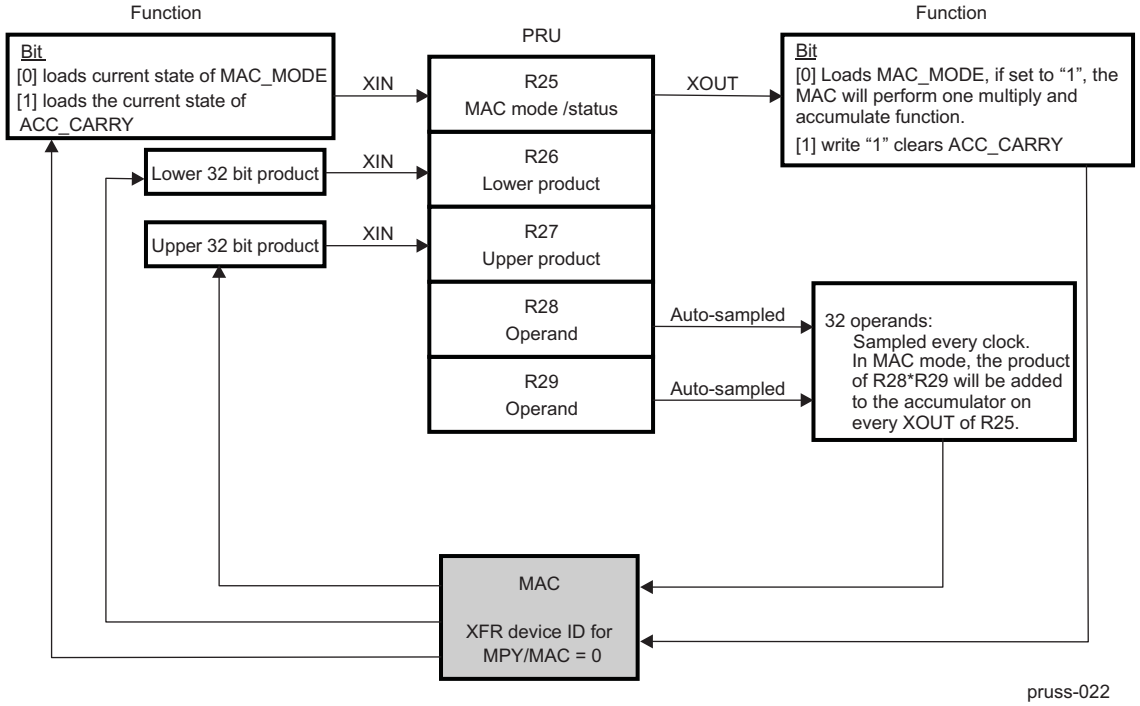
- Configurable Multiply Only and Multiply and Accumulate functionality via PRU register R25
- 32-bit operands with direct connection to PRU registers R28 and R29
- 64-bit result (with carry flag) with direct connection to PRU registers R26 and R27
- PRU broadside interface and XFR instructions (XIN, XOUT) allow for importing multiplication results and initiating accumulate function

30.5.3.1.2 PRU MAC Operations

30.5.3.1.2.1 PRU versus MAC Interface

The MAC directly connects with the PRU internal registers R25-R29 through use of the PRU broadside interface and XFR instructions. Figure 30-24 shows the functionality of each register.

Figure 30-24. Integration of the PRU and MPY/MAC



Copyright © 2015–2017, Texas Instruments Incorporated

The XFR instructions (XIN and XOUT) are used to load/store register contents between the PRU core and the MAC. These instructions define the start, size, direction of the operation, and device ID. The device ID number corresponding to the MPY/MAC is shown in Table 30-84.

Table 30-84. MPY/MAC XFR ID

Device ID	Function
0	Selects MPY/MAC

The PRU register R25 is mapped to the MAC_CTRL_STATUS register (Table 30-85). The MAC's current status (MAC_MODE and ACC_CARRY states) is loaded into R25 using the XIN command on R25. The PRU sets the MAC's mode and clears the ACC_CARRY using the XOUT command on R25.

Table 30-85. MAC_CTRL_STATUS Register (R25) Field Descriptions

Bit	Field	Description
7-2	RESERVED	Reserved
1	ACC_CARRY	Write 1 to clear. 0 - 64-bit accumulator carry has not occurred 1 - 64-bit accumulator carry occurred
0	MAC_MODE	0 - Accumulation mode disabled and accumulator is cleared 1 - Accumulation mode enabled

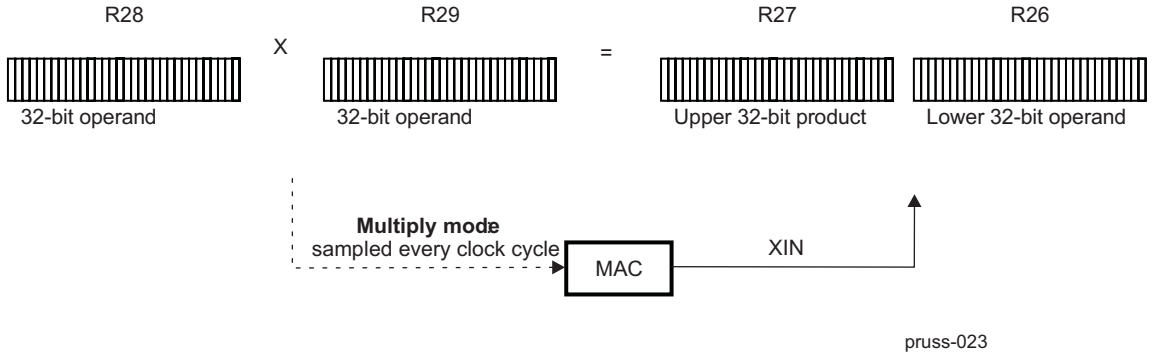
The two 32-bit operands for the multiplication are loaded into R28 and R29. These registers have a direction connection with the MAC. Therefore, XOUT is not required to load the MAC. In multiply mode, the MAC samples these registers every clock cycle. In multiply and accumulate mode, the MAC samples these registers every XOUT R25[7:0] transaction when MAC_MODE = 1.

The product from the MAC is linked to R26 (lower 32 bits) and R27 (upper 32 bits). The product is loaded into register R26 and R27 using XIN.

30.5.3.1.2.2 Multiply only mode(default state), MAC_MODE = 0

The Figure 30-25 summarizes the MAC operation in "Multiply-only" mode, in which the MAC multiplies the contents of R28 and R29 on every clock cycle.

Figure 30-25. MAC Multiply-only Mode- Functional Diagram



30.5.3.1.2.2.1 Programming PRU MAC in "Multiply-ONLY" mode

The following steps are performed by the PRU firmware for multiply-only mode:

1. Enable multiply only MAC_MODE.
   (a) Clear R25[0] for multiply only mode.
   (b) Store MAC_MODE to MAC using XOUT instruction with the following parameters:
   - Device ID = 0
   - Base register = R25

Copyright © 2015–2017, Texas Instruments Incorporated

- Size = 1

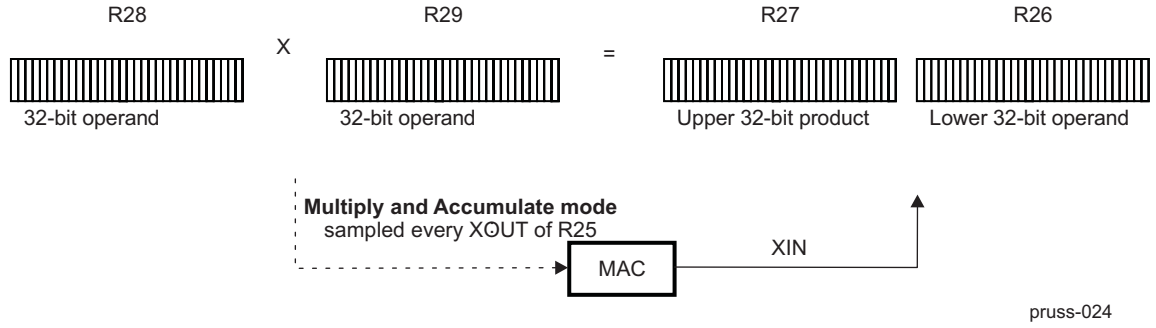
2. Load operands into R28 and R29.
3. Delay at least 1 PRU cycle before executing XIN in step 4.
4. Load product into PRU using XIN instruction on R26, R27.

Repeat steps 2-4 for each new operand.

30.5.3.1.2.3 Multiply and Accumulate Mode, MAC_MODE = 1

The Figure 30-26 summarizes the MAC operation in "Multiply and Accumulate" mode. On every XOUT R25_REG[7:0] transaction, the MAC multiplies the contents of R28 and R29, adds the product to its accumulated result, and sets ACC_CARRY if an accumulation overflow occurs.

Figure 30-26. MAC Multiply and Accumulate Mode Functional Diagram



30.5.3.1.2.3.1 Programming PRU MAC in "Multiply and Accumulate" mode

The following steps are performed by the PRU firmware for multiply and accumulate mode:

1. Enable multiply and accumulate MAC_MODE.
   (a) Set R25[1:0] = 1 for accumulate mode.
   (b) Store MAC_MODE to MAC using XOUT instruction with the following parameters:
   - Device ID = 0
   - Base register = R25
   - Size = 1
2. Clear accumulator and carry flag.
   (a) Set R25[1:0] = 3 to clear accumulator (R25[1]=1) and preserve accumulate mode (R25[0]=1).
   (b) Store accumulator to MAC using XOUT instruction on R25.
3. Load operands into R28 and R29.
4. Multiply and accumulate, XOUT R25[1:0] = 1
   Repeat step 4 for each multiply and accumulate using same operands.
   Repeat step 3 and 4 for each multiply and accumulate for new operands.
5. Load the accumulated product into R26, R27, and the ACC_CARRY status into R25 using the XIN instruction.

NOTE: Steps one and two are required to set the accumulator mode and clear the accumulator and carry flag.

30.5.4 CRC16/32

The PRU0 and PRU1 cores of PRU-ICSS1/PRU-ICSS2 each have a designated CRC16/32 module.

Copyright © 2015–2017, Texas Instruments Incorporated

In general, CRC adds error detection capability to communication systems. The CRC encoder appends redundant bits (or CRC bits) to the systematic data message. During reception of the data message, the received data is also encoded with the same CRC encoder. The 2 sets of CRC bits are compared together. If they match, there were no transmission errors; and if they don't match, a transmission error has been detected.

30.5.4.1 Features

CRC16/32 supports the following features:

- Supports CRC32:
  - $x^{32}+x^{26}+x^{23}+x^{22}+x^{16}+x^{12}+x^{11}+x^{10}+x^{8}+x^{7}+x^{5}+x^{4}+x^{2}+x+1$
- Supports CRC16:
  - $x^{16}+x^{15}+x^{2}+1$
- PRU broadside interface and XFR instructions (XIN, XOUT) allow for importing CRC results and executing accumulate function

30.5.4.2 PRU and CRC16/32 Interface

The CRC16/32 module directly connects with the PRU internal registers R25-R29 through use of the PRU broadside interface and XFR instructions. Table 30-86 shows the functionality of each register.

The XFR instructions (XIN and XOUT) are used to load/store register contents between the PRU core and the CRC16/32 module. These instructions define the start, size, direction of the operation, and device ID. The XFR device ID number corresponding to the CRC16/32 module is 1.

Table 30-86. CRC Register to PRU Port Mapping

CRC Register	R/W	Description	PRU Mapping
CRC_CFG	W	bit [0] CRC32_ENABLE: 0: CRC16 mode is selected. Hardware will auto-set init state of CRC_SEED to 0x0000_0000. Note CRC16 result value is only 16-bits 1: CRC32 mode is selected. Hardware will auto-set init state of CRC_SEED will be 0xffff_ffff. Always write all 4 bytes.	R25_reg
CRC_DATA_8_BFLIP	R	8-bit flip of CRC_DATA. CRC_DATA_8_BFLIP has the same byte order as CRC_DATA[31:0], but each byte has all bits flipped. CRC_DATA_32_FLIP[7:0] = CRC_DATA[0:7] CRC_DATA_32_FLIP[15:8] = CRC_DATA[8:15] CRC_DATA_32_FLIP[23:16] = CRC_DATA[16:23] CRC_DATA_32_FLIP[31:24] = CRC_DATA[24:31] For CRC16, only CRC_DATA_8_BFLIP[15:0] are valid. No auto reset on CRC_DATA_8_BFLIP read.	R27_reg
CRC_SEED	W	CRC SEED value. Hardware will auto-initialize the CRC_SEED value to 0x0000_0000 for CRC16 and 0xFFFF_FFFF for CRC32. Software only needs to initialize CRC_SEED if a different default value is required. Always write 4 bytes. Note when CRC_CFG[CRC32_ENABLE] is enabled, the hardware will switch the CRC_SEED value to 0xFFFF_FFFF. Reading the CRC_DATA register will reset the CRC value to the CRC_SEED state.	R28_reg
CRC_DATA_32_BFLIP	R	Full 32-bit flip of CRC_DATA CRC_DATA_32_BFLIP[0] = CRC_DATA[31] … CRC_DATA_32_BFLIP[31] = CRC_DATA[0] For CRC16, only CRC_DATA_32_BFLIP[31:16] are valid. No auto reset on CRC_DATA_32_BFLIP read.	R28_reg
CRC_DATA	RW	For Write, must use a fixed width throughout the session. The CRC module supports lower 8-bit, or lower 16-bit, or full 32-bit data widths. For Read, LSB or CRC_DATA[0] is first bit on the wire. Note for CRC16, only CRC_DATA[15:0] is valid. Hardware will delay CRC_DATA read operation up to 1 clock if it occurs back to back with a CRC_DATA write.	R29_reg

Copyright © 2015–2017, Texas Instruments Incorporated

30.5.4.3 Programming Model

The following steps are performed by the PRU firmware to use the CRC module:

Step1: Configuration (optional)

1. Configure CRC type:
   For CRC32 operation, set CRC32_ENABLE using XOUT instruction with the following parameters:
   - Device ID = 1
   - Base register = R25
   - Size = 1
2. Update CRC_SEED, if required using XOUT with the following parameters:
   - Device ID = 1
   - Base register = R28
   - Size = 1 to 4

Step 2:

1. Load new CRC data into R29
2. Push CRC data to the CRC16/32 module using XOUT with the following parameters:
   - Device ID = 1
   - Base register = R29
   - Size = 1 to 4
3. Load the accumulated CRC result into the PRU using the XIN instruction with the following parameters:
   - Device ID = 1
   - Base register = R29
   - Size = 4

Repeat Step 2, numbers 1 and 2 for each new CRC data.

NOTE: When a session starts, the PRU firmware must use the same write data width throughout the session.

30.5.5 PRU0 and PRU1 Scratch Pad Memory

The PRU-ICSS supports a scratch pad with three independent banks accessible by the PRU cores. The PRU cores interact with the scratch pad through broadside load/store PRU interface and XFR instructions. The scratch pad can be used as a temporary place holder for the register contents of the PRU cores. Direct connection between the PRU cores is also supported for transferring register contents directly between the cores. This section describes the Scratch Pad Memory shared between and directly accessible by the PRU0 and PRU1 cores, as well as the XFR direct method used by the PRU cores of the PRU-ICSS1 /PRU-ICSS2.

30.5.5.1 PRU0/1 Scratch Pad Overview

The PRU-ICSS scratch pad supports the following features:

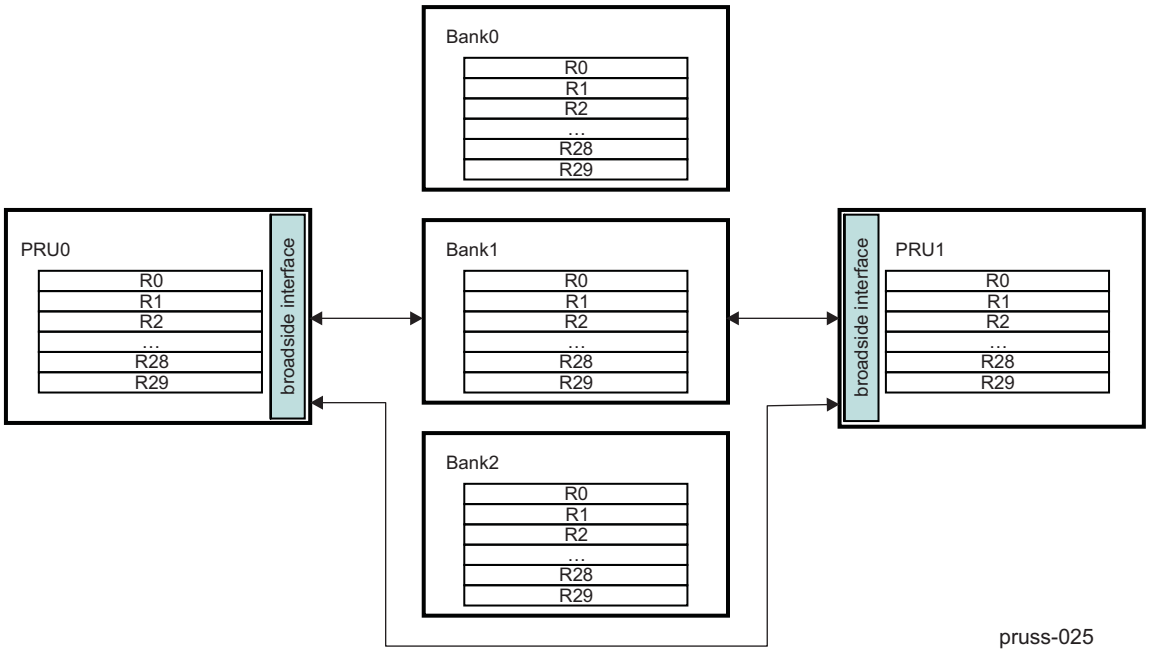
- Three scratch pad banks of 30, 32-bit registers (R29:0)
- Flexible load/store options
  - User-defined start byte and length of the transfer
  - Length of transfer ranges from one byte of a register to the entire register content (R29 to R0)
  - Simultaneous transactions supported between PRU0 ↔ Bank<n> and PRU1 ↔ Bank<m>
  - Direct connection of PRU0 → PRU1 or PRU1 → PRU0 for all registers R29-R0
- XFR instructions operate in one clock cycle
- Optional XIN/XOUT shift functionality allows remapping of registers (R<n> → R<m>) during load/store

Copyright © 2015–2017, Texas Instruments Incorporated

operation

Figure 30-27 shows a simplified model of the ScratchPad integration.

Figure 30-27. ScratchPad and PRU Integration



30.5.5.2 PRU0 /1 Scratch Pad Operations

XFR instructions are used to load/store register contents between the PRU cores and the scratch pad banks. These instructions define the start, size, direction of the operation, and device ID. The device ID corresponds to the external source or destination (either a scratch pad bank or the other PRU core). The device ID numbers are shown in Table 30-87. Note the direct connect mode (device ID 14) can be used to synchronize the PRU cores. This mode requires the transmitting PRU core to execute XOUT and the receiving PRU core to execute XIN.

Table 30-87. Scratch Pad XFR ID

Device ID	Function
10	Selects Bank0
11	Selects Bank1
12	Selects Bank2
13	Reserved
14	Selects other PRU core (Direct connect mode)

A collision occurs when two XOUT commands simultaneously access the same asset or device ID. Table 30-88 shows the priority assigned to each operation when a collision occurs. In direct connect mode (device ID 14), any PRU transaction will be terminated if the stall is greater than 1024 cycles. This will generate the event pr<k>_xfr_timeout that is connected to INTC.

Table 30-88. Scratch Pad XFR Collision and Stall Conditions

Operation	Collision and Stall Handling
PRU <n> XOUT (→) bank[j]	If both PRU cores access the same bank simultaneously, PRU0 is given priority. PRU1 will temporarily stall until the PRU0 operation completes.

Copyright © 2015–2017, Texas Instruments Incorporated

Table 30-88. Scratch Pad XFR Collision and Stall Conditions (continued)

Operation	Collision and Stall Handling
PRU <n> XOUT (→) PRU<m>	Direct connect mode requires the transmitting core (PRU<n>) to execute XOUT and the receiving core (PRU<m>) to execute XIN. If PRU<n> executes XOUT before PRU<m> executes XIN, then PRU<n> will stall until either PRU<m> executes XIN or the stall is greater than 1024 cycles.
PRU<m> XIN (←) PRU<n>	Direct connect mode requires the transmitting core (PRU<n>) to execute XOUT and the receiving core (PRU<m>) to execute XIN. If PRU<m> executes XIN before PRU<n> executes XOUT, then PRU<m> will stall until either PRU<n> executes XOUT or the stall is greater than 1024 cycles.

30.5.5.2.1 Optional XIN/XOUT Shift

The optional XIN/XOUT shift functionality allows register contents to be remapped or shifted within the destination's register space. For example, the contents of PRU0 R6-R8 could be remapped to Bank1 R10-12. The XIN/XOUT shift feature is not supported for direct connect mode, only for transfers between a PRU core and scratch pad bank.

The shift feature is enabled or disabled through the PRU subsystem level register PRUSS_SPP[1] XFR_SHIFT_EN bit. When enabled, R0[4:0] (internal to the PRU) defines the number of 32-bit registers in which content is shifted in the scratch pad bank. Note that scratch pad banks do not have registers R30 or R31.

The following PRU firmware examples demonstrate the shift functionality. Note these assume the XFR_SHIFT_EN bit of the PRUSS_SPP register of the PRU-ICSS CFG register space has been set.

XOUT Shift By 4 Registers

Store R4:R7 to R8:R11 in bank0:

- Load 4 into R0.b0
- XOUT using the following parameters:
  - Device ID = 10
  - Base register = R4
  - Size = 16

XOUT Shift By 9 Registers, With Wrap Around

Store R25:R29 to R4:R8 in bank1:

- Load 9 into R0.b0
- XOUT using the following parameters:
  - Device ID = 11
  - Base register = R25
  - Size = 20

XIN Shift By 10 Registers

Load R14:R16 from bank2 to R4:R6:

- Load 10 into R0.b0
- XIN using the following parameters:
  - Device ID = 12
  - Base register = R4
  - Size = 12

30.5.6 PRUSS_PRU_CTRL Register Manual

Table 30-92. PRU_CONTROL (continued)

Description	CONTROL REGISTER
Type	RW

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PCOUNTER_RST_VAL																RUNSTATE	BIG_ENDIAN	RESERVED					SINGLE_STEP	RESERVED				COUNTER_ENABLE	SLEEPING	ENABLE	SOFT_RST_N

Bits	Field Name	Description	Type	Reset
31:16	PCOUNTER_RST_VAL	Program Counter Reset Value: This field controls the address where the PRU will start executing code from after it is taken out of reset.	RW	0x0
15	RUNSTATE	Run State: This bit indicates whether the PRU is currently executing an instruction or is halted. 0 = PRU is halted and host has access to the instruction RAM and debug registers regions. 1 = PRU is currently running and the host is locked out of the instruction RAM and debug registers regions. This bit is used by an external debug agent to know when the PRU has actually halted when waiting for a HALT instruction to execute, a single step to finish, or any other time when the pru_enable has been cleared.	R	0x0
14	BIG_ENDIAN		R	0x0
13:9	RESERVED		R	0x0
8	SINGLE_STEP	Single Step Enable: This bit controls whether or not the PRU will only execute a single instruction when enabled. 0 = PRU will free run when enabled. 1 = PRU will execute a single instruction and then the pru_enable bit will be cleared. Note that this bit does not actually enable the PRU, it only sets the policy for how much code will be run after the PRU is enabled. The pru_enable bit must be explicitly asserted. It is legal to initialize both the single_step and pru_enable bits simultaneously. (Two independent writes are not required to cause the stated functionality.)	RW	0x0
7:4	RESERVED		R	0x0
3	COUNTER_ENABLE	PRU Cycle Counter Enable: Enables PRU cycle counters. 0 = Counters not enabled 1 = Counters enabled	RW	0x0
2	SLEEPING	PRU Sleep Indicator: This bit indicates whether or not the PRU is currently asleep. 0 = PRU is not asleep 1 = PRU is asleep If this bit is written to a 0, the PRU will be forced to power up from sleep mode.	RW	0x0

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
1	ENABLE	Processor Enable: This bit controls whether or not the PRU is allowed to fetch new instructions. 0 = PRU is disabled. 1 = PRU is enabled. If this bit is de-asserted while the PRU is currently running and has completed the initial cycle of a multi-cycle instruction (LBxO,SBxO,SCAN, etc.), the current instruction will be allowed to complete before the PRU pauses execution. Otherwise, the PRU will halt immediately. Because of the unpredictability timing sensitivity of the instruction execution loop, this bit is not a reliable indication of whether or not the PRU is currently running. The pru_state bit should be consulted for an absolute indication of the run state of the core. When the PRU is halted, its internal state remains coherent therefore this bit can be reasserted without issuing a software reset and the PRU will resume processing exactly where it left off in the instruction stream.	RW	0x0
0	SOFT_RST_N	Soft Reset: When this bit is cleared, the PRU will be reset. This bit is set back to 1 on the next cycle after it has been cleared.	R	0x1

BITWISE_ENABLES																															

Bits	Field Name	Description	Type	Reset
31:0	BITWISE_ENABLES	Wakeup Enables: This field is ANDed with the incoming R31 status inputs (whose bit positions were specified in the stmap parameter) to produce a vector which is unary ORed to produce the status_wakeup source for the core. Setting any bit in this vector will allow the corresponding status input to wake up the core when it is asserted high. The PRU should set this enable vector prior to executing a SLP (sleep) instruction to ensure that the desired sources can wake up the core.	RW	0x0

Description	CYCLE COUNT. This register counts the number of cycles for which the PRU has been enabled.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CYCLECOUNT																															

Bits	Field Name	Description	Type	Reset
31:0	CYCLECOUNT	This value is incremented by 1 for every cycle during which the PRU is enabled and the counter is enabled (both bits ENABLE and COUNTENABLE set in the PRU control register). Counting halts while the PRU is disabled or counter is disabled, and resumes when re-eneabled. Counter clears the COUNTENABLE bit in the PRU control register when the count reaches 0xFFFFFFFF. (Count does does not wrap). The register can be read at any time. The register can be cleared when the counter or PRU is disabled. Clearing this register also clears the PRU Stall Count Register.	RW	0x0

Description	STALL COUNT. This register counts the number of cycles for which the PRU has been enabled, but unable to fetch a new instruction. It is linked to the Cycle Count Register (0x0C) such that this register reflects the stall cycles measured over the same cycles as counted by the cycle count register. Thus the value of this register is always less than or equal to cycle count.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
STALLCOUNT																															

Bits	Field Name	Description	Type	Reset
31:0	STALLCOUNT	This value is incremented by 1 for every cycle during which the PRU is enabled and the counter is enabled (both bits ENABLE and COUNTENABLE set in the PRU control register), and the PRU was unable to fetch a new instruction for any reason.	RW	0x0

Description	CONSTANT TABLE BLOCK INDEX REGISTER 0. This register is used to set the block indices which are used to modify entries 24 and 25 in the PRU Constant Table. This register can be written by the PRU whenever it needs to change to a new base pointer for a block in the State Scratchpad RAM. This function is useful since the PRU is often processing multiple processing threads which require it to change contexts. The PRU can use this register to avoid requiring excessive amounts of code for repetitive context switching.

Description	CONSTANT TABLE PROGRAMMABLE POINTER REGISTER 0. This register allows the PRU to set up the 256-byte page index for entries 28 and 29 in the PRU Constant Table which serve as general purpose pointers which can be configured to point to any locations inside the session router address map. This register is useful when the PRU needs to frequently access certain structures inside the session router address space whose locations are not hard coded such as tables in scratchpad memory.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

30.5.7.2.2 PRUSS_PRU_DEBUG Register Description

Table 30-113. PRUSS_DBG_GPREG0

Address Offset	0x0000 0000		
Physical Address	0x20AA 2400 0x20AA 4400 0x20AE 2400 0x20AE 2400	**Instance**	PRUSS1_PRU0_DEBUG PRUSS1_PRU1_DEBUG PRUSS2_PRU0_DEBUG PRUSS2_PRU0_DEBUG
Description	DEBUG PRU GENERAL PURPOSE REGISTER 0. This register allows an external agent to debug the PRU while it is disabled. Reading or writing to these registers will have the same effect as a read or write to these registers from an internal instruction in the PRU. For R30, this includes generation of the pulse outputs whenever the register is written.		
Type	RW		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
GP_REG0																															

Bits	Field Name	Description	Type	Reset
31:0	GP_REG0	PRU Internal GP Register n: Reading / writing this field directly inspects/modifies the corresponding internal register in the PRU internal regfile	RW	0x0

30.6 PRU-ICSS Local Interrupt Controller

This section describes functionality of the PRU-ICSS integrated Interrupt Controller - PRUSS_INTC.

30.6.1 PRU-ICSS Interrupt Controller Overview

The PRU-ICSS interrupt controller (PRUSS_INTC) maps interrupts coming from different parts of the device (mapped to PRU-ICSS1/PRU-ICSS2 via the device IRQ_CROSSBAR) to a reduced set of PRU-ICSS interrupt channels.

The PRUSS_INTC has the following features:

- Capturing up to 64 System Events (inputs)
- Supports up to 10 output interrupt channels.
- Generation of 10 Host Interrupts
  - 2 Host Interrupts for the PRUs.
  - 8 Host Interrupts exported from the PRU-ICSS for signaling the ARM interrupt controllers.
- Each system event can be enabled and disabled.
- Each host event can be enabled and disabled.
- Hardware prioritization of events.

30.6.2 PRU-ICSS Interrupt Controller Functional Description

The PRU-ICSS incorporates an interrupt controller - PRUSS_INTC that supports up to 64 system interrupts from different peripherals (including 32 interrupts from PRU-ICSS located interrupt sources). The PRUSS_INTC maps these system events to 10 channels inside the PRUSS_INTC (see Figure 30-28). Interrupts from these 10 channels are further mapped to 10 Host Interrupts.

- Any of the 64 system interrupts can be mapped to any of the 10 channels.
- Multiple interrupts can be mapped to a single channel.
- An interrupt should not be mapped to more than one channel.
- Any of the 10 channels can be mapped to any of the 10 host interrupts. It is recommended to map channel “x” to host interrupt “x”, where x is from 0 to 9
- A channel should not be mapped to more than one host interrupt
- For channels mapping to the same host interrupt, lower number channels have higher priority.
- For interrupts on same channel, priority is determined by the hardware interrupt number. The lower the interrupt number, the higher the priority.
- Host Interrupt 0 is connected to bit 30 in register 31 (R31) of PRU0 and PRU1.
- Host Interrupt 1 is connected to bit 31 in register 31 (R31) for PRU0 and PRU1.
- Host Interrupts 2 through 9 exported from PRU-ICSS and mapped to interrupt controllers in the device.

NOTE: The Host interrupt 8 and host interrupt 9 are also exported as DMA requests to the device instantiated DMA_CROSSBAR which in turn can remap them to each line of the device integrated SDMA, EDMA, DSP1_EDMA and DSP2_EDMA controllers. For more details on PRU-ICSS DMA request outputs mapping, refer to the Section 30.3.

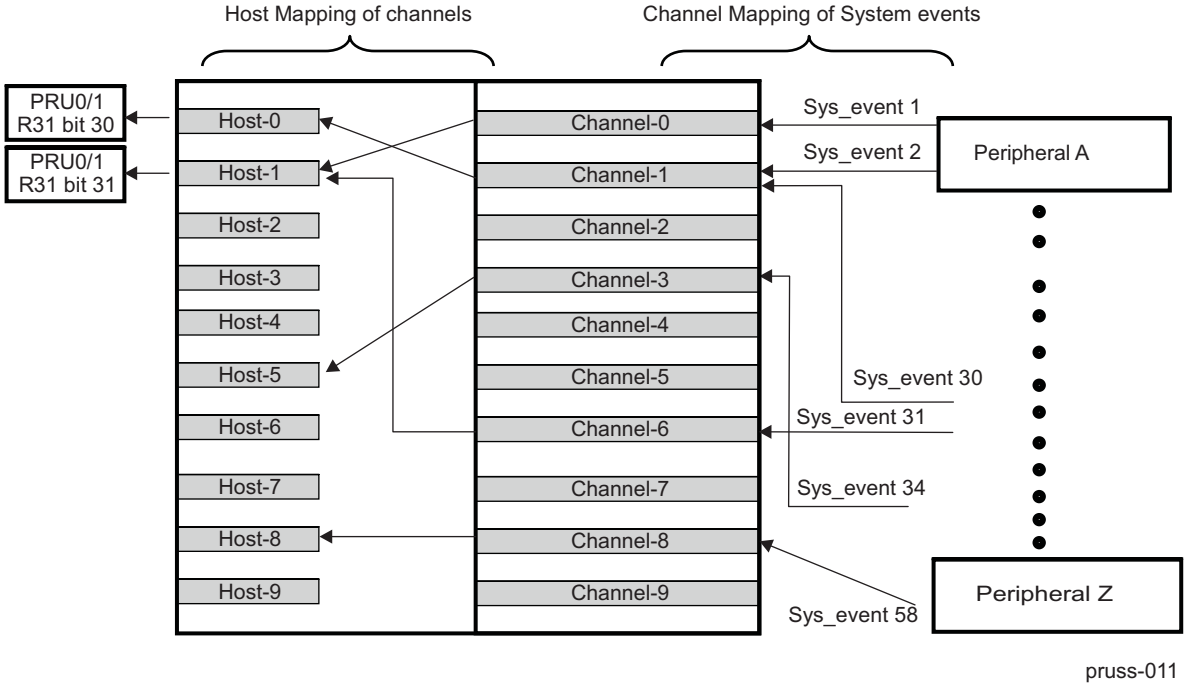
Figure 30-28. PRU-ICSS Interrupt Controller Block Diagram



30.6.2.1 PRU-ICSS Interrupt Controller System Events

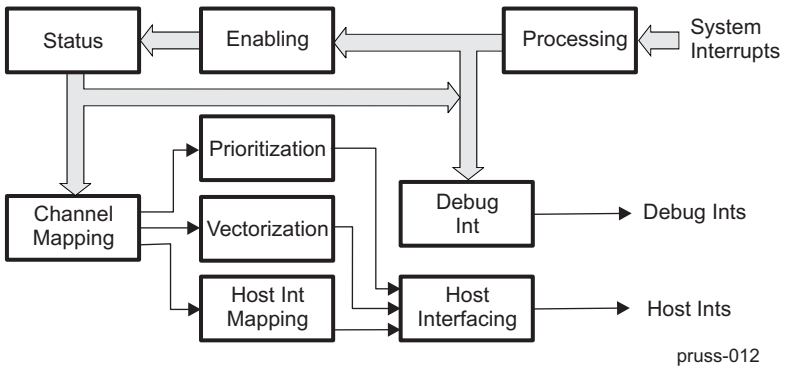
The PRU-ICSS system events - interrupt inputs. The device includes a internal mux that selects the Standard (default) or MII_RT mode system events. The mux control signal is controlled by PRUSS_MII_RT[0] MII_RT_EVENT_EN, which can be modified by software in PRU-ICSS CFG register space.

30.6.2.2 PRU-ICSS Interrupt Controller System Events Flow

The PRUSS_INTC module controls the system event mapping to the host interrupt interface. System events are generated by the device peripherals or PRUs. The PRUSS_INTC receives the system interrupts and maps them to internal channels. The channels are used to group interrupts together and to prioritize them. These channels are then mapped onto the host interrupts. Interrupts from the system side are active high in polarity. They are also pulse type of interrupts.

The PRUSS_INTC encompasses many functions to process the system interrupts and prepare them for the host interface. These functions are: processing, enabling, status, channel mapping, host interrupt mapping, prioritization, and host interfacing. Figure 30-29 illustrates the flow of system interrupts through the functions to the host. The following subsections describe each part of the flow.

Figure 30-29. Flow of System Interrupts to Host



Copyright © 2015–2017, Texas Instruments Incorporated

30.6.2.2.1 PRU-ICSS Interrupt Processing

This block does following tasks:

- Synchronization of slower and asynchronous interrupts
- Conversion of polarity to active high
- Conversion of interrupt type to pulse interrupts

After the processing block, all interrupts will be active high pulses.

30.6.2.2.1.1 PRU-ICSS Interrupt Enabling

The next stage of PRUSS_INTC is to enable system interrupts based on programmed settings. The following sequence is to be followed to enable interrupts:

- Enable required system interrupts: System interrupts that are required to get propagated to host are to be enabled individually by writing to INDEX field in the system interrupt enable indexed set register (PRUSS_INTC_EISR). The interrupt to enable is the index value written. This sets the Enable Register bit of the given index.
- Enable required host interrupts: By writing 1 to the appropriate bit of the INDEX field in the host interrupt enable indexed set register (PRUSS_INTC_HIEISR), enable the required host interrupts. The host interrupt to enable is the index value written. This enables the host interrupt output or triggers the output again if that host interrupt is already enabled.
- Enable all host interrupts: By setting the ENABLE bit in the global enable register (PRUSS_INTC_GER) to 1, all host interrupts will be enabled. Individual host interrupts are still enabled or disabled from their individual enables and are not overridden by the global enable.

30.6.2.2.2 PRU-ICSS Interrupt Status Checking

The next stage is to capture which system interrupts are pending. There are two kinds of pending status: raw status and enabled status. Raw status is the pending status of the system interrupt without regards to the enable bit for the system interrupt. Enabled status is the pending status of the system interrupts with the enable bits active. When the enable bit is inactive, the enabled status will always be inactive. The enabled status of system interrupts is captured in system interrupt status enabled/clear registers (PRUSS_INTC_SECR1 and PRUSS_INTC_SECR0).

Status of system interrupt 'N' is indicated by the N-th bit of PRUSS_INTC_SECR1 and PRUSS_INTC_SECR0. Since there are 64 system interrupts, two 32-bit registers are used to capture the enabled status of interrupts. The pending status reflects whether the system interrupt occurred since the last time the status register bit was cleared. Each bit in the status register can be individually cleared.

30.6.2.2.3 PRU-ICSS Interrupt Channel Mapping

The PRUSS_INTC has 10 internal channels to which enabled system interrupts can be mapped. Channel 0 has highest priority and channel 9 has the lowest priority. Channels are used to group the system interrupts into a smaller number of priorities that can be given to a host interface with a very small number of interrupt inputs.

When multiple system interrupts are mapped to the same channel their interrupts are ORed together so that when either is active the output is active. The channel map registers (PRUSS_INTC_CMRi, where i=0 to 15) define the channel for each system interrupt. There is one register per 4 system interrupts; therefore, there are 16 channel map registers for a system of 64 interrupts. The channel for each system interrupt can be set using these registers.

Copyright © 2015–2017, Texas Instruments Incorporated

30.6.2.2.3.1 PRU-ICSS Host Interrupt Mapping

The hosts can be the local PRU processors (PRU0 and PRU1) as well as device processors located outside PRU-ICSS such as MPU Cortex-A15, DSP1, IPU1, EVEs, etc. The 10 channels from the PRUSS_INTC can be mapped to any of the 10 Host interrupts. The Host map registers (PRUSS_INTC_HMR0 - PRUSS_INTC_HMR2) define the channel for each system interrupt. There is one register per 4 channels; therefore, there are 3 host map registers for 10 channels. When multiple channels are mapped to the same host interrupt, then prioritization is done to select which interrupt is in the highest-priority channel and which should be sent first to the host.

30.6.2.2.3.2 PRU-ICSS Interrupt Prioritization

The next stage of the PRUSS_INTC is prioritization. Since multiple interrupts can feed into a single channel and multiple channels can feed into a single host interrupt, it is to read the status of all system interrupts to determine the highest priority interrupt that is pending. The PRUSS_INTC provides hardware to perform this prioritization with a given scheme so that software does not have to do this. There are two levels of prioritizations:

- The first level of prioritization is between the active channels for a host interrupt. Channel 0 has the highest priority and channel 9 has the lowest. So the first level of prioritization picks the lowest numbered active channel.
- The second level of prioritization is between the active system interrupts for the prioritized channel. The system interrupt in position 0 has the highest priority and system interrupt 63 has the lowest priority. So the second level of prioritization picks the lowest position active system interrupt.

This is the final prioritized system interrupt for the host interrupt and is stored in the global prioritized index register (PRUSS_INTC_GPIR). The highest priority pending interrupt with respect to each host interrupts can be obtained using the host interrupt prioritized index registers (PRUSS_INTC_HIPIRj where j=0 to 9).

30.6.2.2.4 PRU-ICSS Interrupt Nesting

The PRUSS_INTC can also perform a nesting function in its prioritization. Nesting is a method of disabling certain interrupts (usually lower-priority interrupts) when an interrupt is taken so that only those desired interrupts can trigger to the host while it is servicing the current interrupt. The typical usage is to nest on the current interrupt and disable all interrupts of the same or lower priority (or channel). Then the host will only be interrupted from a higher priority interrupt.

The nesting is done in one of three methods:

1. Nesting for all host interrupts, based on channel priority: When an interrupt is taken, the nesting level is set to its channel priority. From then, that channel priority and all lower priority channels will be disabled from generating host interrupts and only higher priority channels are allowed. When the interrupt is completely serviced, the nesting level is returned to its original value. When there is no interrupt being serviced, there are no channels disabled due to nesting. The global nesting level register (PRUSS_INTC_GNLR) allows the checking and setting of the global nesting level across all host interrupts. The nesting level is the channel (and all of lower priority channels) that are nested out because of a current interrupt.
2. Nesting for individual host interrupts, based on channel priority: Always nest based on channel priority for each host interrupt individually. When an interrupt is taken on a host interrupt, then, the nesting level is set to its channel priority for just that host interrupt, and other host interrupts do not have their nesting affected. Then for that host interrupt, equal or lower priority channels will not interrupt the host but may on other host interrupts if programmed. When the interrupt is completely serviced the nesting level for the host interrupt is returned to its original value. The host interrupt nesting level registers (PRUSS_INTC_HINLRj where j=0 to 9) display and control the nesting level for each host interrupt. The nesting level controls which channel and lower priority channels are nested. There is one register per host interrupt.
3. Software manually performs the nesting of interrupts. When an interrupt is taken, the software will disable all the host interrupts, manually update the enables for any or all the system interrupts, and then re-enables all the host interrupts. This now allows only the system interrupts that are still enabled to trigger to the host. When the interrupt is completely serviced the software must reverse the changes to re-enable the nested out system interrupts. This method requires the most software interaction but gives the most flexibility if simple channel based nesting mechanisms are not adequate.

Copyright © 2015–2017, Texas Instruments Incorporated

30.6.2.2.5 PRU-ICSS Interrupt Status Clearing

After servicing the interrupt (after execution of the ISR), interrupt status is to be cleared. If a system interrupt status is not cleared, then another host interrupt may not be triggered or another host interrupt may be triggered incorrectly. It is also essential to clear all system interrupts before the PRU is halted as the PRU does not power down unless all the interrupt status are cleared. For clearing the status of an interrupt, whose interrupt number is N, write a 1 to the Nth bit position in the system interrupt status enabled/clear registers (PRUSS_INTC_SECR0 and PRUSS_INTC_SECR1). System interrupt N can also be cleared by writing the value N into the system interrupt status indexed clear register (PRUSS_INTC_SICR).

30.6.2.3 PRU-ICSS Interrupt Disabling

At any time, if any interrupt is not to be propagated to the host, then that interrupt should be disabled. For disabling an interrupt whose interrupt number is N, write a 1 to the Nth bit in the system interrupt enable clear registers (PRUSS_INTC_ECR0 and PRUSS_INTC_ECR1). System interrupt N can also be disabled by writing the value N in the system interrupt enable indexed clear register (PRUSS_INTC_EICR).

30.6.3 PRU-ICSS Interrupt Controller Basic Programming Model

Follow these steps to configure the interrupt controller.

1. Set polarity and type of system event through the System Interrupt Polarity Registers (PRUSS_INTC_SIPR1 and PRUSS_INTC_SIPR0) and the System Interrupt Type Registers (PRUSS_INTC_SITR1 and PRUSS_INTC_SITR0). Polarity of all system interrupts is always high. Type of all system interrupts is always pulse.
2. Map system event to PRUSS_INTC channel through PRUSS_INTC_CMRi (i=0 to 15) channel mapping registers.
3. Map channel to host interrupt through PRUSS_INTC_HMR0/1/2 registers. Recommended channel “x” to be mapped to host interrupt “x”.
4. Clear system interrupt by writing 1 to PRUSS_INTC_SECR0/1 registers.
5. Enable host interrupt by writing index value to PRUSS_INTC_HIEISR register.
6. Enable interrupt nesting if desired.
7. Globally enable all interrupts through register PRUSS_INTC_GER[0] ENABLE_HINT_ANY bit.

PRUSS2_IRQ_1	pr2_pru0_r31_status_cnt16	PRUSS2.PRU0 (Shift Capture)
PRUSS2_IRQ_0	pr2_parity_err_intr_pend	PRUSS2 Parity Logic

NOTE: PRU-ICSS2 UART and eCAP are not supported on the AM570x family of devices.

PRU-ICSS2 IEP I/Os are not pinned out on AM570x. However, some internal features (such as the IEP timer) are still supported.

The IRQ input lines 32 through 63 receive interrupts which come from various device peripherals located outside PRU-ICSS1 and PRU-ICSS2. They are delivered on the PRUSS1_INTC / PRUSS2_INTC inputs (32 through 63) via the device IRQ_CROSSBAR. For more details on the device IRQ_CROSSBAR signals mapping to the PRUSS1_INTC / PRUSS2_INTC, refer to the Chapter 17, *Interrupt Controllers*. For more details on how to program mapping of the external peripheral IRQ signals to PRUSS1_IRQ_32 through PRUSS1_IRQ_63 / PRUSS2_IRQ_32 through PRUSS2_IRQ_55 inputs of the PRUSS1_INTC/PRUSS2_INTC, respectively, refer to the Section 18.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 18, *Control Module*.

Note that for the PRUSS_INTC input lines **32 through 55**, there is an additional multiplexing option programmable in the PRUSS_CFG located register bit - PRUSS_MII_RT[0] MII_RT_EVENT_EN. By default the MII_RT_EVENT_EN is set to 0b0 which selects the IRQ sources to be the PRU-ICSS dedicated device IRQ_CROSSBAR outputs ("**Standard**"). By setting MII_RT_EVENT_EN to 0b1, a set of PRU-ICSS MII_RT module associated events, are mapped to the same lines.

The Table 30-242 and the Table 30-243 shows PRU-ICSS1/PRU-ICSS2 MII_RT events mapping on the PRUSS1_INTC / PRUSS2_INTC inputs PRUSS1_IRQ_32 through PRUSS1_IRQ_55 / PRUSS2_IRQ_32 through PRUSS2_IRQ_55 valid for the "MII_RT" mode (with PRUSS_MII_RT[0] MII_RT_EVENT_EN register bit set to "0b1")

Table 30-242. PRU-ICSS1 MII_RT Mode Interrupts

While in the Standard mode (default), the PRU-ICSS interrupt controller PRUSS_IRQ_32 through PRUSS_IRQ_55 input lines are mapped to PRU-ICSS external events via the device IRQ_CROSSBAR, in the MII_RT mode (bit MII_RT_EVENT_EN=0b1), the same PRUSS_INTC inputs are directly mapped to PRU-ICSS internally or externally generated MII_MDIO and MII_RT RX/TX signals (i.e. not through the IRQ_CROSSBAR).

For more details on the device IRQ_CROSSBAR signals mapping to the PRUSS1_INTC/ PRUSS2_INTC , refer to the Chapter 17, *Interrupt Controllers*. For more details on the PRU-ICSS1/PRU-ICSS2 external peripheral IRQ signals programmable mapping to PRUSS1_IRQ_32 through PRUSS1_IRQ_55 / PRUSS2_IRQ_32 through PRUSS2_IRQ_55 inputs of the PRUSS1_INTC/PRUSS2_INTC, respectively, refer to the Section 18.4.6.4, *IRQ_CROSSBAR Module Functional Description*, in Chapter 18, *Control Module*.

30.6.5 PRU-ICSS Interrupt Controller Register Manual

This section describes the PRU-ICSS interrupt controller registers.

Table 30-253. PRUSS_INTC_GNLR

Address Offset	0x0000 001C		
Physical Address	0x4B22 001C 0x4B2A 001C	**Instance**	PRUSS1_INTC PRUSS2_INTC
Description	The Global Nesting Level Register allows the checking and setting of the global nesting level across all host interrupts when automatic global nesting mode is set. The nesting level is the channel (and all of lower priority) that are nested out because of a current interrupt. This register is only available when nesting is configured.		
Type	RW

30.7 PRU-ICSS UART Module

This section describes an Universal Asynchronous Receive and Transmit (UART) module which is part of the device integrated PRU-ICSS1 and PRU-ICSS2 - PRUSS1_UART0 and PRUSS2_UART0, respectively.

NOTE: PRU-ICSS2 UART is not supported on the AM570x family of devices.

30.7.1 PRU-ICSS UART Module Overview

30.7.1.1 Purpose of the PRU-ICSS integrated UART Peripheral

The PRUSS_UART0 peripheral is based on the industry standard TL16C550 asynchronous communications element, which in turn is a functional upgrade of the TL16C450. Functionally similar to the TL16C450 on power up (single character or TL16C450 mode), the PRUSS_UART0 can be placed in an alternate FIFO (TL16C550) mode. This relieves the CPU of excessive software overhead by buffering received and transmitted characters. The receiver and transmitter FIFOs store up to 16 bytes including three additional bits of error status per byte for the receiver FIFO.

The PRUSS_UART0 performs serial-to-parallel conversions on data received from a peripheral device and parallel-to-serial conversion on data received from the CPU. The CPU can read the PRUSS_UART0 status at any time. The PRUSS_UART0 includes control capability and a processor interrupt system that can be tailored to minimize software management of the communications link.

The PRUSS_UART0 includes a programmable baud generator capable of dividing the PRUSS_UART0 input clock by divisors from 1 to 65535 and producing a 16× reference clock or a 13× reference clock for the internal transmitter and receiver logic.

30.7.1.2 PRU-ICSS UART Key Features

30.7.1.2.1 PRU-ICSS UART Module Industry Standard Compliance Statement

The PRUSS_UART0 peripheral is based on the industry standard TL16C550 asynchronous communications element, which is a functional upgrade of the TL16C450. The information in this chapter assumes that user is familiar with these standards.

30.7.2 PRU-ICSS UART Environment

This section describes the PRUSS_UART0 module interface to the device environment

30.7.2.1 PRU-ICSS UART Pin Multiplexing

Extensive pin multiplexing is used to accommodate the largest number of peripheral functions in the smallest possible package. Pin multiplexing is controlled using a combination of hardware configuration at device reset and software programmable register settings. For more information on the PRUSS_UART0 pin multiplexing, refer to the Section 18.4.6.1.1, *Pad Configuration Registers* in the chapter, *Control Module*.

30.7.2.2 PRU-ICSS UART Signal Descriptions

The PRUSS_UART0 utilize a minimal number of signal connections to interface with external devices. The PRUSS_UART0 signal descriptions are included in Table 30-307.

Table 30-307. PRUSS_UART0 Signal Descriptions

Signal Name	Signal Type	Function
UART0_TXD	Output	Serial data transmit
UART0_RXD	Input	Serial data receive
$\overline{\text{UART0_CTS}}$	Input	Clear-to-Send handshaking signal

Copyright © 2015–2017, Texas Instruments Incorporated

Table 30-307. PRUSS_UART0 Signal Descriptions (continued)

Signal Name	Signal Type	Function
UART0_RTS	Output	Request-to-Send handshaking signal

30.7.2.3 PRU-ICSS UART Data Format and Protocol Description

30.7.2.3.1 PRU-ICSS UART Transmission Protocol

The PRUSS_UART0 transmitter section includes a transmitter hold register (THR), memory mapped in the register PRUSS_UART_RBR_THR_REGISTERS[7:0] DATA bitfield and a transmitter shift register (TSR), which is NOT memory mapped. When the PRUSS_UART0 is in the FIFO mode, THR is a 16-byte FIFO. Transmitter section control is a function of the PRUSS_UART0 line control register PRUSS_UART_LINE_CONTROL_REGISTER. Based on the settings chosen in this register, the PRUSS_UART0 transmitter sends the following to the receiving device:

- 1 START bit
- 5, 6, 7, or 8 data bits
- 1 PARITY bit (optional)
- 1, 1.5, or 2 STOP bits

30.7.2.3.2 PRU-ICSS UART Reception Protocol

The PRUSS_UART0 receiver section includes a receiver shift register (RSR), that is not memory mapped, and a receiver buffer register (RBR), memory mapped as the register PRUSS_UART_RBR_THR_REGISTERS [7:0] DATA bitfield. When the PRUSS_UART0 is in the FIFO mode, RBR is a 16-byte FIFO. Receiver section control is a function of the PRUSS_UART0 line control register - PRUSS_UART_LINE_CONTROL_REGISTER. Based on the settings chosen in this register, the PRUSS_UART0 receiver accepts the following from the transmitting device:

- 1 START bit
- 5, 6, 7, or 8 data bits
- 1 PARITY bit (optional)
- 1 STOP bit (any other STOP bits transferred with the above data are not detected)

30.7.2.3.3 PRU-ICSS UART Data Format

The PRUSS_UART0 transmits in the following format:

1 START bit + data bits (5, 6, 7, 8) + 1 PARITY bit (optional) + STOP bit (1, 1.5, 2)

It transmits 1 START bit; 5, 6, 7, or 8 data bits, depending on the data width selection; 1 PARITY bit, if parity is selected; and 1, 1.5, or 2 STOP bits, depending on the STOP bit selection.

The PRUSS_UART0 receives in the following format:

1 START bit + data bits (5, 6, 7, 8) + 1 PARITY bit (optional) + 1 STOP bit

It receives 1 START bit; 5, 6, 7, or 8 data bits, depending on the data width selection; 1 PARITY bit, if parity is selected; and 1 STOP bit.

The protocol formats are shown in Figure 30-30.

Transmit/Receive for 8-bit data, parity Enable, 1 STOP bit

		D0	D1	D2	D3	D4	D5	D6	D7	PARITY	STOP1

30.7.2.3.3.1 Frame Formatting

Character length is specified using the PRUSS_UART_LINE_CONTROL_REGISTER[1-0] WLS bit field (see Table 30-309).

The number of stop-bits is specified using the PRUSS_UART_LINE_CONTROL_REGISTER[2] STB bit (see Table 30-309).

The parity bit is programmed using the PRUSS_UART_LINE_CONTROL_REGISTER[5-3] PEN, EPS, and SP bits (see Table 30-308).

Table 30-308. Relationship Between ST, EPS, and PEN Bits in UART_LCR

ST Bit	EPS Bit	PEN Bit	Parity Option
x	x	0	Parity disabled: No PARITY bit is transmitted or checked.
0	0	1	Odd parity selected: Odd number of logic 1s.
0	1	1	Even parity selected: Even number of logic 1s.
1	0	1	Stick parity selected with PARITY bit transmitted and checked as set.
1	1	1	Stick parity selected with PARITY bit transmitted and checked as cleared.

Table 30-309. Number of STOP Bits Generated

STB Bit	WLS Bit	Word Length Selected with WLS Bits	Number of STOP Bits Generated	Baud Clock (BCLK) Cycles
0	x	Any word length	1	16
1	0h	5 bits	1.5	24
1	1h	6 bits	2	32
1	2h	7 bits	2	32
1	3h	8 bits	2	32

30.7.2.4 PRU-ICSS UART Clock Generation and Control

The PRUSS_UART0 bit clock is derived from an input clock to the PRUSS_UART0. See your device-specific data manual to check the maximum data rate supported by the PRUSS_UART0.

Figure 30-31 is a conceptual clock generation diagram for the PRUSS_UART0. The processor clock generator receives a signal from an external clock source and produces a PRUSS_UART0 input clock with a programmed frequency. The PRUSS_UART0 contains a programmable baud generator that takes an input clock and divides it by a divisor in the range between 1 and (2^{16} - 1) to produce a baud clock (BCLK). The frequency of BCLK is sixteen times (16×) the baud rate (each received or transmitted bit lasts 16 BCLK cycles) or thirteen times (13×) the baud rate (each received or transmitted bit lasts 13 BCLK cycles). When the PRUSS_UART0 is receiving, the bit is sampled in the 8th BCLK cycle for 16× over sampling mode and on the 6th BCLK cycle for 13× over-sampling mode. The 16× or 13× reference clock is selected by configuring the mode definition register (MDR) - PRUSS_UART_MODE_DEFINITION_REGISTER [0] OSM_SEL bit. The formula to calculate the divisor is:

$$\text{Divisor} = \frac{\text{UART input clock frequency}}{\text{Desired baud rate} \times 16} \quad [\text{MDR.OSM_SEL} = 0]$$

pruss-013

$$\text{Divisor} = \frac{\text{UART input clock frequency}}{\text{Desired baud rate} \times 13} \quad [\text{MDR.OSM_SEL} = 1]$$

pruss-014

Two 8-bit register fields:

- PRUSS_UART_DIVISOR_REGISTER_MSB_[7:0] DLH
- PRUSS_UART_DIVISOR_REGISTER_LSB_[7:0] DLL,

called divisor latches, hold this 16-bit divisor. DLH holds the most significant bits of the divisor, and DLL holds the least significant bits of the divisor. For information about these register fields, see the PRUSS_UART0 register descriptions in the Section 30.7.4, *PRU-ICSS UART Register Manual*. These divisor latches must be loaded during initialization of the PRUSS_UART0 in order to ensure desired operation of the baud generator. Writing to the divisor latches results in two wait states being inserted during the write access while the baud generator is loaded with the new value.

Figure 30-32 summarizes the relationship between the transferred data bit, BCLK, and the PRUSS_UART0 input clock. Note that the timing relationship depicted in Figure 30-32 shows that each bit lasts for 16 BCLK cycles . This is in case of 16x over-sampling mode. For 13× over-sampling mode each bit lasts for 13 BCLK cycles .

Example baud rates and divisor values relative to a 150-MHz PRUSS_UART0 input clock and 16× over-sampling mode are shown in Table 30-310.

30.7.3.2 PRU-ICSS UART Reset Considerations

30.7.3.2.1 PRU-ICSS UART Software Reset Considerations

Two bits in the power and emulation management register - PRUSS_UART_POWERMANAGEMENT_AND_EMULATION_REGISTER, control resetting the parts of the PRUSS_UART0:

- The bit [14] UTRST controls resetting the transmitter only. If UTRST = 1, the transmitter is active; if UTRST = 0, the transmitter is in reset.
- The bit [13] URRST controls resetting the receiver only. If URRST = 1, the receiver is active; if URRST = 0, the receiver is in reset.

In each case, putting the receiver and/or transmitter in reset will reset the state machine of the affected portion but does not affect the PRUSS_UART0 registers.

30.7.3.2.2 PRU-ICSS UART Hardware Reset Considerations

When the processor RESET pin is asserted, the entire processor is reset and is held in the reset state until the RESET pin is released. As part of a device reset, the PRUSS_UART0 state machine is reset and the PRUSS_UART0 registers are forced to their default states. The default states of the registers are shown in Section 30.7.4.2.2.

30.7.3.3 PRU-ICSS UART Power Management

The PRUSS_UART0 peripheral can be placed in reduced-power modes to conserve power during periods of low activity. The power management of the PRUSS_UART0 peripheral and other PRU-ICSS peripherals is controlled by the device Power, Reset and Clock Manager (PRCM). For more details on the PRUSS_UART0 clock and power management, refer to the Section 30.4.2, *PRU-ICSS Power and Clock Management*.

30.7.3.4 PRU-ICSS UART Interrupt Support

30.7.3.4.1 PRU-ICSS UART Interrupt Events and Requests

The PRUSS_UART0 generates the interrupt requests described in Table 30-312. All requests are multiplexed through an arbiter to a single PRUSS_UART0 interrupt request to the CPU, as shown in Figure 30-34. Each of the interrupt requests has an enable bit in the interrupt enable register (IER) - PRUSS_UART_INTERRUPT_ENABLE_REGISTER and is recorded in INTID bitfield of PRUSS_UART_INTERRUPT_IDENTIFICATION_REGISTER_FIFO_CONTROL_REGISTER.

If an interrupt occurs and the corresponding enable bit is set to 1, the interrupt request is recorded in INTID bitfield and is forwarded to the CPU. If an interrupt occurs and the corresponding enable bit is cleared to 0, the interrupt request is blocked. The interrupt request is neither recorded in INTID, nor forwarded to the CPU.

30.7.3.4.2 PRU-ICSS UART Interrupt Multiplexing

The PRUSS_UART0 have dedicated interrupt signals to the CPU and the interrupts are not multiplexed with any other interrupt source.

Table 30-312. PRU-ICSS UART Interrupt Requests Descriptions

PRUSS_UART0 Interrupt Request	Interrupt Source	Comment
THREINT	THR-empty condition: The transmitter holding register (THR) or the transmitter FIFO is empty. All of the data has been copied from THR (i.e. PRUSS_UART_RBR_THR_REGISTERS [7:0] DATA) to the transmitter shift register (TSR).	If THREINT is enabled in PRUSS_UART_INTERRUPT_ENABLE_REGISTER, by setting the ETBEI bit, it is recorded in INTID bitfield. As an alternative to using THREINT, the CPU can poll the THRE bit in the line status register PRUSS_UART_LINE_STATUS_REGISTER.

Copyright © 2015–2017, Texas Instruments Incorporated

Table 30-312. PRU-ICSS UART Interrupt Requests Descriptions (continued)

PRUSS_UART0 Interrupt Request	Interrupt Source	Comment
RDAINT	Receive data available in non-FIFO mode or trigger level reached in the FIFO mode.	If RDAINT is enabled in PRUSS_UART_INTERRUPT_ENABLE_REGISTER, by setting the ERBI bit, it is recorded in INTID bitfield. As an alternative to using RDAINT, the CPU can poll the DR bit in the line status register PRUSS_UART_LINE_STATUS_REGISTER. In the FIFO mode, this is not a functionally equivalent alternative because the DR bit does not respond to the FIFO trigger level. The DR bit only indicates the presence or absence of unread characters.
RTOINT	Receiver time-out condition (in the FIFO mode only): No characters have been removed from or input to the receiver FIFO during the last four character times (see Table 30-314), and there is at least one character in the receiver FIFO during this time.	The receiver time-out interrupt prevents the PRUSS_UART0 from waiting indefinitely, in the case when the receiver FIFO level is below the trigger level and thus does not generate a receiver data-ready interrupt. If RTOINT is enabled in PRUSS_UART_INTERRUPT_ENABLE_REGISTER, by setting the ERBI bit, it is recorded in INTID bitfield. There is no status bit to reflect the occurrence of a time-out condition.
RLSINT	Receiver line status condition: An overrun error, parity error, framing error, or break has occurred.	If RLSINT is enabled in PRUSS_UART_INTERRUPT_ENABLE_REGISTER, by setting the ELSI bit, it is recorded in INTID bitfield. As an alternative to using RLSINT, the CPU can poll the following bits in the line status register PRUSS_UART_LINE_STATUS_REGISTER: overrun error indicator (OE), parity error indicator (PE), framing error indicator (FE), and break indicator (BI).

Figure 30-34. PRU-ICSS UART Interrupt Request Enable Paths

Table 30-313. Interrupt Identification and Interrupt Clearing Information

Priority Level	IIR Bits				Interrupt Type	Interrupt Source	Event That Clears Interrupt
	3	2	1	0			
None	0	0	0	1	None	None	None
1	0	1	1	0	Receiver line status	Overrun error, parity error, framing error, or break is detected.	For an overrun error, reading the PRUSS_UART_LINE_STATUS_REGISTER clears the interrupt. For a parity error, framing error, or break, the interrupt is cleared only after all the erroneous data have been read.
2	0	1	0	0	Receiver data-ready	Non-FIFO mode: Receiver data is ready.	Non-FIFO mode: The receiver buffer register (RBR) is read.
						FIFO mode: Trigger level reached. If four character times (see Table 30-314) pass with no access of the FIFO, the interrupt is asserted again.	FIFO mode: The FIFO drops below the trigger level. (1)
2	1	1	0	0	Receiver time-out	FIFO mode only: No characters have been removed from or input to the receiver FIFO during the last four character times (see Table 30-314), and there is at least one character in the receiver FIFO during this time.	One of the following events: • A character is read from the receiver FIFO (1) • A new character arrives in the receiver FIFO • The URRST bit in the power and emulation management register (PRUSS_UART_POWERMANAGEMENT_AND_EMULATION_REGISTER) is loaded with 0.
3	0	0	1	0	Transmitter holding register empty	Non-FIFO mode: Transmitter holding register (THR) is empty.	A character is written to the transmitter holding register (THR) or the interrupt identification register (IIR) is read.
						FIFO mode: Transmitter FIFO is empty.	

(1) In the FIFO mode, the receiver data-ready interrupt or receiver time-out interrupt is cleared by the CPU or by the DMA controller, whichever reads from the receiver FIFO first.

30.7.3.5 PRU-ICSS UART DMA Event Support

In the FIFO mode, the PRUSS_UART0 generates the following two DMA events:

- **Receive event (URXEVT):** The trigger level for the receiver FIFO (1, 4, 8, or 14 characters) is set with the FIFO control PRUSS_UART_INTERRUPT_IDENTIFICATION_REGISTER_FIFO_CONTROL_REGISTER [7:6] FIFOEN_RXFIFTL bitfield. Every time the trigger level is reached or a receiver time-out occurs, the PRUSS_UART0 sends a receive event to the EDMA controller. In response, the EDMA controller reads the data from the receiver FIFO by way of the receiver buffer register PRUSS_UART_RBR_THR_REGISTERS [7:0] DATA. Note that the receive event is not asserted if the data at the top of the receiver FIFO is erroneous even if the trigger level has been reached.
- **Transmit event (UTXEVT):** When the transmitter FIFO is empty (when the last byte in the transmitter FIFO has been copied to the transmitter shift register), the PRUSS_UART0 sends an UTXEVT signal to the EDMA controller. In response, the EDMA controller refills the transmitter FIFO by way of the transmitter holding register (THR) - PRUSS_UART_RBR_THR_REGISTERS [7:0] DATA. The UTXEVT signal is also sent to the DMA controller when the PRUSS_UART0 is taken out of reset using the UTRST bit in the power and emulation management register (PRUSS_UART_POWERMANAGEMENT_AND_EMULATION_REGISTER).

Activity in DMA channels can be synchronized to these events. In the non-FIFO mode, the PRUSS_UART0 generates no DMA events. Any DMA channel synchronized to either of these events must be enabled at the time the PRUSS_UART0 event is generated. Otherwise, the DMA channel will miss the event and, unless the PRUSS_UART0 generates a new event, no data transfer will occur.

Copyright © 2015–2017, Texas Instruments Incorporated

30.7.3.6 PRU-ICSS UART Operations

30.7.3.6.1 PRU-ICSS UART Transmission

The PRUSS_UART0 transmitter section includes a transmitter hold register (THR) mapped in the PRUSS_UART_RBR_THR_REGISTERS [7:0] DATA bitfield and a transmitter shift register (TSR). When the PRUSS_UART0 is in the FIFO mode, THR is a 16-byte FIFO. Transmitter section control is a function of the PRUSS_UART0 line control register PRUSS_UART_LINE_CONTROL_REGISTER. Based on the settings chosen in this register, the PRUSS_UART0 transmitter sends the following to the receiving device:

- 1 START bit
- 5, 6, 7, or 8 data bits
- 1 PARITY bit (optional)
- 1, 1.5, or 2 STOP bits

THR receives data from the internal data bus, and when TSR is ready, the PRUSS_UART0 moves the data from THR to TSR. The PRUSS_UART0 serializes the data in TSR and transmits the data on the UART0_TXD pin.

In the non-FIFO mode, if THR is empty and the THR empty (THRE) interrupt is enabled in the interrupt enable register PRUSS_UART_INTERRUPT_ENABLE_REGISTER, an interrupt is generated. This interrupt is cleared when a character is loaded into THR or the interrupt identification register PRUSS_UART_INTERRUPT_IDENTIFICATION_REGISTER_FIFO_CONTROL_REGISTER bitfield INTID is read. In the FIFO mode, the interrupt is generated when the transmitter FIFO is empty, and it is cleared when at least one byte is loaded into the FIFO or INTID bitfield is read.

30.7.3.6.2 PRU-ICSS UART Reception

The PRUSS_UART0 receiver section includes a receiver shift register (RSR) and a receiver buffer register (RBR) mapped in PRUSS_UART_RBR_THR_REGISTERS [7:0] DATA bitfield. When the PRUSS_UART0 is in the FIFO mode, RBR is a 16-byte FIFO. Timing is supplied by the 16× receiver clock. Receiver section control is a function of the PRUSS_UART0 line control register PRUSS_UART_LINE_CONTROL_REGISTER. Based on the settings chosen in this register, the PRUSS_UART0 receiver accepts the following from the transmitting device:

- 1 START bit
- 5, 6, 7, or 8 data bits
- 1 PARITY bit (optional)
- 1 STOP bit (any other STOP bits transferred with the above data are not detected)

RSR receives the data bits from the UART0_RXD pin. Then RSR concatenates the data bits and moves the resulting value into RBR (or the receiver FIFO), accessible in the PRUSS_UART_RBR_THR_REGISTERS [7:0] DATA register bitfield. The PRUSS_UART0 also stores three bits of error status information next to each received character, to record a parity error, framing error, or break.

In the non-FIFO mode, when a character is placed in RBR and the receiver data-ready interrupt is enabled in the interrupt enable register - PRUSS_UART_INTERRUPT_ENABLE_REGISTER, an interrupt is generated. This interrupt is cleared when the character is read from RBR. In the FIFO mode, the interrupt is generated when the FIFO is filled to the trigger level selected in the FIFO control MSB part of the register PRUSS_UART_INTERRUPT_IDENTIFICATION_REGISTER_FIFO_CONTROL_REGISTER, and it is cleared when the FIFO contents drop below the trigger level.

30.7.3.6.3 PRU-ICSS UART FIFO Modes

The following two modes can be used for servicing the receiver and transmitter FIFOs:

- FIFO interrupt mode. The FIFO is enabled and the associated interrupts are enabled. Interrupts are sent to the CPU to indicate when specific events occur.
- FIFO poll mode. The FIFO is enabled but the associated interrupts are disabled. The CPU polls status bits to detect specific events.

Copyright © 2015–2017, Texas Instruments Incorporated

Because the receiver FIFO and the transmitter FIFO are controlled separately, either one or both can be placed into the interrupt mode or the poll mode.

30.7.3.6.3.1 PRU-ICSS UART FIFO Interrupt Mode

When the receiver FIFO is enabled in the FIFO control register (FCR), mapped in the MSB part of the register PRUSS_UART_INTERRUPT_IDENTIFICATION_REGISTER_FIFO_CONTROL_REGISTER, and the receiver interrupts are enabled in the interrupt enable register PRUSS_UART_INTERRUPT_ENABLE_REGISTER, the interrupt mode is selected for the receiver FIFO. The following are important points about the receiver interrupts:

- The receiver data-ready interrupt is issued to the CPU when the FIFO has reached the trigger level that is programmed in FCR. It is cleared when the CPU or the DMA controller reads enough characters from the FIFO such that the FIFO drops below its programmed trigger level.
- The receiver line status interrupt is generated in response to an overrun error, a parity error, a framing error, or a break. This interrupt has higher priority than the receiver data-ready interrupt. For details, see Section 30.7.3.4.
- The data-ready (DR) bit in the line status register (LSR) - PRUSS_UART_LINE_STATUS_REGISTER, indicates the presence or absence of characters in the receiver FIFO. The DR bit is set when a character is transferred from the receiver shift register (RSR) to the empty receiver FIFO. The DR bit remains set until the FIFO is empty again.
- A receiver time-out interrupt occurs if all of the following conditions exist:
  - At least one character is in the FIFO,
  - The most recent character was received more than four continuous character times ago. A character time is the time allotted for 1 START bit, *n* data bits, 1 PARITY bit, and 1 STOP bit, where *n* depends on the word length selected with the WLS0 and WLS1 bits of the line control register PRUSS_UART_LINE_CONTROL_REGISTER. See Table 30-314.
  - The most recent read of the FIFO has occurred more than four continuous character times before.
- Character times are calculated by using the baud rate.
- When a receiver time-out interrupt has occurred, it is cleared and the time-out timer is cleared when the CPU or the EDMA controller reads one character from the receiver FIFO. The interrupt is also cleared if a new character is received in the FIFO or if the URRST bit is cleared in the power and emulation management register PRUSS_UART_POWERMANAGEMENT_AND_EMULATION_REGISTER.
- If a receiver time-out interrupt has not occurred, the time-out timer is cleared after a new character is received or after the CPU or EDMA reads the receiver FIFO.

When the transmitter FIFO is enabled in PRUSS_UART_INTERRUPT_IDENTIFICATION_REGISTER_FIFO_CONTROL_REGISTER [0] IPEND_FIFOEN bit and the transmitter holding register empty (THRE) interrupt is enabled in PRUSS_UART_INTERRUPT_ENABLE_REGISTER[1] ETBEI bit, the interrupt mode is selected for the transmitter FIFO. The THRE interrupt occurs when the transmitter FIFO is empty. It is cleared when the transmitter hold register (THR) PRUSS_UART_RBR_THR_REGISTERS [7:0] DATA bitfield is loaded (1 to 16 characters may be written to the transmitter FIFO while servicing this interrupt) or the interrupt identification register INTID bitfield is read in the PRUSS_UART_INTERRUPT_IDENTIFICATION_REGISTER_FIFO_CONTROL_REGISTER.

Table 30-314. Character Time for Word Lengths

Word Length (*n*)	Character Time	Four Character Times
5	Time for 8 bits	Time for 32 bits
6	Time for 9 bits	Time for 36 bits
7	Time for 10 bits	Time for 40 bits
8	Time for 11 bits	Time for 44 bits

Copyright © 2015–2017, Texas Instruments Incorporated

30.7.3.6.3.2 PRU-ICSS UART FIFO Poll Mode

When the receiver FIFO is enabled in the FIFO control register (via setting the PRUSS_UART_INTERRUPT_IDENTIFICATION_REGISTER_FIFO_CONTROL_REGISTER [0] IPEND_FIFOEN to 0b1) and the receiver interrupts are disabled in the interrupt enable register (PRUSS_UART_INTERRUPT_ENABLE_REGISTER), the poll mode is selected for the receiver FIFO. Similarly, when the transmitter FIFO is enabled via setting the same bit (PRUSS_UART_INTERRUPT_IDENTIFICATION_REGISTER_FIFO_CONTROL_REGISTER [0] IPEND_FIFOEN to 0b1) and the transmitter interrupts are disabled, the transmitted FIFO is in the poll mode. In the poll mode, the CPU detects events by checking bits in the line status register - PRUSS_UART_LINE_STATUS_REGISTER:

- The PRUSS_UART_LINE_STATUS_REGISTER[7] RXFIFOE bit indicates whether there are any errors in the receiver FIFO.
- The PRUSS_UART_LINE_STATUS_REGISTER[6] TEMT bit indicates that both the transmitter holding register (THR) and the transmitter shift register (TSR) are empty.
- The PRUSS_UART_LINE_STATUS_REGISTER[5] THRE bit indicates when THR (mapped in the PRUSS_UART_RBR_THR_REGISTERS [7:0] DATA bitfield) is empty.
- The following PRUSS_UART_LINE_STATUS_REGISTER bits specify which error or errors have occurred:
  - PRUSS_UART_LINE_STATUS_REGISTER[4] BI - Break Interrupt
  - PRUSS_UART_LINE_STATUS_REGISTER[3] FE – Framing Error
  - PRUSS_UART_LINE_STATUS_REGISTER[2] PE – Parity Error
  - PRUSS_UART_LINE_STATUS_REGISTER[1] OE – Overrun Error
- The PRUSS_UART_LINE_STATUS_REGISTER[0] DR (data-ready) bit is set as long as there is at least one byte in the receiver FIFO.

Also, in the FIFO poll mode:

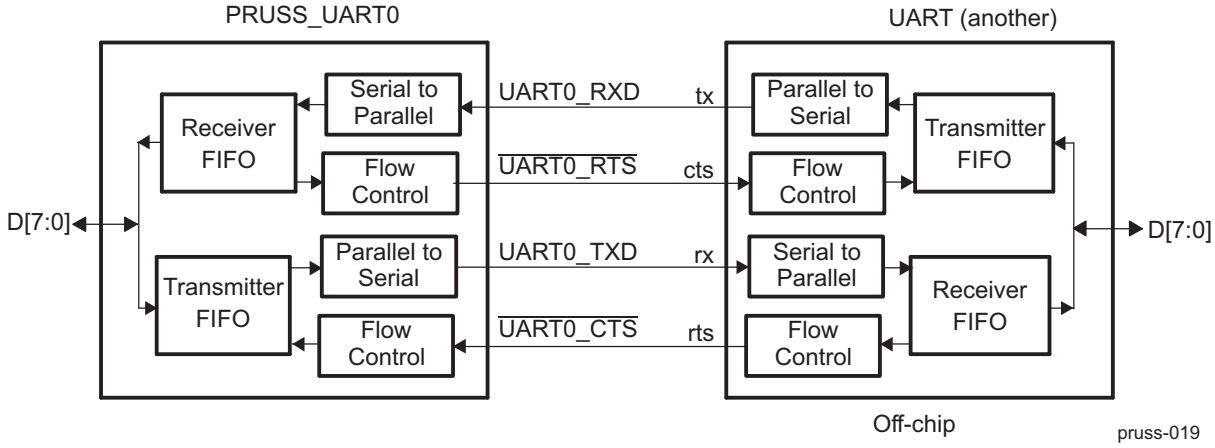
- The interrupt identification register (INTID) bitfields are not affected by any events because the interrupts are disabled.
- The PRUSS_UART0 does not indicate when the receiver FIFO trigger level is reached or when a receiver time-out occurs.

30.7.3.6.4 PRU-ICSS UART Autoflow Control

The PRUSS_UART0 can employ autoflow control by connecting the $\overline{\text{PRUSS_UART0_CTS}}$ and $\overline{\text{PRUSS_UART0_RTS}}$ signals. The $\overline{\text{PRUSS_UART0_CTS}}$ input must be active before the transmitter FIFO can transmit data. The $\overline{\text{PRUSS_UART0_RTS}}$ becomes active when the receiver needs more data and notifies the sending device. When $\overline{\text{PRUSS_UART0_RTS}}$ is connected to $\overline{\text{PRUSS_UART0_CTS}}$, data transmission does not occur unless the receiver FIFO has space for the data. Therefore, when two UARTs are connected as shown in Figure 30-35 with autoflow enabled, overrun errors are eliminated.

Copyright © 2015–2017, Texas Instruments Incorporated

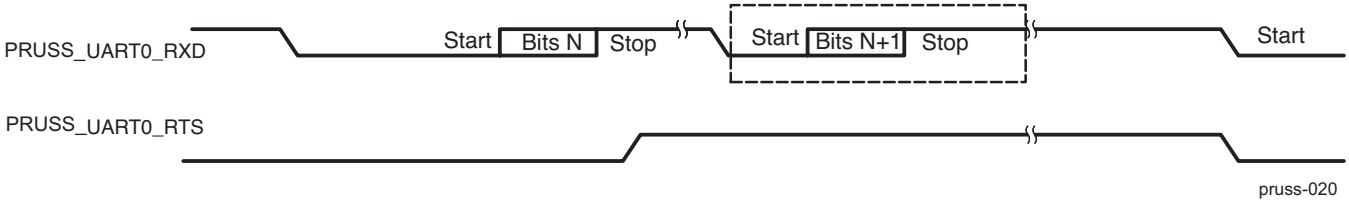
Figure 30-35. UART Interface Using Autoflow Diagram



30.7.3.6.4.1 PRU-ICSS UART Signal UART0_RTS Behavior

PRUSS_UART0_RTS data flow control originates in the receiver block (see Figure 30-33). When the receiver FIFO level reaches a trigger level of 1, 4, 8, or 14 (see Figure 30-36), PRUSS_UART0_RTS is deasserted. The sending UART may send an additional byte after the trigger level is reached (assuming the sending UART has another byte to send), because it may not recognize the deassertion of PRUSS_UART0_RTS until after it has begun sending the additional byte. For trigger level 1, 4, and 8, PRUSS_UART0_RTS is automatically reasserted once the receiver FIFO is emptied. For trigger level 14, PRUSS_UART0_RTS is automatically reasserted once the receiver FIFO drops below the trigger level.

Figure 30-36. Autoflow Functional Timing Waveforms for PRUSS_UART0_RTS



(1) N = Receiver FIFO trigger level.

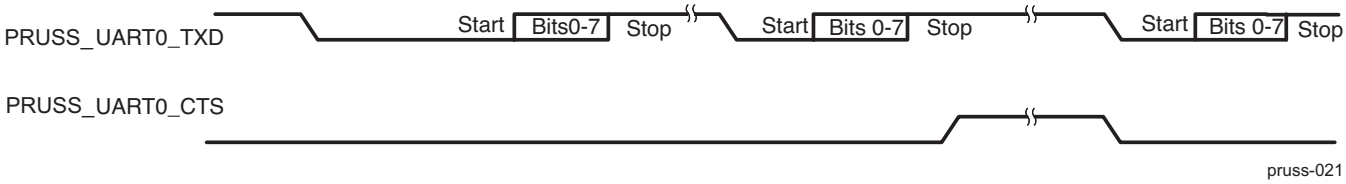
(2) The two blocks in dashed lines cover the case where an additional byte is sent.

30.7.3.6.4.2 PRU-ICSS UART Signal PRUSS_UART0_CTS Behavior

The transmitter checks PRUSS_UART0_CTS before sending the next data byte. If PRUSS_UART0_CTS is active, the transmitter sends the next byte. To stop the transmitter from sending the following byte, PRUSS_UART0_CTS must be released before the middle of the last STOP bit that is currently being sent (see Figure 30-37). When flow control is enabled, PRUSS_UART0_CTS level changes do not trigger interrupts because the device automatically controls its own transmitter. Without autoflow control, the transmitter sends any data present in the transmitter FIFO and a receiver overrun error may result.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 30-37. Autoflow Functional Timing Waveforms for $\overline{\text{PRUSS_UART0_CTS}}$



(1) When $\overline{\text{PRUSS_UART0_CTS}}$ is active (low), the transmitter keeps sending serial data out.

(2) When $\overline{\text{PRUSS_UART0_CTS}}$ goes high before the middle of the last STOP bit of the current byte, the transmitter finishes sending the current byte but it does not send the next byte.

(3) When $\overline{\text{PRUSS_UART0_CTS}}$ goes from high to low, the transmitter begins sending data again.

30.7.3.6.5 PRU-ICSS UART Loopback Control

The PRUSS_UART0 can be placed in the diagnostic mode using the LOOP bit in the modem control register - PRUSS_UART_MODEM_CONTROL_REGISTER, which internally connects the PRUSS_UART0 output back to the PRUSS_UART0's input. In this mode, the transmit and receive data paths, the transmitter and receiver interrupts, and the modem control interrupts can be verified without connecting to another UART.

30.7.3.7 PRU-ICSS UART Initialization

The following steps are required to initialize the PRUSS_UART0:

1. Perform the necessary device pin multiplexing setup (see your device-specific data manual).
2. Set the desired baud rate by writing the appropriate clock divisor values to the divisor latch registers PRUSS_UART_DIVISOR_REGISTER_MSB_ [7:0] DLH and PRUSS_UART_DIVISOR_REGISTER_LSB_ [7:0] DLL.
3. If the FIFOs will be used, select the desired trigger level and enable the FIFOs by writing the appropriate values to the FIFO control register. The PRUSS_UART_INTERRUPT_IDENTIFICATION_REGISTER_FIFO_CONTROL_REGISTER[0] IPEND_FIFOEN bit must be set first, before the other bits in this register are configured.
4. Choose the desired protocol settings by writing the appropriate values to the line control register PRUSS_UART_LINE_CONTROL_REGISTER.
5. If autoflow control is desired, write appropriate values to the modem control register PRUSS_UART_MODEM_CONTROL_REGISTER.
6. Choose the desired response to emulation suspend events by configuring the FREE bit and enable the PRUSS_UART0 by setting the UTRST and URRST bits in the power and emulation management register -PRUSS_UART_POWERMANAGEMENT_AND_EMULATION_REGISTER.

30.7.3.8 PRU-ICSS UART Exception Processing

30.7.3.8.1 PRU-ICSS UART Divisor Latch Not Programmed

Since the processor reset signal has no effect on the divisor latch, the divisor latch will have an unknown value after power up. If the divisor latch is not programmed after power up, the baud clock (BCLK) will not operate and will instead be set to a constant logic 1 state.

The divisor latch values should always be reinitialized following a processor reset.

30.7.3.8.2 Changing Operating Mode During Busy Serial Communication of PRU-ICSS UART

Since the serial link characteristics are based on how the control registers are programmed, the PRUSS_UART0 will expect the control registers to be static while it is busy engaging in a serial communication. Therefore, changing the control registers while the module is still busy communicating with another serial device will most likely cause an error condition and should be avoided.

Address Offset	0x0000 0000		
Physical Address	0x4B22 8000 0x4B2A 8000	**Instance**	PRUSS1_UART PRUSS2_UART
Description	In the non-FIFO mode, when a character is placed in Receiver buffer register and the receiver data-ready interrupt is enabled (DR = 1 in Interrupt identification register), an interrupt is generated. This interrupt is cleared when the character is read from Receiver buffer register. In the FIFO mode, the interrupt is generated when the FIFO is filled to the trigger level selected in the FIFO control register, and it is cleared when the FIFO contents drop below the trigger level. In the non-FIFO mode, if Transmitter holding register is empty and the THR empty (THRE) interrupt is enabled (ETBEI = 1 in Interrupt enable register), an interrupt is generated. This interrupt is cleared when a character is loaded into Transmitter holding register or the Interrupt identification register is read. In the FIFO mode, the interrupt is generated when the transmitter FIFO is empty, and it is cleared when at least one byte is loaded into the FIFO or Interrupt identification register is read.

Address Offset	0x0000 0008		
Physical Address	0x4B22 8008 0x4B2A 8008	**Instance**	PRUSS1_UART PRUSS2_UART
Description	The Interrupt identification register is a read-only register at the same address as the FIFO control register, which is a write-only register. When an interrupt is generated and enabled in the Interrupt enable register, Interrupt identification register indicates that an interrupt is pending in the IPEND bit and encodes the type of interrupt in the INTID bits. Reading Interrupt identification register clears any THR empty (THRE) interrupts that are pending. The FIFOEN bit in Interrupt identification register can be checked to determine whether the UART is in the FIFO mode or the non-FIFO mode. Use FIFO control register to enable and clear the FIFOs and to select the receiver FIFO trigger level. The FIFOEN bit in FIFO control register must be set to 1 before other FIFO control register bits are written to or the FIFO control register bits are not programmed.

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Reserved	R	0x0
7	DLAB	Divisor latch access bit. The divisor latch registers (DLL and DLH) can be accessed at dedicated addresses or at addresses shared by RBR, THR, and IER. Using the shared addresses requires toggling DLAB to change which registers are selected. If you use the dedicated addresses, you can keep DLAB = 0. 0x0: Allows access to the receiver buffer register (RBR), the transmitter holding register (THR), and the interrupt enable register (IER) selected. At the address shared by RBR, THR, and DLL, the CPU can read from RBR and write to THR. At the address shared by IER and DLH, the CPU can read from and write to IER. 0x1: Allows access to the divisor latches of the baud generator during a read or write operation (DLL and DLH). At the address shared by RBR, THR, and DLL, the CPU can read from and write to DLL. At the address shared by IER and DLH, the CPU can read from and write to DLH.	RW	0x0
6	BC	Break control. 0x0: Break condition is disabled. 0x1: Break condition is transmitted to the receiving UART. A break condition is a condition where the UARTn_TXD signal is forced to the spacing (cleared) state.	RW	0x0
5	SP	Stick parity. The SP bit works in conjunction with the EPS and PEN bits. The relationship between the SP, EPS, and PEN bits is summarized in Table 30-308. 0x0: Stick parity is disabled. 0x1: Stick parity is enabled. • When odd parity is selected (EPS = 0), the PARITY bit is transmitted and checked as set. • When even parity is selected (EPS = 1), the PARITY bit is transmitted and checked as cleared.	RW	0x0
4	EPS	Even parity select. Selects the parity when parity is enabled (PEN = 1). The EPS bit works in conjunction with the SP and PEN bits. The relationship between the SP, EPS, and PEN bits is summarized in Table 30-308. 0x0: Odd parity is selected (an odd number of logic 1s is transmitted or checked in the data and PARITY bits). 0x1: Even parity is selected (an even number of logic 1s is transmitted or checked in the data and PARITY bits).	RW	0x0
3	PEN	Parity enable. The PEN bit works in conjunction with the SP and EPS bits. The relationship between the SP, EPS, and PEN bits is summarized in Table 30-308. 0x0: No PARITY bit is transmitted or checked. 0x1: Parity bit is generated in transmitted data and is checked in received data between the last data word bit and the first STOP bit.	RW	0x0
2	STB	Number of STOP bits generated. STB specifies 1, 1.5, or 2 STOP bits in each transmitted character. When STB = 1, the WLS bit determines the number of STOP bits. The receiver clocks only the first STOP bit, regardless of the number of STOP bits selected. The number of STOP bits generated is summarized in Table 30-309. 0x0: 1 STOP bit is generated. 0x1: WLS bit determines the number of STOP bits: • When WLS = 0, 1.5 STOP bits are generated. • When WLS = 1h, 2h, or 3h, 2 STOP bits are generated.	RW	0x0

Address Offset	0x0000 0014		
Physical Address	0x4B22 8014 0x4B2A 8014	**Instance**	PRUSS1_UART PRUSS2_UART
Description	The Line status register provides information to the CPU concerning the status of data transfers. Line status register is intended for read operations only; do not write to this register. Bits 1 through 4 record the error conditions that produce a receiver line status interrupt.		
Type	R		

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RESERVED																								RXFIFOE	TEMT	THRE	BI	FE	PE	OE	DR

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Reserved	R	0x0
7	RXFIFOE	Receiver FIFO error. **In non-FIFO mode:** 0x0: There has been no error, or RXFIFOE was cleared because the CPU read the erroneous character from the receiver buffer register (RBR). 0x1: There is a parity error, framing error, or break indicator in the receiver buffer register (RBR). **In FIFO mode:** 0x0: There has been no error, or RXFIFOE was cleared because the CPU read the erroneous character from the receiver FIFO and there are no more errors in the receiver FIFO. 0x1: At least one parity error, framing error, or break indicator in the receiver FIFO.	R	0x0
6	TEMT	Transmitter empty (TEMT) indicator. **In non-FIFO mode:** 0x0: Either the transmitter holding register (THR) or the transmitter shift register (TSR) contains a data character. 0x1: Both the transmitter holding register (THR) and the transmitter shift register (TSR) are empty. **In FIFO mode:** 0x0: Either the transmitter FIFO or the transmitter shift register (TSR) contains a data character. 0x1: Both the transmitter FIFO and the transmitter shift register (TSR) are empty.	R	0x1
5	THRE	Transmitter holding register empty (THRE) indicator. If the THRE bit is set and the corresponding interrupt enable bit is set (ETBEI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0x0: Transmitter holding register (THR) is not empty. THR has been loaded by the CPU. 0x1: Transmitter holding register (THR) is empty (ready to accept a new character). The content of THR has been transferred to the transmitter shift register (TSR). **In FIFO mode:** 0x0: Transmitter FIFO is not empty. At least one character has been written to the transmitter FIFO. You can write to the transmitter FIFO if it is not full. 0x1: Transmitter FIFO is empty. The last character in the FIFO has been transferred to the transmitter shift register (TSR).	R	0x1

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
4	BI	Break indicator. The BI bit is set whenever the receive data input (UARTn_RXD) was held low for longer than a full-word transmission time. A full-word transmission time is defined as the total time to transmit the START, data, PARITY, and STOP bits. If the BI bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0x0: No break has been detected, or the BI bit was cleared because the CPU read the erroneous character from the receiver buffer register (RBR). 0x1: A break has been detected with the character in the receiver buffer register (RBR). **In FIFO mode:** 0x0: No break has been detected, or the BI bit was cleared because the CPU read the erroneous character from the receiver FIFO and the next character to be read from the FIFO has no break indicator. 0x1: A break has been detected with the character at the top of the receiver FIFO.	R	0x0
3	FE	Framing error (FE) indicator. A framing error occurs when the received character does not have a valid STOP bit. In response to a framing error, the UART sets the FE bit and waits until the signal on the RX pin goes high. Once the RX signal goes high, the receiver is ready to detect a new START bit and receive new data. If the FE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0x0: No framing error has been detected, or the FE bit was cleared because the CPU read the erroneous data from the receiver buffer register (RBR). 0x1: A framing error has been detected with the character in the receiver buffer register (RBR). **In FIFO mode:** 0x0: No framing error has been detected, or the FE bit was cleared because the CPU read the erroneous data from the receiver FIFO and the next character to be read from the FIFO has no framing error. 0x1: A framing error has been detected with the character at the top of the receiver FIFO.	R	0x0
2	PE	Parity error (PE) indicator. A parity error occurs when the parity of the received character does not match the parity selected with the EPS bit in the line control register (LCR). If the PE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0x0: No parity error has been detected, or the PE bit was cleared because the CPU read the erroneous data from the receiver buffer register (RBR). 0x1: A parity error has been detected with the character in the receiver buffer register (RBR). **In FIFO mode:** 0x0: No parity error has been detected, or the PE bit was cleared because the CPU read the erroneous data from the receiver FIFO and the next character to be read from the FIFO has no parity error. 0x1: A parity error has been detected with the character at the top of the receiver FIFO.	R	0x0

Bits	Field Name	Description	Type	Reset
1	OE	Overrun error (OE) indicator. An overrun error in the non-FIFO mode is different from an overrun error in the FIFO mode. If the OE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0x0: No overrun error has been detected, or the OE bit was cleared because the CPU read the content of the line status register (LSR). 0x1: Overrun error has been detected. Before the character in the receiver buffer register (RBR) could be read, it was overwritten by the next character arriving in RBR. **In FIFO mode:** 0x0: No overrun error has been detected, or the OE bit was cleared because the CPU read the content of the line status register (LSR). 0x1: Overrun error has been detected. If data continues to fill the FIFO beyond the trigger level, an overrun error occurs only after the FIFO is full and the next character has been completely received in the shift register. An overrun error is indicated to the CPU as soon as it happens. The new character overwrites the character in the shift register, but it is not transferred to the FIFO.	R	0x0
0	DR	Data-ready (DR) indicator for the receiver. If the DR bit is set and the corresponding interrupt enable bit is set (ERBI = 1 in IER), an interrupt request is generated. **In non-FIFO mode:** 0x0: Data is not ready, or the DR bit was cleared because the character was read from the receiver buffer register (RBR). 0x1: Data is ready. A complete incoming character has been received and transferred into the receiver buffer register (RBR). **In FIFO mode:** 0x0: Data is not ready, or the DR bit was cleared because all of the characters in the receiver FIFO have been read. 0x1: Data is ready. There is at least one unread character in the receiver FIFO. If the FIFO is empty, the DR bit is set as soon as a complete incoming character has been received and transferred into the FIFO. The DR bit remains set until the FIFO is empty again.	R	0x0

Bits	Field Name	Description	Type	Reset
31:8	RESERVED	Reserved	R	0x0
7	CD	Complement of the Carrier Detect input. When the UART is in the diagnostic test mode (loopback mode MCR[4] = 1), this bit is equal to the MCR bit 3 (OUT2).	R	0x0
6	RI	Complement of the Ring Indicator input. When the UART is in the diagnostic test mode (loopback mode MCR[4] = 1), this bit is equal to the MCR bit 2 (OUT1).	R	0x0
5	DSR	Complement of the Data Set Ready input. When the UART is in the diagnostic test mode (loopback mode MCR[4] = 1), this bit is equal to the MCR bit 0 (DTR).	R	0x0
4	CTS	Complement of the Clear To Send input. When the UART is in the diagnostic test mode (loopback mode MCR[4] = 1), this bit is equal to the MCR bit 1 (RTS).	R	0x0
3	DCD	Change in DCD indicator bit. DCD indicates that the DCD input has changed state since the last time it was read by the CPU. When DCD is set and the modem status interrupt is enabled, a modem status interrupt is generated.	R	0x0
2	TERI	Trailing edge of RI (TERI) indicator bit. TERI indicates that the RI input has changed from a low to a high. When TERI is set and the modem status interrupt is enabled, a modem status interrupt is generated.	R	0x0
1	DDSR	Change in DSR indicator bit. DDSR indicates that the DSR input has changed state since the last time it was read by the CPU. When DDSR is set and the modem status interrupt is enabled, a modem status interrupt is generated.	R	0x0
0	DCTS	Change in CTS indicator bit. DCTS indicates that the CTS input has changed state since the last time it was read by the CPU. When DCTS is set (autoflow control is not enabled and the modem status interrupt is enabled), a modem status interrupt is generated. When autoflow control is enabled, no interrupt is generated.	R	0x0

Address Offset	0x0000 0020		
Physical Address	0x4B22 8020 0x4B2A 8020	**Instance**	PRUSS1_UART PRUSS2_UART
Description	Two 8-bit register fields (DLL and DLH), called divisor latches, store the 16-bit divisor for generation of the baud clock in the baud generator. DLH holds the most-significant bits of the divisor, and DLL holds the least-significant bits of the divisor. These divisor latches must be loaded during initialization of the UART in order to ensure desired operation of the baud generator. Writing to the divisor latches results in two wait states being inserted during the write access while the baud generator is loaded with the new value.

30.8 PRU-ICSS eCAP Module

NOTE: PRU-ICSS2 ECAP is not supported on the AM570x family of devices.

30.8.1 PRU-ICSS eCAP Functional Description

A single instance of an **enhanced capture** event module is integrated in the device PRU-ICSS1 subsystem - PRUSS1_eCAP_0 and PRU-ICSS2 subsystem - PRUSS2_eCAP_0.

For more details on the PRUSS1_eCAP_0 and PRUSS2_eCAP_0 I/O signals available at device level, refer to the Section 30.2. For PRUSS1_eCAP_0 and PRUSS2_eCAP_0 integration details and functionalities controlled at PRU-ICSS top level (functional clock control, etc.), refer to the Section 30.3 and the Section 30.4 .

NOTE: The PRUSS1_eCAP_0 and PRUSS2_eCAP_0 "SYNCIn" hardware event synchronization input and "SYNCOut" hardware synchronization output are NOT implemented in the device PRU-ICSS1 and PRU-ICSS2, respectively. However, a software-forced synchronization via bit PRUSS_ECAP_ECCTL2[8] SWSYNC, can be used as an alternative, provided that PRUSS_ECAP_ECCTL2[5] SYNCI_EN bit is set to 0b1.

For full description of the PRUSS1_eCAP_0 and PRUSS2_eCAP_0 modules functionalities, refer to the Section 29.3, *Enhanced Capture (eCAP) Module* of the Chapter 29, *Pulse-Width Modulation Subsystem*.

30.8.2 PRUSS_ECAP Register Manual

This section describes the registers of the PRUSS_eCAP_0 module.

Bits	Field Name	Description	Type	Reset
15:11	RESERVED		R	0x0
10	APWMPOL	APWM output polarity select. This is applicable only in APWM operating mode 0x0 = Output is active high (Compare value defines high time) 0x1 = Output is active low (Compare value defines low time)	RW	0x0

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
9	CAPAPWM	CAP/APWM operating mode select 0x0 = ECAP module operates in capture mode. This mode forces the following configuration. (a) Inhibits TSCNT resets via CTR = PRD event. (b) Inhibits shadow loads on PRUSS_ECAP_CAP1 and PRUSS_ECAP_CAP2 registers. (c) Permits user to enable PRUSS_ECAP_CAP1-PRUSS_ECAP_CAP4 register load. (d) ECAP input/APWM output pin operates as a capture input. 0x1 = ECAP module operates in APWM mode. This mode forces the following configuration. (a) Resets TSCNT on CTR = PRD event (period boundary). (b) Permits shadow loading on PRUSS_ECAP_CAP1 and PRUSS_ECAP_CAP2 registers. (c) Disables loading of time-stamps into PRUSS_ECAP_CAP1 - PRUSS_ECAP_CAP4 registers. (d) ECAP input/APWM ouput pin operates as a APWM output.	RW	0x0
8	SWSYNC	Software-forced Counter (TSCNT) Synchronizing. This provides a convenient software method to synchronize some or all ECAP time bases. In APWM mode, the synchronizing can also be done via the CTR = PRD event. Note: Selection CTR = PRD is meaningful only in APWM mode. However, you can choose it in CAP mode if you find doing so useful. 0x0 = Writing a zero has no effect. Reading always returns a zero 0x1 = Writing a one forces a TSCNT shadow load of current ECAP module and any ECAP modules down-stream providing the SYNCO_SEL bits are 1'b00. After writing a 1, this bit returns to a zero.	RW	0x0
7:6	SYNCO_SEL	Sync-Out Select 0x0 = Select sync-in event to be the sync-out signal (pass through) 0x1 = Select CTR = PRD event to be the sync-out signal 0x2 = Disable sync out signal 0x3 = Disable sync out signal	RW	0x0
5	SYNCI_EN	Counter (TSCNT) Sync-In select mode 0x0 = Disable sync-in option 0x1 = Enable counter (TSCNT) to be loaded from PRUSS_ECAP_CNTPHS register upon either a SYNCI signal or a S/W force event.	RW	0x0
4	TSCNTSTP	Time Stamp (TSCNT) Counter Stop (freeze) Control 0x0 = TSCNT stopped 0x1 = TSCNT free-running	RW	0x0
3	REARMRESET	One-Shot Re-Arming Control, that is, wait for stop trigger. Note: The re-arm function is valid in one shot or continuous mode. 0x0 = Has no effect (reading always returns a 0) 0x1 = Arms the one-shot sequence as follows: 1) Resets the Mod4 counter to zero. 2) Unfreezes the Mod4 counter. 3) Enables capture register loads.	RW	0x0

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
2:1	STOPVALUE	Stop value for one-shot mode. This is the number (between 1 and 4) of captures allowed to occur before the CAP (1 through 4) registers are frozen, that is, capture sequence is stopped. Wrap value for continuous mode. This is the number (between 1 and 4) of the capture register in which the circular buffer wraps around and starts again. Notes: STOPVALUE is compared to Mod4 counter and, when equal, the following two actions occur. (1) Mod4 counter is stopped (frozen). (2) Capture register loads are inhibited. In one-shot mode, further interrupt events are blocked until re-armed. 0x0 = Stop after Capture Event 1 in one-shot mode. Wrap after Capture Event 1 in continuous mode. 0x1 = Stop after Capture Event 2 in one-shot mode. Wrap after Capture Event 2 in continuous mode. 0x2 = Stop after Capture Event 3 in one-shot mode. Wrap after Capture Event 3 in continuous mode. 0x3 = Stop after Capture Event 4 in one-shot mode. Wrap after Capture Event 4 in continuous mode.	RW	0x3
0	CONTONESHT	Continuous or one-shot mode control (applicable only in capture mode) 0x0 = Operate in continuous mode 0x1 = Operate in one-shot mode	RW	0x0

30.9 PRU-ICSS MII RT Module

30.9.1 Introduction

The Real-time Media Independent Interface (MII_RT) provides a programmable I/O interface for the PRUs to access and control up to two MII ports. The MII_RT module can also be configured to push and pull data independent of the PRU cores.

NOTE: In order to guarantee the MII_RT IO timing values published in the device data manual, the PRUSS_GICLK clock must be configured for 200MHz (default value) and PRUSS_MII_RT_TXCFG0/1 must be set to 6h (non-default value).

30.9.1.1 Features

The PRU-ICSS MII_RT module supports:

- Two MII ports
  - Each MII port has:
    - 32-byte RX L1 FIFO
    - 64-byte RX L2 buffer
    - 96-byte TX L1 FIFO
  - Rate decoupling on TX L1 FIFO
  - Configurable pre-amble removal on RX L1 FIFO and insertion on TX L1 FIFO
  - Configurable TX L1 FIFO trigger (10 bits with 40 ns ticks)
- MII port multiplexer per direction to support line/ring structure
  - Link detection through RX_ERR
- Cyclic redundancy check (CRC)
  - CRC32 generation on TX path
  - CRC32 checker on RX path

30.9.1.2 Unsupported Features

The PRU-ICSS MII_RT module does not support:

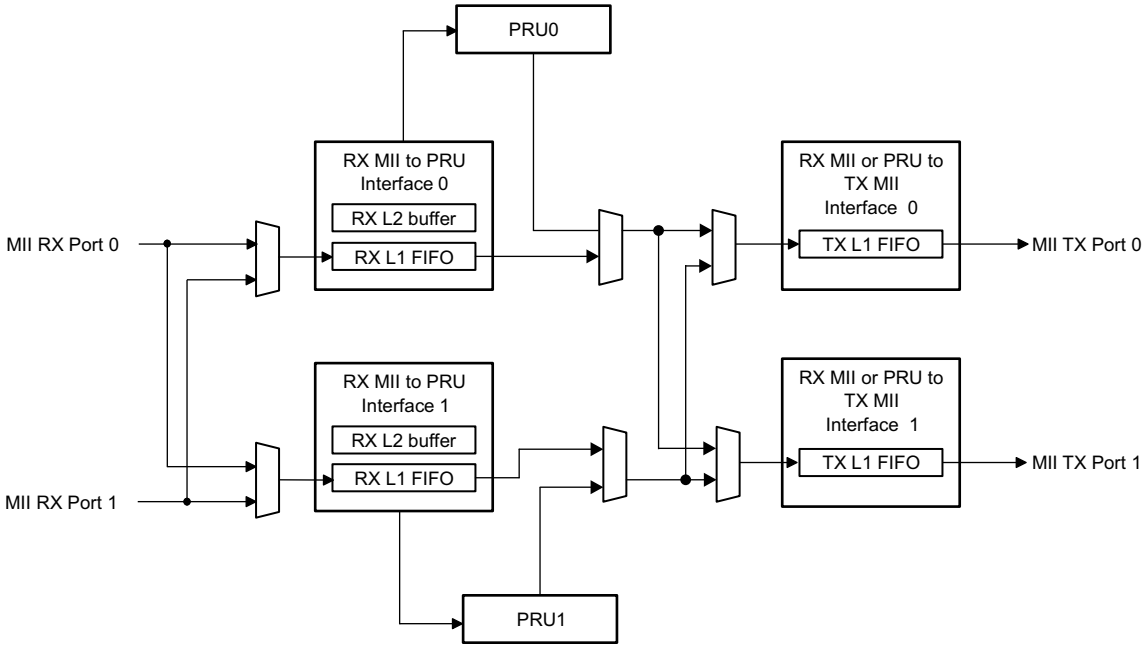
- Auto padding in TX L1 FIFO
- Dynamic TX multiplexer switching during packet handling
  - Can allow one PRU to handle both MII interfaces and a second PRU to manage the host and switch functions.

30.9.1.3 Block Diagram

Figure 30-38 shows the MII_RT in context of the PRU-ICSS. This diagram is a conceptual block diagram and does not necessarily reflect actual topologies.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 30-38. MII_RT Block Diagram



30.9.2 Functional Description

30.9.2.1 Data Path Configuration

The MII_RT module supports three basic data path configurations. These configurations are compared in Table 30-373 and described in the following sections.

Table 30-373. Data Path Configuration Comparison

Configuration	PRU Dependency	Data Servicing	Port-to-Port Latency
Auto-forward	Snoop only	One word in flight	Low
8- or 16-bit processing with on-the-fly modifications (RX L1)	Yes	One word or byte in flight	Low
32-byte double buffer or ping-pong processing (RX L2)	Yes	Multi-words in flight	Medium (application-dependent)

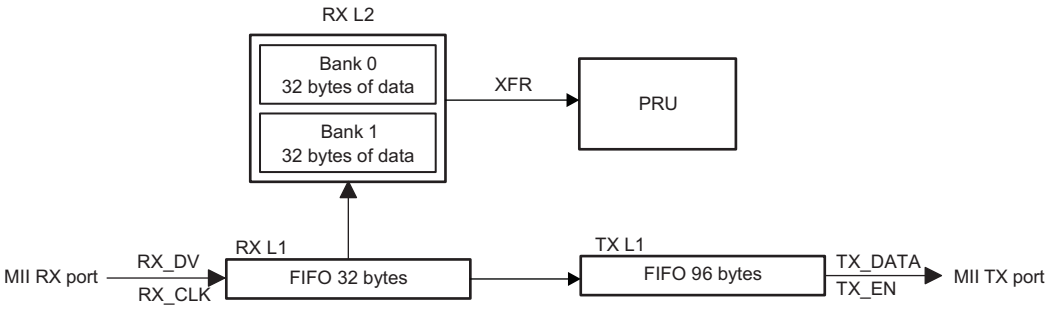
30.9.2.1.1 Auto-forward with Optional PRU Snoop

Data is automatically forwarded from the MII RX port to the MII TX port without manipulations, as shown in Figure 30-39. This configuration does not depend on the PRU core. However, it does support an option for PRU to snoop or monitor the received data through the RX L2, shown in Figure 30-40. The PRU does not access data and status bits through R31, and it does not modify and push data.

Figure 30-39. Auto-forward

Copyright © 2015–2017, Texas Instruments Incorporated

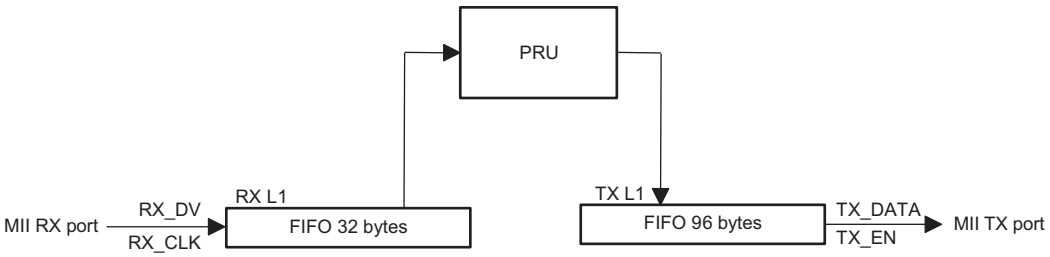
Figure 30-40. Auto-forward with PRU Snoop



30.9.2.1.2 8- or 16-bit Processing with On-the-Fly Modifications

This configuration services one byte or word in flight and has low latency. The PRU has the option to manipulate the received word and control popping data from the RX L1 FIFO and pushing it on the TX L1 FIFO.

Figure 30-41. 8- or 16-bit Processing with On-the-Fly Modifications

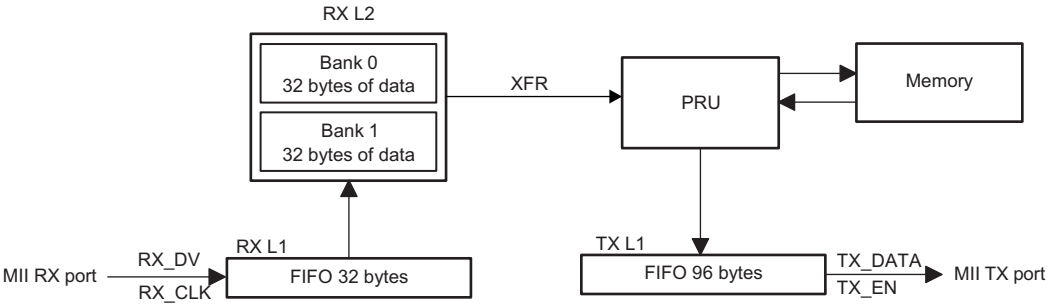


30.9.2.1.3 32-byte Double Buffer or Ping-Pong Processing

This configuration supports high bandwidth, high efficiency transactions. Often implementations using this mode permit relaxed servicing requirements allowing the PRU to manipulate the received data before transmitting.

Data received in this configuration is passed into the RX L2 buffer. The PRU reads multiple bytes of data from one of the RX L2 banks through the high bandwidth broadside interface and XFR instructions. The PRU can then store or manipulate data before pushing it to the TX L1 FIFO for transmission on the MII TX port.

Figure 30-42. 32-byte Double Buffer or Ping-Pong Processing



Copyright © 2015–2017, Texas Instruments Incorporated

30.9.2.2 Definition and Terms

30.9.2.2.1 Data Frame Structure

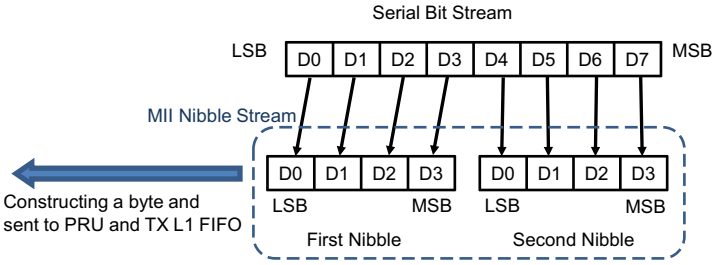
The data received and transmitted over MII conforms with the frame structure shown in Table 30-374.

Table 30-374. Frame Structure

Inter-frame	Preamble	Start of Frame Delimiter (SFD)	Data	Cyclic Redundancy Check (CRC)

The data following the SFD is formatted in a 4-bit nibble structure. Figure 30-43 illustrates the nibble order. The MSB arriving first is on the LSB side of a nibble. When receiving data, the MII_RT receive logic will wait for the next nibble to arrive before constructing a byte and delivering to the PRU.

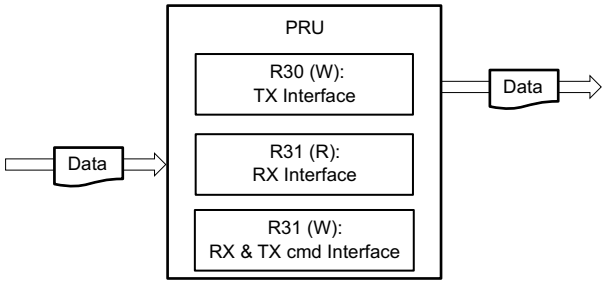
Figure 30-43. Data Nibble Structure



30.9.2.2.2 PRU R30 and R31

The PRU registers R30 and R31 are used to receive, transmit, and control the data for the PRU. As shown in Figure 30-44, the R31 is used to access data in the RX L1 FIFO, the R30 is used to transmit data from the PRU, and the R31 output is used the control the flow of receive and transmit. For more details about these registers, see the following sections.

Figure 30-44. PRU R30, R31 Operations

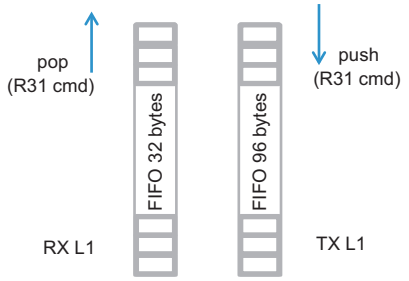


30.9.2.2.3 RX and TX L1 FIFO Data Movement

To advance the next data byte seen by R31, the PRU must pop the data from the RX L1 FIFO. Likewise, the PRU can push the data from R30 to the TX L1 FIFO. These operations are illustrated in Figure 30-45.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 30-45. Reading and Writing FIFO Data



30.9.2.2.4 CRC Computation

30.9.2.2.4.1 Receive CRC Computation

For the incoming data, the MII_RT calculates CRC32 and then compares against the value provided in the incoming frame. If there is a mismatch, the MII RT signals ERROR_CRC to the PRU. If a previous node or Ethernet device appended an error nibble, the CRC calculation of received packet will be wrong because the longer frame and the frame length will end at a 4-bit boundary instead of the usual 8-bit boundary. When RX_DV goes inactive on the 4-bit boundary, the interface will assert DATA_RDY and BYTE_RDY flag with the ERROR NIBBLE. The error event is also mapped into the PRU-ICSS INTC.

30.9.2.2.4.2 Transmit CRC Computation

For the outgoing data, the MII_RT calculates the CRC32 value and inserts it into outgoing packets. The CRC value computed on each MII transmit path is also available in memory map registers (MMRs) that can be read by the PRU and used primarily for debug and diagnostic purposes. The CRC is inserted into the outgoing packet based on the commands received through the R31 register of the PRU. The CRC will be inserted into the TX L1 FIFO, and there must be enough room to store the CRC value in the FIFO or else the FIFO will overflow. As Table 30-375 shows, the CRC programming model supports three sequences that provide more flexibility. Note “cmdR31” indicates write to the mentioned bits of the R31 command interface.

Table 30-375. TX CRC Programming Models

Option 1	Step 1: cmdR31 [TX_CRC_HIGH + TX_CRC_LOW + TX_EOF]
Option 2	Step 1: cmdR31 [TX_CRC_HIGH] Step 2: wait > 6 clocks (PRU cycles) Step 3: cmdR31 [TX_CRC_LOW + TX_EOF]
Option 3	Step 1: cmdR31 [TX_CRC_HIGH] Step 2: wait > 6 clocks (PRU cycles) Step 3: read PRUSS_MII_RT_TX_CRC0/1 Step 4: modify CRC[15:0] Step 5: cmdR31 [TX_PUSH16 + TX_EOF + TX_ERROR_NIBBLE]

30.9.2.3 RX MII Interface

30.9.2.3.1 RX MII Submodule Overview

The RX MII interface is composed of multiple submodules that process the incoming frames and pass receive data and status information into the PRU register R31. These submodules include:

- Latch received data
- Start of frame detection
- Start frame delimiter detection

Copyright © 2015–2017, Texas Instruments Incorporated

- CRC calculation and error detection
- Enhanced link detection through RX error detection

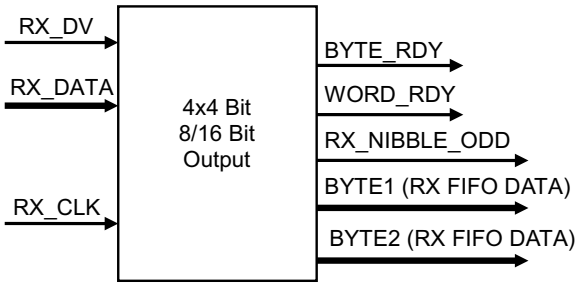
Table 30-376 includes more details about the internal signals and output of these submodules.

30.9.2.3.1.1 Receive Data Latch

The receive data from the MII interface is stored in the receive data FIFO which is 32 bytes. The PRU can access this data through the register R31. Depending on the configuration settings, the data can be latched on reception of one or two bytes. In each scheme, the configured number of nibbles is assembled before being copied into the PRU registers. Figure 30-46 shows the inputs and outputs of the data latch logic block.

The receiver logic in MII_RT can be programmed through the PRUSS_MII_RT_RXCFG0 and PRUSS_MII_RT_RXCFG1 registers to remove or retain the preamble + SFD from incoming frames.

Figure 30-46. RX Data Latch



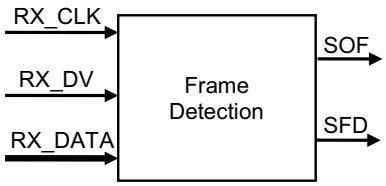
30.9.2.3.1.1.1 Start of Frame Detection

The start of frame detection logic tracks the frame boundaries and signals the beginning of a frame to other components of the PRU-ICSS. This logic detects two events:

- Start of Frame (SOF) event that occurs when Receive Data Valid MII signal is sampled high.
- Start of Frame Delimiter (SFD) event is seen on MII Receive Data bus.

These event triggers can be used to add timestamp to the frames. The notification for these events is available through R31 as well as through INTC which is integrated in the PRU-ICSS. Figure 30-47 shows the inputs and outputs of the start of frame detection logic block.

Figure 30-47. Start of Frame Detection



30.9.2.3.1.1.2 CRC Error Detection

For each incoming frame, the CRC is calculated by the MII_RT and compared against the CRC included in the frame. When the two values do not match, a CRC error is flagged. The ERROR_CRC indication is available in the register interface (PRU R31 Receive Interface) as well as in the FIFO interface (RX L2 Status Interface). It is also provided to the INTC which is integrated in the PRU-ICSS. Figure 30-48 shows the inputs and outputs of CRC error detection logic block.

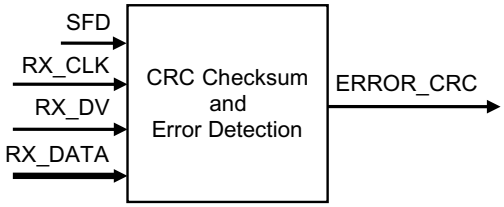
Figure 30-48. CRC Error Detection

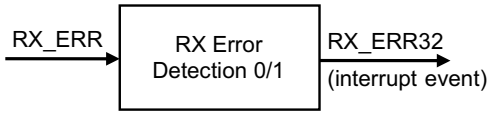


30.9.2.3.1.1.3 RX Error Detection and Action

The RX error detection logic tracks the receive error signaled by the physical layer and informs the PRU-ICSS INTC whenever an error is detected. Figure 30-49 shows the inputs and outputs of the RX error detection logic block. Note the following dependencies:

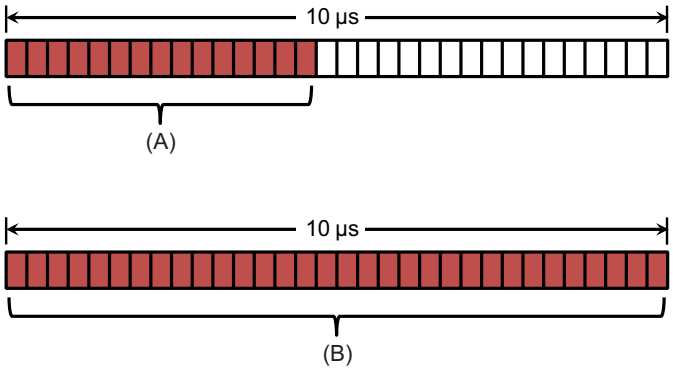
- RX_ERR signal is only sampled when RX_DV is asserted.
- All nibbles are discarded post RX_ERR event, including the nibble which had RX_ERR asserted. This state will remain until EOF occurs.
- Due to this fact, RX L1 FIFO and RX L2 FIFO will never receive any data with RX_ERR or post RX_ERR during that frame.

Figure 30-49. RX Error Detection



This submodule also keeps track of a running count of receive error events within a 10 µs error detection window, as shown in Figure 30-50. The INTC is notified when 32 or more events have occurred in a 10 µs error detection window. The error detection window is not a sliding window but a non-overlapping window with no specific initialization time with respect to incoming traffic. The timer starts its 10 µs counts immediately after de-assertion of reset to the MII_RT module.

Figure 30-50. Error Detection Window with Running Counter



A There are fewer than 32 consecutive error events in the 10 µs window. The detection module will not forward to the interrupt controller (INTC).

B There are more or equal to 32 error events in the 10 µs window. The detection module will notify the interrupt controller (INTC).

30.9.2.3.1.2 RX Data Path Options to PRU

There are two data path options for delivering received data to the PRU, described further in the subsequent sections:

1. RX MII port → RX L1 FIFO → PRU (one word in flight)
2. RX MII port → RX L1 FIFO → RX L2 buffer → PRU (multi-word in flight)

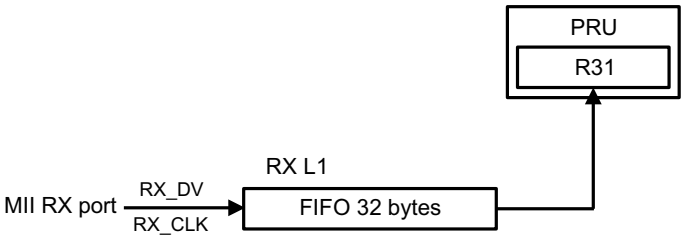
Copyright © 2015–2017, Texas Instruments Incorporated

Once the PRU has received RX data, the PRU can both manipulate received data or send data to the TX MII Interface.

30.9.2.3.1.2.1 RX MII Port → RX L1 FIFO → PRU

The RX L1 FIFO to PRU interface is depicted in Figure 30-51. In this mode, the data received from the MII interface is fed into the 32-byte RX L1 FIFO. The first data byte into the FIFO is automatically available in R31 of the PRU. Therefore, the PRU firmware can directly operate on this data without having to read it in a separate instruction. This allows the PRU to access receive data with low latency.

Figure 30-51. RX L1 to PRU Interface



When the new data is received, the PRU is provided with up to two bytes at a time in the R31 register, as shown in Figure 30-52. Once the PRU processes the incoming data, it instructs the MII_RT by writing to the R31 command interface bits to pop one or two bytes of data from the 32-byte RX FIFO. The pop operation causes current contents of R31 to be refreshed with new data from the incoming packet. Each time the data is popped, the status bits change to indicate so. If the pop is completed and there is no new data, the status bits immediately change to indicate no new data. Note the current R31 content, including data, will be lost after issuing the pop operation. If this information needs to be accessed later, the PRU should store the existing R31 content before popping new data.

Figure 30-52. MII RX Data to PRU R31 (R) and RX FIFO

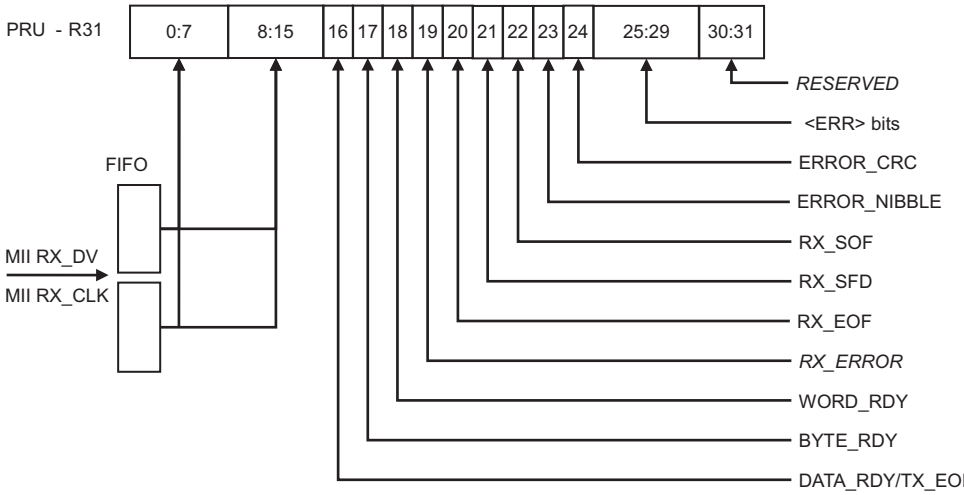


Table 30-376 describes the receive interface data and status contents provided by the R31 register. These contents are available when R31 is read. To configure this register, the PRU GPI mode should be set for MII_RT mode in the CFG register space. Note the following:

1. If the data from receive path is not read in time, it could cause an overflow event because the data is still continuously provided to the 32-byte receive FIFO. Due to the receive FIFO overflow, the data gets automatically discarded to avoid lack of space in the FIFO. At the same time, an interrupt is raised to the INTC through a system event (PRU<n>_RX_OVERFLOW). To detect an overflow condition, the PRU should poll for this system event condition and a RX RESET command through the R31 command interface is required to clear out from this condition. Note that the received Ethernet frame is corrupted and should not be used for further processing as bytes have been dropped due to the overflow condition. A FIFO reset is recommended.

Copyright © 2015–2017, Texas Instruments Incorporated

2. The receive data in the R31 register is available following synchronization to the PRU clock domain. So, there is a finite delay (120 ns) when data is available from MII interface and it is accessible to the PRU.
3. The receive FIFO also has the capability to be reset through software. When reset, all contents of receive FIFO are purged and it may result in the current frame not being received as expected. When a frame is being received and the PRU resets the RX FIFO, the remaining frame is not placed into the RX FIFO. However, any new frame arriving on the receive MII port will be stored in the FIFO.

Copyright © 2015–2017, Texas Instruments Incorporated

Table 30-376. PRU R31: Receive Interface Data and Status (Read Mode)

Bits	Field Name	Description
31:30	RESERVED	In case of register interface, these bits are provided to PRU by other modules in PRU-ICSS. From the MII_RT module point of view, these bits are always zero.
29	RX_MIN_FRM_CNT_ERR	RX_MIN_FRM_CNT_ERR is set to 1 when the count of total bytes of incoming frame is less than the value defined by RX_MIN_FRM_CNT. RX_MIN_FRM_CNT_ERR is cleared by RX_ERROR_CLR.
28	RX_MAX_FRM_CNT_ERR	RX_MAX_FRM_CNT_ERR is set to 1 when the count of total bytes of incoming frame is more than the value defined by RX_MAX_FRM_CNT_ERR. RX_MAX_FRM_CNT_ERR is cleared by RX_ERROR_CLR.
27	RX_EOF_ERROR	RX_EOF_ERROR is set to 1 when an RX_EOF event or RX_ERROR event occurs. RX_EOF_ERROR is cleared by RX_ EOF_CLR and/or RX_ ERROR_CLR.
26	RX_MAX_PRE_CNT_ERR	RX_MAX_PRE_CNT_ERR is set to 1 when the number of nibbles equaling 0x5 before SFD event (0xD5) is more than the value defined by PRUSS_MII_RT_RX_PCNT0/1 [RX_MAX_PCNT]. RX_MAX_PRE_CNT_ERR is cleared by RX_ERROR_CLR.
25	RX_ERR	RX_ERR is set to 1 when pr1_mii0/1_rxer is asserted while pr1_mii0/1_rxdv bit is set. RX_ERR is cleared by RX_ERROR_CLR.
24	ERROR_CRC	ERROR_CRC indicates that the frame has a CRC mismatch. This bit is valid when the RX_EOF bit is set. It should be noted that ERROR_CRC bit is ready in early status, which means it is calculated before data is available in RXL1 FIFO. ERROR_CRC is cleared by RX_ERROR_CLR.
23	ERROR_NIBBLE	ERROR_NIBBLE indicates that the frame ended in odd nibble. It should be considered valid only when the RX_EOF bit and pr1_mii0/1_rxdv are set. Nibble counter is enabled post SFD event. It should be noted that ERROR_NIBBLE bit is ready in early status, which means it is calculated before data is available in RXL1 FIFO. ERROR_NIBBLE is cleared by RX_ERROR_CLR.
22	RX_SOF	RX_SOF transitions from low to high when the frame data starts to arrive and pr1_mii0/1_rxdv is asserted. Note there will be a small sync delay of 0ns – 5ns. The recommended time to clear this bit via RX_SOF_CLR is at the end of frame (EOF). It should be noted that RX_SOF bit is ready in early status, which means it is calculated before data is available in RXL1 FIFO.
21	RX_SFD	RX_SFD transitions from low to high when the SFD sequence (0xD5) post RX_SOF is observed on the receive MII data. The recommended time to clear this bit via RX_SFD_CLR is at the end of frame (EOF). It should be noted that RX_SFD bit is ready in early status, which means it is calculated before data is available in RXL1 FIFO.
20	RX_EOF	RX_EOF indicates that the frame has ended and pr1_mii0/1_rxdv is de-asserted. It also validates the CRC match bit. Note there will be a small sync delay of 0ns – 5ns. It should be noted that RX_EOF bit is ready in early status, which means it is calculated before data is available in RXL1 FIFO. Note also if RX_L2_EOF_SCLR_DIS is set, then this flag will remain asserted when RX_L2 is enabled until RX_EOF_CLR.
19	RX_ERROR	RX_ERROR indicates one or more of the following errors occurred: • RX_MAX/MIN_FRM_CNT_ERR • RX_MAX/MIN_PRE_CNT_ERR • RX_ERR RX_ERROR is cleared by RX_ERROR_CLR.
18	WORD_RDY	WORD_RDY indicates that all four nibbles in R31 have valid data. There is a 2 clock cycle latency from the command RX_POP16 to WORD_RDY update. Therefore, firmware needs to insure it does not read WORD_RDY until 2 clock cycles after RX_POP16.
17	BYTE_RDY	BYTE_RDY indicates that the lower two nibbles in R31 have valid data. There is a 2 clock cycle latency from the command RX_POP8 to BYTE_RDY update. Therefore, PRU firmware needs to insure it does not read BYTE_RDY until 2 clock cycles after RX_POP8.

Copyright © 2015–2017, Texas Instruments Incorporated

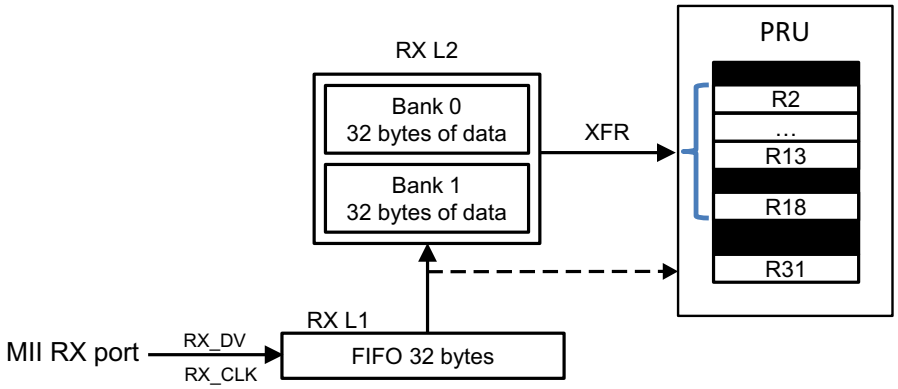
Table 30-376. PRU R31: Receive Interface Data and Status (Read Mode) (continued)

Bits	Field Name	Description
16	DATA_RDY/ TX_EOF	When RX_DATA_RDY_MODE_DIS = 0: DATA_RDY indicates there is valid data in R31 ready to be read. This bit goes to zero when the PRU does a POP8/16 and there is no new data left in the receive MII port. This bit is high if there is more receive data for PRU to read. There is a 2 clock cycle latency from the command RX_POP16/8 to WORD_RDY/BYTE_RDY update. Therefore, PRU firmware needs to insure it does not read BYTE_RDY/WORD_RDY until 2 clock cycles after RX_POP16/8. When RX_DATA_RDY_MODE_DIS = 1: TX_EOF indicates an TX EOF event (i.e. a 1 --> 0 transition on TX_EN) has occurred. After this bit has been set, a new TX frame can be loaded. This bit will clear when TX_RESET is set or when TX_FIFO is not empty.
15:8	BYTE1	Data Byte 1. This data is available such that it is safe to read by the PRU when the DATA_RDY/BYTE_RDY/WORD_RDY bits are asserted.
7:0	BYTE0	Data Byte 0. This data is available such that it is safe to read by the PRU when the DATA_RDY/BYTE_RDY/WORD_RDY bits are asserted.

30.9.2.3.1.2.2 RX MII Port → RX L1 FIFO → RX L2 Buffer → PRU

The RX L2 is an optional high performance buffer between the RX L1 FIFO and the PRU. Figure 30-53 illustrates the receive data path using RX L2 buffer. This data path is characterized by multi-word in flight transactions.

Figure 30-53. RX L2 to PRU Interface



The 64-byte RX L2 buffer is divided into two 32 byte banks, or ping/pong buffers. When the RX L2 is enabled, the incoming data from the MII RX port will transmit first to the 32 byte RX L1 FIFO. RX L1 pushes data into RX L2, starting when the first byte is ready until the final EOF marker. The RX L2 buffer does not apply any backpressure to the RX L1 FIFO. Therefore, it is the PRU firmware's responsibility to fetch the data in RX L2 before it is overwritten by the cyclic buffer. The RX L1 will remain near empty, with only one byte (nibble) stored.

Each RX L2 bank holds up to 32 bytes of data, and every four nibbles (or 16 bits) of data has a corresponding 8-bit status. The data and status information are stored in packed arrays. In each bank, R2 to R9 contains the data packed array and R10 to R13 contains the status packed array. Figure 30-54 shows the relationship of the data registers and status registers. The RX L2 status registers record status information about the received data, such as ERROR_CRC, RX_ERROR, STATUS_RDY, etc. The RX L2 status register details are described in Table 30-377. Note RX_RESET clears all Data and Status elements and resets R18.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 30-54. Data and Status Register Dependency

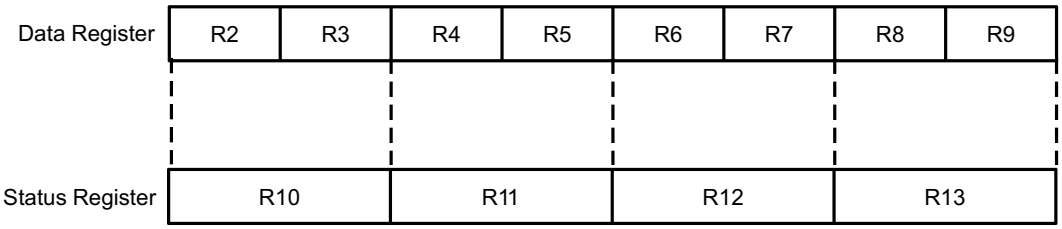


Table 30-377. RX L2 Status

Bit	Field Name	Description
7	ERROR_CRC	ERROR_CRC indicates that the frame has a CRC mismatch. This bit is valid when the RX_EOF bit is set. It should be noted that ERROR_CRC bit is ready in early status, which means it is calculated before data is available in RXL1 FIFO. ERROR_CRC will only be set for one entry, self clear on next entry.
6	ERROR_NIBBLE	ERROR_NIBBLE indicates that the frame ended in odd nibble. It should be considered valid only when the RX_EOF bit and pr1_mii0/1_rxdv are set. Nibble counter is enabled post SFD event. It should be noted that ERROR_NIBBLE bit is ready in early status, which means it is calculated before data is available in RXL1 FIFO. ERROR_NIBBLE will only be set for one entry, self clear on next entry.
5	RX_SOF	RX_SOF transitions from low to high when the frame data starts to arrive and pr1_mii0/1_rxdv is asserted. Note there will be a small sync delay of 0ns – 5ns. It should be noted that RX_SOF bit is ready in early status, which means it is calculated before data is available in RXL1 FIFO. RX_SOF will only be set for one entry, self clear on next entry.
4	RX_SFD	RX_SFD transitions from low to high when the SFD sequence (0xD5) post RX_SOF is observed on the receive MII data. It should be noted that RX_SFD bit is ready in early status, which means it is calculated before data is available in RXL1 FIFO. RX_SOF will only be set for one entry, self clear on next entry.
3	RX_EOF	RX_EOF indicates that the frame has ended and pr1_mii0/1_rxdv is de-asserted. It also validates the CRC match bit. Note there will be a small sync delay of 0ns – 5ns. It should be noted that RX_EOF bit is ready in early status, which means it is calculated before data is available in RXL1 FIFO. If RX_L2_EOF_SCLR_DIS = 1, then RX_EOF will remain set until RX_EOF_CLR event. Otherwise, RX_ERROR is self-clearing on next entry.
2	RX_ERROR	RX_ERROR indicates one or more of the following errors occurred: • RX_MAX/MIN_FRM_CNT_ERR • RX_MAX/MIN_PRE_CNT_ERR • RX_ERR RX_ERROR is cleared by RX_ERROR_CLR.
1	STATUS_RDY	STATUS_RDY is set when RX_EOF or write pointer advanced by 2. This is a simple method for software to determine if RX_EOF event has occurred or new data is available. If RX_EOF is not set, all status bits are static.
0	RX_ERR	RX_ERR is set to 1 when pr1_mii0/1_rxer is asserted while pr1_mii0/1_rxdv bit is set. It will get set for first pr1_mii0/1_rxer event and self clear on SOF for the next FRAME.

Bank 0 and Bank 1 are used as ping/pong buffers. RX L2 supports the reading of a write pointer in R18 that allows software to determine which bank has active write transactions, as well as the specific write address within packed data arrays.

The PRU interacts with the RX L2 buffer using the high performance XFR read instructions and broadside interface. Table 30-378 shows the device XFR ID numbers for each bank.

Copyright © 2015–2017, Texas Instruments Incorporated

Table 30-378. RX L2 XFR ID

Device ID	Function	Description
20	Selects RX L2 Bank0	R2:R9 Data packed array R10:R13 Status packed array
21	Selects RX L2 Bank1	R2:R9 Data packed array R10:R13 Status packed array
20/21	Byte pointer of current write	R18[5:0] Pointer indicating location of current write in data packed array. 0 = Bank0.R2.Byte0 (default and reset value) 1 = Bank0.R2.Byte1 2 = Bank0.R2.Byte2 3 = Bank0.R2.Byte3 4 = Bank0.R3.Byte0 … 63=Bank1.R9.Byte3

XFR read transactions are passive and have no effect on any status or other states in RX L2. The firmware can also read R18 to determine which Bank has active write transactions and the location of the transaction. With this information, the firmware can read multiple times the stable preserved data. Note when RX L1 data is written to RX L2, the next status byte gets cleared at the same time the current status byte gets updated. The rest of the status buffer is persistent. When software is accessing any register of the ping/ pong buffer, software needs to issue an XFER read transaction to fetch the latest/current state of the ping/pong buffer. The PRU registers will not reflect the current snapshot of L2 unless an XFER is issued by software.

30.9.2.4 TX MII Interface

Data to be transmitted is loaded into the TX L1 FIFO. The transmit FIFO (TX L1) stores up to 96 bytes of transmit data. From the FIFO, the data is sent to the MII TX port of the PHY by the MII_RT transmit logic.

The transmit FIFO also has the capability to be reset through software (TX_RESET). When reset, all contents of transmit FIFO are purged and this may result in a frame not getting transmitted as expected, if the transmission is already ongoing. Any new data written in the transmit FIFO results in a new frame being composed and transmitted. An overflow event will require a TX_RESET to recover from this condition.

There are four dependencies that must be true for TX_EN to assert.

1. TX L1 FIFO not empty
2. Interpacket gap (IPG) timer expiration
3. RX_DV to TX_EN timer expiration
4. TX_EN compare timer expiration

The transmit interface also provides an underflow error signal in case there was no data loaded when TX_EN triggered. The transmit underflow signal is mapped to the INTC in PRU-ICSS. The PRU firmware must track the FIFO fill level, such as by a timer or the PRU cycle count register (PRU_ICSS_CTRL_CYCLE).The current FIFO fill level cannot be accessed by PRU firmware. The firmware can issue an R31 command via R31 bit 29 (TX_EOF) to indicate that the last byte has been written into the TX FIFO.

30.9.2.4.1 TX Data Path Options to TX L1 FIFO

There are two data path options for delivering data to the TX L1 FIFO and transmit port, described further in the subsequent sections:

1. PRU → TX L1 FIFO → TX MII port
2. RX L1 FIFO → TX L1 FIFO → TX MII port

Copyright © 2015–2017, Texas Instruments Incorporated

30.9.2.4.1.1 PRU → TX L1 FIFO → TX MII Port

The PRU can be used to feed data into the TX L1 FIFO using the R30 and R31 registers, shown in Figure 30-55. The PRU has the option two write up to two or four bytes of R30 and then pushes the data into the TX L1 FIFO by writing to the R31 command interface.

Figure 30-55. PRU to TX L1 Interface

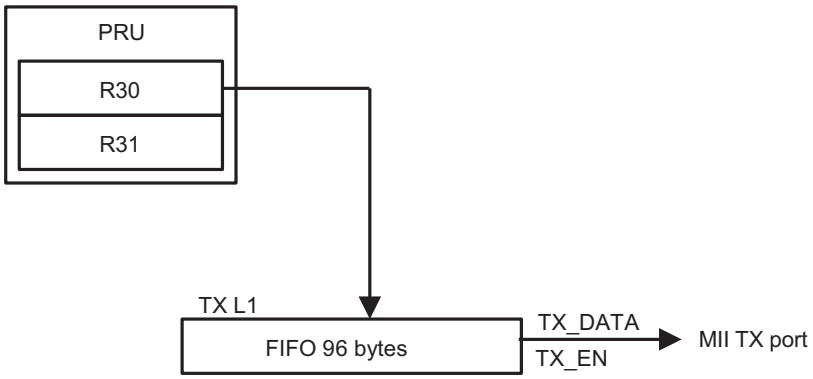

Figure 30-56 shows the R30 transmit interface. The lower 16 bits of the R30 (or FIFO transmit word) contain transmit data nibbles. When PRUSS_MII_RT_TXCFG0/1 [TX_32_MODE_EN] = 0, then the upper 16 bits contain mask information. Alternatively, when PRUSS_MII_RT_TXCFG0/1 [TX_32_MODE_EN] = 1, then the upper 16 bits contain transmit data nibbles. The operation to be performed on the transmit interface is controlled by PRU writes to the R31 command interface. Table 30-379 describes the supported configurations for 8, 16, and 32 bit TX push operations.

Figure 30-56. PRU to TX MII Interface

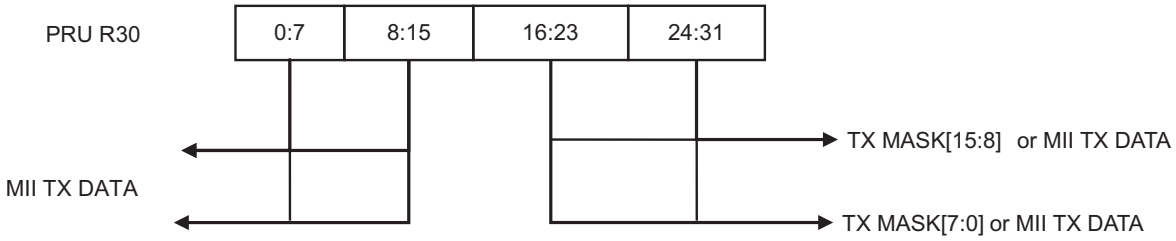

Table 30-379. TX Push

R31[25] TX_PUSH16/32	R31[24] TX_PUSH8/32	Supported R30 bits	TX_32_MODE_EN	TX_BYTE_SWAP	TX Push Action
0	1	X	0	X	8 bits of TXDATA (R30[7:0]) pushed post TX mask
1	0	X	0	X	16 bits of TXDATA (R30[15:0]) pushed post TX mask
1	1	X	0	X	Illegal
X	X	0x000000FF	1	0	8 bits of TXDATA (R30[7:0]) pushed
X	X	0x0000FFFF	1	0	16 bits of TXDATA (R30[15:0]) pushed
X	X	0xFFFFFFFF	1	X	32 bits of TXDATA (R30[31:0]) pushed
X	X	All other - reserved	1	X	Reserved

Copyright © 2015–2017, Texas Instruments Incorporated

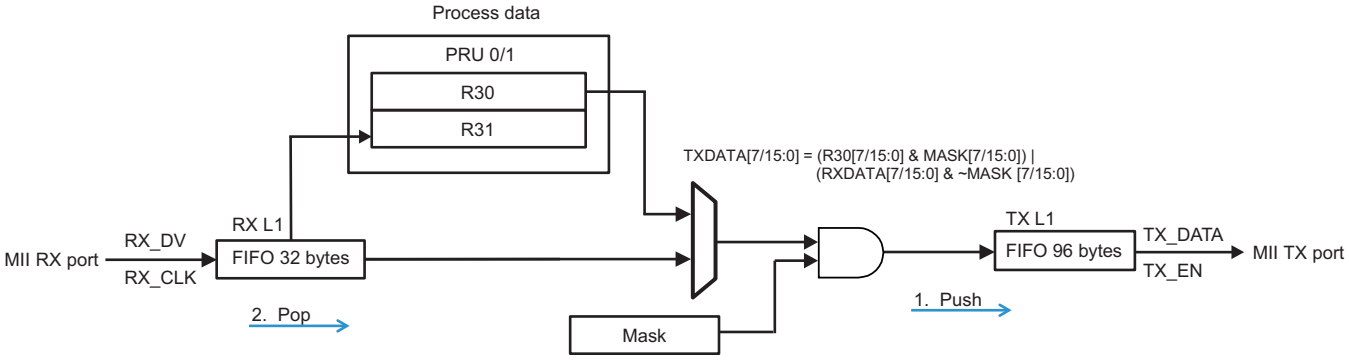
Using PRUSS_MII_RT_TXCFG0/1 [TX_32_MODE_EN] = 0 and the TX mask, the PRU can send a mix of R30 and RX L1 FIFO data to the TX L1 FIFO. Note the TX mask is only available when the PRU is fed one word or byte at a time by the RX L1 FIFO. It is not applicable when the RX L2 buffer is enabled. To disable TX mask, set TXMASK to 0xFFFF.

As shown in Figure 30-57, the PRU drives the MII transmit interface through its R30 register. The contents of R30 and RX data from the receive interface are taken and fed into a 96 byte transmit FIFO.

If PRUSS_MII_RT_TXCFG0/1 [TX_32_MODE_EN] = 0, then before transmission, a mask is applied to the data portion of the R30 register. By using the mask, the PRU firmware can control whether received data from the RX L1 FIFO is sent to transmit, R30 data is sent to transmit, or a mix of the two is sent. The Boolean equation that is used by MII_RT to compose TX data is:

TXDATA[7/15:0] = (R30[7/15:0] & MASK[7/15:0]) | (RXDATA[7/15:0] & ~MASK [7/15:0])

Figure 30-57. TX Mask Mode (PRUSS_MII_RT_TXCFG0/1 [TX_32_MODE_EN] = 0)



30.9.2.4.1.2 *RX L1 FIFO → TX L1 FIFO → TX MII Port*

When PRUSS_MII_RT_TXCFG0/1[TX_AUTO_SEQUENCE] is set, the data frame is passed from the RX to TX FIFOs without the any interaction of the PRU. This mode of operations is shown in Figure 30-58. The RX L1 will push into TX L1 as long as it is enabled and not full.

There is no PRU dependency in this mode and no option for the PRU to perform any operation to the TX L1 FIFO. RX_RESET clears all data and status elements.

Figure 30-58. RX L1 to TX L1 Interface

30.9.2.5 PRU R31 Command Interface

The PRU uses writes to R31[31:16] to control the reception and transmission of packets in register mode. Table 30-380 lists the available commands. Each bit in the table is a single clock pulse output from the PRU. When more than one action is to be performed in the same instant, the PRU firmware must set those command bits in one instruction.

Table 30-380. PRU R31: Command Interface (Write Mode)

Bit	Command	Description
31	TX_CRC_ERR	TX_CRC_ERR command when set will add 0xa5 byte to the TX L1 FIFO if the current FCS is valid. This bit can only be set with the TX_EOF command and optionally with the TX_ERROR_NIBBLE command. It cannot get set with any other commands, and the PRU firmware must wait > 2 clocks from the last command. Note for proper operations auto-forward preamble must be enabled.
30	TX_RESET	TX_RESET command is used to reset the transmit FIFO and clear all its contents. This is required to recover from a TX FIFO overrun.

Copyright © 2015–2017, Texas Instruments Incorporated

Table 30-380. PRU R31: Command Interface (Write Mode) (continued)

Bit	Command	Description
29	TX_EOF	TX_EOF command is used to indicate that the data loaded is considered last for the current frame
28	TX_ERROR_NIBBLE	TX_ERROR_NIBBLE command is used to insert an error nibble. This makes the frame invalid. Also, it will add 0x0 after the 32-bit CRC.
27	TX_CRC_HIGH	TX_CRC_HIGH command ends the CRC calculations and pushes CRC[31:16] to append to the outgoing frame in the TX L1 FIFO. Note PRUSS_MII_RT_TX_CRC0/1 will become valid after 6 clock cycles.
26	TX_CRC_LOW	TX_CRC_LOW command pushes CRC[15:0] to append to the outgoing frame in the TX L1 FIFO.
25	TX_PUSH16	TX_PUSH16 command pushes R30[15:0] when PRUSS_MII_RT_TXCFG0/1 [TX_32_MODE_EN] = 0. See Table x, TX Push for more details. Note there are no restrictions on concurrent PUSH/POP nor R30 requirements to maintain data. Back to back PUSH is supported.
24	TX_PUSH8	TX_PUSH8 command pushes R30[7:0] when PRUSS_MII_RT_TXCFG0/1 [TX_32_MODE_EN] = 0. See Table x, TX Push for more details. Note there are no restrictions on concurrent PUSH/POP nor R30 requirements to maintain data. Back to back PUSH is supported.
23	RX_ ERROR_CLR	RX_ERROR_CLR command is used to clear RX_ ERROR indicator bit by writing 1.
22	RX_EOF_CLR	RX_EOF_CLR command is used to clear RX_EOF status indicator bit by writing 1.
21	RX_SFD_CLR	RX_SFD_CLR command is used to clear RX_SFD indicator bit by writing 1.
20	RX_SOF_CLR	RX_SOF_CLR command is used to clear RX_SOF indicator bit by writing 1.
19	Reserved	Reserved
18	RX_RESET	RX_RESET is used to reset the receive FIFO and clear all contents. This is required to recover from a RX FIFO overrun, if software does not want to undrain. The typical use case is assertion after RX_EOF. If asserted during an active frame, the following actions will occur: 1. Terminate the current frame 2. Block/terminate all new data 3. Flush/clear all FIFO elements 4. Cause RX state machine into an idle state 5. Cause EOF event 6. Cause minimum frame error, if you abort before minimum size reached
17	RX_POP16	RX_POP16 command advances the receive traffic by two bytes. This is only required when you are using R31 to read the data. After R31[15:0] is ready to read by PRU, it will set 1 to WORD_RDY, and the next new data will be allowed to advance. RX_POP16 to WORD_RDY update has 2 clock cycles latency. Firmware needs to insure it does not read WORD_RDY/BYTE_RDY until 2 clock cycles after RX_POP16.
16	RX_POP8	RX_POP8 command advances the receive traffic by one bytes. This is only required when you are using R31 to read the data. After R31[7:0] is ready to read by PRU, it will set 1 to BYTE_RDY, and the next new data will be allowed to advance. RX_POP8 to BYTE_RDY update has 2 clock cycles latency. Firmware needs to insure it does not read WORD_RDY/BYTE_RDY until 2 clock cycles after RX_POP8.

Copyright © 2015–2017, Texas Instruments Incorporated

30.9.2.6 Other Configuration Options

30.9.2.6.1 Nibble and Byte Order

The PRU core is little endian. To support big endian, the MII_RT supports optional nibble swapping on both the RX and TX side.

On the receive side, the order of the two data bytes in RX R31 and the RX L2 buffer are configurable through the RX_BYTE_SWAP bit in the PRUSS_MII_RT_RXCFG0/1 registers, as shown in Table 30-381. Note the Nibble0 is the first nibble received.

Table 30-381. RX Nibble and Byte Order

Configuration	Order
PRUSS_MII_RT_RXCFG0/1 [RX_BYTE_SWAP] = 0 (default)	R31[15:8] / RXL2[15:8] = Byte1{Nibble3,Nibble2} R31[7:0] / RXL2[7:0] = Byte0{Nibble1,Nibble0}
PRUSS_MII_RT_RXCFG0/1 [RX_BYTE_SWAP] = 1	R31[15:8] / RXL2[15:8] = Byte0{Nibble1,Nibble0} R31[7:0] / RXL2[7:0] = Byte1{Nibble3,Nibble2}

On the transmit side, the order of the two data bytes and mask bytes in TX R30 are configurable through the TX_BYTE_SWAP bit in the PRUSS_MII_RT_TXCFG0/1 registers, as shown in Table 30-382. Note the Nibble0 is the first nibble received.

Table 30-382. TX Nibble and Byte Order

Configuration	Order
PRUSS_MII_RT_TXCFG0/1 [TX_BYTE_SWAP] = 0 (default)	If PRUSS_MII_RT_TXCFG0/1 [TX_32_MODE_EN] = 0, R30[15:8] = Byte1{Nibble3,Nibble2} R30[7:0] = Byte0{Nibble1,Nibble0} R30[31:24] = TX_MASK[15:8] R30[23:16] = TX_MASK[7:0] If PRUSS_MII_RT_TXCFG0/1 [TX_32_MODE_EN] = 1, R30[31:24] = Byte3{Nibble7,Nibble6} R30[23:16] = Byte2{Nibble5,Nibble4} R30[15:8] = Byte1{Nibble3,Nibble2} R30[7:0] = Byte0{Nibble1,Nibble0}
PRUSS_MII_RT_TXCFG0/1 [TX_BYTE_SWAP] = 1	If PRUSS_MII_RT_TXCFG0/1 [TX_32_MODE_EN] = 0, R30[15:8] = Byte0{Nibble1,Nibble0} R30[7:0] = Byte1{Nibble3,Nibble2} R30[31:24] = TX_MASK[7:0] R30[23:16] = TX_MASK[15:8] If PRUSS_MII_RT_TXCFG0/1 [TX_32_MODE_EN] = 1, Only 32bit push is supported. R30[31:24] = Byte0{Nibble1,Nibble0} R30[23:16] = Byte1{Nibble3,Nibble2} R30[15:8] = Byte2{Nibble5,Nibble4} R30[7:0] = Byte3{Nibble7,Nibble6}

30.9.2.6.2 Preamble Source

The MII_RT module has the option to preserve and forward a received preamble in the TX data stream, use a preamble provided by the PRU, or auto-generate a preamble. These configurations are highlighted in Table 30-383.

Table 30-383. Preamble Configuration Options

RX_CUT_PREAMBLE	Determines whether RX preamble is passed to the RX L1/L2 FIFO
RX_AUTO_FWD_PRE	Determines whether RX preamble is automatically passed to TX L1 FIFO

Copyright © 2015–2017, Texas Instruments Incorporated

Table 30-383. Preamble Configuration Options (continued)

TX_AUTO_PREAMBLE	TX interface logic auto-generates and appends preamble to TX data stream with the first push of data into the TX L1 FIFO. Note that enabling this option does fill the TX FIFO with the preamble length, hence software has to consider this to not overrun the TX FIFO.

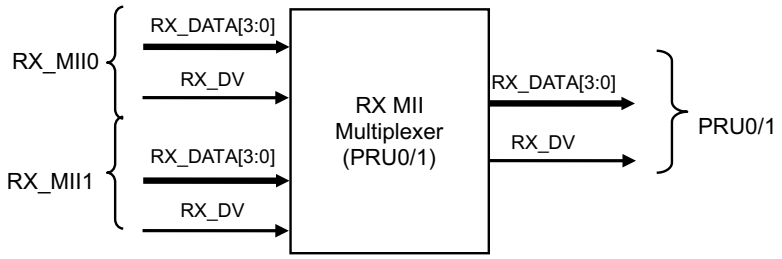
30.9.2.6.3 PRU and MII Port Multiplexer

The MII_RT module supports configurable PRU core to MII TXn / RXn port mapping. By default, PRU0 is mapped to TX1 and RX0 and PRU1 is mapped to TX0 and RX1. However, the system supports the flexibility to map any PRU core to any TX and RX port. Note the mapping options are destination fixed. For example, the input to PRU0 can be either RX_MII0 or RX_MII1. Similarly, the input to TX_MII0 can be either PRU0 or PRU1.

30.9.2.6.3.1 Receive Multiplexer

A multiplexer is provided to allow selecting either of the two MII interfaces for the receive data that is sent to PRU. Figure 30-59 shows the symbol of receive multiplexer of PRU.

Figure 30-59. MII Receive Multiplexer



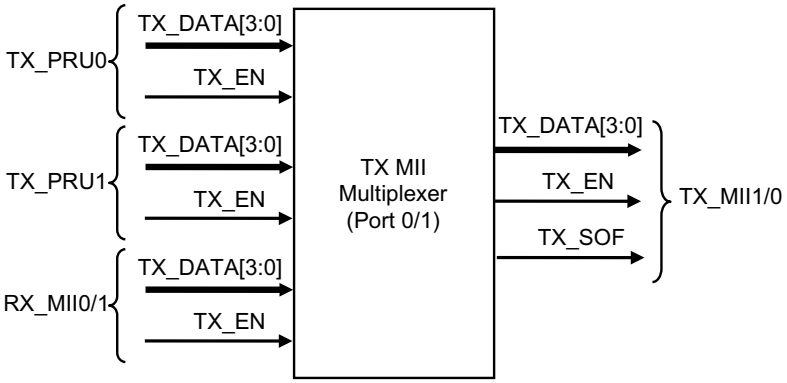
There are two receive multiplexer instances to enable selection of RX MII path for each PRU. The select lines of the RX multiplexers are driven from the PRU-ICSS programmable registers (PRUSS_MII_RT_RXCFG0/1).

30.9.2.6.3.2 Transmit Multiplexer

On the MII transmit ports, there is a multiplexer for each MII transmit port that enables selection of either the transmit data from the PRUs or from the RX MII interface of the other MII interface. Figure 30-60 shows the symbol of transmit multiplexer of PRU.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 30-60. MII Transmit Multiplexer

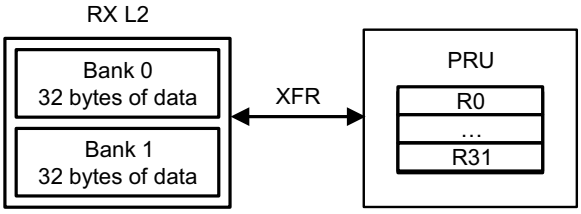


The transmit multiplexers enable the PRU-ICSS to either operate in a bypass mode where the PRU is not involved in processing MII traffic or use of one of the PRU cores for transmitting data into the MII interface. There are two instances of the TX MII multiplexer and the select lines for each TX multiplexer are provided by the PRU-ICSS. The select lines are common between register and FIFO interface. It is expected that the select lines will not change during the course of a frame so that can avoid data exchange error.

30.9.2.6.4 RX L2 Scratch Pad

When the RX L2 is disabled (PRUSS_MII_RT_RXCFG0/1 [RX_L2_EN] = 0), the RX L2 banks can be used as a generic scratch pad. In scratch pad mode, RX L2 Bank0 and RX L2 Bank1 operate like simple write/read memory mapped registers (MMRs). All XFR size and start operations are supported. RX_RESET has no effect in this mode. This mode is shown in Figure 30-61.

Figure 30-61. Scratch Pad Mode



30.9.3 PRU-ICSS MII RT Module Register Manual

This section describes the PRU-ICSS MII_RT module configuration registers.

27:26	RESERVED		R	0x0

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
25:16	TX_START_DELAY	Defines the minimum time interval (delay) between receiving the RXDV for the current frame and the start of the transmit interface sending data to the MII interface. Delay value is in units of MII_RT clock cycles, which uses the PRUSS_GICLK (default is 200MHz, or 5ns). Default TX_START_DELAY value is 320ns, which is optimized for minimum latency at 16 bit processing. Counter is started with RX_DV signal going active. Transmit interface stops sending data when no more data is written into transmit interface by PRU along with TX_EOF marker bit set. If the TX FIFO has data when the delay expires, then TX will start sending data. But if the TX FIFO is empty, it will not start until the TX FIFO is not empty. It is possible to overflow the TX FIFO with the max delay setting when auto-forwarding is enabled since the time delay is larger than the amount of data it needs to store. As long as TX L1 FIFO overflows, software will need to issue a TX_RESET to reset the TX FIFO. The total delay is 96-byte times (size of TX FIFO), but you need to allow delays for synchronization. Do to this fact, the maximum delay should be 80ns less when auto forwarding is enabled. Therefore, 0x3F0 is the maximum in this configuration.	RW	0x40
15:12	RESERVED		R	0x0
11	TX_32_MODE_EN	0x0 Disable 32-bit Data Push mode 0x1 Enable 32-bit, 16-bit, and 8-bit Data Push mode with TX_MASK disabled. In this mode, the internal PRU R30 byte write strobes are used and not the R31 CMD TX_PUSH mode. Any update to R30 will trigger an TX PUSH. See Table 30-379	RW	0x0
10	RESERVED		R	0x0
9	TX_AUTO_SEQUENCE	Enables transmit auto-sequence. Note the transmit data source is determined by TX_MUX_SEL setting. 0x0: Disable 0x1: Enable, transmit state machine based on events on receiver path that is connected to the respective transmitter. Also, the masking logic is disabled and only the MII data is used.	RW	0x0
8	TX_MUX_SEL	Selects transmit data source. The default/reset setting for TX Port 0 is 1. This setting permits MII TX Port 0 to receive data from PRU1 and the MII TX Port 1 which is connected to PRU0 by default. 0x0: Data from PRU0 (default for PRUSS_MII_RT_TXCFG1) 0x1: Data from PRU1 (default for PRUSS_MII_RT_TXCFG0)	RW	0x1

Bits	Field Name	Description	Type	Reset
31	RESERVED		R	0
30:28	TX_CLK_DELAY	In order to guarantee the MII_RT IO timing values published in the device data manual, the PRUSS_GICLK clock must be configured for 200MHz and TX_CLK_DELAY must be set to 6h.	RW	0x0
27:26	RESERVED		R	0x0
25:16	TX_START_DELAY	Defines the minimum time interval (delay) between receiving the RXDV for the current frame and the start of the transmit interface sending data to the MII interface. Delay value is in units of MII_RT clock cycles, which uses the PRUSS_GICLK (default is 200MHz, or 5ns). Default TX_START_DELAY value is 320ns, which is optimized for minimum latency at 16 bit processing. Counter is started with RX_DV signal going active. Transmit interface stops sending data when no more data is written into transmit interface by PRU along with TX_EOF marker bit set. If the TX FIFO has data when the delay expires, then TX will start sending data. But if the TX FIFO is empty, it will not start until the TX FIFO is not empty. It is possible to overflow the TX FIFO with the max delay setting when auto-forwarding is enabled since the time delay is larger than the amount of data it needs to store. As long as TX L1 FIFO overflows, software will need to issue a TX_RESET to reset the TX FIFO. The total delay is 96-byte times (size of TX FIFO), but you need to allow delays for synchronization. Do to this fact, the maximum delay should be 80ns less when auto forwarding is enabled. Therefore, 0x3F0 is the maximum in this configuration.	RW	0x40
15:12	RESERVED		R	0x0
11	TX_32_MODE_EN	0x0 Disable 32-bit Data Push mode 0x1 Enable 32-bit, 16-bit, and 8-bit Data Push mode with TX_MASK disabled. In this mode, the internal PRU R30 byte write strobes are used and not the R31 CMD TX_PUSH mode. Any update to R30 will trigger an TX PUSH. See Table Table 30-379	RW	0x0
10	RESERVED		R	0x0

30.10 PRU-ICSS MII MDIO Module

This section describes the PRU-ICSS1 and PRU-ICSS2 integrated **MII management interface module - MII_MDIO** module (PRUSS1_MII_MDIO / PRUSS2_MII_MDIO, respectively).

30.10.1 PRU-ICSS MII MDIO Overview

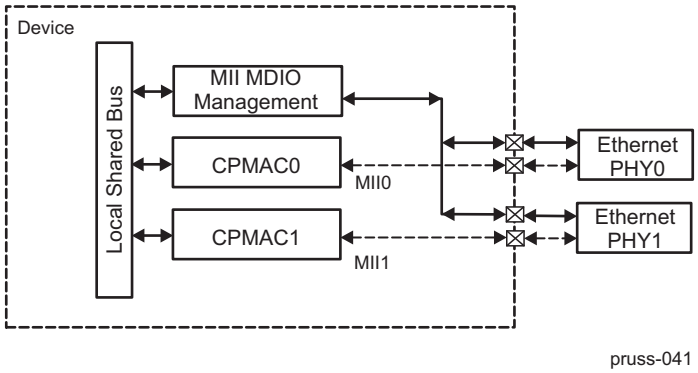
The following features are supported:

- Supports up to 32 PHY addresses.
- Two user access registers to control and monitor up to two PHYs simultaneously.
- Slave interface for configuration and control (MII RT MDIO CFG)

The PRU-ICSS MII MDIO management I/F module implements the **802.3 serial management interface** to interrogate and control two Ethernet PHYs simultaneously using a shared two-wire bus. Figure 1 shows a device with two MACs, each connected to an Ethernet PHY, being managed by the MII interface module using a shared bus.

The Figure 30-62 gives an overview of the MII MDIO management interface.

Figure 30-62. Device PRU-ICSS MII MDIO Management Interface Overview



30.10.2 PRU-ICSS MII MDIO Functional Description

The MII Management interface incorporates:

- **MDIO Registers** - Host interaction with this module is facilitated through the registers in this block.
- **Control and Schedule** - The control and register logic in the MII Management Interface module contain the state machine and scheduling logic which control the wire side operation.
- **MDIO Interface** - The MDIO interface block provides the serial interface to the MDIO interface.

The MDIO logic is fully synchronous to the PRU-ICSS local shared bus clock.

30.10.2.1 MII MDIO Management Interface Frame Formats

The below Table 30-427 shows the read and write format of the 32-bit MII Management interface frames, respectively.

Table 30-427. MII MDIO Frame Formats

Pre-amble	Start Delimiter	Operation Code	PHY Address	Register Address	Turnaround	Data
MDIO Read Frame Format						
0xFFFFFFFF	01	10	AAAAA	RRRRR	Z0	DDDD.DDDD.DDDD.DDDD
MDIO Write Frame Format						
0xFFFFFFFF	01	00	AAAAA	RRRRR	10	DDDD.DDDD.DDDD.DDDD

Copyright © 2015–2017, Texas Instruments Incorporated

The default or idle state of the two wire serial interface is a logic one. All tri-state drivers should be disabled and the PHY's pull-up resistor will pull the **MDIO** line to a logic one. Prior to initiating any other transaction, the station management entity shall send a preamble sequence of 32 contiguous logic one bits on the **MDIO** line with 32 corresponding cycles on **MDCLK** to provide the PHY with a pattern that it can use to establish synchronization. A PHY shall observe a sequence of 32 contiguous logic one bits on **MDIO** with 32 corresponding **MDCLK** cycles before it responds to any other transaction.

Preamble
The start of a frame is indicated by a preamble, which consists of a sequence of 32 contiguous bits all of which are a "1". This sequence provides the Ethernet PHY a pattern to use to establish synchronization.

Start Delimiter
The preamble is followed by the start delimiter which is indicated by a "01" pattern. The pattern assures transitions from the default logic one state to zero and back to one.

Operation Code
The operation code for a read is "10", while the operation code for a write is a "00".

Ethernet PHY Address
The PHY address is 5 bits allowing 32 unique values. The first bit transmitted is the MSB of the PHY address.

Register Address
The Register address is 5 bits allowing 32 registers to be addressed within each PHY. Refer to the 10/100 PHY address map for addresses of individual registers.

Turnaround
An idle bit time during which no device actively drives the MDIO signal shall be inserted between the register address field and the data field of a read frame in order to avoid contention. During a read frame, the PHY shall drive a zero bit onto MDIO for the first bit time following the idle bit and preceding the Data field. During a write frame, this field shall consist of a one bit followed by a zero bit.

Data
The Data field is 16 bits. The first bit transmitted and received is the MSB of the data word.

The Table 30-428 shows the PRU-ICSS1 / PRU-ICSS2 MII MDIO signals and their availability at the device boundary.

Table 30-428. PRU-ICSS MII MDIO Control and Interface Signals

MDIO Control Signals			
Pin Name	**Type**	**Available as device I/O**	**Function**
MDIO_LINKINT[1:0]	O	N.A.	Serial interface link change interrupt. Indicates a change in the state of the PHY link.
MDIO_USERINT[1:0]	O	N.A.	Serial interface user command event complete interrupt.
MDIO Interface Signals			
Pin Name	**Type**	**Available as device I/O**	**Function**
MDIO_I	I	device bidi **pr1_mdio_data** and pr2_mdio_mdclk pin in input mode	Serial data input
MDIO_O	O	device bidi **pr1_mdio_data** pr2_mdio_mdclk pin in output mode	Serial data output
MDIO_OE_N	O	N.A.	Serial data output enable. Asserted "0" when data output is valid
MDCLK_O	O	device output - **pr1_mdio_mdclk** pr2_mdio_mdclk	Serial clock output
MLINK_I[1:0]	I	N.A.	Optional link status inputs from PHY. Each input is connected to a single PHY. Unused inputs are tied '0'.

Copyright © 2015–2017, Texas Instruments Incorporated

30.10.2.2 PRU-ICSS MII MDIO Interractions

The MII Management I/F will remain idle until enabled by setting the **enable** bit in the **MDIO Control** register. The MII Management I/F will then continuously poll the link status from within the Generic Status Register of all possible 32 PHY addresses in turn recording the results in the **MDIOLink** register. The link status of two of the 32 possible PHY addresses can also be determined using the **MLINK** pin inputs. The linksel bit in the **MDIOUserPhySel** register determines the status input that is used. A change in the link status of the two PHYs being monitored will set the appropriate bit in the **MDIOLinkIntRaw** register and the **MDIOLinkIntMasked** register, if enabled by the **linkint_enable** bit in the **MDIOUserPhySel** register.

The **MDIOAlive** register is updated by the MII Management I/F module if the PHY acknowledged the read of the generic status register. In addition, any PHY register read transactions initiated by the host also cause the **MDIOAlive** register to be updated.

At any time, the host can define a transaction for the MII Management interface module to undertake using the **data**, **Ethernet PHY address**, **register address**, and **write** fields in a **MDIOUserAccess** register. When the host sets the go bit in this register, the MII Management interface module will begin the transaction without any further intervention from the host. Upon completion, the MII Management interface will clear the go bit and set the **userintraw** bit in the **MDIOUserIntRaw** register corresponding to the **MDIOUserAccess** register being used. The corresponding bit in the **MDIOUserIntMasked** register may also be set depending on the mask setting in the **MDIOUserIntMaskSet** and **MDIOUserIntMaskClr** registers. A round-robin arbitration scheme is used to schedule transactions which may queued by the host in different **MDIOUserAccess** registers. The host should check the status of the go bit in the **MDIOUserAccess** register before initiating a new transaction to ensure that the previous transaction has completed. The host can use the ack bit in the **MDIOUserAccess** register to determine the status of a read transaction.

It is necessary for software to use the MII Management interface module to setup the autonegotiation parameters of each PHY attached to a MAC port, retrieve the negotiation results, and setup the **MACControl** register in the corresponding MAC.

30.10.2.3 PRU-ICSS MII MDIO Interrupts

The MII Management interface state machine will assert the **MDIO_LINKINT** signals if there is a change in the link state of the Ethernet PHY corresponding to the address in the **phyadr_mon** field of the **MDIOUserPhySel** register and the corresponding **linkint_enable** bit is set. The **MDIO_LINKINT** event is also captured in the **MDIOLinkIntMasked** register. **MDIO_LINKINT[0]** and **MDIO_LINKINT[1]** correspond to the **MDIOUserPhySel0** and **MDIOUserPhySel1** registers, respectively.

When the "GO" bit in the **MDIOUserAccess** registers transitions from ‘1’ to ‘0’, indicating the completion of a user access, and the corresponding **userintmaskset** bit in the

MDIOUserIntMaskSet register is set, the **MDIO_USERINT** signal is asserted ‘1’. The **MDIO_USERINT** event is also captured in the **MDIOUserIntMasked** register. **MDIO_USERINT[0]** and **MDIO_USERINT[1]** correspond to the **MDIOUserAccess0** and **MDIOUserAccess1** registers, respectively.

30.10.3 PRU-ICSS MII MDIO Receive/Transmit Frame Host Software Interface

To facilitate transmission and reception of serial management frames, the host has to perform the following operations:

- Configure the **preamble** and **clkdiv** fields in the **MDIOControl** register.
- Enable the VBUS MII management module by setting the **enable** bit in the MDIOControl register. If Byte access is being used, the **enable** bit should be written last.
- The **MDIOAlive** register can be read after a delay to determine which Ethernet PHYs responded.
- Setup the appropriate PHY addresses in the **MDIOUserPhySel** registers.
- Setup the appropriate **linkint_enable** bit in the **MDIOUserPhySel** register.
- Setup the appropriate **linksel** fields in the **MDIOUserPhySel** register.
- Setup the appropriate **userintmaskset** bits in the **MDIOUserIntMaskSet** register.
- **To write to**an Ethernet PHY register the host should first check to ensure that the go bit in a **MDIOUserAcess** register is cleared. The **GO**, **write**, **regadr**, **phyadr** and data fields in that

Copyright © 2015–2017, Texas Instruments Incorporated

MDIOUserAccess register can then be updated to be appropriate value. If byte access is being used, the go bit should be written last. The write operation to the PHY will be scheduled and completed by the module. Completion of the write operation can be determined by examining the go bit in the **MDIOUserAccess** register. It also results in a transition on the appropriate **MDIO_INT** signal and the corresponding bit in the **MDIOUserIntMasked** register based on the setting of the **MDIOUserIntMaskSet** register.

- **To read from** an Ethernet PHY register the host should first check to ensure that the "GO" bit in a **MDIOUserAccess** register bit is cleared. The **GO**, **regadr**, and **phyadr** fields in that **MDIOUserAccess** register can then be updated to the appropriate value The read data value will be available in the data field of the MDIOUserAccess register after the module completes the read operation on the serial bus. The completion of the read operation can be determined by examining the "GO" and "ACK" bits in the **MDIOUserAccess** register. It also results in a transition on the appropriate **MDIO_INT** signal and the corresponding bit in the **MDIOUserIntMasked** register based on the setting of the **MDIOUserIntMaskSet** register.
- The module de-asserts the **MDIO_USERINT** signal when the host writes to the appropriate **"userintmasked"** bit in the **MDIOUserIntMasked** register or the **userintraw** bit in the **MDIOUserIntRaw** register.
- The host can poll the **MDIOLink** register periodically or use the **MDIO_LINKINT** signals to determine the state of the serial interface to a particular Ethernet PHY.
- The module de-asserts the **MDIO_LINKINT** when the host writes to the appropriate linkintraw bit in the **MDIOLinkIntRaw** register or the **linkintmasked** bit in the **MDIOLinkIntMasked** register.

IDLE	ENABLE	RESERVED	HIGHEST_USER_CHANNEL					RESERVED			PREAMBLE	FAULT	FAULT_DETECT_ENABLE	INT_TEST_ENABLE	RESERVED	CLKDIV																

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
31	IDLE	MDIO state machine IDLE. Set to 1 when the state machine is in the idle state.	R	0x1
30	ENABLE	Enable control. Writing a 1 to this bit enables the MDIO state machine, writing a 0 disables it. If the MDIO state machine is active at the time it is disabled, it will complete the current operation before halting and setting the idle bit. If using byte access, the enable bit has to be the last bit written in this register.	RW	0x0
29	RESERVED		R	0
28:24	HIGHEST_USER_CHANNEL	Highest user channel. This field specifies the highest useraccess channel that is available in the module and is currently set to 1. This implies that **MDIOUserAccess1** is the highest available user access channel.	R	0x1
23:21	RESERVED		R	0x0
20	PREAMBLE	Preamble disable. Writing a 1 to this bit disables this device from sending MDIO frame preambles.	RW	0x0
19	FAULT	Fault indicator. This bit is set to 1 if the MDIO pins fail to read back what the device is driving onto them. This indicates a physical layer fault and the module state machine is reset. Writing a 1 to it clears this bit.	RW	0x0
18	FAULT_DETECT_ENABLE	Fault detect enable. This bit has to be set to 1 to enable the physical layer fault detection.	RW	0x0
17	INT_TEST_ENABLE	Interrupt test enable. This bit can be set to 1 to enable the host to set the userint and linkint bits for test purposes.	RW	0x0
16	RESERVED		R	0
15:0	CLKDIV	Clock Divider. This field specifies the division ratio between CLK and the frequency of MDCLK. MDCLK is disabled when clkdiv is set to 0. MDCLK frequency = clk frequency/(clkdiv+1).	RW	0xff

ALIVE																															

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
31:0	ALIVE	MDIO Alive bitfield. Each of the 32 bits of this register is set if the most recent access to the PHY with address corresponding to the register bit number was acknowledged by the PHY, the bit is reset if the PHY fails to acknowledge the access. Both the user and polling accesses to a PHY will cause the corresponding alive bit to be updated. The alive bits are only meant to be used to give an indication of the presence or not of a PHY with the corresponding address. Writing a 1 to any bit will clear it, writing a 0 has no effect.	RWr1Clr	0x0

LINK																															

Bits	Field Name	Description	Type	Reset
31:0	LINK	MDIO Link state. This register is updated after a read of the Generic Status Register of a PHY. The bit is set if the PHY with the corresponding address has link and the PHY acknowledges the read transaction. The bit is reset if the PHY indicates it does not have link or fails to acknowledge the read transaction. Writes to the register have no effect. In addition, the status of the two PHYs specified in the **MDIOUserPhySel** registers can be determined using the **MLINK** input pins. This is determined by the **linksel** bit in the **MDIOUserPhySel** register.	R	0x0

30.11 PRU-ICSS Industrial Ethernet Peripheral (IEP)

This section describes the Industrial Ethernet Peripheral (IEP) module which is part of the PRU-ICSS.

NOTE: PRU-ICSS2 IEP I/Os are not pinned out on AM570x. However, some internal features (such as the IEP timer) are still supported.

30.11.1 PRU-ICSS IEP Overview

The Industrial Ethernet Peripheral (IEP) performs hardware work required for industrial ethernet functions. The IEP module features an industrial ethernet timer with 16 compare events and a digital I/O port (DIGIO).

30.11.2 PRU-ICSS IEP Functional Description

This section provides the functional description of the IEP components.

30.11.2.1 PRU-ICSS IEP Clock Generation

The IEP has a selectable module input clock (ICSS_IEP_CLK input, see also Section 30.3). The clock source is selected by the state of the IEPCLK.OCP_EN bit within the PRU-ICSS CFG register space.

Two clock sources are supported for the IEP input clock:

- PRUSS_IEP_CLK: The default functional clock for IEP derived from PRCM. Runs at 200 MHz.
- PRUSS_GICLK: The PRUSS_CFG gateable interface clock derived from PRCM.

Switching from PRUSS_IEP_CLK to PRUSS_GICLK is done by writing 1 to the PRUSS_IEPCLK.OCP_EN bit. This is a one time configuration step before enabling the IEP function. Switching back from PRUSS_GICLK to PRUSS_IEP_CLK is only supported through a hardware reset of the PRU-ICSS.

CAUTION

When software enables the clock (at PRU-ICSS level) to the IEP module clock input via setting bit PRUSS_IEPCLK[0] OCP_EN to 0b1 in the PRUSS_CFG space, there must be NO in-flight transactions to the IEP block.

CAUTION

ONLY switching from PRUSS_IEP_CLK (the IEP specific functional clock source) to the PRUSS_GICLK (top level interface clock) source is supported in software by device integrated PRU-ICSS. Switching back from PRUSS_GICLK to PRUSS_IEP_CLK is ONLY supported via assertion of a hardware reset to the PRU-ICSS.

30.11.2.2 PRU-ICSS Industrial Ethernet Timer

The industrial ethernet timer is a simple 64-bit timer. This timer is intended for use by industrial ethernet functions but can also be leveraged as a generic timer in other applications.

30.11.2.2.1 PRU-ICSS Industrial Ethernet Timer Features

The industrial ethernet timer supports the following features:

- One master 64-bit count-up counter with an overflow status bit.
  - Runs on PRUSS_IEP_CLK or PRUSS_GICLK.
  - Write 1 to clear status.

Copyright © 2015–2017, Texas Instruments Incorporated

  - Supports a programmable increment value from 1 to 16 (default 5).
  - An optional compensation method allows the increment value to apply compensation increment value from 1 to 16 count up to 2^{24} PRUSS_IEP_CLK/PRUSS_GICLK events with additional slow compensation mode
- 16× 64-bit compare registers: PRUSS_IEP_COMPARE0j/PRUSS_IEP_COMPARE1j (where j=0 to 15) and PRUSS_IEP_COMPARE_STATUS.
  - 16 status bits, write 1 to clear
  - 16 individual event outputs
  - One global event output for interrupt generation triggered by any compare event
- 32 outputs, one high-level and one high-pulse for each compare hit event
- PRUSS_IEP_COMPARE_CFG[0] CMP0_RST_CNT_EN, if enabled, will reset the master counter
- pwm0_sync_out/pwm3_sync_out, if enabled, will reset the master counter
- master counter reset-state is programmable

30.11.2.2.2 PRU-ICSS Industrial Ethernet Timer Basic Programming Sequence

Follow these basic steps to configure the IEP Timer.

Compare function:

1. Initialize timer to known state (default values)
   - Disable counter (PRUSS_IEP_GLOBAL_CFG[0] CNT_ENABLE = 0)
   - Reset Count Register (PRUSS_IEP_LOW_COUNTER, PRUSS_IEP_HIGH_COUNTER) by writing 0xFFFFFFFF to clear
   - Clear overflow status register (PRUSS_IEP_STATUS[0] CNT_OVF = 1)
   - Clear compare status (PRUSS_IEP_COMPARE_STATUS) by writing 0xFFFFFFFF to clear
2. Set compare values PRUSS_IEP_COMPARE0j,PRUSS_IEP_COMPARE1j
3. Enable compare events (PRUSS_IEP_COMPARE_CFG[8:1] CMP_EN).
4. Set increment value (PRUSS_IEP_GLOBAL_CFG[7:4] DEFAULT_INC).
5. Set compensation value (PRUSS_IEP_COMPENSATION[23:0] COMPEN_CNT)
6. Enable counter (PRUSS_IEP_GLOBAL_CFG[0] CNT_ENABLE = 1)

30.11.2.3 PRU-ICSS Industrial Ethernet Digital IOs

The IEP Digital I/O (DIGIO) block provides dedicated I/Os intended for industrial ethernet protocols, but they can also be used as generic I/Os in other applications.

30.11.2.3.1 Features

The industrial ethernet digital I/O supports the following features:

- Digital data output
  - 8 channels (pr1_edio_data_out[7:0])
  - Software controls enable signal driving output data output
- Digital data out enable (optional tri-state control)
- Digital data input
  - 8 channels (pr1_edio_data_in[7:0])
  - PRUSS_IEP_DIGIO_DATA_IN_RAW supports direct sampling of pr1_edio_data_in
  - External latch event signal (pr1_edio_latch_in) triggers a pulse on which pr1_edio_data_in is sampled

Copyright © 2015–2017, Texas Instruments Incorporated

30.11.2.3.2 DIGIO Block Diagrams

Figure 30-63 shows the signals and registers for capturing the DIGIO data in. Note that IN_MODE in the PRUSS_IEP_DIGIO_CTRL register must be set to 1 for data to be latched on the external pr1_edio_latch_in signal.

Figure 30-63. IEP DIGIO Data In

(2) External pin input/output

30.11.2.3.3 Basic Programming Model

Follow these steps to configure and read the DIGIO Data Input.

1. Read PRUSS_IEP_DIGIO_DATA_IN_RAW for raw input data

or

1. Enable sampling of pr1_edio_data_in[7:0] by setting PRUSS_IEP_DIGIO_CTRL[5:4] IN_MODE = 0x1
2. Read PRUSS_IEP_DIGIO_DATA_IN for data sampled upon pr1_edio_latch_in posedge

Follow these steps to configure and write to the DIGIO Data Output.

1. Pre-configure DIGIO by setting PRUSS_IEP_DIGIO_EXP[1] OUTVALID_OVR_EN and PRUSS_IEP_DIGIO_EXP[0] SW_DATA_OUT_UPDATE
2. Write to PRUSS_IEP_DIGIO_DATA_OUT to configure output data
3. To Hi-Z output, set corresponding PRUSS_IEP_DIGIO_DATA_OUT_EN bits to 1 (clear to 0 to drive value stored in PRUSS_IEP_DIGIO_DATA_OUT)

30.11.3 PRUSS_IEP Register Manual

This section describes the registers of the PRUSS_IEP module.

SLOW_COMPEN_CNT																															

Copyright © 2015–2017, Texas Instruments Incorporated

Bits	Field Name	Description	Type	Reset
31:0	SLOW_COMPEN_CNT	Slow compensation counter. Write: 0x0: Slow compensation is disabled and counter will increment by DEFAULT_INC 0xn: Compensation is enabled for 1 count for every SLOW_COMPEN_CNT cycle, this is free running and continuous until software clears the MMR. For example, SLOW_COMPEN_CNT = 16, every 16 clock cycles the compensation value is used for 1 count. Note COMPEN_CNT MUST be set to zero IF SLOW_COMPEN_CNT is not zero. Read: Software can read the number of cycles left until the compensation event. For example, software writes SLOW_COMPEN_CNT = 0x100 and reads SLOW_COMPEN_CNT = 0x7. This means in 6 more IEP_CLK cycles before the counter reaches 0x1 for the compensation event. If software writes SLOW_COMPEN_CNT = 0x8000 before compensation event, then the counter will reset to 0x8000.	RW	0x0

RESET_VAL																															

Bits	Field Name	Description	Type	Reset
31:0	RESET_VAL	Reset value (upper 32-bits). This register enables SW to define the reset state of the Master Counter, which can be reset by the following events (if enabled): CMP0 event; PWM0_SYNC_OUT event; PWM3_SYNC_OUT event. The RESET_VAL should be in increments of the DEFAULT_INC (default state is 5). For example, 0x0000_000A.	RW	0x0

33.1 Initialization Overview

This chapter provides an overview of the requirements to initialize the device from power on to operating system (OS) and application execution, the overall initialization process (including hardware- and software-related steps), the general ROM code operational requirements, and behavior expectations.

33.1.1 Terminology

- **Bootstrap:** Initial software launched by the ROM code during the memory booting phase
- **Configuration Header (CH):** Optional structure that precedes the initial software and allows the redefinition of the ROM code default settings
- **Downloaded software:** Initial software downloaded into the internal static RAM (SRAM) by the ROM code during the peripheral booting phase
- **eFuse:** A one-time programmable memory location usually set at the factory
- **Flash loader:** Downloaded software launched by the ROM code during the preflashing stage. It also programs an image in external memories.
- **Initial software:** Software executed by any of the ROM code mechanisms (memory booting or peripheral booting). Initial software is a generic term for bootstrap and downloaded software.
- **Memory booting:** ROM code mechanism that consists of executing initial software from external memory
- **Peripheral booting:** ROM code mechanism that consists of polling selected interfaces, downloading, and executing initial software (in this case, downloaded software) in the internal RAM
- **Permanent booting device:** Memory device containing, by default, the image to be executed during the booting sequence. It is the default memory booting device. The permanent booting device is used after a warm reset if no software booting configuration is programmed.
- **Preflashing:** A specific case of peripheral booting where the ROM code mechanism is used to program the external flash memory
- **ROM Code:** The on-chip software in device ROM that implements booting
- **ROM Code-controlled Boot Phase:** This phase covers the sequence operations from the time the platform releases the reset to the time first user- or customer-owned software starts execution. This phase is fully controlled by the device ROM code.
- **Save-And-Restore (SAR) RAM memory:** On-chip RAM memory that is not cleared after warm resets or wakeups from low-power modes
- **Software booting configuration:** A logical structure stored in the SAR memory that allows the redefinition of the ROM code default settings when booting after a warm reset

33.1.2 Initialization Process

Figure 33-1 is an overview of the initialization process and its steps:

- **Preinitialization:** Power, clock, and control connections must be present, and the boot configuration pins must be held at the desired logical levels.
- **Power, clock, reset ramp sequence:** Specific sequence that is applied by the power-management chip
- **ROM code:** Responsible for finding, for downloading, and for executing the initial software
- **Initial software:** Software that prepares and passes control to application software or to the high-level operating system (HLOS)
- **HLOS** or application (primarily for diagnostics)

Figure 33-1. Initialization Process

Copyright © 2015–2017, Texas Instruments Incorporated

The first two steps in the initialization process are hardware-oriented; however, they require an understanding of the process of configuring these system interface pins (balls on the device), which have software-configurable functionality. This configuration is an essential part of the chip configuration and is application-dependent. This chapter discusses these system-interface pins and the associated configuration registers that are vital to the correct initialization of the device.

Copyright © 2015–2017, Texas Instruments Incorporated

33.2 Preinitialization

To accomplish a successful boot-up operation, certain hardware configuration settings must be in place. Clock, reset, and power connections, as well as pins involved in setting the boot memory space for the MPU, must be connected and driven correctly to successfully initialize the device. The following sections describe the specific requirements for the preinitialization stage.

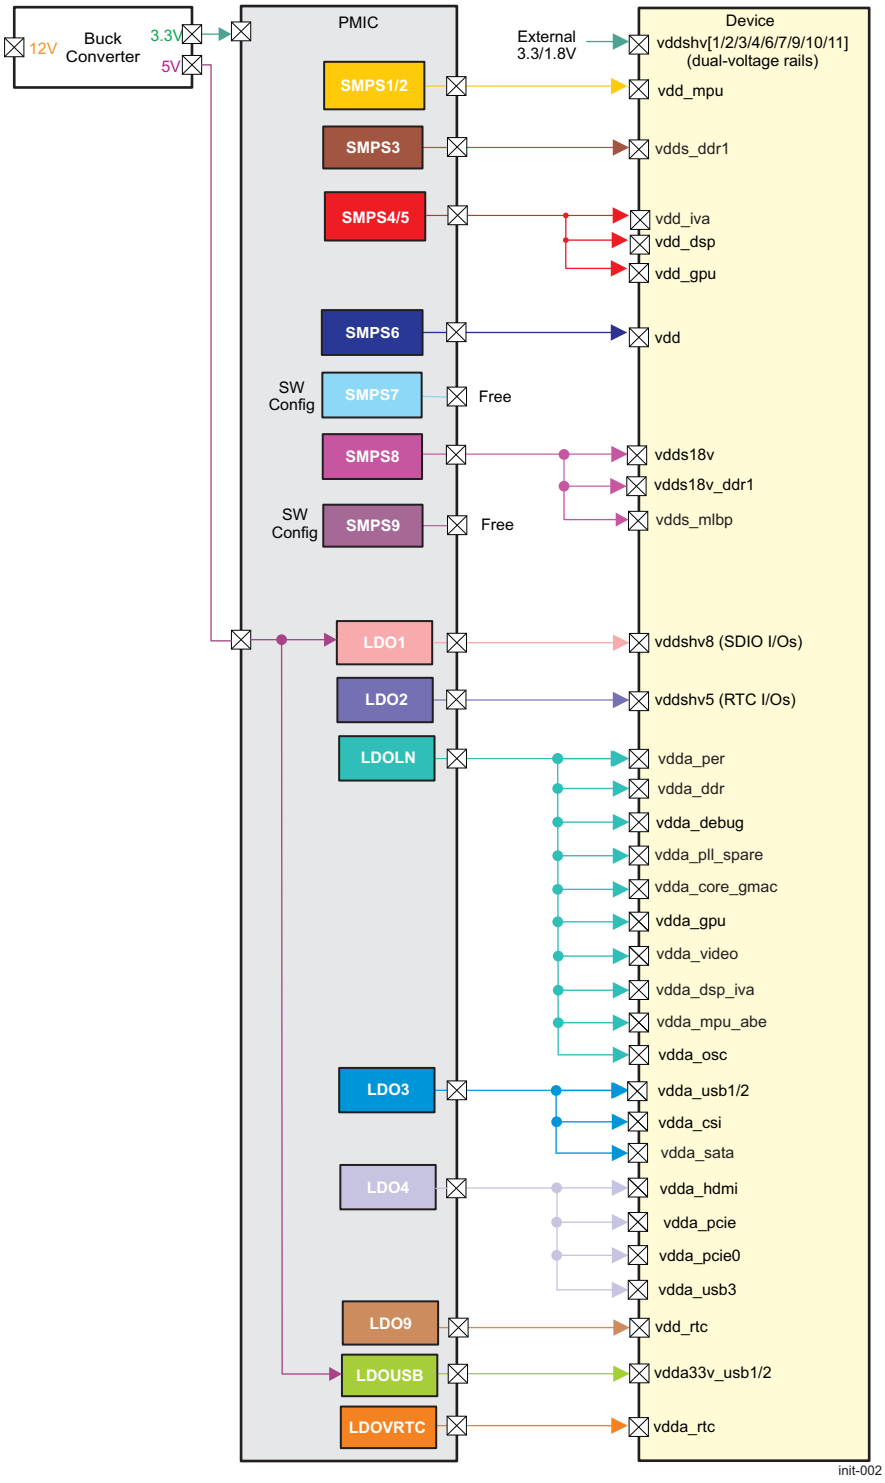
33.2.1 Power Requirements

The device can be supplied by an external power-management integrated circuit (PMIC). TI provides a global solution with the device connected to the power-management IC companion chip. Refer to *Data Manual* for information about the power-management IC companion chips supported for this device.

Figure 33-2 shows typical power connections between the device and a PMIC companion chip.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 33-2. Power Supply Connections Example



NOTE: Figure 33-2 is an example of power connections between the device and the PMIC, representing only one of the multiple PMIC/OTP options.
These connections depend on the actual application, PMIC, and OTP used. Refer to the *Device Data Manual*, respective PMIC *Data Sheet*, and all related application notes before starting a new design.

Table 33-1 describes the device power balls.

Table 33-1. Device Power Balls

Voltage Ball Name	Subsystems and Peripherals
vdd	Subsystems and modules supplied by CORE voltage domain
vdd_mpu(1)	MPU voltage domain
vdd_iva(1)	IVA voltage domain
vdd_dsp	DSP voltage domain
vdd_gpu(1)	GPU voltage domain
vdd_rtc(1)	RTC voltage domain
vdds18v	1.8V I/Os
vdds_mlbp	MLBSS I/Os
vdds_ddr1	EMIF channel 1
vdds18v_ddr1	EMIF channel 1 bias
vdda_video	Analog power supply for DPLL_VIDEO0/1
vdda_ddr	Analog power supply for DPLL_DDR and DDR HSDIVIDER
vdda_mpu_abe	Analog power supply for DPLL_MPU, DPLL_ABE
vdda_per	Analog power supply for DPLL_PER, PER HSDIVIDER
vdda_core_gmac	Analog power supply for DPLL_GMAC DPLL_CORE, and CORE HSDIVIDER
vdda_hdmi	Analog power supply for HDMI I/Os and DPLL_HDMI
vdda_pcie	Analog power supply for DPLL_PCIE_REF and APLL_PCIE
vdda_pcie0(1)	Analog power supply for PCIE0 I/Os
vdda_gpu	Analog power supply for DPLL_GPU
vdda_dsp_iva	Analog power supply for DPLL_DSP and DPLL_IVA
vdda_usb3	Analog power supply for USB1 DPLL_USB_OTG_SS and USB3.0 I/Os
vdda_usb1	Analog power supply for USB1 DPLL_USB and USB2.0 I/Os (1.8 V)
vdda33v_usb1	Analog power supply for USB1 I/Os (3.3 V)
vdda_usb2	Analog power supply for USB2 I/Os (1.8 V)
vdda33v_usb2	Analog power supply for USB2 I/Os (3.3 V)
vdda_pll_spare	Analog power supply for PLL_SPARE
vdda_csi	Analog power supply for CSI
vdda_sata(1)	Analog power supply for SATA I/Os and DPLL_SATA
vdda_debug	Analog power supply for DPLL_DEBUG
vddshv1	Dual-voltage VIN2 group I/Os
vddshv2(1)	Dual-voltage VOUT group I/Os
vddshv3	Dual-voltage GENERAL group I/Os
vddshv4	Dual-voltage MMC4 group I/Os
vddshv5(1)	Dual-voltage RTC group I/Os
vddshv6(1)	Dual-voltage VIN1 group I/Os
vddshv7	Dual-voltage WIFI group I/Os
vddshv8	Dual-voltage MMC1 group I/Os
vddshv9	Dual-voltage RGMII group I/Os
vddshv10	Dual-voltage GPMC group I/Os
vddshv11	Dual-voltage MMC2 group I/Os
vdda_osc	System HF OSC0/1 XTAL oscillators
vdda_rtc(1)	RTC bias and LF RTC XTAL oscillator

(1) Not pinned out on the AM570x family of devices.

Copyright © 2015–2017, Texas Instruments Incorporated

NOTE: For a complete description of the power balls on the device package, see the *Device Data Manual*.

For more information about power management, see Section 3.6 *Clock Management Functional Description*, in Chapter 3, *Power, Reset, and Clock Management*.

NOTE: MLB is not supported on the AM571x / AM570x family of devices.

33.2.2 Boot Device Conditions

The ROM code does not interact with the PMIC companion chip over an I^2C or SPI interface. That is, ROM code is PMIC independent. The following system conditions must be met to perform device initialization:

- The USB transceivers (USB2.0), are powered on reset, as expected by the USB peripheral booting feature.
- The SD card cage must be appropriately powered before entering the SD card boot feature on any reset.
- Devices must be appropriately powered and be up and ready at platform startup:
  - eMMC
  - QSPI
  - GPMC
  - SATA

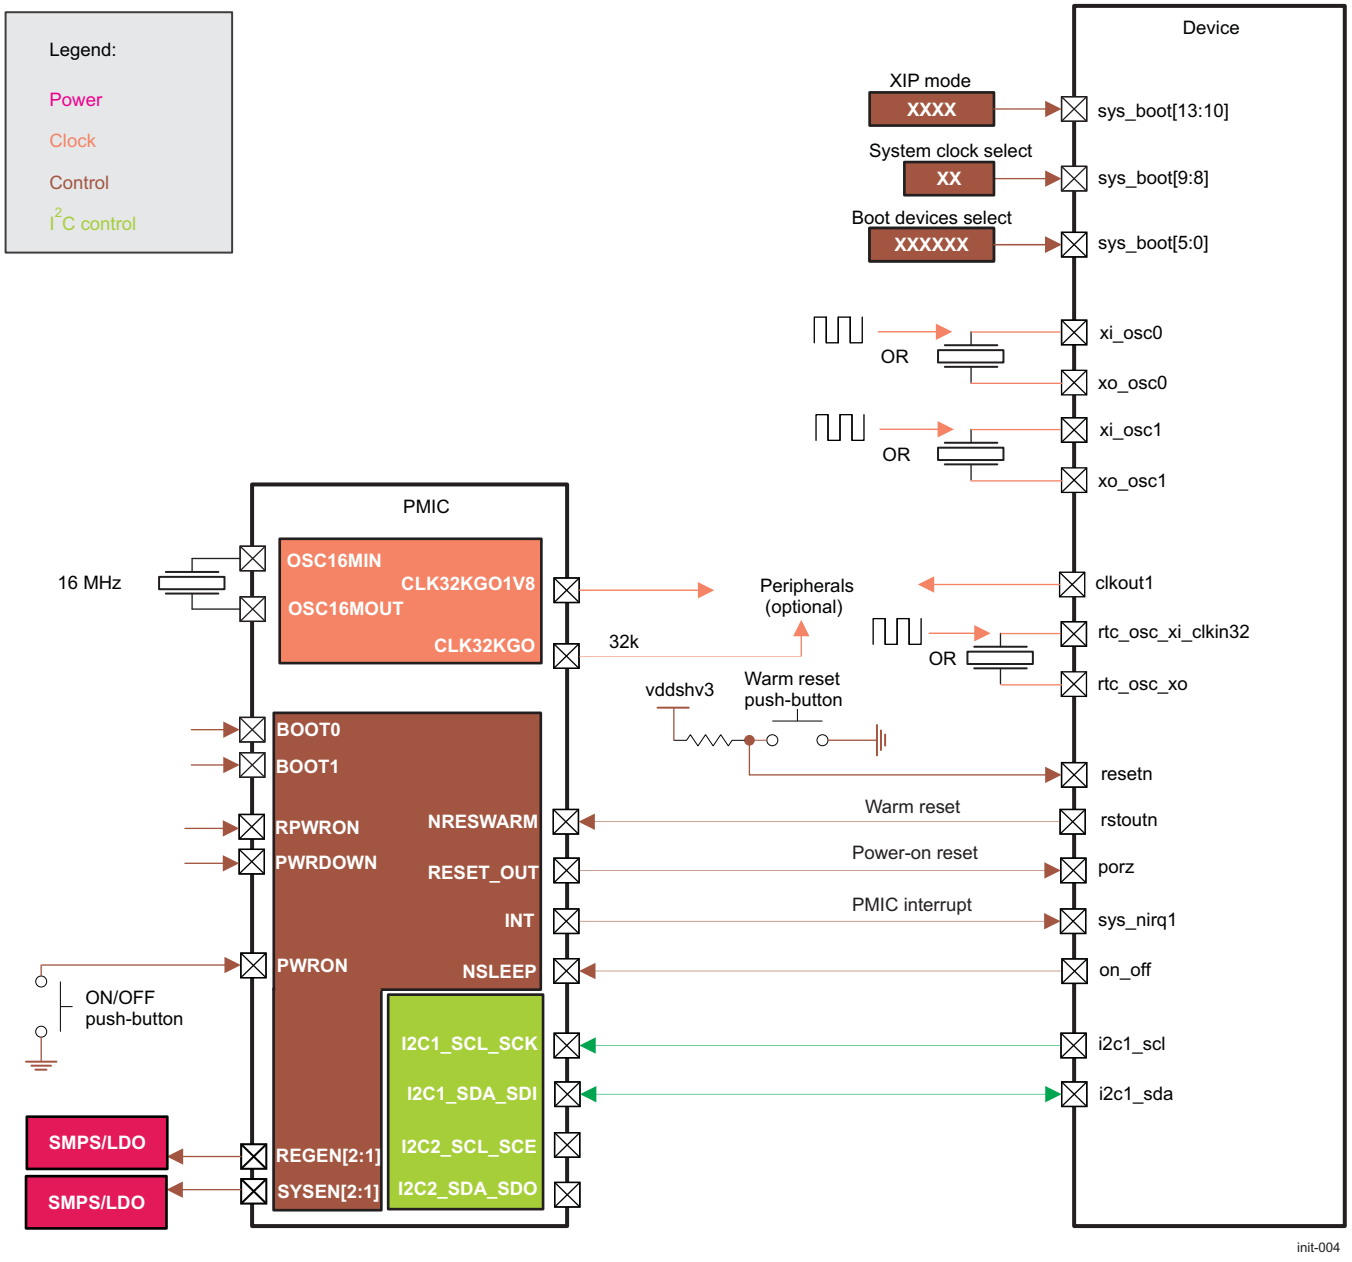
Copyright © 2015–2017, Texas Instruments Incorporated

33.2.3 Clock, Reset, and Control

33.2.3.1 Overview

Figure 33-3 shows the clock and reset environment where clocks and reset-related signals are gathered at the system level, the system-expansion signals, and the crystal oscillator connection.

Figure 33-3. Clock, Reset, and Control Environment Overview



NOTE: Figure 33-3 is a typical example of clock, reset and control connections between the device and a PMIC. Refer to the device *Data Manual* for the supported PMIC(s) for your device and for more information on these balls.
For PMIC ball description, see the respective PMIC *Data Sheet*.

Copyright © 2015–2017, Texas Instruments Incorporated

NOTE: The *rtc_osc_xi_clkin32* and *rtc_osc_xo* device pads are not available on the AM570x family of devices.

The main features of the system interface are:

- Accepts crystals connected between device xi_osc0 and xo_osc0 pads, and xi_osc1 and xo_osc1 pads to generate SYS_CLK1 and SYS_CLK2, resepectively
- Accepts external LVCMOS clock sources connected to xi_osc0, and xi_osc1 pads for SYS_CLK1 and SYS_CLK2, respectively
- A 32-kHz LVCMOS clock input (clkin32) for low-power operation
- Up to four reference clock inputs
- Up to three configurable clock outputs
- sysboot[15:0] input signals to define the boot mode, system clock speed, and GPMC in XIP mode
- Two reset sources
  - Power-on reset (cold reset)
  - Warm reset
- Three external interrupt lines (sys_irq1, sys_irq2, and nmi_dsp)
- Four external DMA requests

33.2.3.2 Clocking Scheme

The device operation requires external input clocks, as follows:

- 32k clock: A 16-MHz crystal is connected to the PMIC companion chip that embeds the 32k-oscillator (a square CMOS 32-kHz clock can also be delivered on the OSC16MIN pin of Power-management IC, if the 32k-crystal is connected on another device of the system). The resulting 32k-clock is delivered to the entire system on two outputs:
  - CLK32KGO
  - CLK32KGO1V8
- System clocks: The device supports two system clocks with two clock sources each:
  - SYS_CLK1 (main system clock):
    - Crystal on OSC0 pins. An internal oscillator (OSC0) embedded in the device is used.
    - External LVCMOS clock on xi_osc0
  - SYS_CLK2 (optional system clock):
    - Crystal on OSC1 pins. An internal oscillator (OSC1) embedded in the device is used.
    - External LVCMOS clock on xi_osc1
- The device can deliver digital clocks to peripherals ICs.

The device provides wide choice of clocks that can be delivered on clkout[1:3] pads to companion devices. For more information, see Section 3.3, *PRCM Subsystem Environment*, in Chapter 3, *Power, Reset, and Clock Management*. For more information on pad multiplexing, see Chapter 18, *Control Module*.

Table 33-2 lists the mapping for the device clock input sources. Table 33-3 lists the PMIC clock requirements.

Table 33-2. Mapping for Input Sources

Clock	Clock Source	Ball Mapping	Frequency Range/List	Type
SYS_CLK1	Internal oscillator 0 (OSC0)	xi_osc0 and xo_osc0	19.2, 20, and 27 MHz	Crystal connection pins
	External	xi_osc0	19.2, 20, and 27 MHz	External LVCMOS
SYS_CLK2	Internal oscillator 1 (OSC1)	xi_osc1 and xo_osc1	19.2 ÷ 32 MHz	Crystal connection pins
	External	xi_osc1	12 ÷ 38.4 MHz	External LVCMOS

Copyright © 2015–2017, Texas Instruments Incorporated

Table 33-3. PMIC Clock Requirements(1)

Clock Source	Mapping	Frequency Range/List	Type
Internal oscillator	OSC16MIN and OSC16MOUT	16.384 MHz	Crystal connection pins
External	OSC16MIN	32.768 kHz (nom.)	External LVCMOS

(1) The PMIC does not need any external clock to operate properly. PMIC can run on internal RC-oscillator. The 16-MHz oscillator is in place to provide an accurate 32-kHz clock to its internal RTC, to the SoC or device in the system. See the corresponding PMIC datasheet for details.

33.2.3.3 Reset Configuration

33.2.3.3.1 ON/OFF Interconnect and Power-On-Reset

The entire system is typically awakened by an ON/OFF push button connected to the PMIC chip. This signal belongs to the VSYS - system power domain and is active low (the PMIC internal pullup ties it to VSYS). The PMIC power-up event is propagated through its NRESPWRON output pin to the device porz pad (that is, the PRM SYS_PWRON_RST signal) when the PMIC power-up sequence is achieved. The device porz input pin is held low all the time during VDD core and I/O power-up.

33.2.3.3.2 Warm Reset

A warm reset can be asserted by the device, by an external button (typically for development platform), or by any other chip connected to it (normally tied to PMIC companion NRESWARM output pin).

The device warm reset pad (resetn - device signal SYS_WARM_IN_RST) is used to trigger a warm reset on the device, which resets part of the device when it has already booted (for example, to recover from a software crash). When an internal device reset occurs, SYS_NRES_WARM_OUT output and device pad rstoutn go low and reset all the peripherals.

The device releases the SYS_NRES_WARM_OUT output signal after SYS_PWRON_RST is deasserted.

33.2.3.3.3 Peripheral Reset by GPIO

Most peripherals can be reset and powered on or off by GPIO. By default, under POR, most device signals are in safe mode with a default value driven by the I/O cell. The value is driven by an internal pullup or pulldown. Depending on the peripheral reset active level, users must select one GPIO or another (according to the reset value).

Once POR is released, the value on the pad is driven by the default configuration of the device control module. Most of time, this configuration is aligned with the default value selected on the I/O cell.

The next step is application-dependent: Users must configure the device registers to validate GPIO use and the default configuration of the control module.

33.2.3.3.4 Warm Reset Impact on GPIOs

When a warm reset event occurs:

- The GPIO controller is reset. Consequently, the GPIO is automatically turned in input mode.
- The control module is not reset. Information related to signal multiplexing mode and pullup or pulldown configuration is still valid.

Therefore, when a warm reset event occurs, the output buffer is disabled. Consequently, two different behaviors can be defined with regard to what is expected by the platform:

- GPIO sensitive to warm reset:

  To prevent a floating pad, user software is designed to have the internal pad PU and PD resistors enabled immediately, before the software warm reset action, because the warm reset-sensitive GPIO controllers will change I/O direction to input after an device warm reset. This is necessary if the warm reset-sensitive GPIO controller pin has been configured for output before the warm reset occurrence. The pulls-enabled-before-warm-reset condition should be set by default in case the user has configured a GPIO as an input, because in this case the user is expected to have enabled the internal PU and PD pads during GPIO configuration (unless external pull resistors were used).

Copyright © 2015–2017, Texas Instruments Incorporated

NOTE: If the PU and PD resistors are enabled immediately by software after a POR (cold reset) for a GPIO that is planned to be used only as an output, then unnecessary consumption can occur.

While the dynamically-enable-the-pull-just-before-warm-reset condition is possible during a software warm reset (because the user software is aware of the exact moment a warm reset event occurs), it is not possible when the warm reset is triggered by hardware (for example, a watchdog reset, SYS_NRESWARM signal assertion, and so forth), because the software is not aware of the exact moment of these warm reset assertions.

- GPIO not sensitive to warm reset:

  To avoid getting a floating signal during (and after) a warm reset event and to keep the same value that was driven before the reset, users must align the pull value with the drive value each time a dedicated GPIO register is accessed.

NOTE: To avoid unnecessary consumption, the user software must ensure that internal pull resistor is disabled when the GPIO buffer is driving.

For the description of the reset sequences and information about the device reset management, see Section 3.5, *Reset Management Functional Description*, in Chapter 3, *Power, Reset and Clock Management*.

33.2.3.4 PMIC Control

- I^2C:

  The device interfaces: system interface I/Os, and I2C1 are involved in system interactions between the device and external power, reset and clock management IC companions.

  The device and PMIC companion implement the basic power-management interface, as follows:

  – 32-kHz clock single input
  – Two system resets: power-on (cold) reset and warm reset
  – One interrupt

- INT:

  PMIC companion device can activate its output interrupt request signal (INT) at any time when requires the device to monitor its activity. When receiving such an interruption, the device checks, through the I^2C, to determine the source of the interrupt. INT pin is active low.

33.2.3.5 PMIC Request Signals

The PMIC drives three external enable-output signals, which allows switching on some external resources at different stages of the power-up sequence:

- REGEN1 and REGEN2 are driven high at the beginning of the power-up sequence, before any internal power source is turned on. They belong to the VSYS power domain. REGEN1 can typically be used for buck boost control.
- SYSEN is driven high immediately after the VCORE power output is turned on. SYSEN belongs to the VIO power domain.

The PMIC companion chip can receive two power resource requests: ENABLE1 and NSLEEP. These pins allow an external device to request PMIC internal resources. The PMIC companion power behavior when pins are activated must be programmed after the first boot (resources and ENABLE pins allocated by group, resource behavior upon group activation, and so forth).

The use of NSLEEP is especially required when PMIC chip is in sleep mode, because it cannot handle an I^2C command. Any device that requires the PMIC companion resource to wake up must first activate its associated ENABLE signal. All power-management chip power regulators are off or in sleep mode when it is in sleep mode.

Copyright © 2015–2017, Texas Instruments Incorporated

33.2.4 Sysboot Configuration

The device implements 16 sampled-on-reset sysboot pads.

Table 33-4. Sysboot Pads Description(1)

Pads	Description
sysboot[15]	Must be pulled to vdd for proper device operation (SR1.0). (2)Used to permanently disable the internal PU/PD resistors on pads gpmc_a[27:24, 22:19] (SR2.0).
sysboot[14]	Must be pulled to vss for proper device operation.
sysboot[13:10]	Used to configure the GPMC interface when booting from XIP memory connected to GPMC. See Table 33-6.
sysboot[9:8]	Selects the SYS_CLK1 clock speed. They must be set correctly according to the speed of the connected crystal. See Table 33-7.
sysboot[7:6]	Sector offset for the location of the redundant SBL images in QSPI.
sysboot[5:0]	Select interfaces or devices for the booting list. See Table 33-9.

(1) Boards should be implemented with a mechanism to easily modify the pull-up/down state to enable any future modifications.
(2) SR1.0 information is valid only for the AM571x family of devices.

Table 33-5. MMC2 Configuration (SR2.0)(1)

sysboot[15]	mmc2_dat[7:0] Pull-down Resistors
0b0	Internal pull-down resistors permanently disabled to avoid contention with the recommended per eMMC standard pull-ups that should be present on PCB. Software re-configuration of internal pull resistors is disabled.
0b1	Software re-configuration of pull resistors is allowed. Internal pull-downs on gpmc_a[n:19] are enabled by default to allow GPMC boot. Pulling low gpmc_a[n:19] is required in order to access the low-order address locations in the flash memory during boot (n = [27:24, 22:19] and depends on the memory volume).

(1) When internal pull-downs are permanently disabled (sysboot[15] = 0), gpmc_a[n:19] pads (where n = [27:24, 22:19]) require external pull-downs to enable GPMC boot.

All sysboot pads are sampled and latched onto the CTRL_BOOTSTRAP register (in control module) after POR. After booting, these pads can be used for other functions such as GPIOs, and the associated register bit field is not updated by the new functionality. For more information about pad multiplexing configuration, see Section 18.4.6.1.1, *Pad Configuration Registers*, in Chapter 18, *Control Module*.

NOTE: If used as GPIOs, the sysboot[15:0] pads must be used only in output mode to ensure that the input values always match a certain hardware predefined boot pattern, interpreted after each POR.

33.2.4.1 GPMC Configuration for XIP/NAND

Table 33-6 describes the GPMC interface configuration used in XIP, fast XIP and NAND modes controlled by sysboot[13:10].

Table 33-6. GPMC for XIP Configuration

sysboot[13]	Bus Width
0b0	8-bit
0b1	16-bit
sysboot[12:11]	**A/D-muxed/non-muxed Device on CS0**
0b00	Non-muxed device
0b01	A/D-muxed device
sysboot[10]	**Wait-pin Monitoring for Read Accesses**
0b0	Disabled

Copyright © 2015–2017, Texas Instruments Incorporated

Table 33-6. GPMC for XIP Configuration (continued)

0b1	Enabled

33.2.4.2 System Clock Speed Selection

There are three crystal speeds available to be selected by means of sysboot[9:8], as described in Table 33-7. User is responsible to set the correct value depending on the actual clock supplied to the device.

Table 33-7. System Clock (SYS_CLK1) Speed Selection

sysboot[9:8]	SYS_CLK1 Speed
0b00	Reserved
0b01	20 MHz
0b10	27 MHz
0b11	19.2 MHz

33.2.4.3 QSPI Redundant SBL Images Offset

Four options are available to set the offset between the redundant SBL images as described in Table 33-8. If not using the redundant SBL feature, there is no change required to sysboot pins as only the primary image is used and the sector offset is a don't care.

Table 33-8. Offset Between Redundant Images

sysboot[7:6]	Offset
0b00	64 KiB
0b01	128 KiB
0b10	256 KiB
0b11	512 KiB

33.2.4.4 Booting Device Order Selection

The ROM code creates the device list (order) based on information gathered from these locations:

- The first location is the sysboot[5:0] external configuration pins sensed in the device CTRL_BOOTSTRAP register. The sysboot[5:0] configuration pads have two main purposes: configure ROM code software in terms of interfaces and devices used for booting and configuring hardware after a POR or cold reset.
- The second location is the software booting configuration stored in the nonvolatile SAR memory, and used after a global warm reset.

The SYSBOOT pins are used to index a booting device list from a table with possible booting scenarios. The order of examined booting devices is from the first to the third devices.

The following names are used in the tables:

- Memory types:
  - Execute in place (XIP): NOR (CFI) flash memory or other XIP device
  - NAND: NAND flash memories (non-XIP)
  - SD: Removable SD card device
  - eMMC: eMMC™ memory device
  - QSPI_1: 1-bit SPI flash memories
  - QSPI_4: 4-bit (Quad) SPI flash memories
  - SATA: SATA-compatible devices such as solid state drives (SSDs) or hard-disk drives (HDDs).

Copyright © 2015–2017, Texas Instruments Incorporated

- Peripheral interfaces:
  - USB: HS USB 2.0 interface
  - UART: UART interface
- Table 33-9 lists the permanent booting devices in bold typeface.

NOTE: If no valid software booting configuration is found in after warm reset, the ROM code builds a device list featuring only the permanent booting devices (in **bold**).

NOTE: Users can force the execution of the peripheral booting procedure after warm reset by using the software booting configuration feature.

Table 33-9 lists the booting device order selected by ROM code depending on sysboot[5:0] pins.

Table 33-9. Booting Devices Order

sysboot[5:4]	sysboot[3:0]	First Device	Second Device	Third Device
Peripheral Preferred Booting				
0b00	0b0000	USB	**eMMC**	
0b00	0b0001	USB	**NAND**	
0b00	0b0010	USB	**SD**	**eMMC**
0b00	0b0011	USB	**SATA**	**SD**
0b00	0b0100	USB	UART	**XIP**
0b00	0b0101	SD	**XIP**	
0b00	0b0110	SD	**QSPI_1**	
0b00	0b0111	SD	**QSPI_4**	
0b00	0b1010	SD	**Fast XIP**	
Recovery/Upgrade or Development Booting				
0b01	0b0000	**USB**		
0b01	0b0011	**UART**		
0b01	0b0100	**SD**	USB	
0b01	0b0101	**SD**	USB	
0b01	0b0110	**SD**	USB	
0b01	0b0111	**SD**	USB	
0b01	0b1000	**SD**	USB	
0b01	0b1001	**SD**	USB	
0b01	0b1010	**SD**	USB	
0b01	0b1011	**SD**	USB	
Memory Preferred Booting				
0b10	0b0000	**eMMC**	USB	
0b10	0b0001	**NAND**	USB	
0b10	0b0010	**SD**	**eMMC**	USB
0b10	0b0011	**SATA**	**SD**	USB
0b10	0b0100	**XIP**	USB	UART
0b10	0b0101	**XIP**	SD	USB
0b10	0b0110	**QSPI_1**	SD	USB
0b10	0b0111	**QSPI_4**	SD	USB
Production Booting (1)				
0b11	0b0000	**SD**		
0b11	0b0100	**SATA**		
0b11	0b0101	**XIP**		

(1) After 10 failed loops through the device list, ROM code initiates immediate global warm reset.

Copyright © 2015–2017, Texas Instruments Incorporated

Table 33-9. Booting Devices Order (continued)

sysboot[5:4]	sysboot[3:0]	First Device	Second Device	Third Device
0b11	0b0110	**QSPI_1**		
0b11	0b0111	**QSPI_4**		
0b11	0b1000	**eMMC**		
0b11	0b1001	**NAND**		
0b11	0b1010	**Fast XIP**		
0b11	0b1011	**eMMC (boot part.)** [(2)]		

(2) The ROM code boots from eMMC boot partition. If the ROM code fails to retrieve the booting image, it does not try boot from the user area contrary to other eMMC options.

NOTE: SATA is not supported on the AM570x family of devices.

33.2.4.5 Boot Peripheral Pin Multiplexing

Table 33-10 lists the code pin multiplexing configuration supported by ROM according to boot peripheral. These settings are not restored to default values at ROM Code exit.

NOTE: The ROM code examines the interfaces that are selected to be searched until a valid bootable interface or device is found. The activities on the pads of the searched interfaces must be considered if they are connected to any other peripherals for any other purposes (for example, a LED connected to a GPMC pad muxed internally to a GPIO).

Table 33-10. Pin Multiplexing According to Boot Peripheral

Boot Device	Boot Interface	Pads	MuxMode	Signals
eMMC	MMC2	gpmc_a[19:27], gpmc_cs[1]	MuxMode=0x1	mmc2_dat[4:7]; mmc2_clk; mmc2_dat[0:3]; and mmc2_cmd
SD	MMC1	mmc1_clk, mmc1_cmd, mmc1_dat[0:3]	MuxMode=0x0	mmc1_clk, mmc1_cmd, mmc1_dat[0:3]
NAND	GPMC	GPMC on CS0	MuxMode=0x0	GPMC on CS0
XIP	GPMC	GPMC on CS0	MuxMode=0x0	GPMC on CS0, wait signal monitoring according to the SYSBOOT[10] setting
SATA	SATA	sata1_txp0, sata1_txn0, sata1_rxp0, sata1_rxn0	-	sata1_txp0, sata1_txn0, sata1_rxp0, sata1_rxn0
QSPI_1/QSPI_4	QSPI1	gpmc_a[13:18], gpmc_cs[2]	MuxMode=0x1	qspi1_rtclk qspi1_d[3:0]; qspi1_sclk; qspi1_cs[0]
USB	USB1	usb1_dp and usb1_dm	-	usb1_dp and usb1_dm
UART	UART3	uart2_rtsn uart2_ctsn	MuxMode=0x1 MuxMode=0x2	uart3_txd uart3_rxd

NOTE: SATA is not supported on the AM570x family of devices.

33.3 Device Initialization by ROM Code

This section describes high-level booting concepts and provides basic knowledge for booting on the device.

33.3.1 Booting Overview

33.3.1.1 Booting Types

Booting is the process of starting a bootstrap from one of the booting devices.

The ROM code has two functions for booting: Peripheral booting and memory booting.

- In peripheral booting, the ROM code polls a selected communication interface such as UART or USB, downloads the executable code over the interface, and executes it in internal RAM. Downloaded software from an external host can be used to program flash memories connected to the device. This special case of peripheral booting is called preflashing; software downloaded for preflashing is called the flash loader. The flash loader burns a new client application image in external flash memory. Initial software is a generic term for bootstrap, downloaded software, and flash loader. A software (warm) reset can be performed after the image is burned.
- In memory booting, the ROM code finds the bootstrap in permanent memories such as flash memory, memory cards, or SATA SSD or HDD memory devices and executes it. This process is normally performed after a cold or warm device reset.

The ROM code detects whether the device should download software from a peripheral interface (USB or UART) by using the sysboot pad configuration. This mechanism encompasses initial flashing in production (external memory is empty) and reflashing in service (external memory is already programmed).

33.3.1.2 ROM Code Architecture

Figure 33-4 shows the ROM code architecture. It is split into three main layers with a top-down approach: high-level, drivers, and hardware abstraction layer (HAL). One layer communicates with a lower-level layer through a unified interface.

- The high-level layer performs the main tasks of the public ROM code: CPU startup, watchdog and clock configurations, interrupt management, and main booting routine.
- The driver layer implements the logical and communication protocols for any booting device in accordance with the interface specification.
- The HAL implements the lowest level code for interacting with the hardware infrastructure modules. End booting devices (typically external flash components) are attached to the device I/O pads.

Figure 33-4 shows the three layers with their modules.

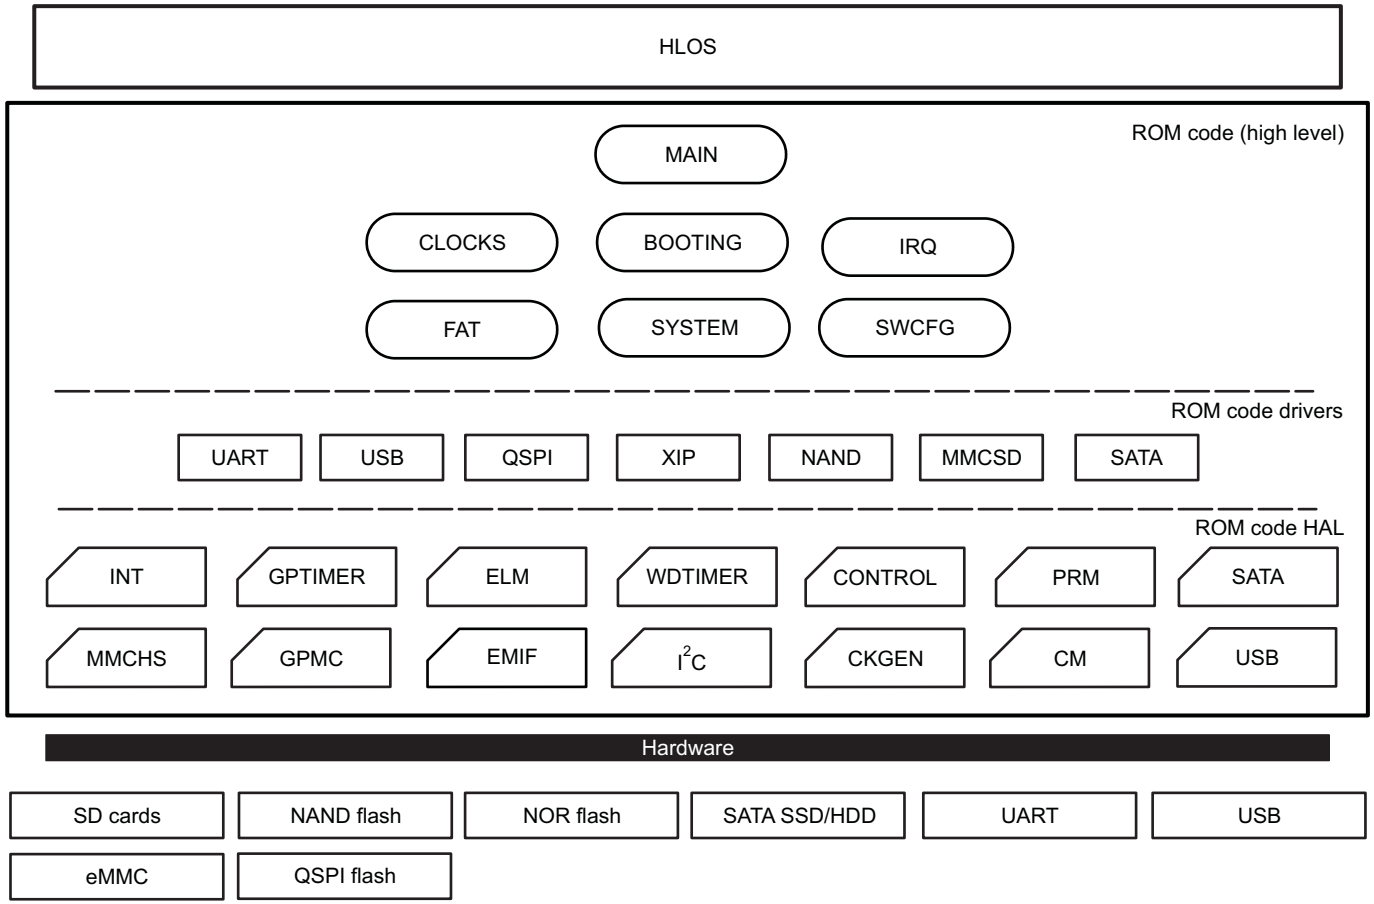
Figure 33-4. ROM Code Architecture



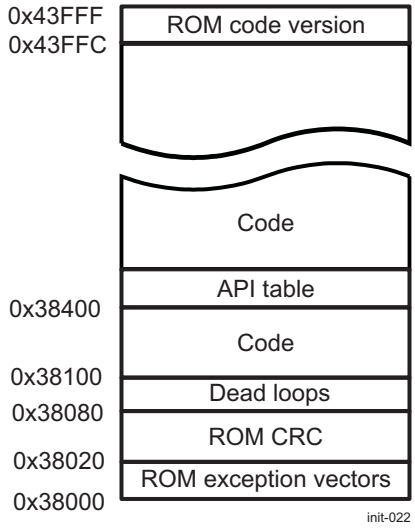
Copyright © 2015–2017, Texas Instruments Incorporated

33.3.2 Memory Maps

33.3.2.1 ROM Memory Map

Figure 33-5 shows the 48-KiB ROM memory map.

Figure 33-5. ROM Memory Map



- ROM exception vectors

  Exceptions are redirected to ROM exception vectors (see Table 33-11). The reset exception is redirected to the public ROM code startup. Other exceptions are redirected to RAM handlers by loading appropriate addresses to the PC register.

Table 33-11. ROM Exception Vectors

Address	Exception	Content
0x38000	Reset	Branch to the ROM code startup
0x38004	Undefined	PC = 0x4037 F004
0x38008	Software interrupt (SWI)	PC = 0x4037 F008
0x3800C	Prefetch abort	PC = 0x4037 F00C
0x38010	Data abort	PC = 0x4037 F010
0x38014	Unused	PC = 0x4037 F014
0x38018	IRQ	PC = 0x4037 F018
0x3801C	FIQ	PC = 0x4037 F01C

- ROM code cyclic redundancy check (CRC)

  The ROM code CRC is calculated as 32-bit CRC code (CRC-32-IEEE 802.3) for the address range 0x38000–0x43FFF. The 4-byte CRC code is stored at location 0x38020.

- Dead loops

  Dead loops are branch instructions coded in ARM mode. They have multiple purposes (see Table 33-12).

Copyright © 2015–2017, Texas Instruments Incorporated

Table 33-12. Dead Loops

Address	Purpose
0x38080	Undefined exception default handler
0x38084	SWI exception default handler
0x38088	Prefetch abort exception default handler
0x3808C	Data abort exception default handler
0x38090	Unused exception default handler
0x38094	IRQ exception default handler
0x38098	FIQ exception default handler

- Code

  This space is used to hold code and constant data.
- API table

  The purpose of this table is to allow external code access to system maintenance, utility, and device driver functions which are used for ensuring the ROM code boot functionality. These functions can be reused at run time by calling a fixed address hardcoded in this table.
- ROM code version

  The ROM code version consists of two BCD numbers: major and minor. It can be used to identify the ROM code release version burned in a given IC. The ROM code version is a 32-bit hexadecimal value at address 0x43FFC.

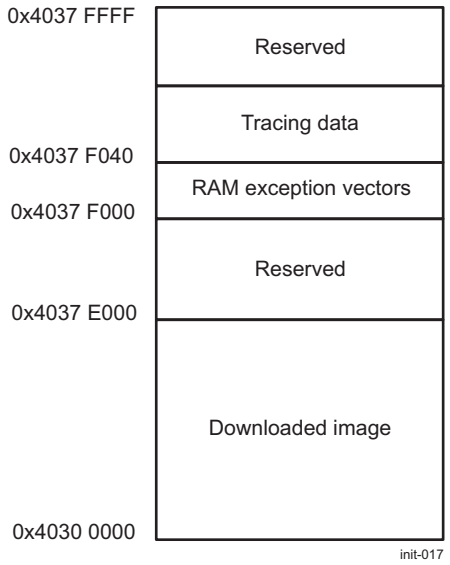
  The ROM code version number is:

  – 0x2801 for SR1.0 and SR2.0

33.3.2.2 RAM Memory Map

The partitioning of the on-chip SRAM (L3 OCM RAM) shown in Figure 33-6 is used during the booting process. Tracing areas can also be accessed when calling API functions.

Figure 33-6. RAM Memory Map



- Downloaded image

  This space is used by the public ROM code to store a downloaded booting image. It can be up to 504 KiB.
- RAM exception vectors

  The RAM exception vectors provide an easy way to redirect exceptions to the custom handler. Table 33-13 lists the contents of the RAM space reserved for RAM vectors. The first eight addresses

Copyright © 2015–2017, Texas Instruments Incorporated

are ARM instructions that load the value in the subsequent eight addresses into the PC. These instructions are executed when an exception occurs because they are called from ROM exception vectors. Undefined, SWI, unused, and FIQ exceptions are redirected to a hardcoded dead loop. Prefetch abort, data abort, and IRQ exception are redirected to predefined ROM handlers. Users can redirect an exception to another handler by writing its address to the appropriate location from 0x4037 F024 to 0x4037 F03C, or by overriding the branch (load into PC) instruction between addresses from 0x4037 F004 to 0x4037 F01C.

Table 33-13. RAM Exception Vectors

Address	Exception	Content
0x4037 F000	Reserved	Reserved
0x4037 F004	Undefined	PC = [0x4037 F024]
0x4037 F008	SWI	PC = [0x4037 F028]
0x4037 F00C	Prefetch abort	PC = [0x4037 F02C]
0x4037 F010	Data abort	PC = [0x4037 F030]
0x4037 F014	Unused	PC = [0x4037 F034]
0x4037 F018	Interrupt request (IRQ)	PC = [0x4037 F038]
0x4037 F01C	Fast interrupt request (FIQ)	PC = [0x4037 F03C]
0x4037 F020	Reserved	0x38090
0x4037 F024	Undefined	0x38080
0x4037 F028	SWI	0x38084
0x4037 F02C	Prefetch abort	Address of default prefetch abort handler(1)
0x4037 F030	Data abort	Address of default data abort handler (1)
0x4037 F034	Unused	0x38090
0x4037 F038	IRQ	Address of default IRQ handler
0x4037 F03C	FIQ	0x38098

(1) The default handlers for prefetch and data abort perform reads from CP15 debug registers to retrieve the reason for the abort:
- In case of prefetch abort: the IFAR register is read from CP15 and stored into R0. The IFSR register is read and stored into the R1 register. Then the ROM code jumps to the prefetch abort dead loop (38088h).
- In case of data abort: the DFAR register is read from CP15 and stored into R0. The DFSR register is read and stored into the R1 register. Then the ROM code jumps to the data abort dead loop (3808Ch).

- Tracing data

  This area contains trace vectors reflecting the execution path of the ROM code. Table 33-14 describes the public ROM code tracing data. For more information about ROM code tracing, see Section 33.3.9, *Tracing*.

Table 33-14. Tracing Data

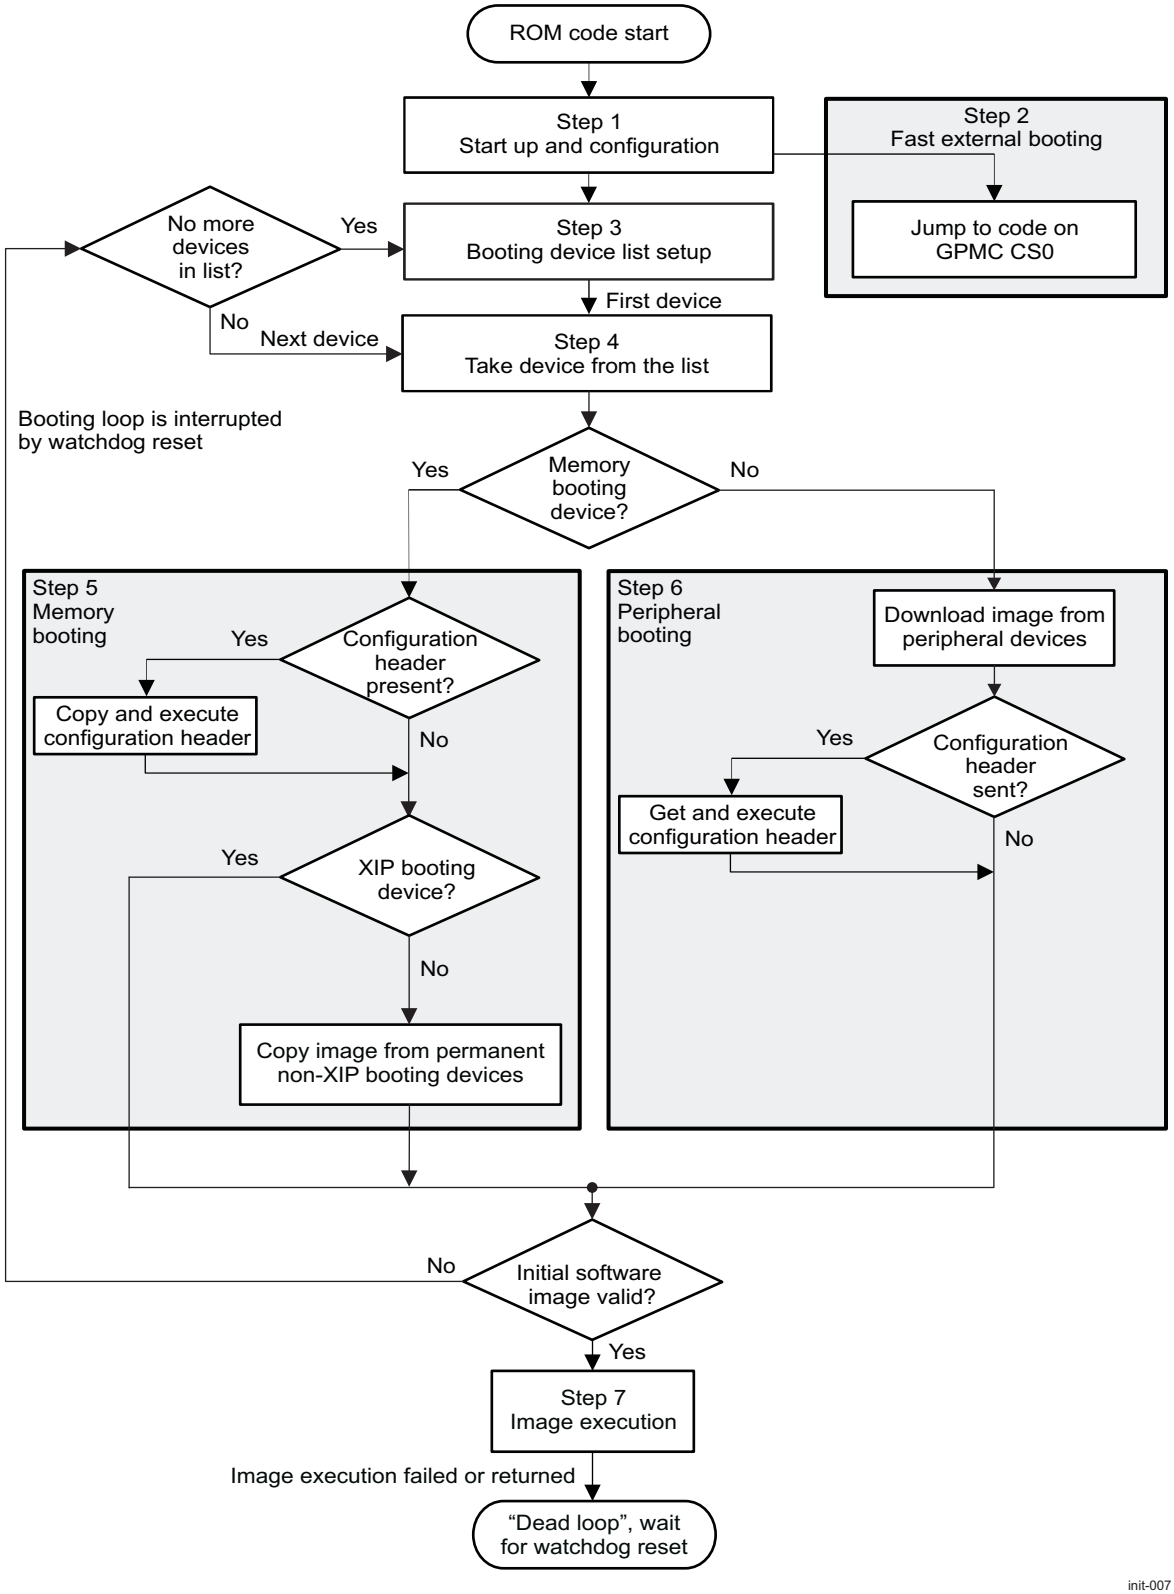
Address	Size	Description
0x4037 F040	32 bits	Current tracing vector, word 1
0x4037 F044	32 bits	Current tracing vector, word 2
0x4037 F048	32 bits	Current tracing vector, word 3
0x4037 F04C	32 bits	Current tracing vector, word 4
0x4037 F050	32 bits	Cold reset run tracing vector, word 1
0x4037 F054	32 bits	Cold reset run tracing vector, word 2
0x4037 F058	32 bits	Cold reset run tracing vector, word 3
0x4037 F05C	32 bits	Cold reset run tracing vector, word 4
0x4037 F060	32 bits	Current copy of the PRM_RSTST register (reset reasons)

Copyright © 2015–2017, Texas Instruments Incorporated

33.3.3 Overall Booting Sequence

Figure 33-7 shows the ROM code flow chart.

Figure 33-7. Overall Booting Sequence



Copyright © 2015–2017, Texas Instruments Incorporated

The main loop of the booting module goes through the booting device list and tries to get an image from the currently selected booting device. The ROM code performs the following steps:

Step 1. Basic configuration and initialization. Reading of SYSBOOT pins or software booting configuration.

Step 2. The path named fast external boot is a special low-latency boot mode. It consists of a blind jump to an external addressable memory. See Section 33.3.6, *Fast External Booting.*

Step 3. A booting device list is created (see Section 33.3.4.5, *Booting Device List Setup*). The list consists of all devices to be searched for a booting image. The list is created based on the SYSBOOT pins, or the software booting configuration described in Section 33.3.4.6, *Software Booting Configuration*. The software booting configuration structure is in the SAR memory and can be written by software before executing a software reset. After a software reset, the software booting configuration has priority over the SYSBOOT signals configuration.

Step 4. The main loop of the booting procedure goes through the booting device list and tries to search for an image from the currently selected booting device. This loop is exited if a valid booting image is found and successfully executed or when the watchdog expires. If an image is found, ROM code executes memory booting or peripheral booting, depending on the type of the current booting device:

- Memory booting is executed when the booting device is XIP memory, NAND, QSPI, eMMC or SD, SATA SSD/HDD.
- Peripheral booting is executed when the booting device is UART or USB.

Step 5. Memory booting reads data from memory-type devices. Memory booting is described in detail in Section 33.3.7, *Memory Booting*.

Step 6. Peripheral booting downloads data from communication interfaces. Peripheral booting is described in Section 33.3.5, *Peripheral Booting*.

Step 7. The image automatically starts.

An additional feature of the booting module is the execution of the Configuration Header (CH). The CH configures the system for faster and more flexible booting from the selected permanent or peripheral booting device. The CH, which is optional, is described in *Section 33.3.8.2, Configuration Header*.

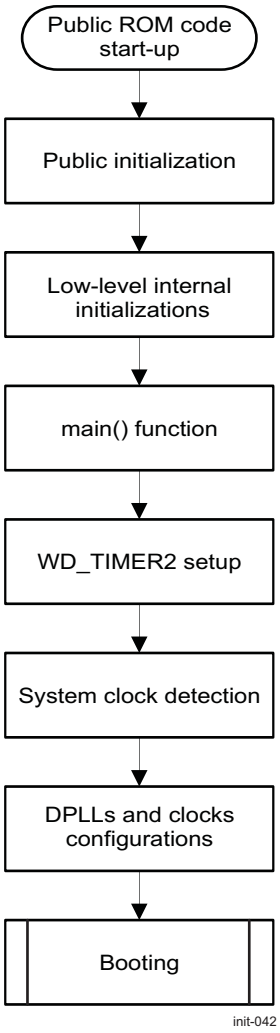
33.3.4 Startup and Configuration

33.3.4.1 Startup

Figure 33-8 shows the ROM code start-up sequence.

Figure 33-8. ROM Code Start-Up Sequence



The MPU L1 instruction cache and branch prediction mechanisms are activated as part of the public boot process. The base address of the public vector is configured to the reset vector of ROM code (0x38000). The memory management unit (MMU) remains switched off during boot (thus, L1 data cache is off). The MPU performs the basic initialization of the public side. Next, the MPU configures WD_TIMER2 (set to 3 minutes), detects system clock, and configures the system clock. Finally, the MPU jumps to the booting routine.

33.3.4.2 Control Module Configuration

Table 33-15 lists the Control Module registers modified at each ROM code startup. It is a Control Module requirement to be met prior to modify any of the pad control registers. These registers are not reverted back to default values (that is, to LOCK state) when ROM code completes.

Copyright © 2015–2017, Texas Instruments Incorporated

Table 33-15. Control Module Registers Modified by ROM Code at Each Startup

Register	Value	Meaning
CTRL_CORE_MMR_LOCK_1	0x2FF1AC2B	Unlock Control Module registers starting at address offset 0x0000 0100 and ending at 0x0000 079F
CTRL_CORE_MMR_LOCK_2	0xF757FDC0	Unlock Control Module registers starting at address offset 0x0000 07A0 and ending at 0x0000 0D9F
CTRL_CORE_MMR_LOCK_3	0xE2BC3A6D	Unlock Control Module registers starting at address offset 0x0000 0DA0 and ending at 0x0000 0FFF
CTRL_CORE_MMR_LOCK_4	0x1EBF131D	Unlock Control Module registers starting at address offset 0x0000 1000 and ending at 0x0000 13FF
CTRL_CORE_MMR_LOCK_5	0x6F361E05	Unlock Control Module registers starting at address offset 0x0000 1400 and ending at 0x0000 1FFF

Once the booting device list is completed, the ROM code applies the pin multiplexing settings as described in Section 33.2.4.5, *Pin Multiplexing According to Boot Peripheral*.

33.3.4.3 PRCM Module Mode Configuration

Table 33-16 lists the PRCM module mode, clock control, and power control registers modified at each ROM code startup. These registers are not reverted back to default values when ROM code completes.

Table 33-16. PRCM Module Mode Registers Modified by ROM Code

Register	Field	Value
CM_L3INSTR_L3_INSTR_CLKCTRL	MODULEMODE	DISABLED
CM_L3INSTR_OCP_WP_NOC_CLKCTRL	MODULEMODE	DISABLED
CM_CM_CORE_PROFILING_CLKCTRL	MODULEMODE	DISABLED
CM_PRM_PROFILING_CLKCTRL	MODULEMODE	DISABLED
CM_CM_CORE_AON_PROFILING_CLKCTRL	MODULEMODE	DISABLED
CM_EMU_CLKSTCTRL	CLKTRCTRL	HW_AUTO
CM_DSP1_CLKSTCTRL	CLKTRCTRL	HW_AUTO
CM_DSP1_DSP1_CLKCTRL	MODULEMODE	DISABLED
PM_DSP1_PWRSTCTRL	POWERSTATE	OFF
CM_IVA_CLKSTCTRL	CLKTRCTRL	HW_AUTO
PM_IVA_PWRSTCTRL	POWERSTATE	OFF

33.3.4.4 Clocking Configuration

The ROM code detects the system input clock frequency (SYS_CLK1) from the sysboot[9:8] pins value. The supported system frequencies in the device are:

- 19.2 MHz
- 20 MHz
- 27 MHz

See Section 33.2.3.2, *Clocking scheme*, and Section 33.2.4.2, *System clock speed configuration*.

After detecting the input clock, the ROM code configures the clocks and DPLLs required for ROM code execution.

The configured DPLLs are:

- DPLL_PER: locked to provide clocks to peripheral blocks
- DPLL_CORE: locked to provide L3_MAIN interconnect, L4 interconnect, and EMIF clocks
- DPLL_MPU: locked
- DPLL_USB_OTG_SS / DPLL_USB DPLLs: Locked only in case of USB peripheral booting. It is left

Copyright © 2015–2017, Texas Instruments Incorporated

untouched otherwise.

- DPLL_SATA: locked only in the case of the SATA memory booting. It is left untouched otherwise.

The DPLLs and PRCM clock dividers are configured with the default values of the ROM code (depending on the detected system input clock) after cold or warm reset in order to give the same working conditions to the ROM code sequence.

Table 33-17 summarizes the default ROM code clock settings.

Table 33-17. ROM Code Default Clock Settings

Clock	Frequency (MHz)	Source
DPLL_CORE clock with F_{DPLL} locked frequency	2128	Gated SYS_CLK1
EMIF_PHY_GCLK(1)	44.33	DPLL_DDR (M2)
EMIF_DLL_GCLK	266	DPLL_DDR .HSDIVIDER (H11)
CORE_X2_CLK	266	DPLL_CORE.HSDIVIDER (H12)
CORE_CLK	266	CORE_X2_CLK
CORE_USB_OTG_SS_LFPS_TX_CLK	34.3	DPLL_CORE.HSDIVIDER (H13)
CORE_GPU_CLK	212.8	DPLL_CORE.HSDIVIDER (H14)
CORE_IPU_ISS_BOOST_CLK	212.8	DPLL_CORE.HSDIVIDER (H22)
CORE_ISS_MAIN_CLK	152	DPLL_CORE.HSDIVIDER (H23)
BB2D_GFCLK	177.3	DPLL_CORE.HSDIVIDER(H24)
L3_ICLK	133	CORE_CLK
L4_ICLK	66.5	L3_ICLK
MPU_DPLL_HS_CLK	266	CORE_X2_CLK
IVA_DPLL_HS_CLK	266	CORE_X2_CLK
DPLL_PER – clock with Fdpll locked frequency	768	Gated SYS_CLK1
FUNC_192M_CLK	192	DPLL_PER (M2)
FUNC_256M_CLK	256	DPLL_PER.HSDIVIDER (H11)
DSS_GFCLK	192	DPLL_PER.HSDIVIDER (H12)
PER_QSPI_CLK	192	DPLL_PER.HSDIVIDER(H13)
PER_GPU_CLK	192	DPLL_PER.HSDIVIDER (H14)
DPLL_MPU - clock with Fdpll locked frequency	2352	Gated SYS_CLK1
MPU_DPLL_CLK	588	PRM
MPU_GCLK	588	DPLL_MPU (M2)
DPLL_USB - clock with Fdpll locked frequency (2)	960	Gated SYS_CLK1
L3INIT_480M_GFCLK	480	DPLL_USB (M2)
L3INIT_60M_GFCLK	60	L3INIT_480M_GFCLK
DPLL_USB_OTG_SS - clock with F_{DPLL} locked frequency (2)	2500	Gated SYS_CLK1
DPLL_SATA - clock with Fdpll locked frequency (2)	1500	Gated SYS_CLK1

(1) This clock is intentionally set up at low frequency to ensure correct initialization of external DRAM components.

(2) This clock is locked specifically if USB peripheral or SATA memory booting is selected.

However it is possible to override the default clock settings. There are three ways to change DPLLs and all related clock divider, gating, and multiplexer configurations during the boot:

- ROM code default settings, described in Table 33-17. They are always applied at any reset.
- Software booting configuration after a software reset, described in Section 33.3.4.6, *Software Booting Configuration*

Copyright © 2015–2017, Texas Instruments Incorporated

- The CH, described in Section 33.3.8.2, *Configuration Header*. The CH lets users have a known configuration (about GPMC and clock registers) after memory or peripheral booting. This configuration can be blocked by the software booting configuration. For more information, see Table 33-19, *Software Booting Configuration Structure*.

33.3.4.5 Booting Device List Setup

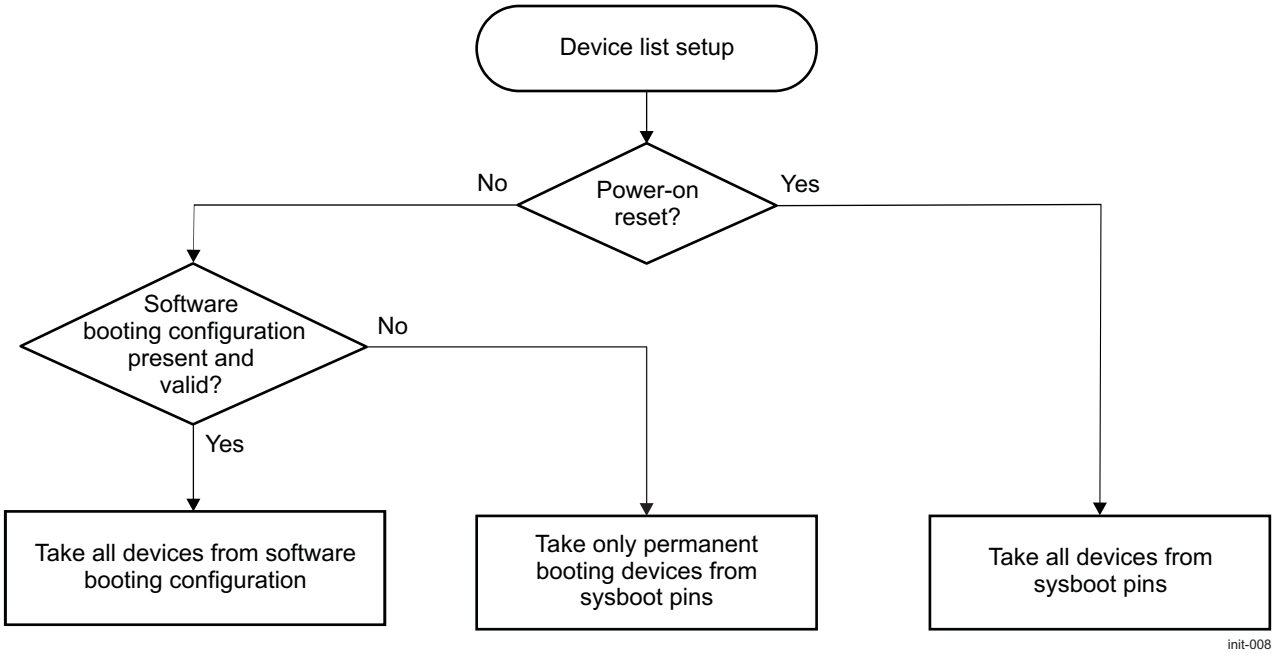
The ROM code creates a device list based on two sources:

- The software booting configuration (if present after a warm reset). The software booting configuration structure is stored in nonvolatile RAM SAR memory.
- The sysboot[5:0] signals latched in the control module are used to index the device table from which the list of devices is extracted.

Figure 33-9 shows how the ROM code sets up the device list depending on the reset source.

NOTE: Only permanent booting devices are put to the list when the reset is not power-on and the devices are taken from the sysboot pins. Users can force peripheral booting after software reset by using the software booting configuration.

Figure 33-9. Device List Setup



33.3.4.6 Software Booting Configuration

The software booting configuration is a logical structure stored in SAR RAM memory, which is not cleared after warm resets or wakeups from low-power modes.

33.3.4.6.1 Public Use of SAR RAM

The public ROM code offers some flexibility about the location of the software booting configuration structure. The PUBLIC_SW_BOOT_CFG_ADDR pointer defines the start address of the structure within the SAR RAM bank (see Table 33-18).

Copyright © 2015–2017, Texas Instruments Incorporated

Table 33-18. Public Use of SAR RAM

Logical name	Address	Size (Bytes)	Description
PUBLIC_SW_BOOT_CFG_ADDR	0x4AE2 6B00	4	Public software booting configuration pointer. The word value at this location is: - Reset (zero) on a cold reset. - Read on a warm reset.
PUBLIC_SAR_RAM_1_FREE	0x4AE2 6CC8	...	Recommended address for start of software booting configuration structure described in Section 33.3.4.6.2, *Software Booting Configuration Structure*.
PUBLIC_SAR_RAM_1_END	0x4AE2 6FFF		End of SAR RAM bank 1

As mentioned previously, the software booting configuration feature is optional. Hence, the public ROM code decides to use the feature based on the value read on a warm reset at the address pointed to by the PUBLIC_SW_BOOT_CFG_ADDR pointer. If the value matches the range 0x4AE2 6CC8 to 0x4AE2 6FFC, the ROM code extracts the structure at that address. The value pointed to by PUBLIC_SW_BOOT_CFG_ADDR is always overwritten to 0 on a cold reset.

It is possible to use the public SAR RAM area for any other purpose, such as storing traces for HLOS use. Obviously, care must be taken not to overwrite the locations used for low-power modes and/or software booting configuration, if used.

33.3.4.6.2 Configuration Structure for Software Booting

Table 33-19 describes the configuration structure for software booting . It offers three levels of flexibility for redefining the ROM code defaults after a warm reset:

- Redefining the default device booting list (from ROM code defaults given by SYSBOOT pins configuration)
- Redefining the default clock settings
- Redefining time-out linked to the peripheral booting mechanism

NOTE: The sections are provided as a linked list; therefore, the order and number of items is not relevant.

The ROM code searches for the next section at the location based on the size filled in the previous section. The clock configuration from software booting configuration may override the CH settings, if the appropriate bit is set in the configuration structure for software booting.

33.3.5 Peripheral Booting

33.3.5.1 Description

The ROM code can boot from these peripherals:

- USB1: High-, and Full-speed USB from USB1 internal transceivers
- UART3: 115.2 Kbps, 8 bits, even parity, 1 stop-bit, no flow control

The purpose of booting from a peripheral is to download a flash loader code from an external host. This booting method is used primarily for programming flash memories connected to the device (for example, in the case of initial flashing, firmware update or servicing). Figure 33-12 shows the overall peripheral booting procedure. It consists of a synchronization phase (handshake between the host and the device) and a transfer phase. The synchronization phase is similar for UART and USB boots. Both transfer phases use the same procedure.

When booting from the UART, the ROM code first initializes the UART3 interface. Then the ROM code sends an ASIC ID block of data. From there, it expects to receive a boot message from the host within 300 ms, by default. Figure 33-10 shows this procedure.

Figure 33-10. Synchronization Phase for UART

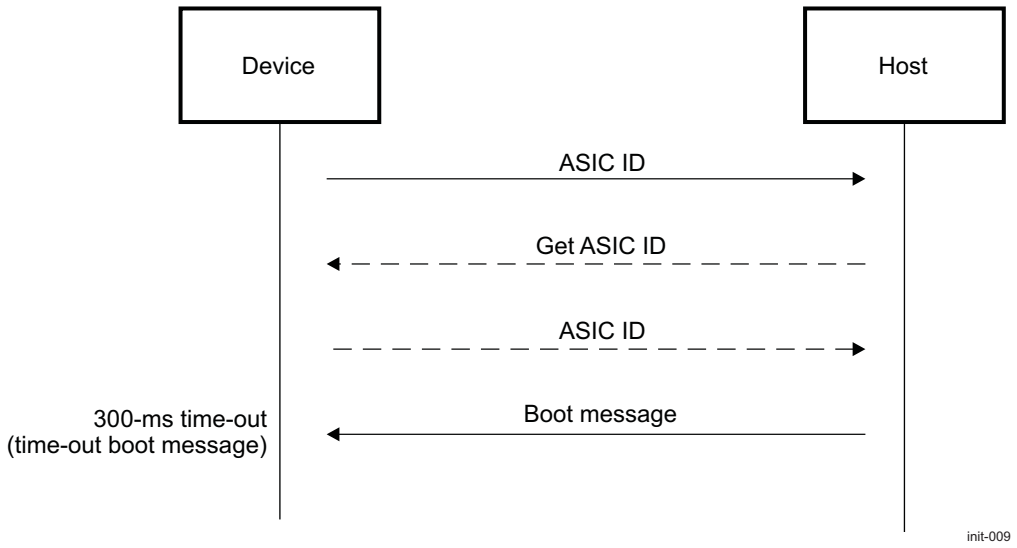

Figure 33-11 shows the procedure when booting from the USB.

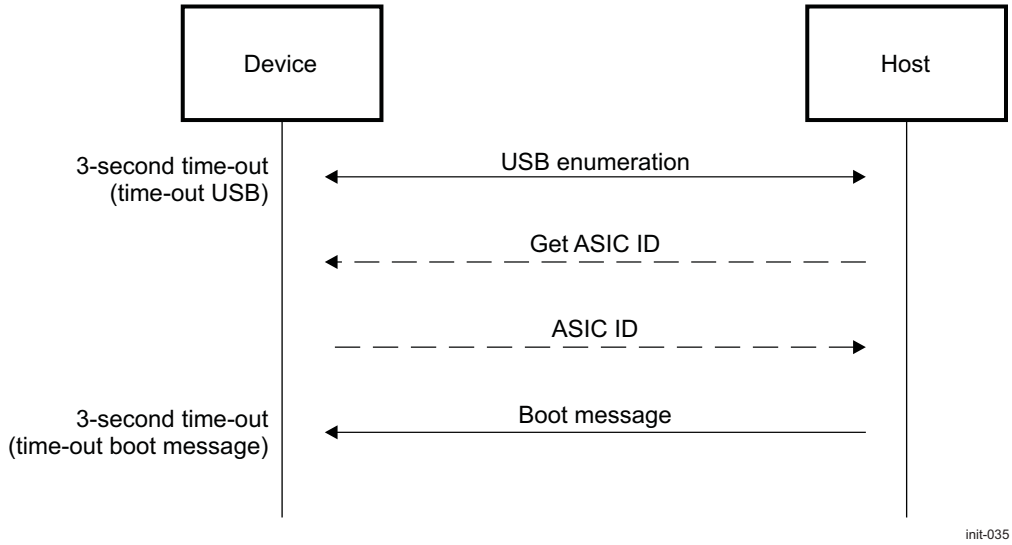
Copyright © 2015–2017, Texas Instruments Incorporated

Figure 33-11. Synchronization Phase for USB



During the synchronization phase (see Figure 33-10 and Figure 33-11), the device can provide a small packet of data called the ASIC ID (described in Table 33-20). It is a simple structure that contains different kinds of information, such as ROM version, checksums, and ID.

The default time-outs involved during the synchronization phase can be redefined after a warm reset by means of the software booting configuration (described in Section 33.3.4.6, *Software Booting Configuration*). The host can decide the desired operation by providing a booting message (see Table 33-24). This message can be: Get ASIC ID, peripheral boot, change device, or next device. If the device receives the Get ASIC ID boot message, it sends back the ASIC ID contents.

If the change device or next device message is received, the ROM code stops the current peripheral booting procedure and returns to the main booting, which decides about the next booting device according to the boot message received.

If the peripheral boot message is received without a time-out, the device is entering the transfer phase. From there, the flash loader image size (as a 32-bit word) and the flash loader image itself are expected to be received. The ROM code waits up to 1 minute for completion of image size reception, and up to 1 more minute to download the image. If the download procedure does not complete before this time, the peripheral booting procedure aborts. ROM code continues to examine the devices included in the booting device list. If the download procedure passes, then the image can be executed.

The flash loader image is downloaded directly into internal RAM from address 0x4030 0000 and the maximum size of the downloaded image is 504 KiB.

NOTE: Sending an image size of zero skips the peripheral booting procedure.

The USB or UART connection is left open at the end of the transfer phase and once exiting the ROM code for the initial software to take over. It means the initial software can reuse the currently established connection. In the case of a USB connection, the endpoints can be reused as such, without closing the connection and performing a full enumeration again.

33.3.5.2 Initialization Phase for UART Boot

The ROM code supports booting from a UART interface with the following characteristics:

- UART3 interface
- Communication parameters set to 115.2 Kbps, 8 bits, even parity, 1 stop-bit, no flow control
- Two-pin interface: RX/TX
- The boot message default time-out is 300 ms (time-out boot message)

33.3.5.3 Initialization Phase for USB Boot

The ROM code supports booting from a USB interface with the following characteristics:

- Using the USB1 subsystem in USB2.0 mode
- Device integrated USB transceiver (USB2PHY1)
- Enumeration default time-out is 3 seconds (time-out USB)
- The boot message default time-out is 3 seconds (time-out boot message).

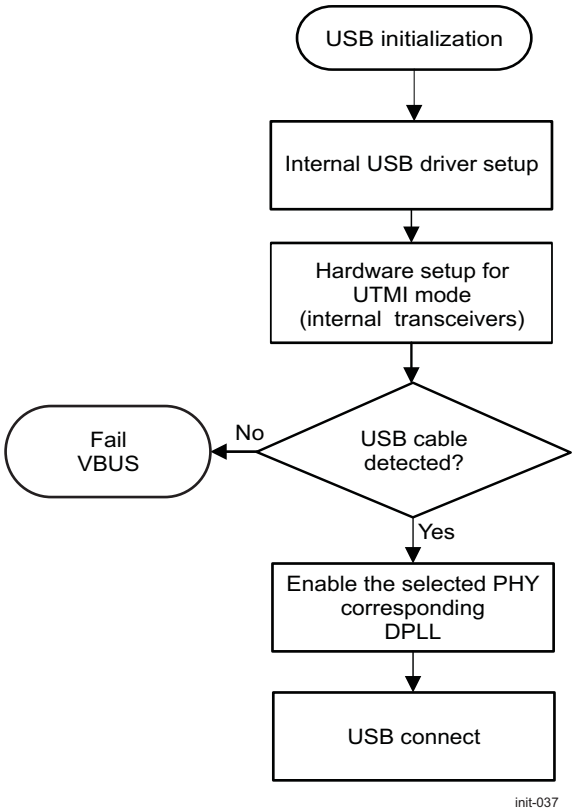
NOTE: The ROM code does not handle any OTG-specific features.

33.3.5.3.1 Initialization Procedure

NOTE: The internalUSB2PHY1 (HS) transceiver must be powered and configured upon startup. No action is expected from the device ROM code for its configuration.

Figure 33-13 shows the USB initialization procedure.

Figure 33-13. USB Initialization Procedure



Copyright © 2015–2017, Texas Instruments Incorporated

NOTE: The ROM code does not consider the USB PHYs charger detection circuitry status.

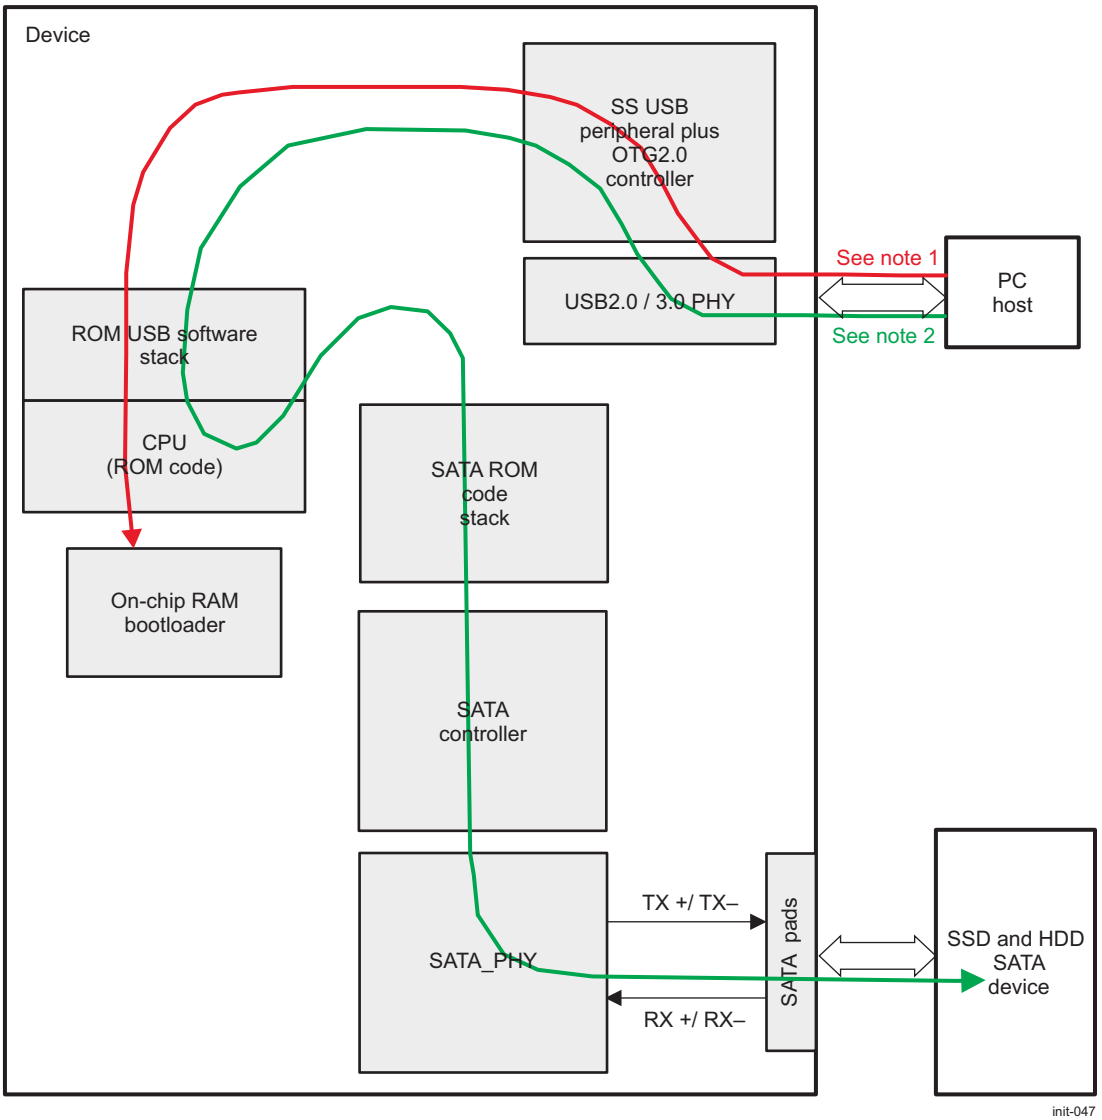
NOTE: The ROM code assumes that VBUS is always present.

33.3.5.3.2 SATA Peripheral Device Flashing over USB Interface

NOTE: SATA is not supported on the AM570x family of devices.

In the next scheme (see Figure 33-14), it is assumed that the new version of the firmware Flash Loader Host is located in the PC host. In the same way, the application loaded to device internal L3 On-chip RAM (using the peripheral boot function of the device ROM code) is called Flash Loader Second.

Figure 33-14. SATA Flashing Over USB



(1) ROM boots from USB controller and downloads deviceFlash Second in RAM.

(2) The PC host is allowed to flash the device firmware located in the SATA device.

33.3.5.3.3 USB Driver Descriptors

USB devices use descriptors to report their attributes. A descriptor is a data structure with a defined format. Each descriptor begins with a byte-wide field that contains the total number of bytes in the descriptor followed by a byte-wide field that identifies the descriptor type. Using descriptors allows concise storage of the attributes of individual configurations so that each configuration can reuse descriptors or portions of descriptors from other configurations that have the same characteristics. Where appropriate, descriptors contain references to string descriptors. String descriptors contain displayable, human-readable description information. These descriptor details can be used for tool development or debugging:

- Device descriptor

  A device descriptor contains general information about a USB device, including global information that applies to the device and all device configurations. A USB device has only one device descriptor. A device-qualifier descriptor is required because the ROM code uses the HS feature of the USB core. Table 33-25 lists the device descriptors.

Table 33-25. Device Descriptor

Field	Value	Description
bLength	0x12	Size of this descriptor in bytes
bDescriptorType	0x01	Device descriptor type
bcdUSB	0x0210	USB specification release number in binary coded decimal (BCD) format
bDeviceClass	Vendor-specific (0xFF)	Class code
bDeviceSubClass	Vendor-specific (0xFF)	Subclass code
bDeviceProtocol	Vendor-specific (0xFF)	Protocol code
bMaxPacketSize0	0x40	Maximum packet size for endpoint 0
idVendor	0x0451	Vendor ID (Texas Instruments), TI default value
idProduct	0xD014	Product ID, TI default value
bcdDevice	0x0000	Device release number
iManufacturer	See Section 33.3.5.3.4.	Index of string descriptor describing manufacturer
iProduct	See Section 33.3.5.3.4.	Index of string descriptor describing product
iSerialNumber	See Section 33.3.5.3.4.	Index of string descriptor describing device serial number
bNumConfigurations	0x01	Number of possible configurations

- Device-qualifier descriptor

  The device-qualifier descriptor contains information about a HS-capable device that changes if the device operates at its other speed. This descriptor is retrieved by the host using the GetDescriptor() request (standard device request). Table 33-26 lists the device-qualifier descriptors.

Table 33-26. Device-Qualifier Descriptor

Field	Value	Description
bLength	0x0a	Size of this descriptor in bytes
bDescriptorType	0x06	Device-qualifier descriptor type
bcdUSB	0x0210	USB specification release number in BCD
bDeviceClass	0xFF	Class code
bDeviceSubClass	0xFF	Subclass code
bDeviceProtocol	0xFF	Protocol code
bMaxPacketSize0	0x40	Maximum packet size for endpoint 0
bNumConfigurations	0x01	Number of possible configurations
bReserved	0x00	Reserved for future use

- Configuration descriptor

  This descriptor gives information about a specific device configuration. It describes the number of interfaces supported by the configuration (see Table 33-27).

Copyright © 2015–2017, Texas Instruments Incorporated

Table 33-27. Configuration Descriptor

Field	Value	Description
bLength	0x09	Size of this descriptor in bytes
bDescriptorType	0x02	Configuration descriptor type
wTotalLength	–	Combined length of all descriptors
bNumInterfaces	0x01	Number of interfaces supported
bConfigurationValue	0x01	Value to use as an argument for the SetConfiguration() request
iConfiguration	Index	Index of string descriptor describing this configuration
bmAttributes	0xC0	Power setting and remote wakeup
bMaxPower	0x32	Maximum power consumption of the USB device

- Other speed configuration descriptor

  This descriptor describes the configuration of a HS-capable device if it operates at its other possible speed (see Table 33-28).

Table 33-28. Other Speed Configuration Descriptor

Field	Value	Description
bLength	0x09	Size of this descriptor in bytes
bDescriptorType	0x07	Other speed configuration descriptor type
wTotalLength	–	Combined length of all descriptors
bNumInterfaces	0x01	Number of interfaces supported
bConfigurationValue	0x01	Value to use as an argument for the SetConfiguration() request
iConfiguration	Index	Index of string descriptor describing this configuration
bmAttributes	0xC0	Power setting and remote wakeup
bMaxPower	0x32	Maximum power consumption of the USB device

- Interface descriptor

  This descriptor describes a specific interface in a configuration (see Table 33-29).

Table 33-29. Interface Descriptor

Field	Value	Description
bLength	0x09	Size of this descriptor in bytes
bDescriptorType	0x04	Interface descriptor type
bInterfaceNumber	0x00	Number of this descriptor
bAlternateSetting	0x00	Value to select the alternate setting
bNumEndpoints	0x02	Number of endpoints used for this interface
bInterfaceClass	0xFF	Class code
bInterfaceSubClass	0xFF	Subclass code
bInterfaceProtocol	0xFF	Protocol code
iInterface	Index	Index of string descriptor describing this interface

- Endpoint descriptor

  Each endpoint used for an interface has its own descriptor. This descriptor contains information required by the host to determine the bandwidth requirements of each endpoint. This descriptor is returned as part of the GetDescriptor(Configuration) request (see Table 33-30 and Table 33-31).

Table 33-30. BULK IN Endpoint Descriptor

Field	Value	Description
bLength	0x07	Size of this descriptor in bytes
bDescriptorType	0x05	Endpoint descriptor type

Copyright © 2015–2017, Texas Instruments Incorporated

Table 33-30. BULK IN Endpoint Descriptor (continued)

Field	Value	Description
bEndpointAddress	0x81 (1 IN)	Address of the endpoint on the USB device
bmAttributes	0x02 (Bulk)	Type of transfer
wMaxPacketSize	See (1).	Number of endpoints used for this interface
bInterval	0x00	Maximum NAK rate

(1) The maximum size is 0x0200 (512 bytes) for HS bulk endpoint and 0x0040 (64 bytes) for FS bulk endpoint.

Table 33-31. BULK OUT Endpoint Descriptor

Field	Value	Description
bLength	0x07	Size of this descriptor in bytes
bDescriptorType	0x05	Endpoint descriptor type
bEndpointAddress	0x01 (1 OUT)	Address of the endpoint on the USB device
bmAttributes	0x02 (Bulk)	Type of transfer
wMaxPacketSize	See (1).	Number of endpoints used for this interface
bInterval	0x00	Maximum NAK rate

(1) The maximum size is 0x0200 (512 bytes) for HS bulk endpoint and 0x0040 (64 bytes) for FS bulk endpoint.

- String descriptors

  String descriptors use UNICODE encoding. The strings in a USB device can support multiple languages. When requesting a string descriptor, the requester specifies the desired language using a 16-bit language ID (LANGID) defined by the USB interface. String index 0 for all languages returns a string descriptor that contains an array of 2-byte LANGID codes supported by the device.

  For the description of the different string descriptors, see:

  – The language ID string descriptor (Table 33-32)
  – The manufacturer ID string descriptor (Table 33-33)
  – The product ID string descriptor (Table 33-34)
  – The configuration string descriptor (Table 33-35)
  – The interface string descriptor (Table 33-36)

Table 33-32. Language ID String Descriptor

bString	pbi	Interface string

33.3.5.3.4 USB Customized Vendor and Product IDs

When device ROM Code enumerates through USB, one may want to use his/her own vendor and product IDs rather than TI defaults. Product and Vendor IDs are transmitted as part of the USB Standard Device Descriptor during the USB device enumeration process (resp. idProduct and idVendor 16 bits fields).

Product IDs (PIDs) and vendor IDs (VIDs) are stored as part of device chip eFuses and readable from control module. The built-in USB ROM driver behaves differently whether the VID value is either left unfused, or fused with a customer-specific VID. Thus, two main cases are distinguished:

- VID is fused with a customer-specific ID value
- VID is left unfused

Table 33-37 lists standard USB ROM device descriptors. Table 33-38 lists USB ROM descriptor strings.

Table 33-37. USB ROM Standard Device Descriptor

Device Descriptor Field	Size (Bytes)	VID≠0x0000 (1) (fused)	VID=0x0000 (unfused) (2)
bLength	1	0x12	
bDescriptorType	1	0x1	
bcdUSB	2	0x0200 (if enumerated in USB2.0 HS or FS)	
bDeviceClass	1	0xFF	
bDeviceSubClass	1	0xFF	
bDeviceProtocol	1	0xFF	
bMaxPacketSize0	1	0x40 (64 bytes if enumerated in USB2.0 HS or FS)	
idVendor	2	(VID value from control module)	0x0451
idProduct	2	(PID value from control module)	0xD014
bcdDevice	2	0x0000	
iManufacturer	1	0x20	0x21
iProduct	1	0x24	0x25
iSerialNumber	1	0	
bNumConfigurations	1	1	

(1) VID other than 0x0 and VID other than 0xFFFF and VID other than 0x0451 values
(2) VID=0x0 or VID=0xFFFF or VID=0x0451

Table 33-38. USB ROM Descriptor Strings

String Descriptor	Size (bytes)	VID ≠ 0x0000	VID=0x0000(unfused) (1)
Serial Number		N/A	
Configuration	8	"pbc"	

(1) VID=0x0451

Copyright © 2015–2017, Texas Instruments Incorporated

Table 33-38. USB ROM Descriptor Strings (continued)

String Descriptor	Size (bytes)	VID ≠ 0x0000	VID=0x0000(unfused)[1]
Interface	8	"pbi"	
Product	8/18	N/A	<string>
Manufacturer	8/36	N/A	"Texas Instruments"

The ROM code transmits additional descriptors as part of the enumeration procedure: configuration descriptor, device qualifier, language ID string, configuration string, interface string, and function string descriptors. Those do not depend on the VID or PID value.

33.3.5.3.5 USB Driver Functionality

- Transactions supported:
  - Control transactions: Used for standard device requests
  - Bulk transactions: Used for data transfer in the image downloading stage. The ASIC ID is sent to the BULK IN endpoint and the image is transferred from the host over the BULK OUT endpoint.

  The device USB device first attaches to the host as an FS device. In the reset mechanism, the USB core requests HS operation. If the HS negotiation in the reset phase succeeds, further transactions are at HS; otherwise, they are at FS. After reset, the USB driver checks for the speed of the device, whether it is FS or HS. Depending on the speed configured by the host, the standard USB device requests are answered with the corresponding descriptors.
- Standard device request restrictions:

  Some standard device requests are not supported by the driver because the USB driver is dedicated for use by the ROM code for peripheral booting. Table 33-39 lists the standard device requests supported by the driver.

Table 33-39. Standard Device Requests Supported

Request	Description	Support
CLEAR_FEATURE	Sets or clears a specific feature	Supported only for the ENDPOINT_HALT feature
GET_CONFIGURATION	Returns the current device configuration value	Yes
GET_DESCRIPTOR	Returns the specified descriptor	Yes
GET_INTERFACE	Returns the selected alternate setting for the specified interface	Yes
GET_STATUS	Returns the status for the specified recipient	Yes
SET_ADDRESS	Sets the device address	Yes
SET_CONFIGURATION	Sets the device configuration	Yes
SET_DESCRIPTOR	Updates existing descriptors or adds new descriptors	Runtime updating of descriptors is not supported.
SET_FEATURE	Sets or enables a specific feature	Supported only for the ENDPOINT_HALT feature
SET_INTERFACE	Selects an alternate setting in an interface	Runtime setting of alternate features is not supported.
SYNCH_FRAME	Sets and reports an endpoint synchronization frame	No, because isochronous transfers are not used

33.3.6 Fast External Booting

33.3.6.1 Overview

The fast external boot is a special memory booting mode. It consists of a blind jump to a code in an external XIP memory device connected to GPMC CS0 and lets customers create their own booting code. Fast external booting is selected by means of the SYSBOOT[5:0] pins .

The NOR device must fulfill the following requirements for fast XIP mode:

- Non-muxed or address/data multiplexed mode, configured through sysboot[12:11] (=0x1 for A/D mux)
- 8-bit or 16-bit data bus width, configured through sysboot[13] (=1 for 16-bit)
- CS0 chip select
- Device wait signal connected to the WAIT0 GPMC signal (if used)
- The wait monitoring enable/disable is based on the value of SYSBOOT[10]. SYSBOOT[10] value is exported to GPMC by hardware means.

The jump is performed with minimum on-chip ROM code execution.

33.3.6.2 Fast External Booting Procedure

Figure 33-15 shows the procedure for fast external boot. The code does not use any RAM and is designed for fast execution.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 33-15. Fast External Boot Procedure

33.3.7 Memory Booting

33.3.7.1 Overview

The memory booting process starts an external code in memory devices. ROM code can use only the memory type of booting devices as permanent booting devices (that is, devices examined after both cold [POR] and warm resets). Temporary booting devices are examined only after cold resets. The supported permanent booting devices are:

- NOR flash devices
- NAND flash devices
- SPI/QSPI flash memories
- eMMC memories
- SD cards
- SATA SSD and HDD storage memory devices

NOTE: SATA is not supported on the AM570x family of devices.

Two main groups of permanent booting devices are distinguished by code shadowing. Code shadowing means copying code from a nondirectly addressable device (non-XIP) to RAM, where the code can be executed. Directly addressable devices are XIP devices.

Figure 33-16 shows the general memory booting procedure common to all types of devices. First, CH is copied to internal RAM. It is copied even for XIP devices, because the device can temporarily lose a connection with XIP memory during CH execution (for example, while updating interface timings). The second step is to shadow the image, if the device is not XIP. The last step is image execution and any return from image results in a dead loop.

If CH copying or shadowing fails, memory booting returns to the main booting procedure, which selects the next device for booting.

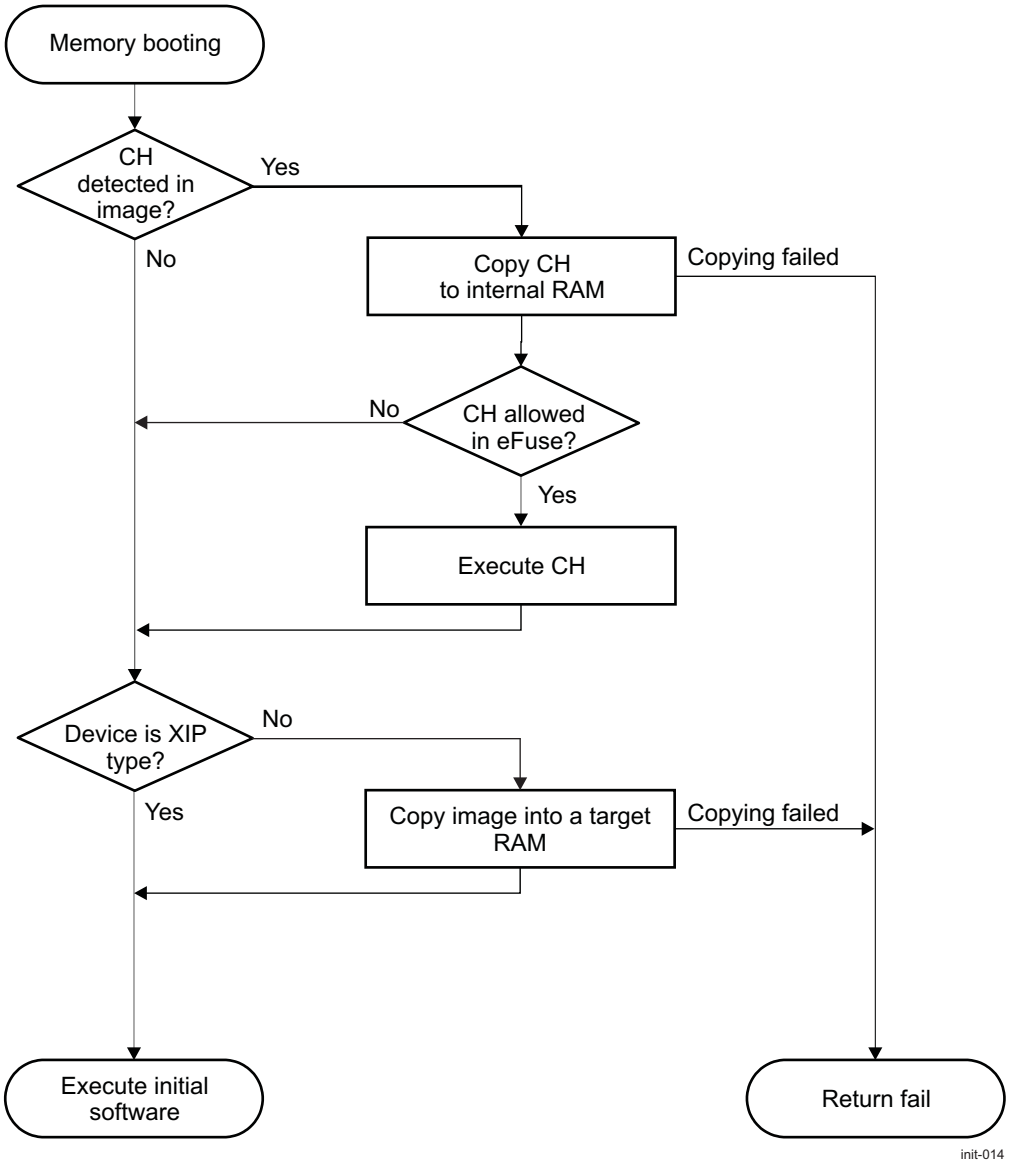
NOTE: A booting image is considered to be present when the first 4-byte word of the sector is not equal to 0000 0000h or FFFF FFFFh.

During the first read sector (512 bytes) call, sectors are copied to a temporary device on-chip SRAM buffer. Once the image is found and the destination address is known, the content of the temporary buffer is moved to the target device on-chip SRAM location so it is required to reread the first image sector. GP header is not copied into target buffer location; therefore, only executable code is in device on-chip RAM, with the first executable instruction at the destination address.

SATA, eMMC, SD cards, SPI/QSPI and NAND devices can hold up to four copies of the booting image. Therefore, the ROM code searches for one valid image out of the four copies, if present, by walking over the first blocks of mass storage space. Other XIP devices (NOR) use only one copy of the booting image.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 33-16. Memory Booting Procedure



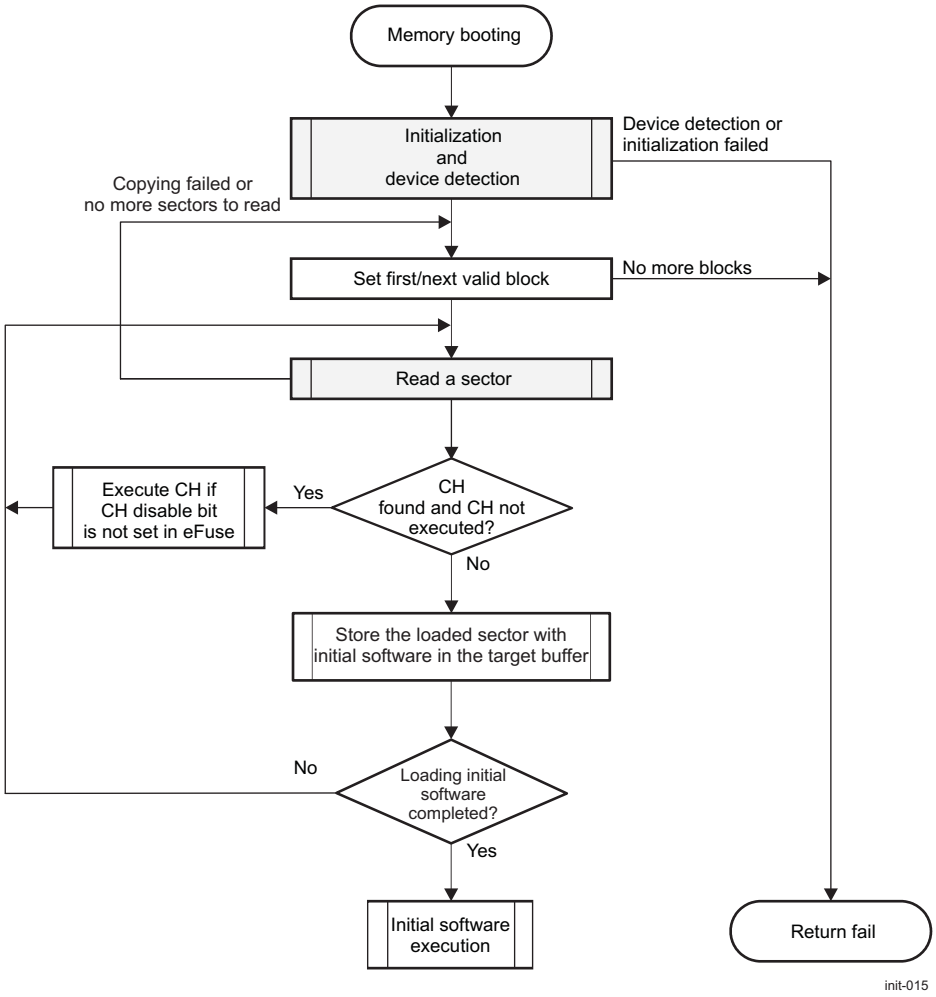
33.3.7.2 Non-XIP Memory

Figure 33-17 shows the procedure used when memory booting runs with non-XIP memories. The shaded procedures are specific to each memory. The ROM code searches for the image in the first four physical blocks of the memories. Other devices use only one copy of the image and the block loop runs only once.

During image shadowing, the CH is expected to be in a separate sector before the initial software.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 33-17. Image Shadowing



For more information about the GPMC module, see Section 15.4, *General-Purpose Memory Controller*.

The following sections describe the supported device types.

33.3.7.3 XIP Memory

The ROM code can boot directly from XIP devices, such as NOR flash memories, that have the following characteristics:

- The GPMC is the communication interface.
- Memories up to 1Gibit (128MiB) can be connected.
- 8-bit or 16-bit data bus width, configured through sysboot[13] (=1 for 16-bit)
- Non-muxed or address/data multiplexed mode, configured through sysboot[12:11] (=0x1 for A/D mux)
- The GPMC clock is 133 MHz.
- The device is connected to CS0 mapped to address 0x0800 0000.
- The wait pin gpmc_wait0 signal is monitored according to the sysboot[10] configuration pin (=1 is enabled)
- For an XIP memory booting, no user intervention is required; the following debugging steps are described. Only the CH, which is not mandatory, lets users change clock settings and GPMC parameters. Failure in CH copying causes a return to the main booting procedure, which selects the next device for booting.

Booting from an XIP device consists of the following steps:

Copyright © 2015–2017, Texas Instruments Incorporated

1. Configure the GPMC for XIP device access.
2. Verify that the CH is present at address 0x0800 0000. If the CH is present, copy the entire sector (512 bytes) to internal RAM and execute the CH.
3. Set the image location:
   - 0x0800 0000 if the CH is not found
   - 0x0800 0200 if the CH is found
4. Verify that a bootable image is at the image location.
5. If the image is found, execute it.
6. If the image is not found, return from XIP booting to the main booting loop.

33.3.7.3.1 GPMC Initialization

Table 33-40 lists the timing settings of the GPMC when set for XIP and other address-data accessible devices. Table 33-40 is included for debug information.

Table 33-40. XIP Timing Parameters

Parameter	Value (Clock Cycles)[1]	Register Initialization (where i = 0)
Write cycle period	17	GPMC_CONFIG5_i[12:8] WRCYCLETIME = 0x11
Read cycle period	17	GPMC_CONFIG5_i[4:0] RDCYCLETIME = 0x11
CS low time	1	GPMC_CONFIG2_i[3:0] CSONTIME = 0x1
CS high time	16	GPMC_CONFIG2_i[12:8] CSRDOFFTIME = 0x10
ADV low time	1	GPMC_CONFIG3_i[3:0] ADVONTIME = 0x1
ADV high time	2	GPMC_CONFIG3_i[12:8] ADVRDOFFTIME = 0x2
OE low time	3	GPMC_CONFIG4_i[3:0] OEONTIME = 0x3.
OE high time	16	GPMC_CONFIG4_i[12:8] OEOFFTIME = 0x10
WE low time	3	GPMC_CONFIG4_i[19:16] WEONTIME = 0x3
WE high time	15	GPMC_CONFIG4_i[28:24] WEOFFTIME = 0xF
Data latch time	15	GPMC_CONFIG5_i[20:16] RDACCESSTIME = 0xF

[1] The one clock cycle is approximately 7.5 ns, which corresponds to a 133-MHz frequency.

There is no specific identification routine executed before booting from an XIP device.

33.3.7.4 NAND

NAND flash memory is not an XIP device; it requires shadowing before the code can be executed. ROM code support for the NAND flash devices has the following characteristics:

- The GPMC is the communication interface.
- Device from 512 Mibit (64 MiB) to 64 Gibit (8 GiB)
- ×8 and ×16 bus width
- Support for large page size (2048 bytes + 64 spare bytes) or very large page size (4096 bytes + 128/218 spare bytes)
- Chip enable (CE) don't-care devices only
- Single-level cell (SLC) and multilevel cell (MLC) devices
- Device identification based on ONFI or ROM table
- ECC correction: 8 bits per sector for most devices (16 bits per sector for devices with large spare area)
- GPMC timings are adjusted for NAND access.
- The GPMC clock is 133 MHz.
- The device is connected to CS0.
- The gpmc_wait0 wait-pin signal is connected to the NAND BUSY output.

Copyright © 2015–2017, Texas Instruments Incorporated

- Four physical blocks are searched for an image. Block size depends on the device.

For NAND memory booting, no user intervention is needed; the information in the following subsections is included for debugging. Only the CH, which is not mandatory, lets the user change clock settings and GPMC parameters. Failure in CH copying causes a return to the main booting procedure, which selects the next device for booting.

33.3.7.4.1 Initialization and NAND Detection

The initialization routine for NAND consists of three parts: GPMC initialization, device detection with parameter determination, and bad block detection.

- GPMC initialization

  The GPMC interface is configured so that it can access NAND. Because NAND memories do not need the address bus, it is released. The data bus width is initially set to 8 bits. If necessary, it is changed to 16 bits after the device parameters are determined. Table 33-41 shows the GPMC configuration used during NAND boot. Table 33-41 is included for debug information.

Table 33-41. NAND Timing Parameters

Parameter	Value (Clock Cycles)(1)	Register Initialization (where i = 0)
Write cycle time	20	GPMC_CONFIG5_i[12:8] WRCYCLETIME = 0x14
Read cycle time	20	GPMC_CONFIG5_i[4:0] RDCYCLETIME = 0x14
CS low time	0	GPMC_CONFIG2_i[3:0] CSONTIME = 0x0
CS low to OE low time	5	GPMC_CONFIG4_i[3:0] OEONTIME = 0x5
CS low to OE high time	16	GPMC_CONFIG4_i[12:8] OEOFFTIME = 0x10
CS low to WE low time	1	GPMC_CONFIG4_i[19:16] WEONTIME = 0x1
CS low to WE high time	15	GPMC_CONFIG4_i[28:24] WEOFFTIME = 0xF
CS low to data latch time	14	GPMC_CONFIG5_i[20:16] RDACCESSTIME = 0xE

(1) The one clock cycle is approximately 7.5 ns, which corresponds to a 133-MHz frequency.

- Device detection and parameters

  The ROM code first performs an initial wait for device auto initialization (with a 250-ms time-out) with polling of the ready information. Then, it must identify the NAND type connected to the GPMC interface. The GPMC is initialized using 8 bits, asynchronous mode. The NAND device is reset (command FFh) and its status is polled until ready for operation (with a 100-ms time-out). The ONFI Read ID (command 90h/address 20h) is sent to the NAND device. If it replies with the ONFI signature (4 bytes) then a Read parameters page (command ECh) is sent. The information provided in Table 33-42 is then extracted: page size, spare area size, number of pages per block, and the addressing mode. The remaining data bytes from the parameter page stream are ignored.

Table 33-42. ONFI Parameters Page Description

Offset	Description	Size (Bytes)
6	Features supported	2
80	Number of data bytes per page	4
84	Number of spare bytes per page	2
92	Number of pages per block	4
101	Number of address cycles	1

If the ONFI Read ID command fails (it will be the case with any device not supporting ONFI), then the device is reset again with polling for device to be ready (with 100-ms time-out). Then, the standard Read ID (command 90h/address 00h) is sent. If the Device ID (second byte of the ID byte stream) is recognized as being a supported device, then the device parameters are extracted from an internal ROM code table. Table 33-43 lists the supported NAND devices.

Copyright © 2015–2017, Texas Instruments Incorporated

Table 33-43. Supported NAND Devices

Capacity	Device ID	Bus Width	Page Size in Bytes
512 Mibit	F0h	8	2048
512 Mibit	C0h	16	2048
512 Mibit	A0h	8	2048
512 Mibit	B0h	16	2048

After retrieving parameters from the table, the page size and block size are updated based on the fourth byte of the NAND ID data. Because of inconsistency among manufacturers, only devices recognized to be at least 2 Gibit have these parameters updated. Therefore, the ROM code supports 4-KiB page devices, but only if their size, according to the table, is at least 2 Gibit. Devices that are smaller than 2 Gibit have the block size parameter set to 128 KiB (when the page size is 2 KiB). Table 33-44 lists the fourth ID data byte encoding used in the ROM code.

Table 33-44. Fourth NAND ID Data Byte

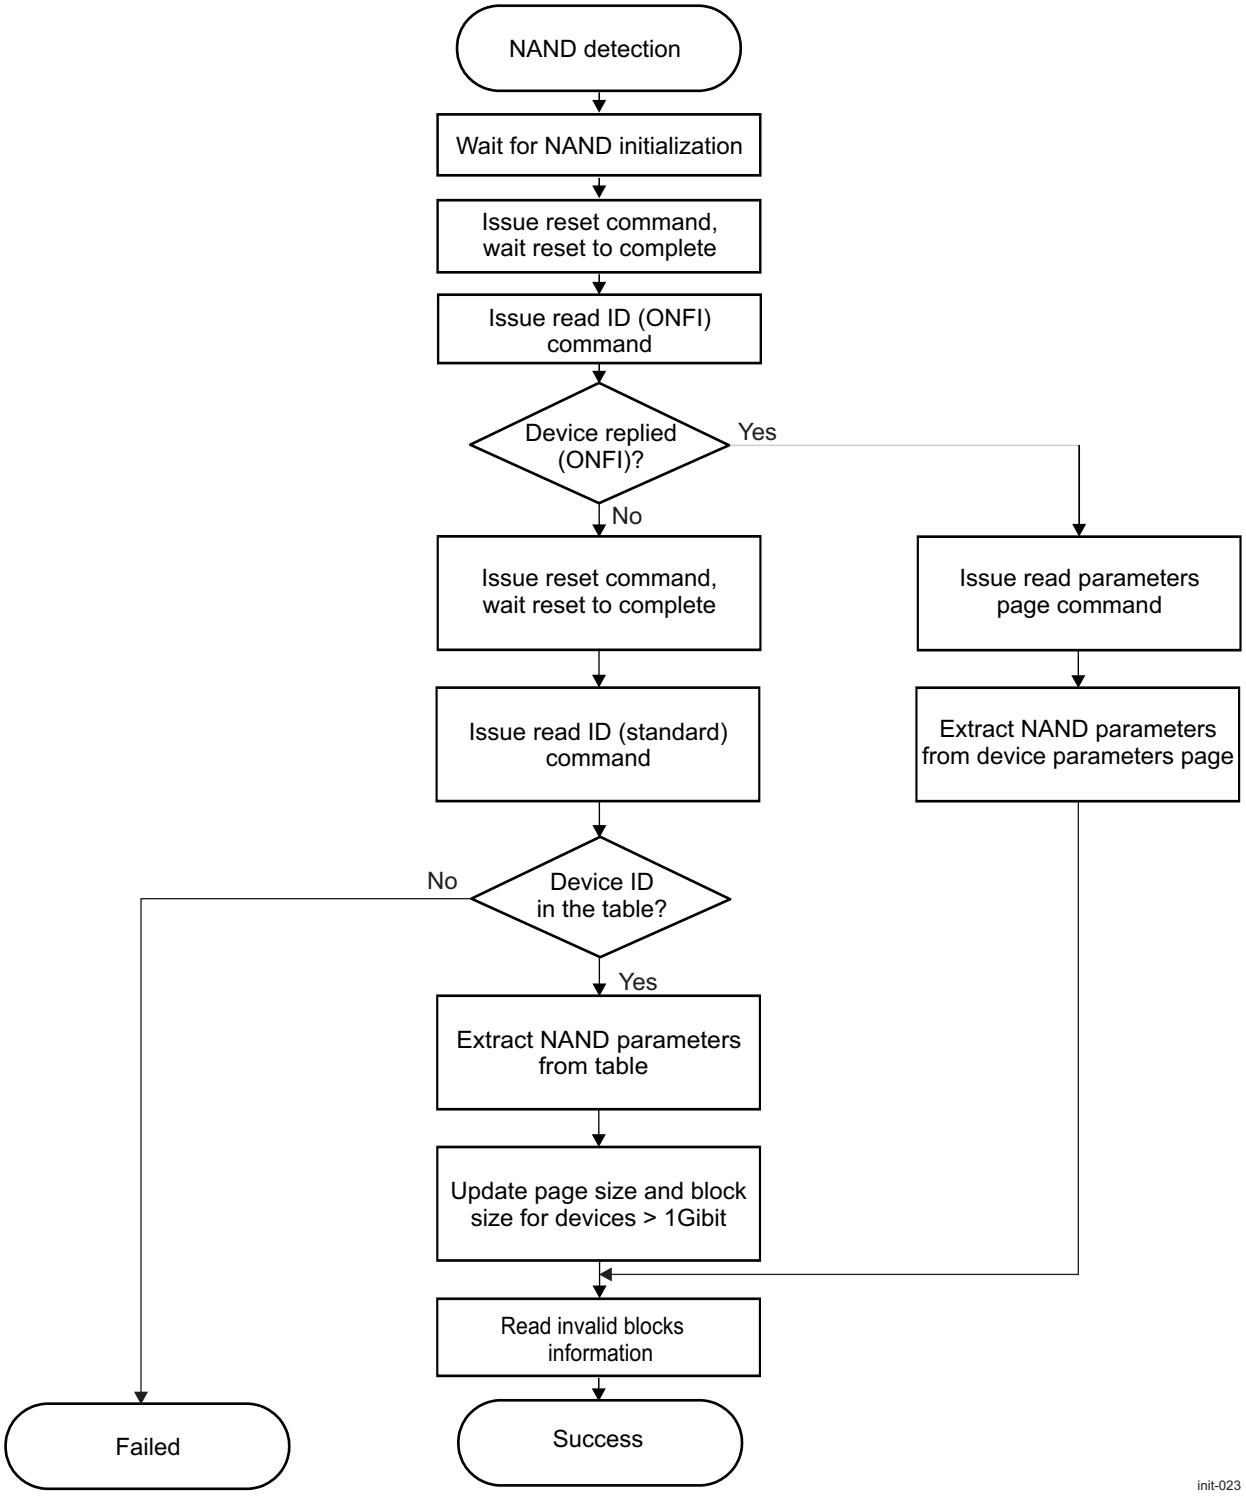
Item	Description	I/O Number							
		7	6	5	4	3	2	1	0
Page size	512 bytes							0	0
	2048 bytes							0	1
	4096 bytes							1	0
	8192 bytes							1	1
Cell type (1)	2 levels					0	0		
	4 levels					0	1		
	8 levels					1	0		
	16 levels					1	1		
Block size	64 KiB			0	0				
	128 KiB			0	1				
	256 KiB			1	0				
	512 KiB			1	1				

(1) Read by ROM code only when the manufacturer code (first ID byte) is 98h

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 33-18 shows the detection procedure. When the NAND device is successfully detected, the ROM code changes the GPMC to 16-bit bus width, if necessary.

Figure 33-18. NAND Device Detection



- Bad block verification

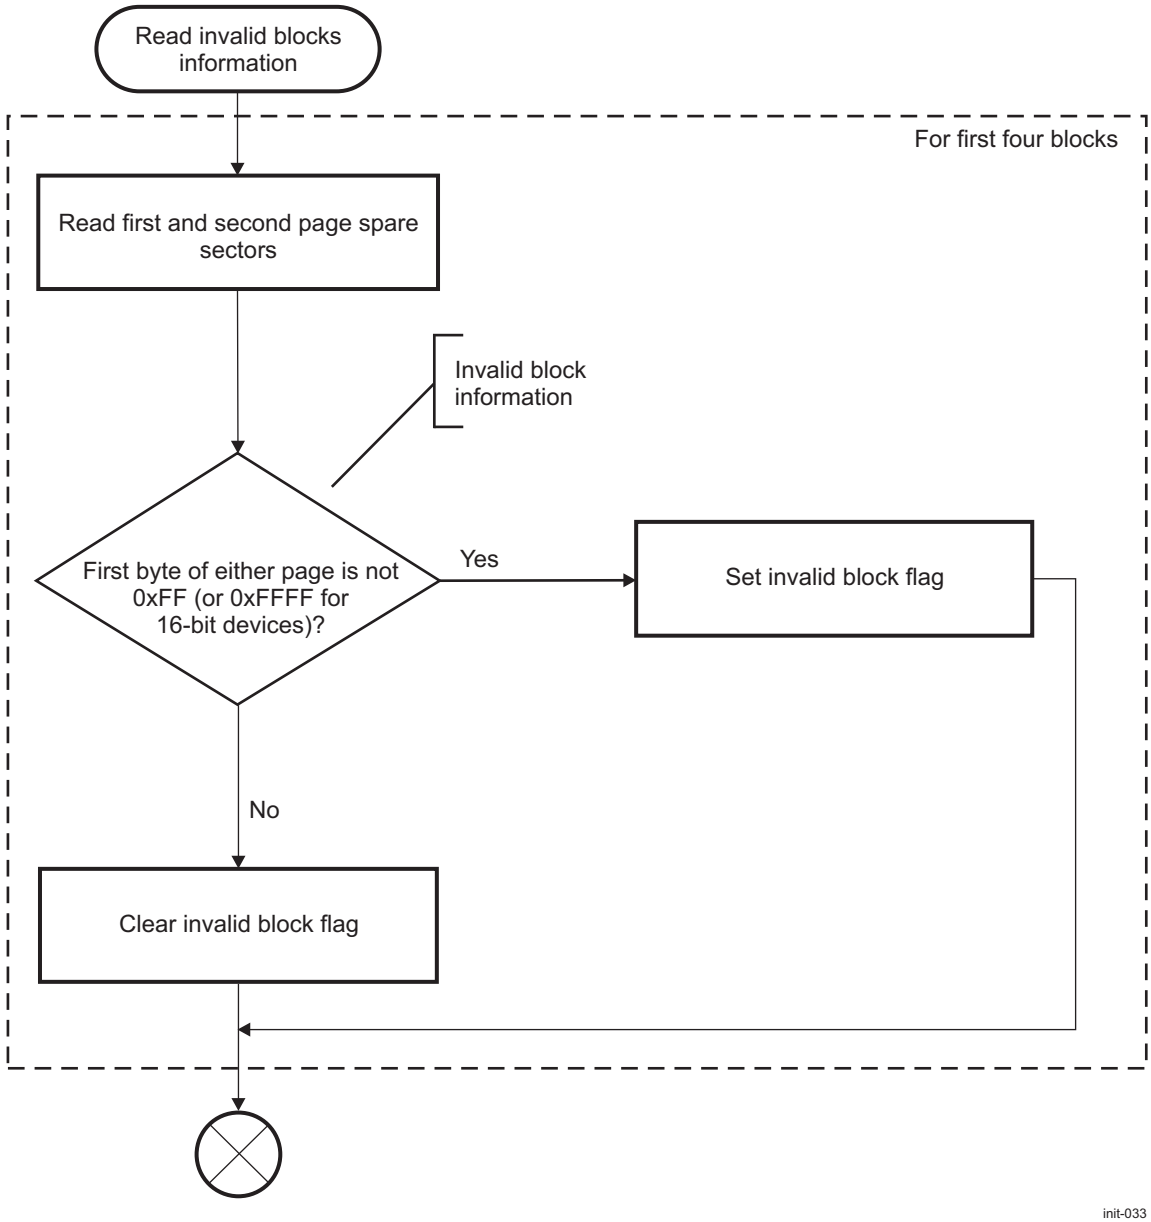
  Invalid blocks contain invalid bits whose reliability cannot be ensured by the manufacturer. These bits are identified in the factory or during the programming and reported in the initial invalid block information in the spare area on the first and second page of each block. Because the ROM code

Copyright © 2015–2017, Texas Instruments Incorporated

looks for an image in the first four blocks, it detects the validity status of these blocks. Blocks detected as invalid are not accessed later. Block validity status is coded in the spare areas of the first two pages of a block (first byte equal to FFh in the first and second pages for an 8-bit device/first word equal to FFFFh in the first and second pages for a 16-bit device).

Figure 33-19 shows the invalid block detection routine. The routine consists in reading spare areas and checking the validity data pattern.

Figure 33-19. Bad NAND – Invalid Block Detection



33.3.7.4.2 NAND Read Sector Procedure

During the booting procedure, the ROM code reads 512-byte sectors from the NAND device. The reading fails in two cases:

- The accessed sector is in a block marked as invalid.
- The accessed sector contains an error that cannot be corrected with ECC.

The ROM code uses normal read (command 00h 30h) for reading NAND page data.

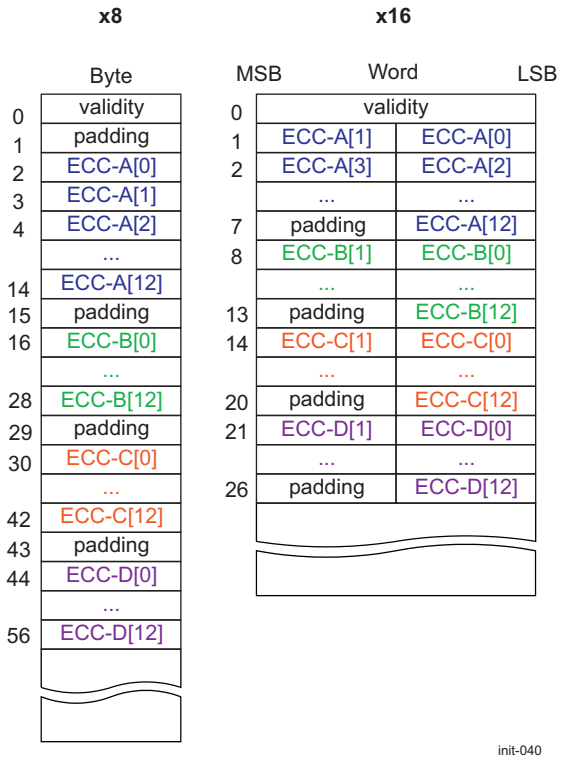
Copyright © 2015–2017, Texas Instruments Incorporated

Page data can contain errors caused by memory alteration. The ROM code uses an ECC correction algorithm to detect and possibly correct those errors. The default ECC correction applied is BCH 8b/sector using the GPMC and ELM hardware.

For device ID codes D3h, C3h, D5h, C5h, D7h, C7h, DEh, and CEh when the manufacturer code (first ID byte) is 98h, the cell type information is checked in the fourth byte of ID data. If it is equal to 10b, the ECC correction applied is BCH 16b/sector.

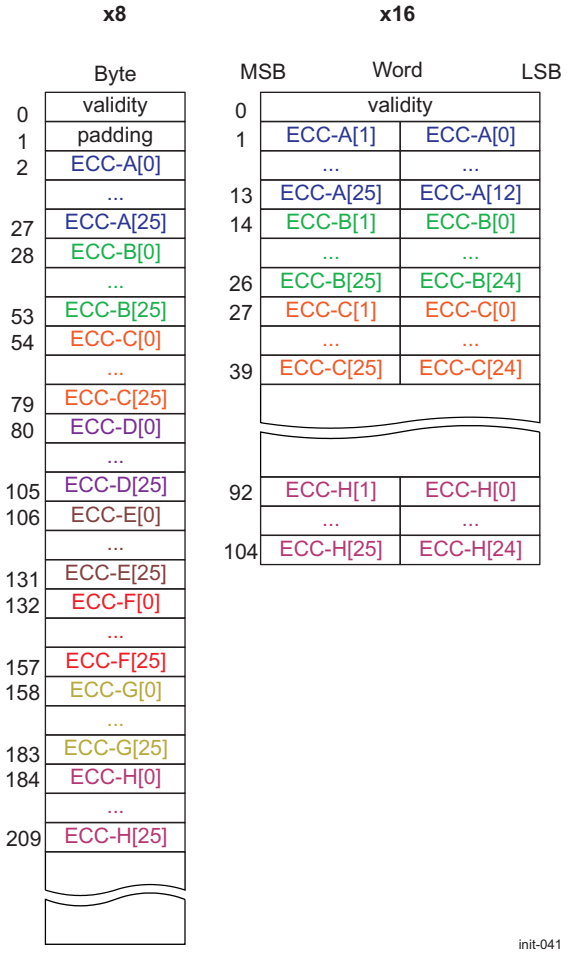
The BCH data is automatically calculated by the GPMC on reading each 512-byte sector. The computed ECC is compared against the ECC stored in the spare area for the corresponding page. Depending on the page size, the amount of ECC data bytes stored in the corresponding spare area is different. Figure 33-20 and Figure 33-21 show the mapping of ECC data inside the spare area for 2-KiB page and 4-KiB page devices, respectively. If both ECC data are equal, the read sector function returns the read 512-byte sector without error. Otherwise, the ROM code tries to correct errors in the corresponding sector (this procedure is assisted by the ELM hardware) and returns the data if successful. If errors are uncorrectable, the function returns with FAIL.

Figure 33-20. ECC Data Mapping for 2-KiB Page and 8b BCH Encoding



Copyright © 2015–2017, Texas Instruments Incorporated

Figure 33-21. ECC Data Mapping for 4-KiB Page and 16b BCH Encoding



33.3.7.5 SPI/QSPI Flash Devices

SPI/QSPI Flash memories provide a storage solution for systems with limited space, pins and power.

The ROM code support for SPI/QSPI devices has the following characteristics:

- 24-bit addressing, up to 128 Mbit (16 MiB), no banking
- QSPI1 on CS0 is the communication interface
- Uses Mode 3:
  - Clock inactive state = high
  - Data input captured on rising edge of clock
  - Data output generated on falling edge of clock
- QSPI 4-bit data read mode at 48 MHz in configuration port mode
  - Read command is 0x6B (Fast Quad Read), 3 address bytes,1 dummy bytes and read type is quad read
  - ROM will not perform any quad-enable sequence nor bank register update
- SPI 1-bit data read mode at 12 MHz in configuration port mode
  - Read command is 0x03 (Single Read), 3 address bytes, 0 dummy bytes and read type is normal read.
- Up to four redundant images can be stored on SPI/QSPI flash. The offset between them is set in sysboot[7:6] as described in Table 33-8. If not using the redundant SBL feature, the offset set in sysboot[7:6] is a don't care. A booting image is considered to be present when the first 4 bytes word is

Copyright © 2015–2017, Texas Instruments Incorporated

not equal to 0000 0000h or FFFF FFFFh.

NOTE: ROM code does not perform any specific action to detect, reset or power up the QSPI device. QSPI is assumed to be properly powered and reset to be completed before every attempt to boot by ROM code.

33.3.7.6 eMMC Memories and SD Cards

The device allows booting from eMMC embedded memories or SD cards connected to device embedded MMC2 or MMC1 controllers I/Os, respectively. The booting interface is selected by configuration of the SYSBOOT pins.

The device high speed MMC/SD/SDIO host controller handles the physical layer, while the ROM code handles the simplified logical protocol layer (read-only protocol). A limited range of commands is implemented in the ROM code.

The SD card interface supports 1.8-V/3-V digital I/Os. The selection on I/O voltage level is done using the PBIAS circuitry. The PBIAS reference level is sensed by the ROM code and PBIAS cell voltage setup appropriately before any communication with the SD card device. The eMMC interface supports also 1.8-V/3-V digital I/Os but with the difference that there is no PBIAS circuitry to select the I/O voltage level. This voltage depends only on the voltage provided to the eMMC associated power pads.

The device supports three booting modes:

- Raw (Boot): The booting image is read from one of the selectable partitions in raw mode (this mode is also called Alternative Boot Operation mode and applies to eMMC only).
- Raw (UDA): The booting image is read from the user data area (eMMC and SD).
- File system (FAT12/16/32 with or without master boot record): The image data is read from a booting file within a file system in the user data area (eMMC and SD).

NOTE: File system mode is only supported when booting from an eMMC user area. It is not supported in the eMMC boot area.

33.3.7.6.1 eMMC Memories

The ROM code supports booting from eMMC memories, with the following conditions:

- eMMC memory devices compliant with *Embedded MultiMediaCard (eMMC) eMMC/Card Product Standard, High Capacity, including Reliable Write Boot, and Sleep Modes, Dual Data Rate, Multiple Partitions Supports and Security Enhancement v4.5* from the MMCA Technical Committee. The exception is the hardware reset feature. For example, if the user software requires eMMC device hardware reset, it can be accomplished with a GPIO. To correctly boot from eMMC when using Alternative Boot Operation mode, it is recommended to tie the eMMC device RST_N signal to the platform warm reset.
- eMMC device connected to the device MMC2 controller I/O interface (only one device can be connected to the bus).
- The eMMC memory device is powered externally by a PMIC or other power supply.
- When booting from user area: Initial (default) 1-bit SDR mode, optional 4-bit and 8-bit SDR- and DDR-modes using Configuration Header
- Initial SDR- and DDR- modes supported
- Clock frequency when booting from user area:
  - Identification mode: 400 kHz
  - Data transfer mode: 10 MHz, optionally up to 48 MHz by Configuration Header
  - Support for eMMC boot partitions. eMMC booting from boot partitions (BPs), which is typical for booting in Alternative Boot operation mode, is always done at 8-bit / 48 MHz / DDR.

Copyright © 2015–2017, Texas Instruments Incorporated

33.3.7.6.1.1 System Conditions and Limitations

The ROM code does not provide a bus direction control signaling in case of using MMC interface 2 with level shifters.

NOTE: The ROM Code does not support large 4-KiB sectors as defined in the latest standard.

The ROM code expects that the eMMC device is powered externally and supplies are set and stable when entering the booting procedure.

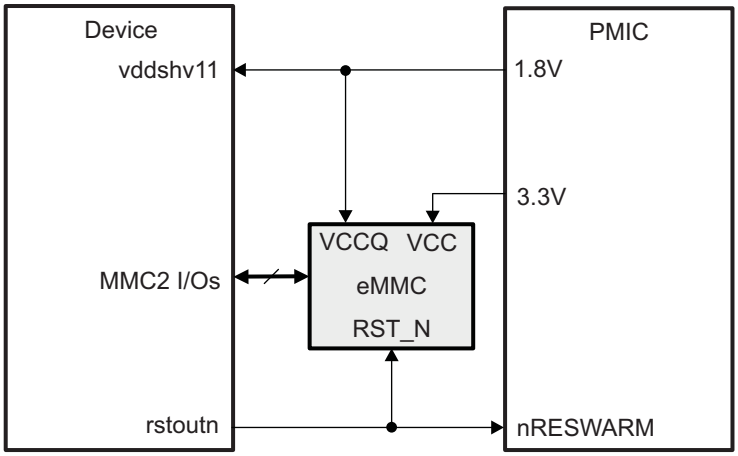
The ROM code supports the alternative boot operation mode specific to eMMC devices as described in the *Partition Management* and *Boot Operation Mode* sections of the eMMC Standard. It does not support the hardware boot operation mode (CMD line held low for 74 emmc_clk cycles) described in the same document.

33.3.7.6.1.2 eMMC Memory Connection

An eMMC device typically requires two supplies: one for the core memory array (VCC) and one for the device interface I/Os and controller (typical VCCQ = 1.8 V). Both memory device supply pins can possibly be merged into one, thus requiring only one power supply.

Figure 33-22 shows an example of the system connection between the PMIC, memory device, and device.

Figure 33-22. eMMC Connection



NOTE: For correct handling of eMMC boot partitions when using alternative boot operation mode, it is recommended to tie the eMMC RST_N signal to the signal indicating a platform warm reset (nRESWARM).

The ROM code performs the necessary I/O pin muxing configuration to route the MMC2 I/O signals on the eMMC pads depending on the selected SYSBOOT configuration.

33.3.7.6.2 SD Cards

The ROM code supports booting from SD cards under the following conditions:

- SD cards compliant with *SD Specifications Part 1 Physical Layer Specification Version 4.00*and the *SD Specifications Part 2 File System Specification Version 3.00* from the SD Association. These include low- (SDSC) and high-capacity (SDHC) cards.
- SD card connected to MMC1 controller I/Os. Only one card is allowed to be connected to the bus.

Copyright © 2015–2017, Texas Instruments Incorporated

- 3-V VCC power supply
- 3-V or 1.8-V I/O voltages
- Initial 1-bit MMC mode, optional 4-bit mode
- Clock frequency:
  - Identification mode: 400 kHz
  - Data transfer mode: 10 MHz (optionally up to 19.2 MHz by Configuration Header)

33.3.7.6.2.1 System Conditions and Limitations

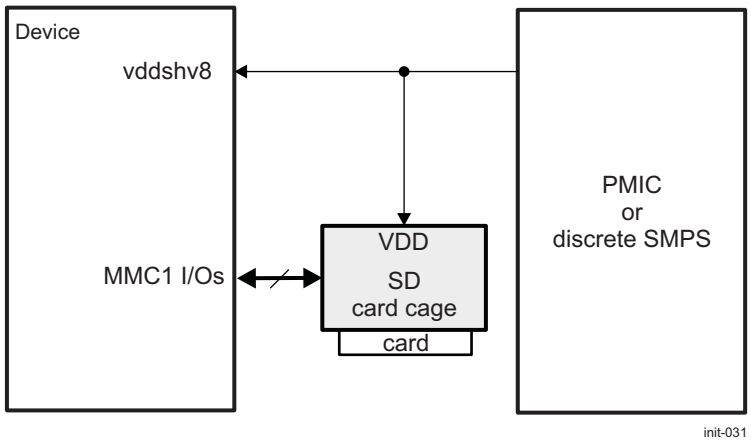
Even though the ROM Code identities SDXC cards, it does not handle its specificities such as exFAT support. It does neither support UHS-I nor UHS-II speed grades.

33.3.7.6.2.2 SD Card Connection

An SD card can be connected to the SD card interface, typically through a card cage.

Figure 33-23 shows the typical connection between the power IC, the card, and the device.

Figure 33-23. MMC/SD Card Connection



NOTE: The ROM code does not handle the card detection feature on the card cage.

33.3.7.6.2.3 Booting Procedure

If the selected booting device is eMMC, then a first attempt to trigger alternative boot operation mode is tried. If the eMMC device replies within a fixed timeout, then the booting image is directly retrieved from one of the possible partitions specified in the local EXT_CSD.BOOT_PARTITION_ENABLE bit field for the eMMC device (this is referred to as the Raw(Boot) mode). Raw(Boot) mode improves the boot time by avoiding the regular eMMC/SD identification phase (usually done at low speed). When the booting image is retrieved, the ROM code continues the boot process.

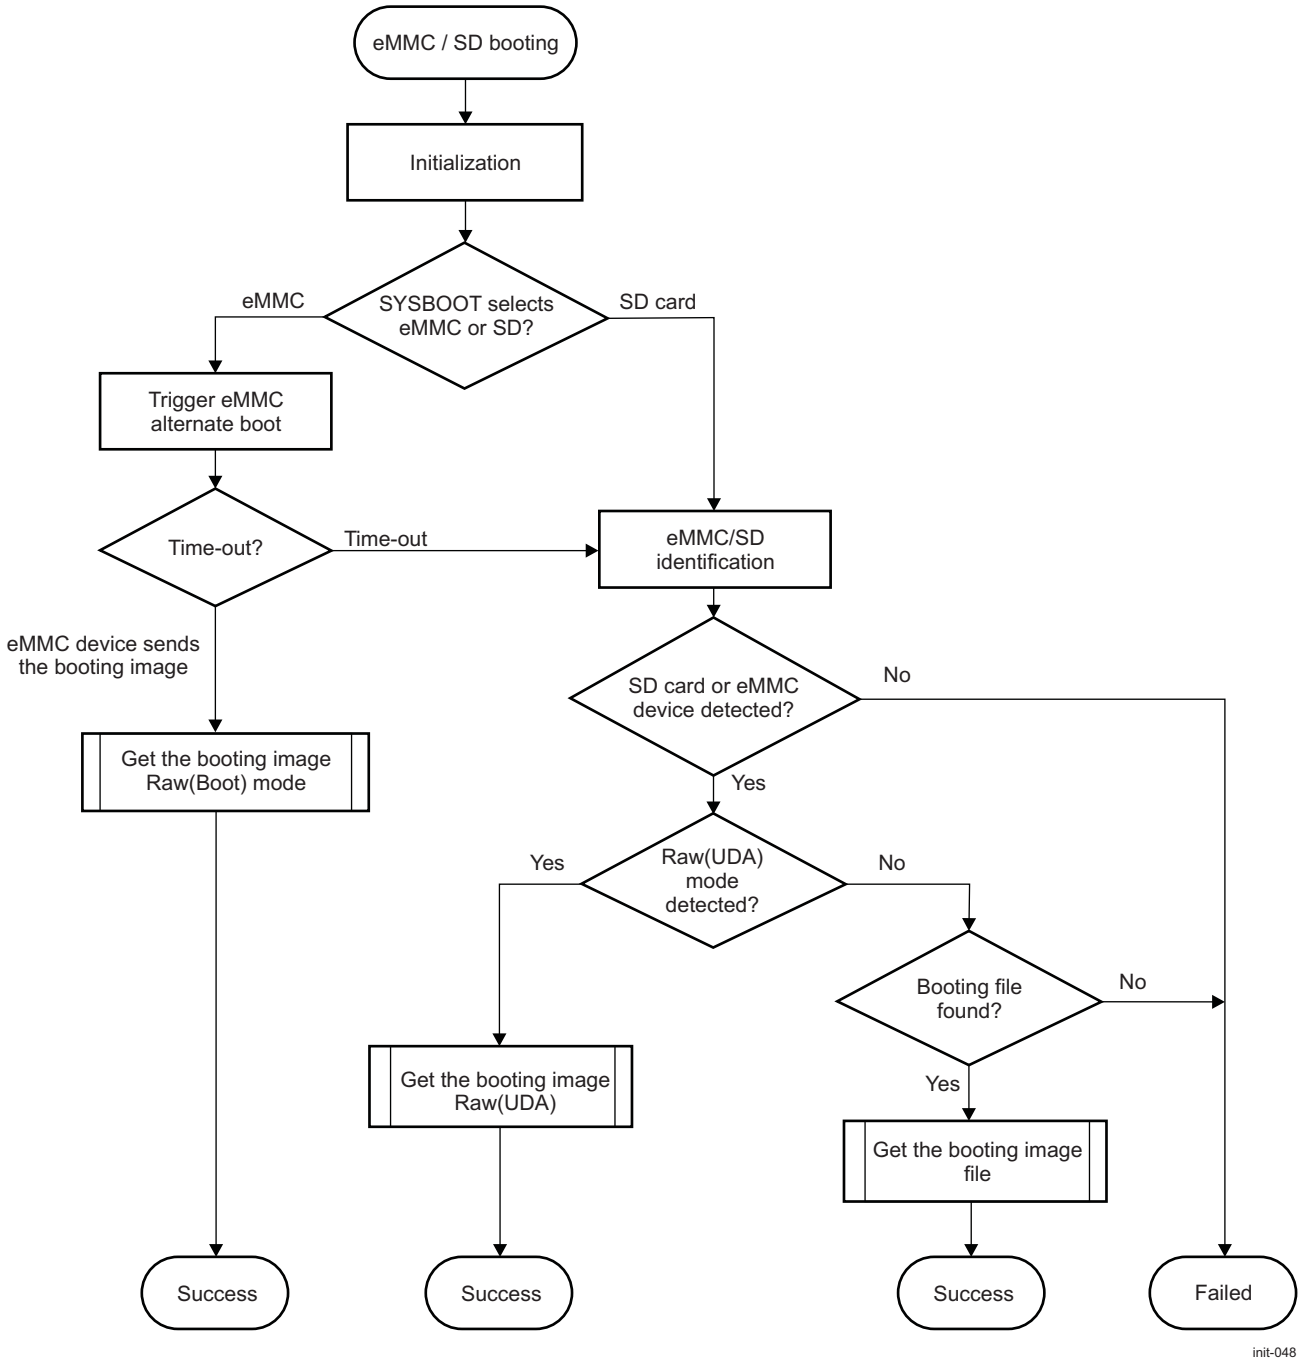
If the time-out elapses, then the ROM code proceeds with normal identification. SD cards do not support Alternative Boot Operation mode, and therefore are always going through normal identification.

If normal identification succeeds, then it next determines whether the SD card or eMMC device contains a known file system. If the file system is known, then the booting image is extracted from the file system hierarchy. If a file system is not detected, then the Raw(UDA) mode is assumed.

Figure 33-24 is the high level flow chart of the eMMC and SD booting procedure.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 33-24. eMMC and SD Booting



33.3.7.6.2.4 eMMC Partitions Handling in Alternative Boot Operation Mode

To trigger alternative boot operation mode, the ROM code sends a specific CMD0 + Argument 0xFFFF FFFA. Then, the ROM code waits up to 50 ms for the eMMC device to return a boot-acknowledge signal. If the time-out elapses, then the ROM code skips alternative boot operation mode. Booting from eMMC partitions can be done in 8-bit mode at 48 MHz / DDR. This configuration is static and cannot be changed.

33.3.7.6.2.4.1 eMMC Devices Preflashing

For correct handling of eMMC partitions in alternative boot operation mode, it is necessary to prepare the eMMC device at flashing time with the following settings applied to the device EXT_CSD register:

Copyright © 2015–2017, Texas Instruments Incorporated

- The BOOT_ACK and BOOT_PARTITION_ENABLE fields must be updated accordingly (EXT_CSD[179], bit 6 and bits [5:3], respectively) to activate the boot acknowledge signal and select the partition from which to boot. There are several boot options selectable in the BOOT_PARTITION_ENABLE bit field, as follows:
  - Booting from boot partition 1 (BP1)
  - Booting from boot partition 2 (BP2)
  - Booting from User Area

  For more details, see the eMMC Standard documentation.
- RST_N must be enabled for correct handling of the warm reset cases (EXT_CSD[162] bits [1:0] = 0x1).
- The BOOT_BUS_WIDTH fields (EXT_CSD[177]) must be updated properly based on device alternate boot operation: 8-bit / 48 MHz / DDR mode.
- Optionally the BOOT_CONFIG_PROT (EXT_CSD[178]) may be updated for altering access permissions to the selected partitions.

NOTE: Although an alternate boot from user area is possible, alternate booting from BP1 or BP2 is recommended.

NOTE: It is possible to permanently or temporarily lock the boot configuration through the use of the BOOT_CONFIG_PROT register. For more details, see the eMMC Standard documentation.

NOTE:

- It is highly recommended to refer to the eMMC Standard for details on EXT_CSD handling.
- The EXT_CSD is updated by using a SWITCH command as detailed in the eMMC standard.
- The mentioned EXT_CSD fields are retained after a power cycle so only one “flashing” phase is required

33.3.7.6.2.4.2 eMMC Device State After ROM Code Execution

If alternative boot operation mode is successful, and the booting image is properly retrieved, then the eMMC device state remains in the BOOT state even after the execution has passed to the initial software. The initial software must bring the device out of the BOOT state.

33.3.7.6.2.4.3 Consideration on device Global Warm Reset

Once the system has booted and upon triggering a warm reset at device level (it can be triggered by the warm-reset push button, a timer, watchdog, etc.), it is important that the eMMC device is properly brought to its PRE-IDLE state so that the next Alternative Boot operation succeeds. This is ensured by the eMMC RST_N pin to be connected to device rstoutn pin (warm reset). Not doing so would make the boot procedure fail after a warm reset.

33.3.7.6.2.4.4 Booting Image Size

In Raw(Boot) mode, the size of the booting image is determined after the first sector read access. The boot image size is contained within the GP header. This ensures that the ROM code is only retrieving the necessary size of data and not the full contents of the partition.

33.3.7.6.2.4.5 Booting Image Layout

In Raw(Boot) mode only one copy of the booting image is maintained, as opposed to up to four copies in Raw(UDA) mode.

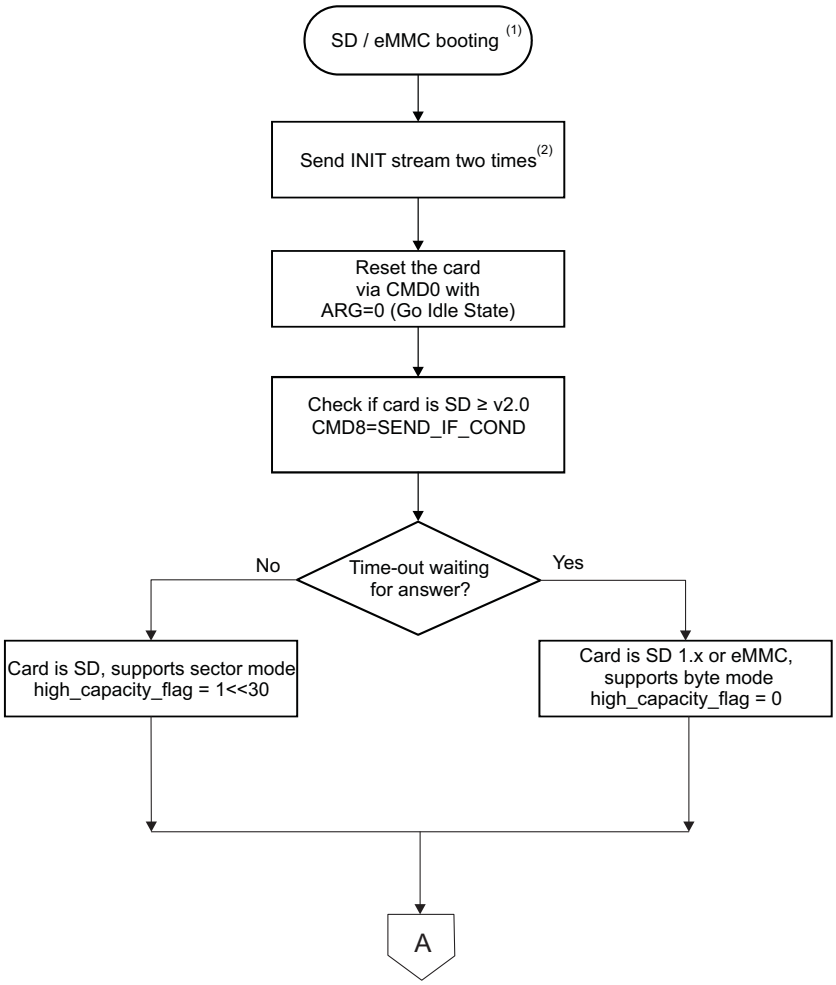
Copyright © 2015–2017, Texas Instruments Incorporated

33.3.7.6.3 Initialization and Detection

If the eMMC Alternate Boot operation fails in time-out, or the requested boot device is an SD card, the ROM code initializes the memory device or card connected on the eMMC and SD card interface using 1.8 V for eMMC and standard high-voltage range (3.0 V) for SD card I/Os. If neither a card nor memory device is detected, the ROM code moves to the next booting device. The standard identification process and relative card address (RCA) assignment are performed. The ROM code assumes that only one memory or card is connected on the bus. This is done using the CMD line common to the SD and eMMC memory devices. The eMMC and SD standards describe this phase as the initialization phase. They differ in the commands involved, as described in Figure 33-26. The ROM code uses CMD55 to discriminate between eMMC and SD cards; that is, CMD55 is only supported by the SD standard. Depending on response received or not, ACMD41 (the combination of CMD55 and CMD41 for SD) or CMD1 (for MMC) is sent. If no response is received this time, no devices are connected and the ROM code exits eMMC/SD booting with FAIL.

Figure 33-25 shows the eMMC/SD detection procedure.

Figure 33-25. SD/eMMC Detection Procedure (part 1)



Note 1: MMC bus clk = 160 kHz

Note 2: MMC bus clk = 400 kHz

Note3: VHS / test pattern are specific to SD standard in this state.
eMMC CMD8 (=SEND_EXT_CSD) is NOT relevant in this state and this is the way to discriminate the SD v eMMC card

33.3.7.6.4 Read Sector Procedure

The contents of an eMMC or SD card may be formatted as raw binary (referred to as Raw(UDA) or within a FAT file system. The ROM Code reads out sectors from raw image or the booting file within the file system and boots from it.

- **Raw mode**

Copyright © 2015–2017, Texas Instruments Incorporated

In Raw(UDA) mode, an image can be at one of the four consecutive locations in the main area: offset 0x0 (0 KiB)/0x20000 (128 KiB)/0x40000 (256 KiB)/0x60000 (384 KiB). For this reason, the size of a booting image must not exceed 128 KiB. However, a device with an image greater than 128 KiB can be flash starting at one of the aforementioned locations. Therefore, the ROM code does not check the image size. The only drawback is that the image crosses the subsequent image boundary. Raw mode is detected by reading sectors 0, 256, 512, and 768. The content of these sectors is verified for the presence of a TOC structure. GP header must be located at the beginning of the booting image, as described in Section 33.3.8.2, *Configuration Header*. Image data is read directly from continuous sectors of a card. If raw mode is not detected, file system mode is assumed.

- File system handling

  The read sector procedure uses the standard SD/eMMC read data procedure. The sector address is generated based on the booting memory file map collected during initialization. Thus, the ROM code can freely address sectors in the booting file space.

33.3.7.6.5 File System Handling

The eMMC / SD cards can hold a file system that the ROM code reads. The image used by the booting procedure is taken from a booting file named MLO. This file must be in the root directory on an ***active*** primary partition of type FAT12/16 or FAT32.

An eMMC/SD card can be configured as floppy-like or hard-drive-like:

- When acting like a floppy, the content of the card is a single FAT12/16/32 file system without an MBR holding a partition table.
- When acting like a hard drive, an MBR is present in the first sector of the card. This MBR holds a table of partitions, one of which must be FAT12/16/32, primary, and active.

According to the *MultiMediaCard FAT16 File System Specification* from the MMCA Technical Committee, the card must always hold an MBR, except when using a floppy-like file system. However, depending on the operating system used, the eMMC / SD card is formatted with or without partitions (using an MBR). The ROM code supports both types: floppy-like or hard-drive-like. The ROM code retrieves a map of the booting file from the FAT. The booting file map is a collection of all FAT entries related to the booting file (a FAT entry points to a cluster holding part of the file). The booting procedure uses this map to access any 512-byte sector in the booting file without involving the ROM code FAT module. Figure 33-28 shows the complete process.

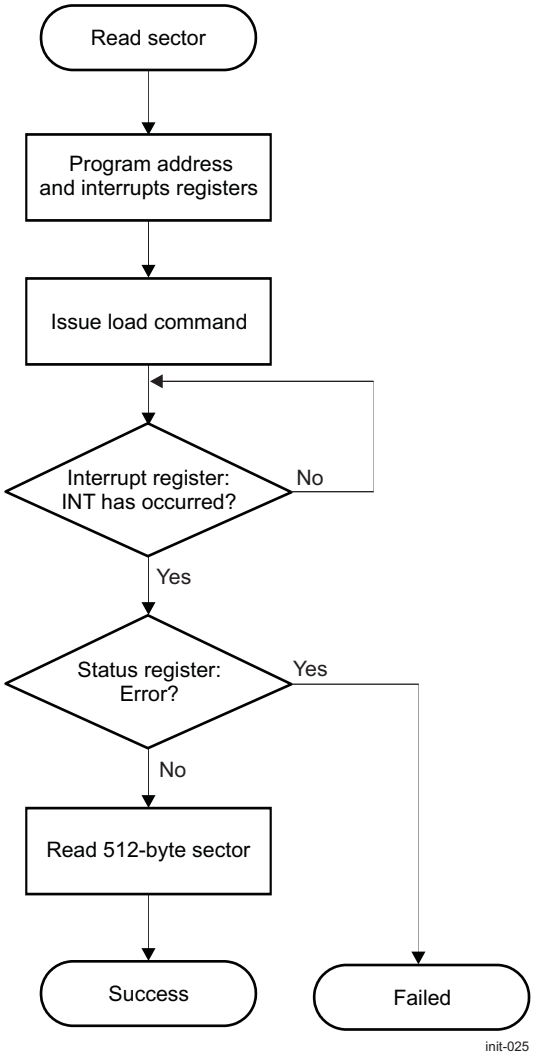
Figure 33-28. SD/MMC Get Booting File



33.3.7.6.5.1 MBR and FAT File System

This paragraph describes functions used by the ROM code to recognize whether an MBR with a FAT is used. It is not intended to fully describe the MBR and the FAT file system detection and reading procedure. The ROM code can detect FAT12/16/32 allocation table types. It cannot boot on devices with NTFS or Linux® FS partitions. Some memory devices that support file systems can be formatted with or without MBR; therefore, the first task of the ROM code is to detect whether the device is holding an MBR in the first sector.

The MBR is the first sector of a memory device. It consists of executable code, four partition entries, and one signature. The aim of such a structure is to divide the hard disk in partitions used primarily to boot different systems (for instance, Microsoft Windows®). Table 33-45 describes this structure, and Table 33-46 describes the partition table entry.

Table 33-45. Master Boot Record Structure

Offset	Length (Bytes)	Entry Description
0000h	446	Optional code
01BEh	16	Partition table entry
01CEh	16	Partition table entry
01DEh	16	Partition table entry

Copyright © 2015–2017, Texas Instruments Incorporated

Table 33-45. Master Boot Record Structure (continued)

Offset	Length (Bytes)	Entry Description
01EEh	16	Partition table entry
01FEh	2	Signature (0xAA55)

Table 33-46. Partition Table Entry

Offset	Length (Bytes)	Entry Description	Value
0000h	1	Partition state	00h: Inactive 80h: Active
0001h	1	Partition start head	Hs
0002h	2	Partition start cylinder and sector	Cs[7:0] – Cs[9:8] – Ss[5:0]
0004h	1	Partition type	01h: FAT12 04h, 06h, 0Eh: FAT16 0Bh, 0Ch, 0Fh: FAT32
0005h	1	Partition end head	He
0006h	2	Partition end cylinder and sector	Ce[7:0]–Ce[9:8]–Se[5:0]
0008h	4	First sector position relative to the beginning of media	LBAs = Cs.H.S + Hs.S + Ss – 1
000Ch	4	Number of sectors in partition	LBAe = Ce.H.S + He.S + Se – 1 Nb s = LBAe – LBAs + 1

SD/eMMC booting consists of the following steps:

1. Detection of MBR

   The ROM code first checks whether the MBR signature is present, and then it searches an active FAT12/16/32 partition in all four MBR partition entries, based on the Type field. If the MBR entries are not valid, or if no usable partition is found, the ROM code returns to the booting procedure with FAIL. The extended partitions are not checked; the booting file must reside in a primary partition. Each partition entry is checked to determine the following:

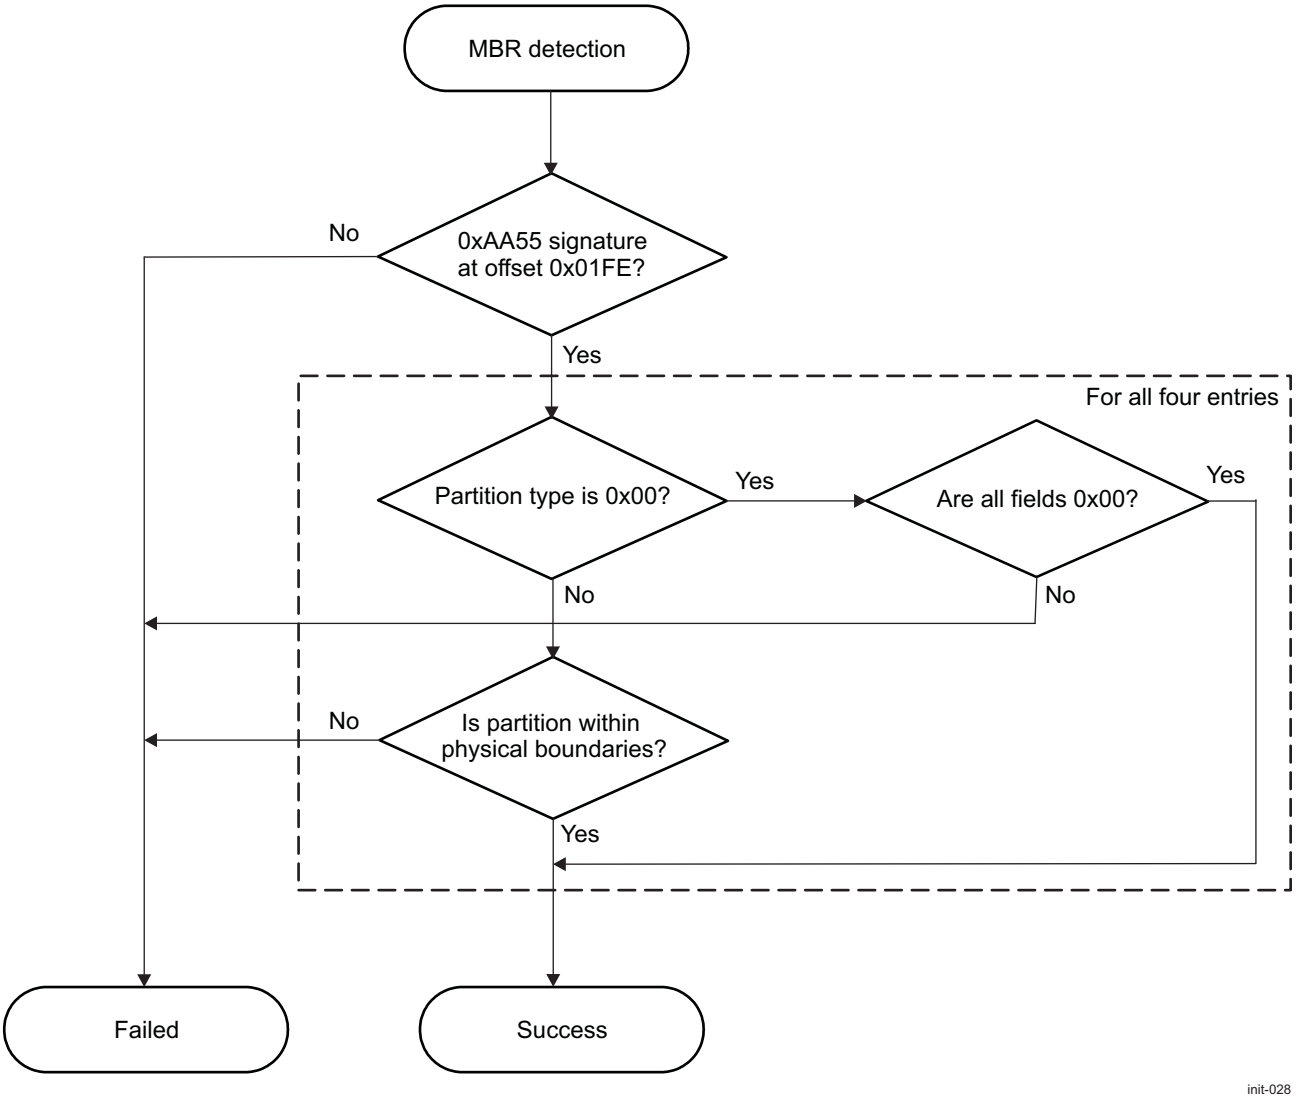
   (a) If the partition type is set to 00h, all fields in the entry must be 00h.

   (b) The partition is within physical boundaries (that is, the partition is inside and it fits the total physical sectors).

   See Figure 33-29 for more information about MBR detection.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 33-29. MBR Detection Procedure



2. Get the MBR partition.

   Once identified, the ROM code gets the partition using the procedure described in Figure 33-29. The partition type is checked to be FAT12/16 or FAT32. Its state must be 00h (inactive) or 80h (active). The ROM code returns with FAIL if no active primary FAT12/16/32 is found, or the test fails if there is more than one active partition. If an active partition is found, its first sector is read and used later. If no MBR is present (in case of a floppy-like system), the first sector of the device is read and used later. The read sector is checked to be a valid FAT12/16 or FAT32 partition. If this fails, the ROM code returns with FAIL if another partition type is used (for instance, Linux FS) or if the partition is not valid.

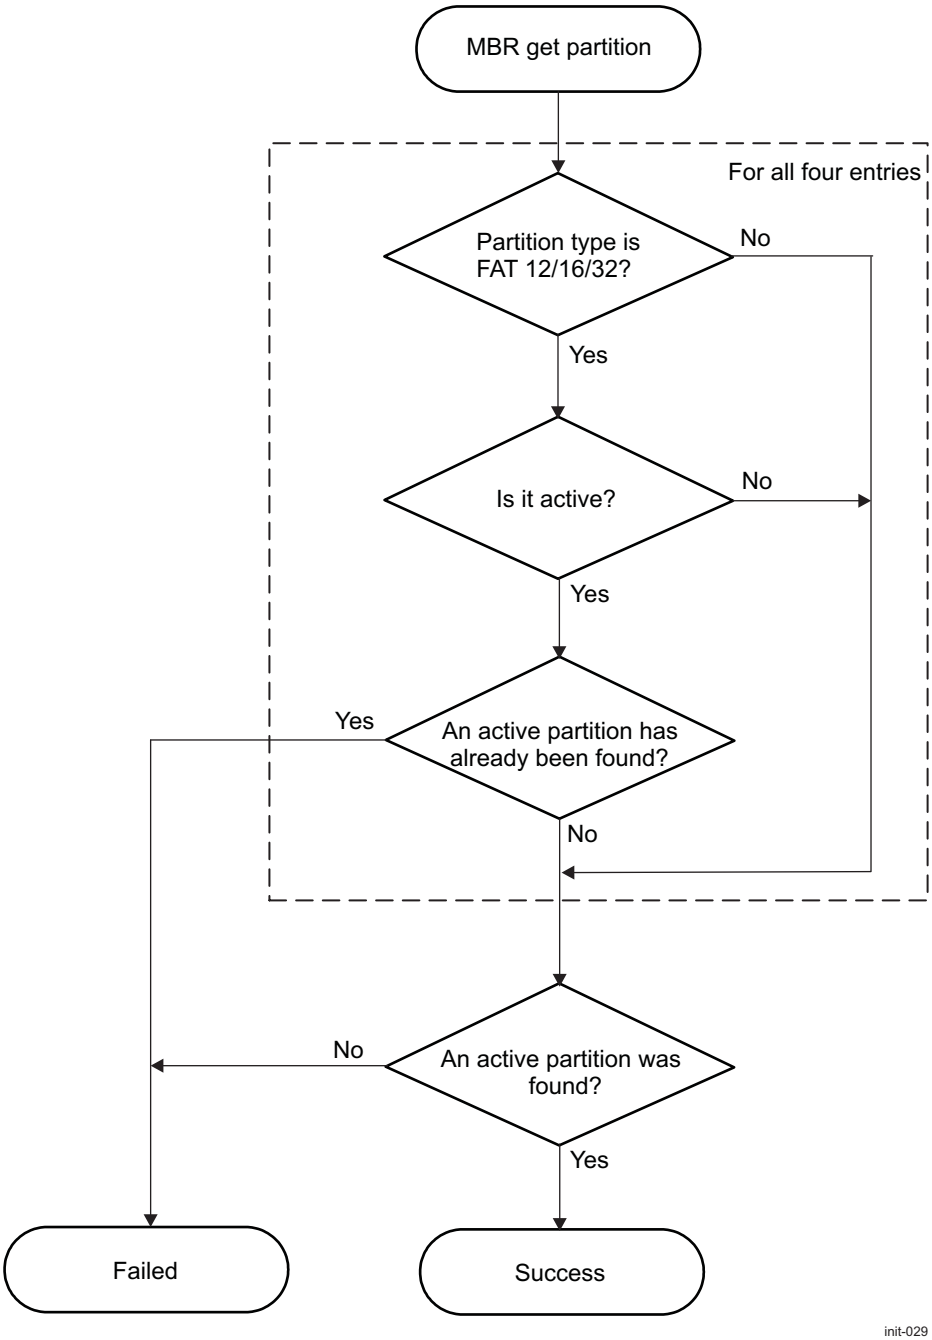
   The FAT file system consists of several parts:

   - Boot sector, which holds the BIOS parameter block (BPB). Not all are used by the ROM code.
   - FAT, which describes the use of each cluster of the partition
   - Data area, which holds the files, directories, and root directory (for FAT12/16, the root directory has a specific fixed location)

   To check whether a sector holds a valid FAT12/16/32 partition, many fields of the boot sector (used by all FAT types) that require specific values are checked. Figure 33-30 shows more about getting the partition.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 33-30. MBR, Get Partition



3. Find the booting file.

   When a partition is found, the root directory entries are searched for a booting file named MLO in the root directory of the FAT12/16/32 file system. The file is not searched in any other location. For a FAT12/16 file system, the root directory has a fixed location, which is cluster 0. For a FAT32 file system, its cluster location is given by BPB_RootClus. The formula to find the sector number (relative to device sector 0, not partition sector 0) of a cluster is given by the following equation:

$$Cluster_{sector} = BPB_HiddSec + BPB_RsvdSecCnt + BPB_NumFATs \cdot BPB_FATSz + Cluster \cdot BPB_SecPerCLus$$

init-E001

NOTE: BPB_FATSz is BPB_FATSz16 for FAT12/16, or BPB_FATSz32 for FAT32.

Copyright © 2015–2017, Texas Instruments Incorporated

NOTE: The BPB_HiddSec field can contain 0, even though the FAT file system is somewhere other than on sector 0 (floppy-like). The ROM code uses the partition offset taken from the MBR instead of this field, which can be wrong. If no MBR is found (floppy-like), the value 0 is used.

Each entry in the root directory is 32 bytes and holds information about the file (the filename, date of creation, rights, cluster location, and so forth). See Table 33-47.

Table 33-47. FAT Directory Entry

Offset	Length (Bytes)	Name	Description
0000h	11	DIR_Name	Short Name (8 + 3)
000Bh	1	DIR_Attr	File attributes: 01h – ATTR_READ_ONLY 02h – ATTR_HIDDEN 04h – ATTR_SYSTEM 08h – ATTR_VOLUME_ID 10h – ATTR_DIRECTORY 20h – ATTR_ARCHIVE 0Fh – ATTR_LONG_NAME
000Ch	1	DIR_NTRes	Reserved. Set to 00h.
000Dh	1	DIR_CrtTimeTenth	Millisecond stamp at file creation
000Eh	2	DIR_CrtTime	Time file was created.
0010h	2	DIR_CrtDate	Date file was created.
0012h	2	DIR_LstAccDate	Last access date
0014h	2	DIR_FstClusHi	High word of the first cluster number of this entry
0016h	2	DIR_WrtTime	Time of last write
0018h	2	DIR_WrtDate	Date of last write
001Ah	2	DIR_FstClusLo	Low word of the first cluster number of this entry
001Ch	4	DIR_FileSize	File size in bytes

The ROM code checks each entry in the root directory until either the booting file is found or the entry is empty (first byte is 00h), or when the end of the root directory is reached. Entries with the ATTR_LONG_NAME attribute (LFN) and first byte at E5h (erased file) are ignored. When found, the first cluster offset of the file is read from the DIR_FstClusHi/DIR_FstClusLo fields. There is a slight difference between FAT12/16 and FAT32 when handling the root directory. On FAT12/16, this directory has a fixed location (see Table 33-47) and length fixed by BPB_RootEntCnt, which is the total of 32-byte entries. Therefore, handling this directory is straightforward. On FAT32, the root directory is like a standard file. The FAT must be used to retrieve each sector of the directory. Step 4 describes the way in which the FAT is handled.

4. Buffer FAT entries in the FAT buffer.

   When the booting file is found, the ROM code reads the FAT and buffers the singly-linked chain of clusters in the FAT buffer that is used during boot to access the booting file directly, sector by sector. For FAT12/16 and for FAT32, multiple copies of the FAT exist (ROM code supports only two copies), after the boot sector.

$$FATn_{sector} = BPB_HiddSec + BPB_RsvdSecCnt + BP_FatSz \cdot n$$

init-E002

   The size of the FAT buffer is given by BPB_FATSz16 or BPB_FATSz32. The ROM code checks each copy of the FAT if the values are identical. If the values are different, the ROM code uses the value from the last FAT copy. With the FAT32 file system, the copy system can be disabled according to a flag in BPB_ExtFlags[7]. If this flag is set, the FAT BPB_ExtFlags[3:0] bit field is used. In this case, no verification is made by the ROM code with other copies of FAT.

   The FAT is a simple array of values, each referring to a cluster in the data area. One entry of the array is 12, 16, or 32 bits, depending on the file system in use. The value in an entry defines whether the

Copyright © 2015–2017, Texas Instruments Incorporated

cluster is being used or not, and if another cluster must be considered. This creates a singly-linked chain of clusters defining the file. Table 33-48 describes the meaning of an entry.

NOTE: For compatibility, cluster 0 and cluster 1 are not used for files, and these entries must contain:

- FF8h and FFFh (for FAT12)
- FFF8h and FFFFh (for FAT16)
- 0FFFFFF8h and 0FFFFFFFh (for FAT32)

Table 33-48. FAT Entry Description

FAT12	FAT16	FAT32	Description
000h	0000h	00000000h	Free cluster
001h	0001h	00000001h	Reserved cluster
002h–FEFh	0002h–FFEFh	00000002h–0FFFFFEFh	Used cluster; value points to next cluster
FF0h–FF6h	FFF0h–FFF6h	0FFFFFF0h–0FFFFFF6h	Reserved values
FF7h	FFF7h	0FFFFFF7h	Bad cluster
FF8h–FFFh	FFF8h–FFFFh	0FFFFFF8h–0FFFFFFFh	Last cluster in file

NOTE: FAT32 uses only bits [27:0]; the upper 4 bits are usually 0 and must remain untouched.

When accessing the root directory for FAT32, the ROM code starts from the root directory cluster entry and follows the linked chain to retrieve the clusters.

When the booting file has been found, the ROM code buffers each FAT entry corresponding to the file in a sector way. This means each cluster is translated to one or several sectors, depending on how many sectors are in a cluster (BPB_SecPerClus). This buffer is used later by the booting procedure to access the file.

33.3.7.7 SATA Device Boot Operation

NOTE: SATA is not supported on the AM570x family of devices.

The SATA is a host interface dedicated for mass storage memory devices. SATA aims to connect SATA disk drive compliant SSD (SATA solid state drive) or HDD (hard disk drive) for mass storage use case only.

The mass storage device (SSD or HDD) is intended to be connected through SATA standard connector (in case of HDD) or directly soldered on the board (in case of SSD). In the latter case, the SATA mass-storage device is actually permanently attached to the device.

The device embedded SATA host controller has a single port (P0) implementation, and one internal electrical transceiver (SATA_PHY). For more information on the device-embedded SATA (SATA AHCI core and wrapper), see Section 24.8, *SATA Controller*. For more details on SATA subsystem integrated SATA PHY transceiver components, see Section 26.1, *SATA PHY Subsystem*. A system integration block diagram is provided in following section.

33.3.7.7.1 SATA Booting Overview

The device attached to the device SATA for boot operation must meet the following requirements:

- It must be compliant with the *Serial ATA Standard* specification, rev. 2.6.
- It must support READ SECTOR(s) ATA command (code 0x20) as defined in the ATA / ATAPI - 7

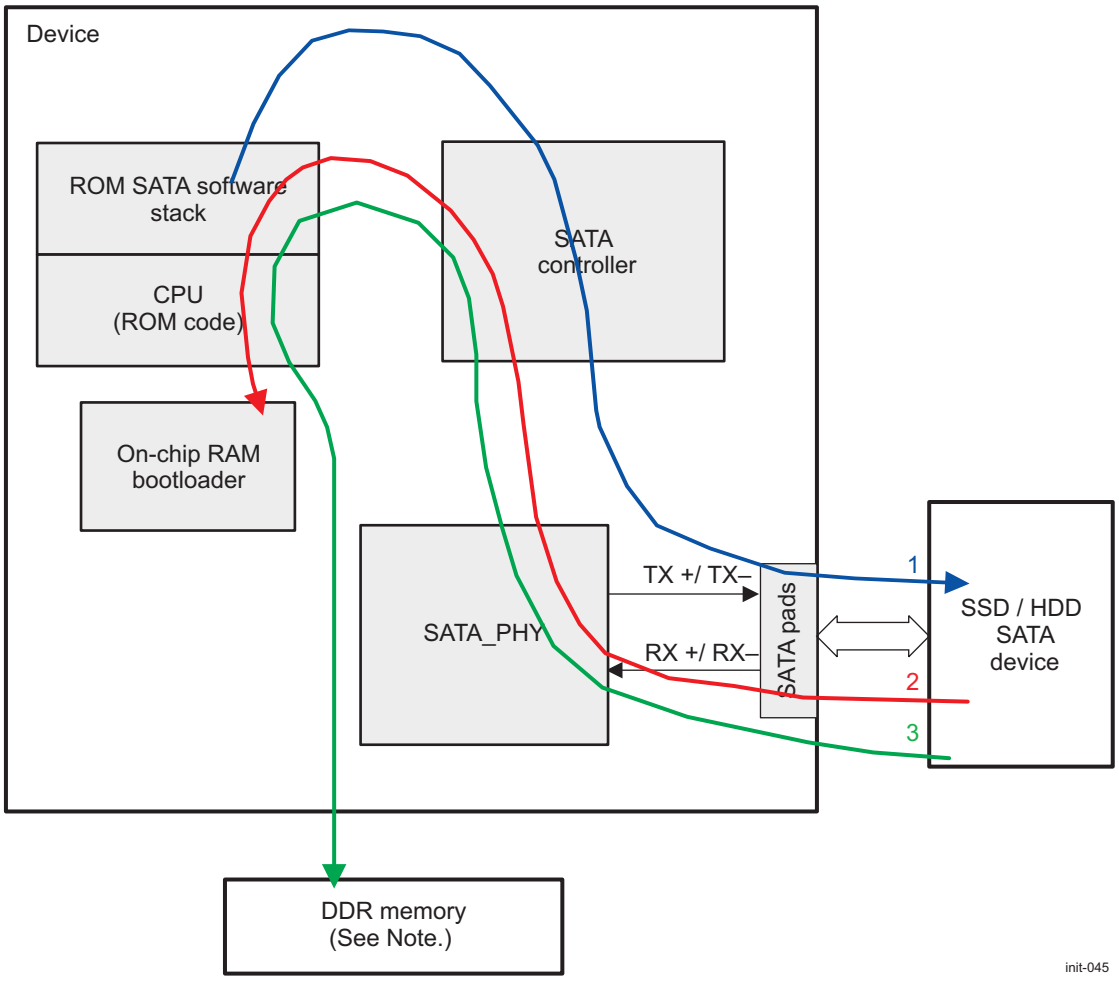
Copyright © 2015–2017, Texas Instruments Incorporated

specification.

- It must be connected directly to the device SATA IOs – sata_tx / sata_ty, sata_rx / sata_ry (no port multiplier connected).
- It must have been already powered by the companion chip or external supply before start of the boot procedure.
- It must be taken in consideration for the device that maximum power on ready time allowed by ROM Code is 900ms. First COMRESET procedure targeting the attached device is triggered 300ms after device SATA subsystem initialization by ROM Code.

Figure 33-31 highlights the booting of the platform from the SSD device.

Figure 33-31. Booting from a Permanently-Attached SSD Device



The device booting from an attached SATA mass storage memory device is performed in the following steps:

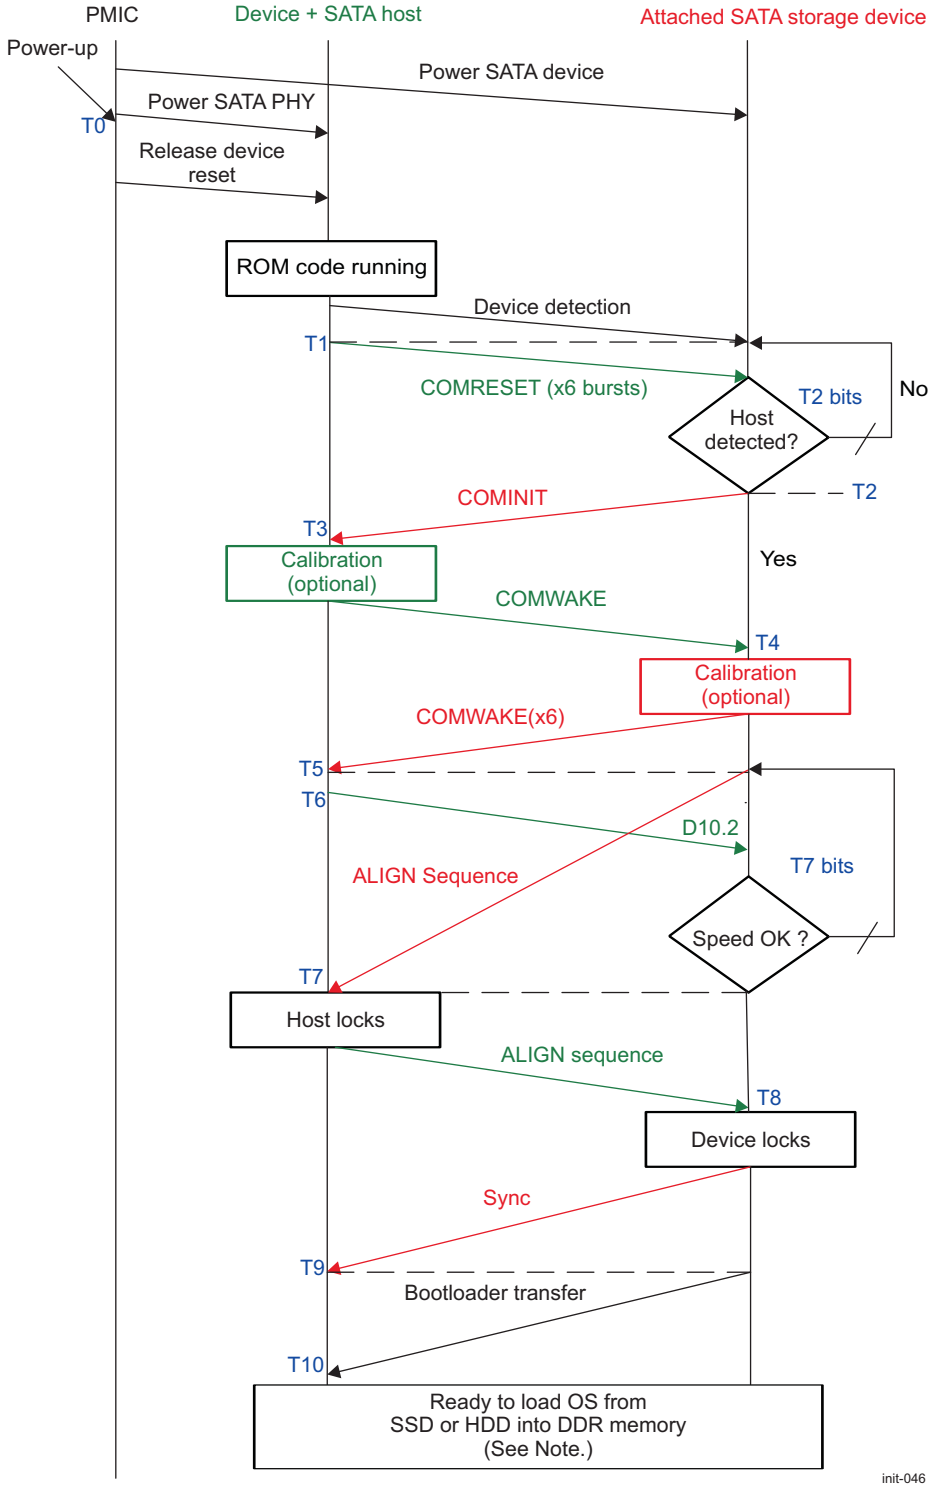
1. At reset or power on, the device ROM code boots and checks for the SSD / HDD to be ready.
2. The SSD / HDD transfers the boot-loader to the internal RAM of device.
3. The OS in the SSD or HDD is downloaded into DDR memory and the platform is ready.

33.3.7.7.2 SATA Power-Up Initialization Sequence

Figure 33-32 shows all messages exchanges between power-on event up to when the platform is ready. The sequencing aims to depict the complete sequence without any specific connecting issues that may appear.

Copyright © 2015–2017, Texas Instruments Incorporated

Figure 33-32. SATA Power-on Initialization Sequencing



The following time phases can be identified during booting from SATA interface:

- T0: the SATA_PHY is powered and device reset is maintained until all Power-management IC companion powers are set.
- T1: the ROM code validates a SATA SSD device detection.
- Within the T1-T2 time interval: the SATA host issues a COMRESET sequence for a minimum of 6 bursts (and a multiple of 6) to force a hardware reset to the SATA peripheral device.

Copyright © 2015–2017, Texas Instruments Incorporated

- T2: As long as the attached SATA SSD device does not explicit reset request (COMINIT), the host issues COMRESET sequences
- Within the T2-T3 time interval, once the host release the COMRESET sequence (made of 6 bursts minimum), the device responds with a COMINIT to request a communication initialization (It requests a reset from the host).
- Within the T3-T4 time interval, the SATA host controller may calibrate at T3, but issues a COMWAKE sequence to the peripheral in order to inform the other part the wish to use the link.
- Within the T4-T5 time interval, the SSD device responds and may calibrate. The device response is made of 6 burst COMWAKE sequence.
- Within the T5-T6 time interval, SATA host controller shall start transmitting D10.2 characters no later than a defined moment.
- Within the T6-T7 time interval, when the device host detects the COMWAKE from the device, it starts transmitting D10.2 character at its lowest speed.
- At the same time within T5-T7 time interval, continuous stream of device ALIGN sequence (following the 6 bursts COMWAKE sequence) starting at the device highest speed.
- T7: Without any SATA host's answer (D10.2 character), the device ALIGN sequence is repeated for as many slower speeds as are supported. When host receives ALIGN sequence, it locks.
- in case no proposed speeds are supported by the host, the device enters in error state.
- in case no ALIGNp sequence is received by the host within a defined time gap after detecting the release of the device COMWAKE, the host restarts the power on sequence indefinitely until stop by user intervention.
- Within the T7-T8 time interval, as soon as the device SATA host locks, it issues an ALIGN sequence to the attached SATA SSD device that also locks
- Within the T8-T9 time interval, the SATA peripheral device sends a SYNC primitive to inform the communication link is established.
- Within the T9-T10 time interval, once the link has been set successfully, the boot loader is transferred from the SATA peripheral device to device internal on-chip RAM

After passing through all above described phases, the device is ready to load OS source from SSD to the device DDR RAM.

33.3.7.7.3 System Conditions and Limitations for SATA Boot

The following system conditions and limitations are defined by ROM Code implementation:

- The ROM Code sets Gen2 speed (3 Gbps) for a SATA boot operation.
- The ROM Code expects that the SATA I/Os are connected to device SATA subsystem at system reset (i.e. a permanently attached boot device).
- The ROM Code expects that the SATA device is powered externally and supplies are set and stable upon entering the booting procedure. The ROM Code does not perform any software action to the companion device with respect to powering the SATA device.
- The ROM Code allows the SATA device 300ms power on ready time before starting the device detection. In case that the detection fails, the ROM Code retries 3 times with 200ms delay before returning and reporting a SATA boot failure.
- The ROM Code does not handle or enable advanced SATA power modes (slumber and partial).

The ROM Code initializes SATA subsystem after SATA boot is started, as defined in this chapter. The ROM Code does not close SATA connection after it was initialized following procedure defined in Section 33.3.4.5, *Booting Device List Setup*.

33.3.7.7.4 SATA Read Sector Procedure in FAT Mode

The booting medium may hold a FAT file system which the ROM Code is able to read and process. The image used by the booting procedure is taken from a specific booting file named "HLO". This file has to be located in the root directory on an active primary partition of FAT12 / 16 or FAT32 type.

A SATA drive can be configured either as floppy-like or hard-drive-like.

Copyright © 2015–2017, Texas Instruments Incorporated

- When acting as floppy-like, the content of the card is a single file system without any **Master Boot Record (MBR)** holding a partition table.
- When acting as hard-drive-like, a **MBR** is present in the first sector of the card. This **MBR** holds a table of partitions, one of which must be **FAT 12/ 16 / 32, primary and active**.

Refer to the Section 33.3.7.6.5.1, *MBR and FAT File System*, for a more detailed description of FAT file system support.

Copyright © 2015–2017, Texas Instruments Incorporated

33.3.8 Image Format

33.3.8.1 Overview

An image has two major parts:

- An optional CH
- Software to execute

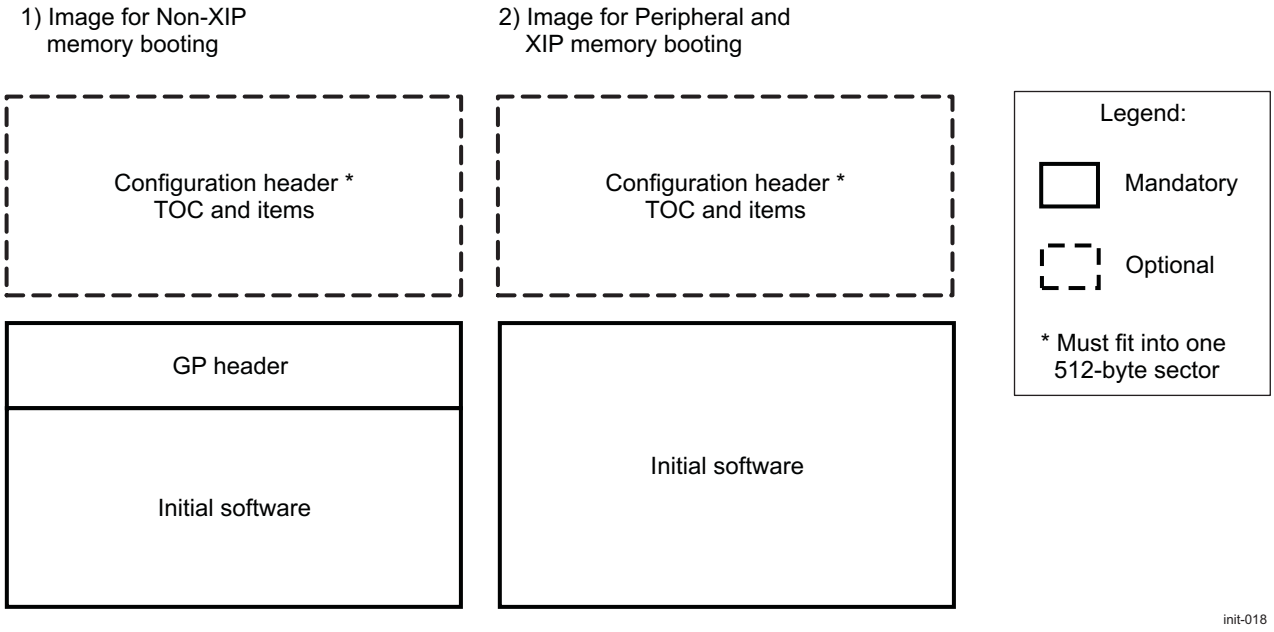
The CH can contain several parameters set by users to speed up booting. It is further described in Section 33.3.8.2, *Configuration Header*.

The second part contains the software that is loaded into the memory and executed.

Figure 33-33 is an overview of the boot image formats. There are two image types:

1. Non-XIP memory booting: This image type is used for memories that require shadowing (for example, NAND). Image for non-XIP memory may not contain a CH and start straight from the GP header. Next, there must be a small header (referred to as a GP header) that contains information about the size and the destination address.
2. When the memory device is of XIP type (for example, NOR), the GP header is not required, and the image can contain code for direct execution. Optionally, the first sector can contain a CH. The same image format is used for peripheral booting (where the code is transferred to internal RAM).

Figure 33-33. Image Formats



33.3.8.2 Configuration Header

The ROM code default settings (such as clock frequencies, EMIF, GPMC, MMCHS, or QSPI interfaces) can be tuned by the user by using the CH.

The CH can contain the following parts:

- Settings: Various clock settings (mandatory)
- FLASH: Flash interface (GPMC) settings
- eMMC / SD: MMC2 / MMC1 interface settings
- QSPI: QSPI interface settings

The beginning of the CH is a table of contents (TOC), which points to each item. This is described in Figure 33-34. Each TOC item is a simple structure described in Table 33-49. The complete CH (CH TOC and items) should fit in a 512-byte sector.

Copyright © 2015–2017, Texas Instruments Incorporated

The ROM code identifies the presence of a CH by reading the first TOC item if it contains a known string (CHSETTINGS, CHFLASH, etc.). Next, the TOC is identified and searched until a 0xFFFF FFFF offset is found. The CH is read and parameters are executed sequentially.

For the sake of simplicity, each field represents the content of a register to be modified. Only fields required for the configuration are used; fields for status, for instance, are not modified and therefore are not shown in the tables.

Figure 33-34. CH Format

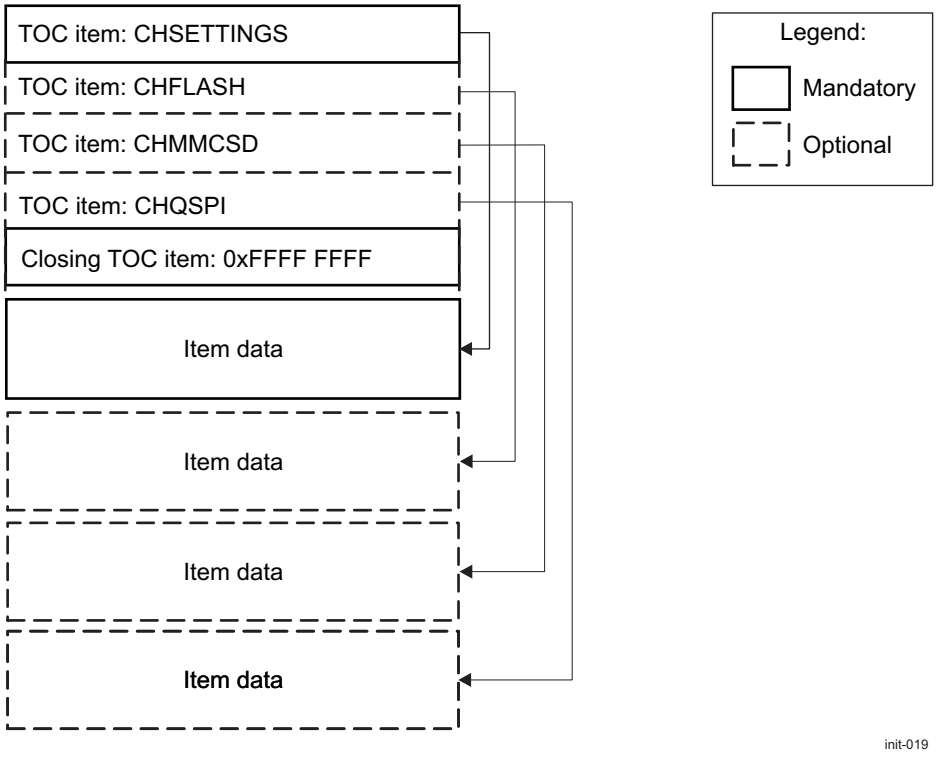


Table 33-49. CH TOC Item

Offset	Field	Size (Bytes)	Description
0x0000	Start	4	Offset from the start address of the TOC to the actual address of item contents
0x0004	Size	4	Size of item
0x0008	Reserved	4	Unused
0x000C	Reserved	4	Unused
0x0010	Reserved	4	Unused
0x0014	TOC Filename	12	12-character name of a TOC item, including the NULL termination character. That is, this is an array where first byte accomodates the first character.

The ROM Code recognizes sections pointed to by the TOC based on the filename as described in Table 33-50

- The ‘X-LOADER’, ‘2ND', ‘MLO’, ‘ULO’, or ‘HLO’ section contains the Initial Software
- Optionally, TOC may contain CH sections. The “CHSETTINGS” is a mandatory section of CH and is used to recognize CH presence.

Copyright © 2015–2017, Texas Instruments Incorporated

Table 33-50. TOC Filenames

Filename	Item Type	Usage	Description
MLO	Initial Software	eMMC/SD Memory Booting	“Mmc LOader”
HLO	Initial Software	SATA Memory Booting	“Hdd LOader”
ULO	Initial Software	USB or UART Peripheral Booting	“Usb LOader”
2ND	Initial Software	USB or UART Peripheral Booting	“Secondary Loader”
X-LOADER	Initial Software	Other devices	“eXternal LOADER”
CHSETTINGS	Configuration Header	Memory and Peripheral Booting	Configuration Header General Setting Item
CHFLASH	Configuration Header	Memory and Peripheral Booting	Configuration Header GPMC Item
CHMMCSD	Configuration Header	Memory and Peripheral Booting	Configuration Header eMMC/SD Item
CHQSPI	Configuration Header	Memory and Peripheral Booting	Configuration Header QSPI Item

33.3.8.2.1 CHSETTINGS Item

The CHSETTINGS configuration header contains settings specific to the clock system. The ROM code configures the device clocking to some default settings as described in Section 33.3.4.4, *Clocking Configuration*. The CH CHSETTINGS section contains a method to override the ROM code default clock settings.

Table 33-51 describes the fields. The clocking procedure and the clocking setting structure are described in Section 33.3.4.6, *Software Booting Configuration*.

Table 33-51. CHSETTINGS Item

Offset	Field	Description
0000h	Section key	Key used for item verification: C0C0C0C1h
0004h	Valid	Enables/disables the section: 00h: Disable Others: Enable
0005h	Version	Configuration header version 01h Others: Reserved
0006h	Reserved	
0008h	Clocking settings	Described in Table 33-19, *Software Booting Configuration Structure*, starting from the FLAGS field.

33.3.8.2.2 CHFLASH Item

The CHFLASH configuration header contains settings specific to the general-purpose memory controller (GPMC). For more information, see Section 15.4, *General-Purpose Memory Controller*. Table 33-52 describes the fields.

Table 33-52. CHFLASH Item

Offset	Field	Description
0000h	Section Key	Key used for section verification: C0C0C0C3h.
0004h	Valid	Enables/disables the section: 00h: Disable Others: Enable
0005h	Reserved	
0008h	GPMC_SYSCONFIG (LSW)	Register values

0028h	GPMC_CONFIG7_0	
002Ch	GPMC_PREFETCH_CONFIG1	
0030h	GPMC_PREFETCH_CONFIG2 (LSW)	
0032h	GPMC_PREFETCH_CONTROL (LSW)	
0034h	GPMC_ECC_CONFIG (LSW)	
0036h	GPMC_ECC_CONTROL (LSW)	
0038h	GPMC_ECC_SIZE_CONFIG	
003Ch	Reserved	

33.3.8.2.3 CHMMCSD Item

The CHMMCSD configuration header contains settings specific to the high-speed MMC/SD/SDIO host controller (MMCHS). For more information, see Chapter 25, *eMMC/SD/SDIO*. Table 33-53 describes the fields.

Table 33-53. CHMMCSD Item

Offset	Field	Description
0000h	Section key	Key used for section verification C0C0C0C4h
0004h	Valid	Enables/disables the section: 00h: Disable Other: Enable
0005h	Reserved	
0008h	CLKD	Functional clock divisor MMCHS_SYSCTL[15:6] CLKD = 0x0: FCLK/1 0x1: FCLK/1 0x2: FCLK/2 … 0x3FF: FCLK/1023 0xFFFF FFFF: Do not modify clock divisor
000Ch	MMCHS interface bus width	Configure the MMCHS interface bus width according to the field value : 1: Configured to 1 bit (SDR) 2: Configured to 4 bits (SDR) 4: Configured to 8 bits (SDR)(1) 8: Configured to 4 bits (DDR)(1) 16: Configured to 8 bits (DDR)(1) 0xFFFF FFFF: Do not update bus width. Others: Reserved

(1) The 8 bits SDR and 4-/8-bits DDR (respective values 4, 8, and 16) are only applicable to eMMC devices.

Copyright © 2015–2017, Texas Instruments Incorporated

The ROM code provides a booting parameter structure to the initial software (see Section 33.3.8.4, *Image Execution*). This structure contains a field that indicates whether the configuration header items have been correctly processed. For a CHMMCSD item, if the MMCHS_SYSCTL and bus width fields are set to 0xFFFF FFFF, the booting parameters report that the CHMMCSD section has not been executed, regardless of the value of the Valid field.

33.3.8.2.4 CHQSPI Item

The CHQSPI configuration header contains settings specific to the QSPI interface controller. For more information, see Section 24.5, *Quad Serial Peripherial Interface*. Table 33-54 describes the fields.

Table 33-54. CHQSPI Item

Offset	Register Field Modified	Description
0000h	Section key	Key used for section verification C0C0C0C6h
0004h	Valid	Enables/disables the section: 00h: Disable Other: Enable
0005h	Reserved	
0008h	SPI Clock	SPI clock rate: 0x03: 32 MHz 0x07: 16 MHz 0x13: 48 MHz 0x17: 24 MHz 0x1F: 12 MHz All other: reserved
0009h	RCMD	Read command
000Ah	READ_TYPE	Determines if the read command is a single, dual or quad read mode command
000Bh	NUM_A_BYTES	Number of address bytes to be sent
000Ch	NUM_D_BYTES	Number of dummy bytes to be used for fast read

33.3.8.3 GP Header

When the booting memory device is non-XIP (for example, NAND) the image must contain a small header, located before the executable code, and having the size of the software to load and the destination address of where to store it. Table 33-55 describes the image format. The GP header is not required when booting from an XIP memory device (for example, NOR) or in case of peripheral booting. In this case, the peripheral or memory booting image starts directly with executable code.

Table 33-55. GP Header Image Format

Field	Non-XIP Device Offset	XIP Device Offset	Size (Bytes)	Description
Size	0x0000	–	4	Size of the image (including GP header)
Destination	0x0004	–	4	Address where to store the code or code entry point
Image Code	0x0008	0x0000	x	Executable code

NOTE: The Destination address field stands for:

- Target address for the image copy from the non-XIP storage to the target XIP location (for example, internal RAM or SDRAM)
- Entry point for image code

Users must take care to locate the code entry point to the target address for image copy.

Copyright © 2015–2017, Texas Instruments Incorporated

33.3.8.4 Image Execution

The image is executed when the ROM code performs the branch to the first executable instruction in the initial software. In non-XIP, the execution address is the first word after the GP header. The branch is performed in public ARM supervisor mode. The R0 register points to the booting parameter structure that contains information about booting execution. Table 33-56 shows the booting parameter structure.

Table 33-56. Booting Parameter Structure

Offset	Field	Size (Bytes)	Description
0x00	Booting message	4	Last received booting message
0x04	Memory booting device descriptor	4	Pointer to the memory device descriptor that has been used during the memory booting process
0x08	Current booting device	1	Code of device used for booting: 0x01: XIP 0x02: XIP (with wait monitoring) 0x03: NAND 0x05: SD cards 0x06: eMMC (boot partition) 0x07: eMMC 0x09: SATA 0x0A: QSPI_1 0x0B: QSPI_4 0x43: UART 0x45: USB Others: Reserved
0x09	Reset reason	1	Current reset reason bit mask (bit = 1, event present): direct copy from lower byte of PRM_RSTST (more bits exist in PRM_RSTST register): [0]: Power-on (cold) reset [1]: Global software warm reset [2]: Reserved [3]: MPU watchdog reset [4]: Reserved [5]: External warm reset [6]: VDD_MPU voltage manager reset [7]: VDD_MM voltage manager reset
0x0A	CH flags	1	Configuration header items flag. Each item is described by 1 bit. A set bit indicates that the item was executed: [0]: CHSETTINGS [2]: CHFLASH [3]: CHMMCSD [4]: CHQSPI Other bits: Reserved

33.3.9 Tracing

Tracing in the public ROM code consists in 32-bit vectors for which each bit corresponds to a particular way point in the ROM code execution sequence. Table 33-57 through Table 33-60 list the organization of the tracing data in RAM. Tracing vectors are initialized at the beginning of the start-up phase and are updated all along the boot process.

There are two sets of tracing vectors (Table 33-14, *Tracing Data)*. The first set is the current trace information (after a cold or warm reset). The second set holds a copy of trace vectors collected at the first ROM code run after a cold reset. As a result, after a warm reset it is possible to have visibility on the boot scenario that occurred during a cold reset.

Table 33-57 lists the organization of tracing vector 1.

Table 33-57. Tracing Vector 1

Bit	Group	Meaning
0	Boot	Passed the public reset vector
1	Boot	Entered main function
2	Boot	Running after the cold reset
3	Boot	Main booting routine entered
4	Memory boot	Memory booting started
5	Peripheral boot	Peripheral booting started
6	Boot	Booting loop reached last device

33.4 Services for HLOS Support

The ROM code provides different services that can be called for L1 and L2-cache maintenance, Enter in Low Power, etc. These services are implemented in monitor mode and must be called by using the SMC instruction. The caller must ensure the save and restore of the processor registers before and after calling the Monitor Service.

The following code example shows how the monitor ROM code functions can be accessed by an application running in public mode:

```
 ;-----------------------------------------------------------------------------
;FUNCTION: SetL2CacheLatency
;
; DESCRIPTION: Function calls the Monitor Service to setup the L2 Cache Latency
;
; INPUTS: r0 Tag RAM Latency to set
;         r1 Data RAM Latency to set
; RETURN:
;
;-----------------------------------------------------------------------------
SetL2CacheLatency FUNCTION

  PUSH {R1-R12, LR}
  LDR R12, =0x105
  SMC 0x1
  POP {R1-R12, PC}
  ENDFUNC
```

33.4.1 Hypervisor

Table 33-61. Start Hypervisor

Function ID	**Description**	
R12 = 0x102	This function starts the CPU Hypervisor mode.	
Parameters

34.1 Introduction

Debugging a system that contains an embedded processor involves an environment that connects high-level debugging software running on a host computer to a low-level debug interface supported by the target device. Between these levels, a debug and trace controller (DTC) facilitates communication between the host debugger and the debug support logic on the target chip.

The DTC is a combination of hardware and software that connects the host debugger to the target system. The DTC uses one or more hardware interfaces and/or protocols to convert actions dictated by the debugger user to JTAG® commands and scans that execute the core hardware.

The debug software and hardware components let the user control multiple central processing unit (CPU) cores embedded in the device in a global or local manner. This environment provides:

- Synchronized global starting and stopping of multiple processors
- Starting and stopping of an individual processor
- Each processor can generate triggers that can be used to alter the execution flow of other processors

System topics include but are not limited to:

- System clocking and power-down issues
- Interconnection of multiple devices
- Trigger channels

For easy integration into applications, a set of application-programming interfaces (APIs) for debug-IP programming and a software message library are provided. CToolsLib is a library of embedded target APIs to enable easy programmatic access to the chip tools (CTools), which are system-level debug facilities included in the debug subsystem capabilities of TI devices. More information about the APIs, download files, and other useful links for available libraries can be found on the CToolsLib Wiki site:

http://processors.wiki.ti.com/index.php/CToolsLib

The previous link connects to TI community resources. Linked contents are provided “AS IS” by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

34.1.1 Key Features

NOTE: For AM570x: The supported set of features and peripherals is device part number dependent. For more information, see device Data Manual.

The device deploys Texas Instrument's CTools debug technology for on-chip debug and trace support. It provides the following features:

- External debug interfaces:
  - Primary debug interface - IEEE1149.1 (JTAG)
    - Used for debugger connection
    - Controls ICEPick™ (generic test access port [TAP] for dynamic TAP insertion) to allow the debugger to access several debug resources through its secondary (output) JTAG ports (for more information, see Section 34.3.3.1, *ICEPick Secondary TAPs*).
    - For more information about IEEE1149.1, see Section 34.2.1, *IEEE1149.1*.
  - Debug (trace) port
    - Can be used to export processor or system trace off-chip (to an external trace receiver)
    - Can be used for cross-triggering with an external device
    - Configured through debug resources manager (DRM) module instantiated in the debug subsystem
    - For more information about debug (trace) port, see Section 34.2.2, *Debug (Trace) Port* , and Section 34.11, *Concurrent Debug Modes*.
- JTAG based processor debug on:

Copyright © 2015–2017, Texas Instruments Incorporated

  - Cortex-A15 in MPU
  - C66x in DSP1
  - Cortex-M4 (x2) in IPU1, IPU2
  - ARM968 (x2) in IVA
  - PRU (x2) in PRU-ICSS1, PRU-ICSS2
- Dynamic TAP insertion
  - Controlled by ICEPick
  - For more information, see Section 34.3.3, *Dynamic TAP Insertion.*
- Power and clock management
  - Debugger can get the status of the power domain associated to each TAP.
  - Debugger may prevent the application software switching off the power domain.
  - Application power management behavior can be preserved during debug across power transitions.
  - For more information, see Section 34.6.1, *Power and Clock Management.*
- Reset management
  - Debugger can configure ICEPick to assert, block, or extend the reset of a given subsystem.
  - For more information, see Section 34.6.2, *Reset Management.*
- Cross-triggering
  - Provides a way to propagate debug (trigger) events from one processor, subsystem, or module to another:
    - Subsystem A can be programmed to generate a debug event, which can then be exported as a global trigger across the device.
    - Subsystem B can be programmed to be sensitive to the trigger line input and to generate an action on trigger detection.
  - Two global trigger lines are implemented
  - Device-level cross-triggering is handled by the XTRIG (TI cross-trigger) module implemented in the debug subsystem
  - Various ARM® CoreSight™ cross-trigger modules implemented to provide support for CoreSight triggers distribution
    - CoreSight Cross-Trigger Interface (CS_CTI) modules
    - CoreSight Cross-Trigger Matrix (CS_CTM) modules
  - For more information about cross-triggering, see Section 34.4.2, *Cross-Triggering.*
- Suspend
  - Provides a way to stop a closely coupled hardware process running on a peripheral module when the host processor enters debug state
  - For more information about suspend, see Section 34.4.3, *Suspend.*
- MPU watchpoint
  - Embedded in MPU subsystem
  - Provides visibility on MPU to EMIF direct paths
  - For more information, see Section 34.8, *MPU Memory Adaptor (MPU_MA) Watchpoint*
- Processor trace
  - Cortex-A15 (MPU) and C66x (DSP) processor trace is supported
  - Program trace only for MPU (no data trace)
  - MPU trace supported by a CoreSight Program Trace Macrocell (CS_PTM) module
  - Three exclusive trace sinks:
    - CoreSight Trace Port Interface Unit (CS_TPIU) – trace export to an external trace receiver
    - CTools Trace Buffer Router (CT_TBR) in system bridge mode – trace export through USB
    - CT_TBR in buffer mode – trace history store into on-chip trace buffer

Copyright © 2015–2017, Texas Instruments Incorporated

  - For more information, see Section 34.9, *Processor Trace.*
- System instrumentation (trace)
  - Supported by a CTools System Trace Module (CT_STM), implementing MIPI System Trace Protocol (STP) (rev 2.0)
  - Real-time software trace
    - MPU software instrumentation through CoreSight STM (CS_STM) (STP2.0)
    - System-on-chip (SoC) software instrumentation through CT_STM (STP2.0)
  - OCP watchpoint (OCP_WP_NOC)
    - OCP target traffic monitoring: OCP_WP_NOC can be configured to generate a trigger upon watchpoint match (that is, when target transaction attributes match the user-defined attributes).
    - SoC events trace
    - DMA transfer profiling
  - Statistics collector (performance probes)
    - Computes traffic statistics within a user-defined window and periodically reports to the user through the CT_STM interface
    - Embedded in the L3_MAIN interconnect
    - 10 instances:
      - 1 instance dedicated to target (SDRAM) load monitoring
      - 9 instances dedicated to master latency monitoring
  - IVA instrumentation (hardware accelerator [HWA] profiling)
    - Supported through a software message and system trace event (SMSET) module embedded in the IVA subsystem
  - Power-management events profiling (PM instrumentation [PMI])
    - Monitoring major power-management events. The PM state changes are handled as generic events and encapsulated in STP messages.
  - Clock-management events profiling (CM instrumentation [CMI])
    - Monitoring major clock management events. The CM state changes are handled as generic events and encapsulated in STP messages.
    - Two instances, one per CM
      - CM1 Instrumentation (CMI1) module mapped in the PD_CORE_AON power domain
      - CM2 Instrumentation (CMI2) module mapped in the PD_CORE power domain
  - For more information, see Section 34.10, *System Instrumentation.*
- Performance monitoring
  - Supported by subsystem counter timer module (SCTM) for IPU
  - Supported by performance monitoring unit (PMU) for MPU subsystem
  - For more information, see Section 34.7, *Performance Monitoring*.

34.2 Debug Interfaces

34.2.1 IEEE1149.1

The target debug interface has the following signals:

- Five standard IEEE1149.1 JTAG signals: nTRST, TCK, TMS, TDI, and TDO
- A return clock (RTCK) due to the clocking requirements of the ARM968™ processor
- Two EMU [1:0] TI extensions

Table 34-1 describes the IEEE1149.1 signals.

Table 34-1. IEEE1149.1 Signals

Device Pad Name	Internal Signal Name	Type(1)	Function	Description
trstn	nTRST	I	Test reset	When asserted (active low), resets all test and debug logic in the device along with the IEEE1149.1 interface.
tclk	TCK	I	Test clock	This is the test clock used to drive an IEEE1149.1 TAP state-machine and logic. This is either a free-running clock or a gated clock, depending on the DTC attached to the device and the RTCK monitoring.
rtck	RTCK	O	Returned (synchronized) test clock	Depending on the DTC attached to the device, the JTAG signals are either clocked from RTCK or the RTCK is monitored by the DTC to the gate TCK.
tms	TMS	I/O	Test mode select input	Directs the next state of the IEEE1149.1 TAP state-machine.
tdi	TDI	I	Test data input	Scans data input to the device.
tdo	TDO	O	Test data output	Scans data output by the device.
emu0	EMU0	I/O	Emulation 0	Channel 0 trigger or boot mode or trace port.
emu1	EMU1	I/O	Emulation 1	Channel 1 trigger or boot mode or trace port.

(1) I = Input; O = Output; I/O = bidirectional

NOTE: For more information about device pads pull type resistors, see the device Data Manual, Section Signal Descriptions in Chapter Terminal Configuration and Functions.

NOTE: The device JTAG ID code can be accessed through ICEPick. For information about the JTAG ID code value, see Chapter 1, *Introduction*.

34.2.2 Debug (Trace) Port

On-chip debug and trace events can be exported to external equipment through the debug (trace) port of the device. The following exportable debug events and trace sources are supported:

- Debug events
  - Triggers. For more information about triggers, see Section 34.4.2, *Cross-Triggering*.
- Trace sources
  - Processor trace: Cortex-A15 MPU and C66x DSP traces are supported. For more information about the processor trace, see Section 34.9, *Processor Trace*.
  - System trace: Trace coming from various system instrumentation modules, and supported by the CT_STM module. For more information about the system trace, see Section 34.10, *System Instrumentation*.

Note that not all debug and trace features can be supported concurrently because of the limited number of pins allocated to debug. Thus, multiplexing among debug and trace sources is implemented. The configuration and the debug/trace source selection occur through the DRM module embedded in the debug subsystem.

Copyright © 2015–2017, Texas Instruments Incorporated

Table 34-2 describes the trace port signals.

Table 34-2. Trace Port Signals

Pin Name	Internal Signal Name	I/O[1]	Pull Type [2]	Description
emu19	EMU19	O	PD	Emulator pin 19
emu18	EMU18	O	PD	Emulator pin 18
emu17	EMU17	O	PD	Emulator pin 17
emu16	EMU16	O	PD	Emulator pin 16
emu15	EMU15	O	PD	Emulator pin 15
emu14	EMU14	O	PD	Emulator pin 14
emu13	EMU13	O	PD	Emulator pin 13
emu12	EMU12	O	PD	Emulator pin 12
emu11	EMU11	O	PD	Emulator pin 11
emu10	EMU10	O	PD	Emulator pin 10
emu9	EMU9	O	PD	Emulator pin 9
emu8	EMU8	O	PD	Emulator pin 8
emu7	EMU7	O	PD	Emulator pin 7
emu6	EMU6	O	PD	Emulator pin 6
emu5	EMU5	O	PD	Emulator pin 5
emu4	EMU4	O	PD	Emulator pin 4
emu3	EMU3	O	PD	Emulator pin 3
emu2	EMU2	O	PD	Emulator pin 2
emu1	EMU1	I/O	PU	Emulator pin 1
emu0	EMU0	I/O	PU	Emulator pin 0

(1) I = Input; O = Output; I/O = bidirectional
(2) PU = internal pullup; PD = internal pulldown

NOTE: The emu[19:0] pins are shared with other functional (application) pins on the device boundary. To use the emu[19:0] pins, the user must program the device application pin manager (Control Module) appropriately. For more information, see Chapter 18, *Control Module*.

For more information about DRM multiplexing and concurrent debug modes, see Section 34.11, *Concurrent Debug Modes*.

34.2.3 Trace Connector and Board Layout Considerations

Texas Instruments supports a variety of eXtended Development System (XDS) JTAG controllers with various debug capabilities beyond only JTAG support. Because this device supports the export of processor trace and system trace over the EMU pins, if you want your target to be compatible with XDS products capable of acquiring either trace types, see the following document for guidelines: *Emulation and Trace Headers* (literature number SPRU655). You can also find more information at the “XDS Target Connection Guide” TI wiki page:

http://processors.wiki.ti.com/index.php/XDS_Target_Connection_Guide

The previous link connects to TI community resources. Linked contents are provided “AS IS” by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

34.3 Debugger Connection

34.3.1 ICEPick Module

The debugger connects to the device through its JTAG interface. The first level of debug interface seen by the debugger is the ICEPick module embedded in the debug subsystem.

NOTE: ICEPick version D (ICEPick-D) is used in the device.

SoC designs typically have multiple processors, each having a JTAG TAP embedded in the processor. The ICEPick module manages these TAPs and the power, reset, and clock controls for modules that have TAPs.

The ICEPick module is visible only from the debugger point of view and thus cannot be programmed by application software. The debugger can configure ICEPick through its own TAP controller. The ICEPick TAP has an instruction length of 6 bits and is the primary TAP. It is always visible in the scan chain and is used to control and monitor the other secondary TAPs.

ICEPick provides the following debug capabilities:

- Debug connect logic for enabling or disabling most ICEPick instructions
- Dynamic TAP insertion
  - Serially linking up to 32 TAP controllers
  - Individually selecting one or more of the TAPs for scan without disrupting the instruction register (IR) state of other TAPs
- Power, reset, and clock management (PRCM)
  - Provides the power and clock states of each domain
  - Provides debugger control of the power domain of a processor. Can force the domain power and clocks on, and prohibit the domain from being clock-gated or powered down while a debugger is connected.
  - Applies system reset
  - Provides wait-in-reset (WIR) boot mode
  - Provides global and local WIR release
  - Provides global and local reset blocking

The ICEPick module implements a connect register, which must be configured with a predefined key to enable the full set of JTAG instructions. Once the debug connect key is properly programmed, ICEPick signals and subsystems emulation logics should be turned on.

For more information about ICEPick dynamic TAP insertion, see Section 34.3.3, *Dynamic TAP Insertion*.

For more information about ICEPick PRCM features, see Section 34.6, *Power, Reset, and Clock Management Debug Support*.

34.3.2 ICEPick Boot Modes

The initial configuration of ICEPick is determined by the level of the EMU0 and EMU1 pins at POR release. At POR, EMU0 and EMU1 are automatically configured as inputs. The EMU0 and EMU1 pins are free when POR is released.

Table 34-3 summarizes the ICEPick boot modes.

Table 34-3. ICEPick Boot Modes at POR

EMU1	EMU0	TAPs in the TDI → TDO Path	Other Effects/Comments
0	0	None	Reserved (do not use)
0	1	None	Reserved (do not use)
1	0	ICEPick	TAP only + WIR mode
1	1	ICEPick	TAP only (default mode)

Copyright © 2015–2017, Texas Instruments Incorporated

34.3.2.1 Default Boot Mode

In ICEPick-only configuration, none of the secondary TAPs are selected. The ICEPick TAP is the only TAP between device-level TDI and TDO pins. This mode is the recommended boot mode.

34.3.2.2 Wait-In-Reset

The device can boot to invoke WIR mode. If the device is booted in this mode, all processors within the device that support a TAP through ICEPick are held in reset until released. Individual processors can be released from reset (local), or all processors held in the reset state can be released at the same time (global).

34.3.3 Dynamic TAP Insertion

34.3.3.1 ICEPick Secondary TAPs

To include more or fewer secondary TAPs in the scan chain, the debugger must use the ICEPick TAP router to program the TAPs. At its root, ICEPick is a scan-path linker that lets the DTC selectively choose which subsystem TAPs are accessible through the device-level debug interface. Each secondary TAP can be dynamically included in or excluded from the scan path. From the external JTAG interface point of view, secondary TAPs that are not selected appear not to exist.

Table 34-4 lists the secondary debug TAPs connected to the ICEPick scan chain along with the modules that can be accessed. The TAP number shows the position of the TAP in the scan chain.

Table 34-4. ICEPick Secondary Debug TAPs Mapping

34.4 Primary Debug Support

34.4.1 Processor Native Debug Support

34.4.1.1 Cortex-A15 Processor

The dual Cortex-A15 processor supports the following native debug features:

- Halt mode and monitor mode debugging
- Six breakpoints and four watchpoints
- Asynchronous aborts
- Performance monitoring
- Cross-triggering: Allows stopping one CPU upon debug event (for example, breakpoint) detection in the other CPU

For more information about Cortex-A15 native debug support features, see the *Cortex-A15 Technical Reference Manual*.

34.4.1.2 Cortex-M4 Processor

The Cortex-M4 processor supports the following native debug features:

- Program halt and stepping
- Hardware breakpoints, breakpoint instruction
- Data watchpoint on access to data add, add range, and data value
- Register value accesses
- Debug monitor exception
- Memories accesses

For more information about Cortex-M4 native debug support features, see the *Cortex-M4 Technical Reference Manual*.

34.4.1.3 DSP C66x

The main components of the DSP subsystem are:

- TMS320C66x DSP core with an execution control and analysis module that uses TI's ICEMaker™ technology. The core includes the following debug capabilities:
  - Up to four hardware breakpoints and a breakpoint counter
  - Software breakpoints
  - Internally and externally generated triggers
  - Reset control
  - Emulation interrupt support
  - Modes for debugging without halting time-critical blocks of code
  - Options to protect user-selected blocks of code against debug activity
- Emulation memory access hardware. This hardware enables several methods for reading and writing memory and registers in the DSP subsystem during debugging.
- Advanced Event Triggering (AET) unit is used to generate debug actions for managing breakpoints, watchpoint, trace, timers/counters, event outputs to external logic of DSP, based on events detected by instruction and data bus comparators or by auxiliary event detectors. DSP's AET can also handle complex events with event state machine and event counters.

34.4.1.4 IVA ARM968

The ARM968E-S processor (in each ICONT) supports the following native debug features through its EmbeddedICE-RT logic:

- Two hardware watchpoints/breakpoints

Copyright © 2015–2017, Texas Instruments Incorporated

- Halt mode and monitor mode debugging
- Debug control and status registers
- Debug communications channel

For more information about ARM968 native debug support features, see the *ARM968E-S Technical Reference Manual*.

34.4.1.5 PRU

The PRU processors in the PRU-ICSS support the following native debug features:

- Manual halt
- Single-step execution
- Software Breakpoint

34.4.2 Cross-Triggering

The device supports a cross-triggering feature that provides a way to propagate debug (trigger) events from one processor subsystem/module to another. For example, a given subsystem A can be programmed to generate a debug event, which can then be exported as a global trigger across the device. Another subsystem B can be programmed to be sensitive to the trigger line input and to generate an action on trigger detection.

Examples of debug events are: Processor entering debug state, watchpoint match, CS_PTM trigger, and so forth.

Examples of debug actions are: Debug request generation, restart (Cortex-A15 synchronous run), interrupt request generation, start/stop trace, and so forth.

The device implements two global cross-triggering lines: Trigger0 and Trigger1, also referred to as EMU0 and EMU1, respectively.

Subsystem cross-triggering is consolidated at the device level by the XTRIG module, which is embedded in the debug subsystem.

NOTE: XTRIG is not programmatically visible from the JTAG interface or any device processor. Thus, cross-triggering is programmed at the subsystem level.

The Trigger0 and Trigger1 lines can also be configured as external triggers and contribute to cross-triggering.

Copyright © 2015–2017, Texas Instruments Incorporated

34.4.2.1 SoC-Level Cross-Triggering

Device-level cross-triggering is handled by the XTRIG module. XTRIG manages two emulation triggers: Trigger0 and Trigger1. These trigger lines are shared by all the device subsystems implementing cross-triggering and are used to facilitate co-emulation.

Table 34-6 summarizes the device cross-triggering capabilities.

Table 34-6. Device Cross-Triggering

34.4.2.2 Cross-Triggering With External Device

Based on DRM settings, the Trigger0 and Trigger1 lines may also be used as external triggers. Trigger0 is connected to the EMU0 device pin, and Trigger1 is connected to the EMU1 device pin. The user must make sure to program the DRM module in accordance with Table 34-32.

34.4.3 Suspend

The device supports a suspend feature, which provides a way to stop a closely coupled hardware process running on a peripheral-IP when the host processor enters debug state. The suspend mechanism is important for debug to ensure that peripheral-IPs operate in a lock-step manner with a host controller processor.

An entry is provided for each peripheral-IP that must consider the suspend signals from a number of processors (MPU or DSP). For each peripheral-IP, sensitivity to the suspend signals is defined within two possibilities (and so coded using 1 bit):

- Peripheral-IP is sensitive to the suspend line request.
- Peripheral-IP ignores the suspend line request.

For more information about how to program the sensitivity, see the corresponding peripheral-IP TRM chapter.

34.4.3.1 Debug Aware Peripherals and Host Processors

Table 34-7 lists the mapping of the device processors to the suspend control input lines.

34.6 Power, Reset, and Clock Management Debug Support

The global PRCM module implements facilities to support debug across power and clock domain cycles. The debugger can control or get the status of each power and clock domain associated with an ICEPick secondary TAP.

ICEPick provides a set of directives allowing the debugger to:

- Get visibility on the associated power and clock domains state. This includes:
  - Current power setting indicating whether the power domain is on or off
  - Loss of power detected since the software last checked the status
  - Current clock setting indicating whether the clock domain is on or off
  - Sleep desired (PM and CM indicate that the debug settings in ICEPick are changing the application state. If it were not for the ICEPick controls, the power or clock would be turned off.)
  - Subsystem reset state
  - Subsystem has entered a debug state that requires the attention of the host debug software.
- Override power/clock control settings to wake up a power or clock domain or to prevent a power or clock domain from going to sleep once it is in ACTIVE state
- Assert/block/extend reset; release from extended reset (WIR)

34.6.1 Power and Clock Management

34.6.1.1 Power and Clock Control Override From Debugger

The debugger can override the application software power and clock management settings through the ICEPick module. It can configure ICEPick to force a domain active or prevent it from going to sleep once it is active. This can be achieved through the following debugger directives:

- FORCEACTIVE
- INHIBITSLEEP

34.6.1.1.1 Debugger Directives

34.6.1.1.1.1 FORCEACTIVE Debugger Directive

To ensure that the subsystem debug registers can always be accessed, regardless of the application power-management scenarios, a FORCEACTIVE directive can be issued through the debugger along the entire debug session. From an application standpoint, the system state, status, and timing are preserved, but the subsystem power domain is never shut down. Therefore, the emulation setup is preserved across power transitions, regardless of where the debug hardware is implemented.

If the debugger connects and the subsystem were previously powered down, a FORCEACTIVE directive wakes up the system and allows the debugger to take control of the system.

34.6.1.1.1.2 INHIBITSLEEP Debugger Directive

The debugger can use the INHIBITSLEEP directive to keep a subsystem powered and clocked, even if the applicative settings request that this subsystem go to sleep. Contrary to the FORCEACTIVE directive, the INHIBITSLEEP command does not wake up a subsystem that is already powered down by the application.

The typical use of the INHIBITSLEEP directive is to prevent power and clock transitions on the subsystem during a debug session. In this situation, when the applicative scenario initiates a transition, the transition does not take place, but from an applicative point of view the subsystem is not accessible.

34.6.1.1.2 Intrusive Debug Model

The use of debugger directives is intrusive from the standpoint of the power and clock controls, because they affect the power-management behavior of the application.

Copyright © 2015–2017, Texas Instruments Incorporated

34.6.1.2 Debug Across Power Transition

34.6.1.2.1 Nonintrusive Debug Model

To preserve the power-management behavior of the device and allow the subsystem power and clock to be switched off by application software, the subsystem TAP must be disconnected from the ICEPick scan chain. The subsystem is then completely ignored by the debugger and the host-to-target communication is no longer affected by the state of the subsystem power and clocks. The debugger can still be informed that the disconnected subsystem entered the debug state by polling the Debug Attention status bit from ICEPick. The debugger can then insert the TAP, take control of the subsystem power and clock, and examine the system state.

This debug model is nonintrusive, because it allows the power-management behavior of the application to be preserved.

34.6.1.2.2 Debug Context Save and Restore

34.6.1.2.2.1 Debug Context Save

The device partitioning is such that not all the debug components are mapped to an always-on domain. Typically, the programmer wants the debug setup to be preserved along a debug session, including subsystem power cycling. When debug registers are memory mapped and not implemented within the emulation power domain, the application software must save the state of the debug registers before going to sleep and restore them upon wakeup.

34.6.1.2.2.2 Debug Context Restore

When the application software performs a context restore, it must be able to write to all the debug registers to restore their contents, regardless of the previous ownership. After subsystem power domain ramp up, the debug resources are in the available state, and ownership is restored. The debug context save and restore sequences are protected. All debug functionality is disabled and debugger accesses are blocked.

34.6.2 Reset Management

The debugger can take control of the system reset for each subsystem through ICEPick. The debugger can configure ICEPick to assert, block, or extend the subsystem reset.

34.6.2.1 Debugger Directives

34.6.2.1.1 Assert Reset

The debugger can program ICEPick to generate a subsystem reset request to the device reset management module. The debugger reset event is then merged with system reset events.

34.6.2.1.2 Block Reset

The debugger can program ICEPick to request the device reset management module to block an unsafe application system or subsystem reset event.

A reset originated by some safe reset sources cannot be blocked by the debugger.

34.6.2.1.3 Wait-In-Reset

WIR mode is latched from boot mode (see Section 34.3.2, *Boot Modes*) and allows the user to hold a secondary TAP module in reset state when a reset is applied (and thus, extend the reset). This mode lets the user control the following system level activities:

- Gain emulation control of any processor in a power domain at POR
- Capture and extend system-generated functional resets while running (under emulation control or not)
- Hold an entire power domain in reset until emulation control of the subsystem can be established

Copyright © 2015–2017, Texas Instruments Incorporated

- Stall the entire system while reset is extended to a power domain
- Reset extension is visible external to the power domain.
- Debug execution of code from the first cycle of execution
- Prevent processor execution of random instructions in uninitialized program memory at power up
- Download code before any code execution takes place
- Coordinate debug initialization across multiple cores before code execution begins

WIR mode extends only the processor reset. During reset extension, the debugger can still access modules such as L2 memory and MMU, even if they are embedded in the device subsystem affected by WIR.

When the debugger task is complete, the DTC releases the subsystem reset by programming the corresponding ICEPick TAP control register.

34.7 Performance Monitoring

34.7.1 MPU Subsystem Performance Monitoring

34.7.1.1 Performance Monitoring Unit

The Cortex-A15 processor includes a PMU that enables events, such as cache misses and instructions executed, to be counted over a period of time. The PMU provides six counters to gather statistics about the operation of the processor and memory system. Each counter can count any of the events available in Cortex-A15. Upon counter overflow, PMU can generate an interrupt on its PMUIRQ output. This interrupt signal is mapped to the CTITRIGIN[1] input and routed to an MPU_INTC input (MPU_IRQ_131 for Cortex-A15 CPU0 PMU; MPU_IRQ_132 for Cortex-A15 CPU1 PMU).

The Cortex-A15 PMU outputs events to CS_PTM. For details of PMU events, please refer to the ARM Cortex-A15 TRM, available at infocenter.arm.com/help/index.jsp.

34.7.1.2 L2 Cache Controller

The MPU subsystem includes 2 MiB of L2 cache (L2CACHE_MPU) and L2 cache controller (L2CACHE_CTRL_MPU). The L2 cache controller includes logic to support cache event monitoring.

Table 34-10 summarizes the L2 cache events.

Table 34-10. L2 Cache Events

Event	Event Description
0	Eviction of a line from the L2 cache
1	Data read hit in the L2 cache
2	Data read lookup to the L2 cache. Subsequently results in a hit or miss.
3	Data write hit in the L2 cache
4	Data write lookup to the L2 cache. Subsequently results in a hit or miss.
5	Data write lookup to the L2 cache with Write-Through attribute. Subsequently results in a hit or miss.
6	Instruction read hit in the L2 cache
7	Instruction read lookup to the L2 cache. Subsequently results in a hit or miss.
8	Prefetch line-fill sent to L3
9	Allocation into the L2 cache caused by a write (with Write-Allocate attribute) miss

The L2 cache controller implements two 32-bit event counters. The L2 cache controller can be configured to generate interrupts on error conditions or event counter overflow or increment. The L2 cache controller interrupt is routed to MPU_IRQ_0. When an interrupt occurs, software can look at the relevant interrupt status register to determine the source of the interrupt.

34.7.2 IPU Subsystem Performance Monitoring

34.7.2.1 Subsystem Counter Timer Module

The IPU subsystem includes a subsystem counter timer module (SCTM), which is embedded in shared cache and provides additional data to the user timing or profiling capability. SCTM integrates eight profiling counters that collect:

- Forty-four shared cache events
- Four sleep/deep-sleep events from Cortex-M4 cores (one sleep and one deep sleep event per core)

Table 34-11 describes the repartition of the IPU SCTM counters.

Copyright © 2015–2017, Texas Instruments Incorporated

Table 34-11. IPU SCTM Counters Repartition

Counters	Features
0–1	Timer and event
2–3	64-bit chained + shadowing
4–5	64-bit chained + shadowing
6–7	Event

34.7.2.2 Cache Events

34.7.3 DSP Subsystem Performance Monitoring

34.7.3.1 Advanced Event Triggering

The Advanced Event Trigger (AET) unit has the capability to generate the debug actions based on events detected by instruction and data bus comparators or by auxiliary event detectors to manage:

- Hardware Program Breakpoints: specify addresses or address ranges that can generate events such as halting the processor or triggering the trace capture.
- Data Watchpoints: specify data variable address, address ranges, or data values that can generate events such as halting the processor or triggering the trace captures.
- Counters: count the occurrence of an event of cycles for performance monitoring.
- State Sequencing: allows combinations of hardware program breakpoint and data Watchpoints to precisely generate events for complex sequences.

For more information on AET, see the following documents:

- *Using Advanced Event triggering to Find and Fix Intermittent Real-Time Bugs* application report (SPRA753).
- *Using Advanced Event Triggering to Debug Real-Time Problems in High Speed Embedded Microprocessor System* application report (SPRA387)

Copyright © 2015–2017, Texas Instruments Incorporated

34.8 MPU Memory Adaptor (MPU_MA) Watchpoint

The MPU subsystem implements a watchpoint allowing the user tracking the MPU_MA transactions from/to external memory.

The watchpoint can be programmed to generate a trigger when a MPU_MA transaction satisfies a set of user-defined attributes:

- Access within or outside an address region
- Access type (instruction, data, read, write)
- Transaction target (on-chip, memory channel, chip select)
- Qualifier
- Transaction originating from a specific core
- Specific transaction followed by memory barrier (DSB, DMB)
- Memory barrier (DSB, DMB) followed by specific transaction

When the MPU_MA transaction attributes match the debug use case setup, the MPU debug logic captures the transaction data and associated qualifiers:

- Read or write data (128-bit) for the specific beat of the burst
- Address (MSB field)
- MReqInfo (19-bit)
- Byte enables
- Burst type
- Burst length
- Target

When the MPU_MA watchpoint is configured to track memory barriers in order to investigate potential ordering issues, the debugger will report:

- Attributes of the transaction immediately following the memory barrier
- Attributes of the matching transaction chained to the memory barrier

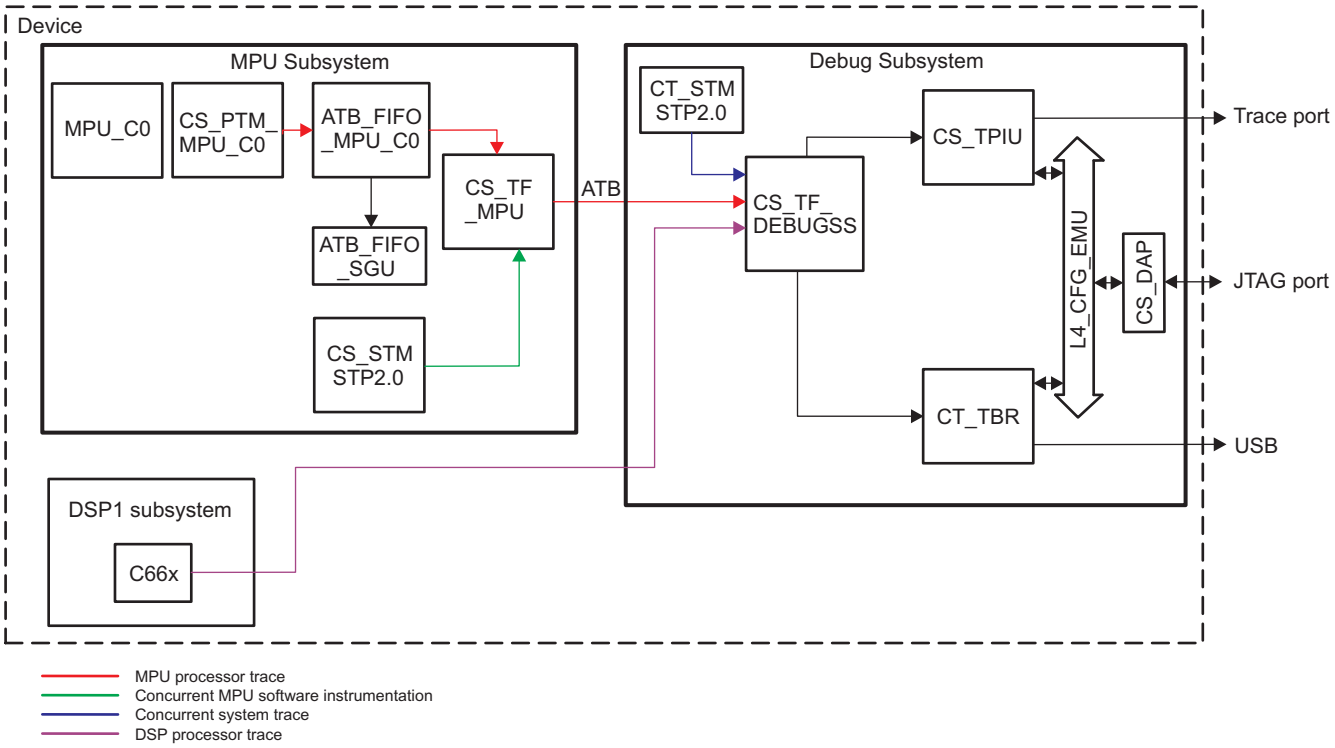
34.9 Processor Trace

The device supports:

- MPU Cortex-A15 processor trace
- DSP1 C66x processor trace

Figure 34-1 shows an overview of the MPU and DSP processor traces flow.

Figure 34-1. MPU and DSP Processor Traces Flow



NOTE: Mapping of trace funnels inputs:

- CS_TF_MPU:
  - Port 0 – ATB_FIFO_MPU_C0
  - Port 2 – CS_STM
- CS_TF_DEBUGSS_1
  - Port 0 – MPU ATB interface
  - Port 1 – DSP1 ATB interface
  - Port 7 – CT_STM ATB interface

34.9.1 Cortex-A15 Processor Trace

The main MPU trace characteristics are:

- Program trace only (no data trace)
- Three exclusive trace sinks:
  - CS_TPIU – trace exported to an external trace receiver
  - CT_TBR (buffer mode) – trace stored into on-chip buffer
  - CT_TBR (system bridge mode) – trace exported through USB
- Trace can be optionally:
  - Cycle accurate useful for profiling sections of code

Copyright © 2015–2017, Texas Instruments Incorporated

– Locally time-stamped using a 48-bit free-running graycode counter exported to the CS_PTM

34.9.2 DSP Processor Trace

Trace targets the debug of unstable code, performance analysis, and quality assurance. This infrastructure component use bus snoopers to collect and export trace data using hardware dedicated to the trace function. The use of dedicated hardware to both collect, buffer, transfer trace data to the host makes trace non-intrusive. DSP processor trace characteristics are:

- Program trace
- Data trace (address and value)
- Time stamp
- Three exclusive trace sinks:
  - CS_TPIU – trace exported to an external trace receiver
  - CT_TBR – trace history stored into on-chip buffer
  - CT_TBR – trace exported through USB

The trace function can collect and export a record of the program flow and timing at the same rate generated by the CPU. Tracing data references must be restricted however as the export mechanism is generally limited to size of on-chip CT_TBR to sustain tracing of all memory references. In the case of data trace, the Advanced Event Triggering facilities provide a means to restrict the trace data exported to data of interest to maintain the non-intrusive aspect of trace. This reduces the export bandwidth needs and facilitates the successful collection of the data of interest. Error indications are embedded in the debug stream in the event the export logic is unable to keep up with the data rate generated by the collection logic. This notification allows the user to scale back the amount of requested data collection.

The user can optionally select the export of all specified trace data. In this case the CPU is stalled to avoid the loss of trace data, with trace becoming intrusive to the application if trace related stalls are generated. The user is notified that trace stalls.

34.9.3 Trace Export

The debug subsystem implements three exclusive trace sinks:

- CS_TPIU
- CT_TBR (buffer mode)
- CT_TBR (system bridge mode)

A concurrent software instrumentation flow from the local CS_STM component (STP 2.0) can also be interleaved with the MPU program trace.

One ATB_FIFO module (ATB_FIFO_MPU_C0) is implemented in the trace path between the Cortex-A15 CPU and the CS_TF_MPU module. The ATB_FIFO allows concurrent trace capture and export. It provides buffering in the trace export path and therefore allows absorbing peaks of trace data. The depth of the ATB_FIFO is 16 entries.

The CS_TF_MPU sends the MPU trace (or CS_STM software instrumentation) to a trace funnel in the debug subsystem (CS_TF_DEBUGSS) through a single ATB interface. The CS_TF_DEBUGSS redirects the MPU trace to the three exclusive trace sinks.

NOTE: It is strongly recommended to disable trace sinks not in use when generating trace to an in-use trace sink to eliminate undesirable throughput throttling effects.

Besides the ATB_FIFO, the MPU subsystem also instantiates an ATB_FIFO statistics gathering unit (ATB_FIFO_SGU) which provides silicon and presilicon characterization information of ATB_FIFO. The FIFO_LEVEL_OUT output of ATB_FIFO, which gives visibility of the number of used entries, is used for the statistics gathering. ATB_FIFO may be full under the following condition:

- Trace sink does not have the bandwidth to meet peak bandwidth demands from the trace generator on a single ATB trace stream

The following statistics are gathered by ATB_FIFO:

Copyright © 2015–2017, Texas Instruments Incorporated

- Peak utilization depth of the FIFO
- Number of consecutive cycles that FIFO level is at or above the programmable FIFO threshold when there is an ATB command pending
- Number of ATB bus stall cycles

34.9.3.1 Trace Exported to External Trace Receiver

Processor trace can be exported to an external trace receiver through the CS_TPIU module. To achieve this, the debugger or application software must ensure to program the DRM module properly (that is, according to Table 34-32).

The CS_TPIU has a configurable export width of maximum 18 data pins (TRACEDATA) plus a dedicated export clock (TRACECLK) and a control signal (TRACECTL).

34.9.3.2 Trace Captured Into On-Chip Trace Buffer

Processor trace flow can be redirected to the on-chip trace buffer (CT_TBR working in buffer mode). The CT_TBR provides on-chip storage of trace data using a 32-KiB RAM memory.

The CT_TBR receives trace flow data through its ATB port. The debugger can then access trace data through CS_DAP (APB port).

The CT_TBR supports two modes when in buffer mode configuration:

- Circular buffer mode for continuous capture. In this mode, the CT_TBR functions as a circular buffer where the oldest data is overwritten with the most recent entries.
- Stop-on-full mode for no-loss (single shot) capture. In this mode, the buffer fills linearly and then halts when the last entry is written.

34.9.3.3 Trace Exported Through USB

Processor trace can be exported off-chip through an application interface (USB). For this purpose, the debug subsystem instantiates a CTools trace buffer rooter (CT_TBR) module, which operates in a system bridge configuration and basically represents a temporary buffer that holds data that is awaiting transfer to the L3_MAIN interconnect for export on functional I/O interfaces (USB) or storage in system memory.

The CT_TBR allows concurrent trace capture and export. A USB3.0 DMA engine (L3_MAIN) master can read trace data from the CT_TBR slave port as soon as a block is available for transfer.

The CT_TBR supports a DMA request generation via a read-only burst-capable interface. The primary purpose of the DMA event generation is to signal a DMA engine when the CT_TBR export FIFO has enough data to satisfy a burst read request on the system interface. The threshold for the DMA trigger is software configurable. A new DMA event is generated when the threshold is met again with new data being written to the FIFO.

The USB3.0 DMA engine supports hardware DMA requests. The CT_TBR can generate a DMA request (CT_TBR_DREQ) to the DMA_SYSTEM module (mapped to DMA_SYSTEM_DREQ_6 request line) for system memory storage.

The USB3.0 master only uses a single AXI-ID and does not support out of order execution. Therefore tracing through USB will prevent application software using USB simultaneously due to stalls from CT_TBR.

Such configuration allows supporting program trace on end product without additional debug pins taking advantage of the USB PHY throughput.

Copyright © 2015–2017, Texas Instruments Incorporated

34.10 System Instrumentation

The device supports the following system instrumentation features:

- Real-time software trace
  - MPU software instrumentation via CS_STM (STP2.0) (see Section 34.10.3.1, *MPU Software Instrumentation*)
  - SoC software instrumentation via CT_STM (STP2.0) (see Section 34.10.3.2, *SoC Software Instrumentation*)
- OCP watchpoint
  - OCP target traffic monitoring (see Section 34.10.4.1, *OCP Target Traffic Monitoring*)
  - SoC events trace (see Section 34.10.4.2, *Messages Triggered from System Events*)
  - DMA transfer profiling (see Section 34.10.4.3, *DMA Transfer Profiling*)
- Statistics collector
  - L3 Target Load Monitoring (see Section 34.10.6.1, *L3 Target Load Monitoring*)
  - L3 Master Latency Monitoring (see Section 34.10.6.2, *L3 Master Latency Monitoring*)
- IVA HWA load monitoring (see Section 34.10.5, *IVA Pipeline*)
- PM events trace (see Section 34.10.7, *PM Instrumentation* [PMI])
- CM events trace (see Section 34.10.8, *CM Instrumentation* [CMI])

34.10.1 MIPI STM (CT_STM)

CT_STM is a trace module that aids in software debugging. The main features of this module are:

- Implements MIPI STP protocol (rev 2.0) with the following characteristics:
  - Highly optimized for software-generated traces
  - Automatic timestamping of messages
  - Support for 8-, 16-, and 32-bit data types
- Collects the following information:
  - Software messages
  - Hardware instrumentation trace from hardware agents:
    - OCP_WP_NOC
    - PMI
    - CMI
    - IVA SMSET
    - L3 NoC statistics collectors
- Supports the following trace export paths:
  - ATB export - to CS_TPIU or CT_TBR
- Available in 1-, 2-, or 4-pin mode with single- or dual-edge clock, depending on the trace bandwidth requirements and characteristics of the trace receiver
- Timestamps:
  - Can use local relative timestamp if exported to the CS_TPIU/CT_TBR (through ATB)
- Dedicated 128 × 48-bit FIFO buffer
- Mechanism to generate repeat MASTER and C8 messages periodically even if not needed

A maximum of 255 different bus masters can be connected to the STM trace port through a bus arbiter. STP recognizes two distinct modes of tracing (software and hardware types), which use slightly different message combinations to output different types of data. The bus masters can be configured for either type to optimize the system for the different types of trace data.

Copyright © 2015–2017, Texas Instruments Incorporated

34.10.2 System Trace Export

34.10.2.1 CT_STM ATB Export

If a trace receiver cannot be attached to the device, or relevant CT_STM trace port pins are unavailable for a particular reason, the user can configure the CT_STM module to redirect the STP trace stream as an ATB stream to the CS_TPIU or CT_TBR and enable local timestamp. This is accomplished by outputting a local timestamp granularity (LTSG) message, which is a TI addition to the MIPI standard messages.

34.10.2.2 Trace Streams Interleaving

Two levels of interleaving system instrumentation flows and arbitrating between instrumentation masters are implemented:

- CORE L3 instrumentation interconnect interleaves data coming from the following bus masters:
  - OCP_WP_NOC
  - L3 NoC statistics collectors, or software instrumentation (interleaving at the L3 level)
  - CMI2
  - IVA SMSET and ARM968 (software instrumentation)
- EMU L3 instrumentation interconnect interleaves data coming from the following bus masters:
  - CORE L3 instrumentation interconnect
  - CMI1
  - PMI

34.10.3 Software Instrumentation

34.10.3.1 MPU Software Instrumentation

The CS_STM embedded in the MPU subsystem provides extended stimulus port registers designated to be accessible by software with minimum instrumentation cycles overhead.

Each extended stimulus port occupies 256 consecutive bytes in the memory map and is write-only. Up to 64K instrumentation channels are available at MPU level.

The CS_STM supports "guaranteed" or invariant timing transactions:

- Guaranteed transactions are guaranteed to be traced. This might involve stalling the MPU core to ensure the transaction is accepted by the CS_STM.
- Invariant timing transactions are not guaranteed to be traced. These transactions take an invariant amount of time regardless of the state of the CS_STM.

The CS_STM implements tracing of software writes to its stimulus ports using a dedicated AXI slave interface. In addition to the AXI interface, the CS_STM provides a hardware event input interface (HWEVENTS[31:0]). The HWEVENTS[31:0] input bus is connected to the MPU hardware debug observability signals going out to the MPU hardware debug port (MPUHWDBGOUT[31:0]). This enables any of the signals observed on MPUHWDBGOUT[31:0] to act as a hardware event to the CS_STM. The CS_STM can be programmed to generate a debug packet on a rising edge transition on any signal of the HWVENTS[31:0] input bus. Because some of the signals mapped on the MPUHWDBGOUT[31:0] bus are active low, a 32-bit programmable register – MPU.STM_HWEVENTS_INV, is implemented for polarity inversion. Each bit of MPU.STM_HWEVENTS_INV when set to 0x1 inverts the polarity of the corresponding signal of MPUHWDBGOUT[31:0] going to HWEVENTS[31:0]. This programmable register is part of the MPU_WUGEN address map (see Chapter 4, *Cortex-A15 MPU Subsystem*, for its description).

NOTE: The MPUHWDBGOUT[31:0] signals can be routed to the hw_dbg[31:0] device pads through various hardware debug observability MUXes controlled by device control module (CTRL_MODULE). For more information, see Chapter 18, *Control Module*.

Copyright © 2015–2017, Texas Instruments Incorporated

To save power, the output port can be gated off (to all zeros) by setting the CTRL_MODULE. CONTROL_HWOBS_CONTROL[0] HWOBS_MACRO_ENABLE bit to 0x0. Ungated version of MPUHWDBGOUT[31:0] (not gated with CTRL_MODULE. CONTROL_HWOBS_CONTROL[0] HWOBS_MACRO_ENABLE) is sent to HWEVENTS[31:0] input of STM so each of these signals can generate a debug packet on the trace port.

The message structures in STP-2.0 are optimized to provide an efficient transport.

34.10.3.2 SoC Software Instrumentation

The CT_STM module embedded in the debug subsystem provides a flexible interface for trace instrumentation.

The device provides support for real-time software trace through user-defined message writes to specific memory mapped register (MMR) locations. Software masters can transmit trace data from the operating system (OS) processes or tasks on 256 different channels, with each channel being defined by the software protocol implemented. The different channels can be used to group different types of data logically so that it is easy to filter out the data irrelevant to the ongoing debugging task. The message structures in STP-2.0 are optimized to provide an efficient transport for software data through the CT_STM module.

The software masters are:

- Cortex-A15 MPU subsystem
- DAP (for testing purpose)
- DSP subsystem
- IPU subsystem
- Dual PRU processors in PRU-ICSS
- SDMA controller write port (DMA_SYSTEM_WR)
- IVA subsystem
- EDMA TPTC WR1 and WR2 channels

Each software master has a master-ID assigned to it (see Section 34.10.9, *Master-ID Encoding*, for more information).

Software messages can be interleaved with other hardware messages.

Software messages are intrusive and use both processor cycles and memory.

34.10.4 OCP Watchpoint

34.10.4.1 OCP Target Traffic Monitoring

The L3_MAIN interconnect provides several functional probes embedded and attached to the following L3_MAIN targets:

- GPMC
- L4_PER1, L4_PER2, L4_PER3
- L4_CFG
- DMM_P1 (DMM target port 1)
- DMM_P2 (DMM target port 2)
- OCMC_RAM1

The probes output are muxed together and then sent to the L3_MAIN interconnect debug port. A component called OCP_WP_NOC is used to collect data from functional probes and then transmit captured data to the CT_STM module. The OCP_WP_NOC drives a probe-ID signal to the L3_MAIN interconnect for probe selection. The probe selection is exclusive, meaning that interleaving is not possible.

The OCP_WP_NOC provides the following main features:

- Monitoring the OCP traffic originated by all initiators that can access the selected target where the

Copyright © 2015–2017, Texas Instruments Incorporated

probe is attached

- Filtering OCP monitored bus traffic by:
  - Address range
  - Initiator-ID (see Table 34-14)
  - Transaction type
  - Transaction qualifier
- Generating a trigger upon watchpoint match
- Starting and stopping OCP traffic monitoring upon:
  - WP address match
  - External trigger
- Profiling DMA transfers
- Generating hardware message upon system event
- OCP_WP_NOC messages can be interleaved with software messages
- Programming from:
  - Debugger
  - Application

NOTE: The OCP_WP_NOC is restricted to monitor request flow only.

Table 34-13 summarizes the OCP targets that can be monitored by the OCP_WP_NOC and their respective probe-ID.

Table 34-13. L3_MAIN Interconnect Functional Probe Mapping

Probe-ID	L3 OCP Target
0000	Reserved
0001	GPMC
0010	L4_PER1
0011	L4_CFG
0100	DMM_P1 (DMM target port 1)(1)
0101	DMM_P2 (DMM target port 2)(1)
0110	OCMC_RAM1
0111	L4_PER2
1000	L4_PER3

(1) Does not allow tracking MPU transactions routed through Memory Adapter and DMM.

The user can program the OCP_WP to extract the traffic from a specific set of initiators (maximum four master-IDs). Table 34-14 lists the master-ID reported by the L3_MAIN debug port for the device initiators.

Table 34-14. Master-ID Mapping (Debug View)

Master-ID	Initiator
0x1	MPU
0x4	CS_DAP
0x5	IEEE1500_2_OCP
0x8	DSP1 MDMA
0x9	DSP1 CFG
0xA	DSP1 DMA
0xB	Reserved
0xC	Reserved
0xD	Reserved

34.10.4.2 Messages Triggered from System Events

The OCP_WP_NOC can be programmed to export a message through the CT_STM upon detection of a system event (interrupt, DMA request, etc.). A bus of 16 system events pre-selected at SoC level from a large number of observable events is routed to the OCP_WP_NOC. This can be useful to determine interrupts latencies:

- Interrupt request traced through OCP_WP_NOC system event detection
- ISR boundary tracked either through CT_STM software trace or OCP_WP_NOC address range detection

34.10.4.3 DMA Transfer Profiling

The OCP_WP_NOC can be configured to profile DMA transfers. This feature provides to the user visibility on:

- DMA logical channel interleaving
- DMA channel ID
- DMA transfer duration (time stamp)
- DMA burst size
- DMA reads
- DMA writes

When operating in this mode, the OCP_WP_NOC exports to CT_STM:

- DMA channel ID
- Burst size
- R/W

The CT_STM module encapsulates the information above in a compact STP message.

The address range filtering remains active but OCP address data are not encapsulated into the trace message to maximize CT_STM throughput.

34.10.5 IVA Pipeline

The device takes advantage of the system trace infrastructure to provide visibility to the user regarding IVA microtask sequencing. This is supported through a SMSET module instantiated in the IVA subsystem. The microtask boundaries are handled as generic events and encapsulated in STP messages with an event-ID and local timestamp and exported through the CT_STM module.

The IVA instrumentation scheme allows the user to understand microtask dependencies, hardware accelerators load balancing, and potential bottlenecks. DMA transfer boundaries are reported as IVA events. Software messages from ARM968 execution can be interleaved with IVA events.

34.10.6 L3 NOC Statistics Collector

The L3_MAIN interconnect supports a built-in performance monitoring feature by implementing a statistics collector (NOC_SC) component, which computes traffic statistics within a user-defined window and periodically reports to the user through the CT_STM interface. Ten NOC_SC instances are instantiated in the device:

- One statistics collector dedicated to SDRAM load monitoring – SC_SDRAM (see Section 34.10.6.1, *L3 Target Load Monitoring*, for more information)
- Nine statistics collectors dedicated to L3 Master Latency Monitoring – SC_LAT0 through SC_LAT8 (see Section 34.10.6.2, *L3 Master Latency Monitoring* , for more information)

Statistics collectors (SC_SDRAM and SC_LAT) can report:

- Average burst length in bytes/packet per sampling window
- Average throughput in bytes/cycle
- Percent link occupancy on the request link (for store transactions) during a sampling window
- Percent link occupancy on the response link (for load transactions) during a sampling window
- Percent arbitration conflict cycles on the request link
- Percent initiator busy cycles on the response link
- Histogram of payload length in bytes (for example, 0–16, 16–32, 32–128) each sampling window.
- Histogram of quality of service (QoS) metric for IVA initiator (for example, low priority, high priority) each sampling window.

The performance metrics are interleaved with software instrumentation data at the L3_MAIN interconnect level.

The performance monitoring probes implement three main functions:

- Events detection
- Transactions filtering
- Aggregation

The probes can be configured to detect the NTTP and OCP link events summarized in Table 34-15.

Table 34-15. Performance Monitoring Events Detection

Link Event	NTTP	OCP	Definition
NONE	✓	✓	No event selected
ANY	✓	✓	Any clock cycles
TRANSFER	✓	✓	Word has been accepted by the receiver.
WAIT	✓	–	Transfer has been initiated but the transmitter currently has no data to send.
BUSY	✓	✓	Receiver applies flow control
PKT	✓	✓	Transfer of a new packet header
DATA	✓	✓	Transfer of a payload word
IDLES	✓	✓	No communication over the link
LATENCY	✓	–	Debug bit detection

The probes can be configured to filter the traffic based on the criteria summarized in Table 34-16.

The probes implement a user-defined set of counters that aggregate the events sampled by the detector and filtered according to the user setup.

NOTE: Statistics collectors counter values are accessible by application software.

Table 34-19 summarizes the performance probe aggregation modes.

Copyright © 2015–2017, Texas Instruments Incorporated

Table 34-19. Aggregation Modes

Aggregation Mode	Description
FILTER_HIT	The counter increments by 1 when the filter hits.
MIN_MAX_HIT	The counter increments by 1 when the filter hits and the selected event information is within range. – Payload length (bytes) – Pressure value – Request/response latency (clock cycles)
EVT_INFO	The selected event information is added to the counter value when the filter hits. Payload length (bytes) Pressure value Request/response latency (clock cycles)
AND_FILTER	The counter increments by 1 when all unit filters hit.
OR_FILTER	The counter increments by 1 when at least one unit filter hits.
SUM_REQ_EVT	The counter sums the events from any request port.
SUM_RSP_EVT	The counter sums the events from any response port.
SUM_ALL_EVT	The counter sums the events from any port.
EXT_EVT	The counter increments by 1 when selected external event input signal is sampled high.

34.10.6.1 L3 Target Load Monitoring

The L3_MAIN interconnect implements five performance monitoring probes on DDR memory channels. The traffic statistics are computed within a user-defined window and periodically reported to the user through the CT_STM interface.

SC_SDRAM supports the following main features:

- Four probe inputs:
  - Probe 0 (128 bit-wide) – EMIF1_SYS
  - Probe 1 (128 bit-wide) – Reserved
  - Probe 2 (128 bit-wide) – MPU_MA_P1
  - Probe 3 (128 bit-wide) – Reserved
- Eight 32-bit counters shared concurrently:
  - Counter 0 with two filters
  - Counter 1 with one filter
  - Counter 2 with two filters
  - Counter 3 with one filter
  - Counter 4 with one filter
  - Counter 5 with one filter
  - Counter 6 with one filter
  - Counter 7 with one filter
- Simple (with one element) or complex (with several elements) filters available
- Filtering according to:
  - Initiator of traffic
  - Access priorities
  - OCP address
- No latency counter. Only bandwidth measurement on this collector.
- 32-bit collecting window counter
- Dump identifier is 0x0 (tie-off value)
- Dumps frames at L3_MAIN interconnect slave address 0x19 (L3_INSTR)

34.10.6.2 L3 Master Latency Monitoring

The L3 interconnect implements performance monitoring probes on initiator (master) interfaces. The master latency statistics are computed within a user-defined window and periodically reported to the user through the CT_STM interface.

The probes can be configured to filter latencies in four classes and report to the user a latency distribution along execution.

Because the performance metrics and the software events are exported through a unified export channel, it is possible to correlate latency trends with ongoing execution and system context.

Because computing latency requires maintaining the state between request and response ports, the probe cannot compute latency statistics on 100 percent of the initiator traffic. Hence, latency histograms must be extracted on large execution windows to be accurate.

34.10.6.2.1 SC_LAT0 Configuration

SC_LAT0 supports the following main features:

- Six probe inputs:
  - Probe 0: MPU
  - Probe 1: MMU1
  - Probe 2: EDMA_TC0_RD
  - Probe 3: EDMA_TC0_WR
  - Probe 4: EDMA_TC1_RD
  - Probe 5: EDMA_TC1_WR
- Four 32-bit counters shared concurrently:
  - Counter 0 with one filter
  - Counter 1 with one filter
  - Counter 2 with one filter
  - Counter 3 with one filter
- Filtering according to:
  - L3 target
  - Access priorities
- 10-bit counter for latency measurement
- 32-bit collecting window counter
- Identifier is 0x1 (tie-off value)
- Dumps frames at slave address 0x19 (L3_INSTR)

Table 34-21 shows the SC_LAT0 port mapping.

34.10.6.2.8 SC_LAT7 Configuration

SC_LAT7 supports the following main features:

- Eight probe inputs:
  - Probe 0: MMC1
  - Probe 1: MMC2
  - Probe 2: SATA – SATA is not supported on the AM570x family of devices.
  - Probe 3: MLB – MLB is not supported on the AM571x / AM570x family of devices.
  - Probe 4: BB2D_P2
  - Probe 5: IEEE1500
  - Probe 6: DEBUGSS
  - Probe 7: VCP1 – VCP1 is not supported on the AM571x / AM570x family of devices.
- Four 32-bit counters shared concurrently:
  - Counter 0 with one filter
  - Counter 1 with one filter
  - Counter 2 with one filter
  - Counter 3 with one filter
- Filtering according to:
  - L3 target
  - Access priorities
- 10-bit counter for latency measurement
- 32-bit collecting window counter
- Identifier is 0x8 (tie-off value)
- Dumps frames at slave address 0x19 (L3_INSTR)

Table 34-22 shows the SC_LAT7 port mapping.

Table 34-28. SC_LAT7 Port Mapping

		NTTP RSP	15

(1) SATA is not supported on the AM570x family of devices.
(2) MLB and VCP1 are not supported on the AM571x / AM570x family of devices..

34.10.6.2.9 SC_LAT8 Configuration

SC_LAT8 supports the following main features:

- Eight probe inputs:
  - Probe 0: OCMC_RAM1
  - Probe 1: Reserved
  - Probe 2: Reserved
  - Probe 3: GPMC
  - Probe 4: MCASP1
  - Probe 5: MCASP2
  - Probe 6: MCASP3
  - Probe 7: VCP2 – VCP2 is not supported on the AM571x / AM570x family of devices..
- Four 32-bit counters shared concurrently:
  - Counter 0 with one filter
  - Counter 1 with one filter
  - Counter 2 with one filter
  - Counter 3 with one filter
- Filtering according to:
  - L3 target
  - Access priorities
- 10-bit counter for latency measurement
- 32-bit collecting window counter
- Identifier is 0x9 (tie-off value)
- Dumps frames at slave address 0x19 (L3_INSTR)

Table 34-22 shows the SC_LAT8 port mapping.

		NTTP RSP	11
6	MCASP3	NTTP REQ	12
		NTTP RSP	13
7	VCP2[(1)]	NTTP REQ	14
		NTTP RSP	15

(1) VCP2 is not supported on the AM571x / AM570x family of devices..

34.10.6.2.10 Statistics Collector Alarm Mode

Statistic collectors can be used to provide the application software with information about the NoC or SDRAM reaching corner cases (for example, too much traffic for a given OPP) while in application mode where for an end product use case the debug subsystem (which is normally exporting the statistic frames) is off. An interrupt-based scheme using a dedicated signal (L3_MAIN_IRQ_STAT_ALARM) is implemented to avoid CPU polling periodically statistic registers. This interrupt alert is fired when a given metric is out of specified range (below the programmed MIN threshold or above the programmed MAX threshold). The L3_MAIN_IRQ_STAT_ALARM interrupt is connected to the IRQ_CROSSBAR_16 input and the user can map it to any device INTC via Control Module.

NOTE: NTTP statistic collectors (SC_LAT) support latency measurement. However, comparison cannot be done on the latency counter. In case of latency measurement the comparison has to be done on number of latencies in user defined range, not on the latency value itself.

34.10.6.2.11 Statistics Collector Suspend Mode

The statistics collector module implements a suspend input that is used to avoid statistics collector counters to be updated while the processor has entered the debug state. This avoids triggering false alerts upon execution resume. When the statistics collector is asserted to 1, it freezes the monitoring process. When it goes back to 0, the monitoring resumes. If a frame is being dumped, it will not be stopped by suspend.

NOTE: Each statistic collector has an ignore suspend register, which can be used to disable the suspend feature.

34.10.7 PM Instrumentation

The device takes advantage of the system trace infrastructure to provide visibility to the user about the major power-management events. This is supported through a PMI module (PM profiler) instantiated in the PRM module. The PRM state changes are handled as generic events and encapsulated in STP hardware messages and exported through the CT_STM module. The nature of the PM events does not require accurate timestamping and thus, timestamping is handled at CT_STM or trace receiver level.

Copyright © 2015–2017, Texas Instruments Incorporated

The PM events are organized by class. Any PM state change from a specific class refreshes the entire instrumentation frame associated with that class. The STP message structure includes a PM event-ID indicating the class of the PM events.

The PM event classes supported are:

- Logic voltage domain OPP change
- Memory voltage domain OPP change
- Logic power domain state change
- Memory power domain state change

The PMI has a unique hardware master-ID assigned to it (see Section 34.10.9, *Master-ID Encoding*).

The PMI supports the possibility to report on activity in different event classes in the same sampling window. The user can size the capture sampling window.

Software events from the PM routines instrumentation can be interleaved with the PM hardware events. The user can take advantage of that feature to understand latencies for a specific power-management scenario or strategy.

The PM module implements an instrumentation port that directly interfaces with the debug subsystem (used to export PM events to CT_STM).

34.10.8 CM Instrumentation

The device instantiates two CMI modules (CM profilers), one in CM1 (CMI1), and one in CM2 (CMI2). CMI1 and CMI2 are instantiations of the same debug-IP and can operate concurrently. Each of them has a separate unique hardware master-ID assigned to it (see Section 34.10.9, *Master-ID Encoding*).

The CM events profiling is similar to the PMI. Two exclusive instrumentation modes are supported:

- Clock activity:
  - Exposes to the user a snapshot of the state of all the clock domains derived from the same DPLL when CM detects a state change in the clock domain
  - Exposes to the user a snapshot of the DPLL settings when the CM signals a DPLL programming
- Module activity:
  - Exposes to the user periodically the active cycles count of the target modules
  - Exposes to the user periodically the active cycles count of the initiator modules

It provides visibility to the user about the state of the major clock domains along the application code execution. The STP message reports the effective state of the clock domain and therefore can highlight scenarios where a particular dependency is preventing the clock domain from being switched off.

The CM event classes supported are:

- Events capture mode – four classes:
  - Clock domain state
  - DPLL settings update
  - Clock frequency divider ratio
  - Clock source selection update
- Module activity collection mode – two classes:
  - Target module activity
  - Initiator module activity

When in events capture mode, the CMI supports the possibility of reporting on activity in different event classes in the same sampling window. The user can size the capture sampling window.

34.10.9 Master-ID Encoding

A master-ID (MReqMstID[7:0]) field is used by the CT_STM to encode a MASTER type of message:

- MReqMstID[7] – Differentiates software versus hardware masters (0 for software masters; 1 for

Copyright © 2015–2017, Texas Instruments Incorporated

hardware masters)

- MReqMstID[6:2] – Master address exported by the L3_MAIN interconnect debug subsystem target
- MReqMstID[1:0] – Additional qualifier for multicore masters (MPU, IPU)

34.10.9.1 Software Masters

The CT_STM module allows:

- Enabling a maximum of four SoC software masters
- Masking MReqMstID[1:0]
- Differentiating multicore software masters through MReqMstID[1:0]

Table 34-30 summarizes the software initiators that can export trace messages through the CT_STM.

Table 34-30. STM Message Software Masters

Initiator	MReqMstID				Restriction/Comment
	ConnID	[7]	[6:2]	[1:0]	
MPU (SMP)	0x1	0	00001	00	MPU_C0
				01	MPU_C1

34.10.9.2 Hardware Masters

The CT_STM module allows enabling a subset of SoC hardware masters (maximum = 4).

Table 34-31 summarizes the hardware initiators that can export trace messages through the STM.

Table 34-31. STM Message Hardware Masters

Initiator	MReqMstID

34.11 Concurrent Debug Modes

The debugger or application software can program the DRM to route a specific debug function to each device debug port pin.

Because of the limited number of pins allocated to debug, debug and trace source signals are multiplexed.

Table 34-32 summarizes the trace port configuration.

Table 34-32. Trace Port Configuration

Pin Name	Internal Signal Name	I/O	Trigger	CS_TPIU (CS_PTM, DSP, CS_STM, CT_STM)	
				Mode A (up to 16 data pins)	Mode B(1) (up to 18 data pins)
emu19	EMU19	O		TRACEDATA[15]	TRACEDATA[17]
emu18	EMU18	O		TRACEDATA[14]	TRACEDATA[16]
emu17	EMU17	O		TRACEDATA[13]	TRACEDATA[15]
emu16	EMU16	O		TRACEDATA[12]	TRACEDATA[14]
emu15	EMU15	O		TRACEDATA[11]	TRACEDATA[13]
emu14	EMU14	O		TRACEDATA[10]	TRACEDATA[12]
emu13	EMU13	O		TRACEDATA[9]	TRACEDATA[11]
emu12	EMU12	O		TRACEDATA[8]	TRACEDATA[10]
emu11	EMU11	O		TRACEDATA[7]	TRACEDATA[9]
emu10	EMU10	O		TRACEDATA[6]	TRACEDATA[8]
emu9	EMU9	O		TRACEDATA[5]	TRACEDATA[7]
emu8	EMU8	O		TRACEDATA[4]	TRACEDATA[6]
emu7	EMU7	O		TRACEDATA[3]	TRACEDATA[5]
emu6	EMU6	O		TRACEDATA[2]	TRACEDATA[4]
emu5	EMU5	O		TRACEDATA[1]	TRACEDATA[3]
emu4	EMU4	O		TRACEDATA[0]	TRACEDATA[2]
emu3	EMU3	O		TRACECTL	TRACECTL
emu2	EMU2	O		TRACECLK	TRACECLK
emu1	EMU1	I/O	Trigger1		TRACEDATA[1]
emu0	EMU0	I/O	Trigger0		TRACEDATA[0]

(1) This is the recommended mode for primary use.

NOTE: The configuration of the trace port must comply with Table 34-32; otherwise, it will be ignored by DRM hardware. For example, if Trigger0 is programmed on EMU3 and Trigger1 is programmed on EMU4, this configuration will be ignored.

Table 34-33 summarizes the concurrent debug and trace in the device.

Table 34-33. Concurrent Debug and Trace

Debug Use Case	Concurrent Debug Flows	Debug Pins	Trace Pins

Glossary

1

1MS— One milisecond

2

2D— Two Dimensional

3

3A— AF + AE + AWB

3D— Three Dimensional

3G— 3rd Generation of mobile communication systems

3GPP— 3rd Generation Partnership Project

8

8B— 8 bits

10

10B/8B— 10 bit to 8 bit conversion (i.e., 8B/10B decoding)

A

A/D— Analog to Digital Converter

ABB— Adaptive Body Bias

ABBLDO— Adaptive Body Bias Low Drop Out

ABS— Absolute Value

ACB— AC–bias frequency

ACBI— AC–bias line transitions per interrupt

ACE— ASIC Compiler Environment.

ACK— Acknowledge

ADC— Analog-to-Digital Converter/Conversion.

ADMA— Advanced DMA

ADPLL— All Digital Phase Locked Loop. A closed loop frequency control system whose function is based on the phase–sensitive detection of the phase difference between the input signal and the output signal of the controlled oscillator (CO).

AER— Advanced Error Reporting (PCIe)

AES— Advanced Encryption Standard

Copyright © 2015–2017, Texas Instruments Incorporated

AET— Advanced Event Triggering - this capability can be used to debug complex problems as well as understand performance characteristics of user applications

AF— Auto Focus

AFE— Analog Front End

AFSX— Audio transmit frame synchronization

AHB— Advanced High-performance Bus

AHB-AP— Advanced High-performance Bus - Access Port

AIC— Analog Interface Chip.

ALE— Address Latch Enable

AM— Amplitude Modulation

AMBA— Advanced Micro-Controller Bus Architecture

AMMU— Attribute Memory Management Unit

ANSI— American National Standards Institute

AP— Address Protection

APB— Advanced Peripheral Bus

APB-AP— Advanced Peripheral Bus - Access Port

APE— Application Engine

API— Application Programming Interface

APLL— Analog Phase–Locked Loop

APWM— Asymmetrical Pulse Width Modulation (eCAP module related)

AR— Automatic Reload

ARGB— Alpha Red Green Blue

ARI— Alternative Routing-ID Interpretation (PCIe)

ARM— Advanced RISC Machine

ASCII— American Standard Code for Information Interchange

ASIC— Application–Specific Integrated Circuit

ASP— Application-Specific Peripheral

ASPM— Active State Power Management: Automatic PM in PCIe link layer FSM (PCIe)

ATA— Interface standard for the connection of storage devices (Advanced Technology Attachment)

ATAPI— ATA Packet Interface

ATB— AMBA Advanced Trace Bus

ATS— Address Translation Service (PCIe)

AVB— Audio Video Bridging

AVS— Adaptive Voltage Scaling

AWB— Auto White Balance

Copyright © 2015–2017, Texas Instruments Incorporated

AWS— Audio Word Select

AXI— Adavced eXtensible Interface

B

B— Byte, 8 bits

BARn— Base Address Register (PCIe)

BB— Bus Busy

BCD— Binary-Coded Decimal.

BCH— Bose-Chaudhuri-Hocquenghem (CRC Code)

BCM— BIST Combiner Module

BDF— Bus / Device/ Function: (PCIe) function identifier

BE— Big Endian.

BFSW— Buffer Switch

BGA— Ball Grid Array

BGAP— Band Gap

BGT— Block Guard Time

BIOS— Basic Input/Output System. First software run after reset. Known also as ROM Code.

BIST— Built-In Self-Test

BIU— Bus Interface Unit

BL— Buffer Logic

BME— Bus Master Enable (PCI CFG bit)

BNC— British Naval Connector, Bayonet Nut Connector, or Bayonet Neill Concelman

BOF— Beginning of Frame

BOL— Beginning of Line

BPP— Bits Per Pixel

BS— Block Synchronization

BSP— Buffered Serial Port.

BTA— Bus Turn Around

BW— Band Width

BWM— Band Width Manager (functional entity in the TMS320C66x DSP CorePac)

BWS— Baseband Word Select

C

CABAC— Context-Adaptive Binary Arithmetic Coding

CAF— Combing Artifacts Calculation

CALC3— Transform and Quantization Calculation Engine

CAN— Controller Area Network

Copyright © 2015–2017, Texas Instruments Incorporated

CAS— Column Address Strobe

CAVLC— Context-Adaptive Variable Length Coder

CB— Copy Back

CBC— Cipher Block Chaining

CBP— Coded Block Pattern

CBUF— Circular Buffer (Associated with OCMC)

CC— Channel Controller

CCC— Command Completion Coalescing feature

CDP— Coprocessor Data Operation

CDR— Clock Data Recovery

CE— Chip Enable

CEA-861-D— Video standard. It defines the video timing requirements, discovery structures, and data transfer structure.

CEC— Consumer Electronics Control

CFI— Common Flash Interface device

CH— Configuration Header. To use different settings than ROM Code defaults, i.e. clock frequencies, SDRAM settings, GPMC settings.

CID— Card Identification Number

CIF— Common Intermediate Format.

CIR— Consumer Infra Red

CLB— Command List Base Address

CLE— Command Latch Enable

CLK— Clock

CLO— Command List Override feature

CLUT— Color Look-Up Table

CM— Clock Management

CMOS— Complimentary Metal Oxide Semiconductor

CO— Controlled Oscillator

CODEC— Coder/Decoder or Compression/Decompression. A device that codes in one direction of transmission and decodes in another direction of transmission.

COS— Class Of Service

CP15— ARM Cortex-A15 system control coprocessor. This coprocessor controls and provides status information for the functions implemented in the main processor

CPFROM— Customer Programable eFuse ROM

CPPI— Communications Port Programming Interface

CPR— Color Phase Rotation

CPS— Cell Search Platform

Copyright © 2015–2017, Texas Instruments Incorporated

CPSR— Current Program Status Register

CPU— Central Processing Unit

CRC— Cyclic Redundancy Check

CS— Chip-Select

CSL— Chip Support Library

CSWR— Closed switch retention

CTM— Counter-Timer Module

CTR— Hardware block for CCTrCh processing

CTRL— Control

CTS— Clear to Send

ConnID— Connection Identifier.An Initiator Module Identifier. A ConnID is transmitted in-band with the request and is used for security and error logging mechanism.

D

D2H— Device to Host transfer of a FIS

DAC— Digital to Analog Converter

DAP— Debug Access Port

DBI— Display Buffer Interface

DC— Direct Current

DCAN— CAN Controller Module

DCC— Duty Cycle Correction Circuit

DCD— Data Carrier Detect

DCO— Digitally Controlled Oscillator

DCT— Discrete Cosine Transform.

DDC— Display Data Channel

DDR— Double Data Rate

DE— Data Enable

DED— Double Error Detection

DEI— Deinterlacer

DES— Data Encryption Standard.

DES3DES— Data Encryption Standard and triple DES

DFF— Data Flip-Flop

DFT— Design For Test

DIN— Data In

DIR— Digital audio Interface Receiver

DISPC— Display Controller

Copyright © 2015–2017, Texas Instruments Incorporated

DL— Data Length

DLB— Data Loopback.

DLL— Delay-Locked Loop

DLLP— Data Link Layer Packet: PCIe (compare PLP, TLP)

DMA— Direct Memory Access.

DMC— Digital Motor Control

DMEM— Data Memory

DMM— Dynamic Memory Management

DMT— Display Monitor Timing

DO— Data Out

DPC— Defect Pixel Correction

DPI— Display Parallel Interface

DPLL— Digital Phase-Locked Loop. Digital implementation of PLL.

DPS— Digital Power Switching

DRDY— Data Ready

DRM— Digital Rights Management

DS— Downstream: from the host (or a hub) to a device (or hub).

DSP— Digital Signal Processor.

DSR— Data Set Ready

DSS— Display Sub-System. Also DISS

DTBC— Data Buffer Controller

DTC— Debug and Trace Controller

DTCM— Data Tightly Coupled Memory

DTR— Data Transmit Ready

DVFS— Dynamic Voltage and Frequency Scaling

DVI— Digital Video Interface

DWORD— Double WORD (32-bit sized portion of data)

E

EAV— End of Active Video

ECAM— Enhanced Configuration Access Mechanism (PCIe)

ECC— Error Checking and Correction. Also Error Correction Code.

ECD3— Entropy Coder/Decoder

ECRC— End-to-end Cyclic Redundancy Check (optional, compare LCRC)

ED— Endpoint Descriptor

EDC— Error Detection Code

Copyright © 2015–2017, Texas Instruments Incorporated

EDI— Edge Directed Interpolation

EDMA— Enhanced DMA

EDMA_TPCC— Enhanced DMA Third Party Channel Controller

EDMA_TPTC— Enhanced DMA Third Party Transfer Controller

EEE— Energy Efficient Ethernet

EEPROM— Electrically Erasable Programmable Read Only Memory

EFUSE— Electrical Fuse. A one-time programmable memory location usually set at the factory

EMC— External Memory Controller

EMI— Electromagneric interference

EMIF— External Memory Interface

EOB— End of Block

EOF— End of Frame

EOL— End of Line

EOP— End of Packet

EOT— End of Transfer

EP— Entry Point. Also End Point in USB and PCIe controller context.

EPM— Emulation Pin Manager

ES— Erase Status

ESC— Escape

ESR— Event Set Register

ETB— Embdedded Trace Bus

ETM— Embedded Trace Macrocell

EVM— Evaluation Module

F

FB— Received FISes base address

FBB— Forward Body-Bias

FC— Frame Counter

FCLK— Functional Clock

FCS— Frame Check Sequence

FD— Face Detect

FE— Framing Error

FF— Flip-Flop

FIFO— First In First Out

FIQ— Fast Interrupt Request. See ISR.

FIR— Fast Infrared

Copyright © 2015–2017, Texas Instruments Incorporated

FLR— Function Level Reset (PCIe)

FM— Frequency Modulation

FMD— Film Mode Detection

FPGA— Field Programmable Gate Array.

FPKA— Fast-Public Key Accelerator

FROM— eFuse ROM

FS— Full-Speed

FSM— Finite State Machine.

FTS— Fast Training Sequence (PCIe)

FW— Firewall

G

GDP— Generic Dot Product

GFX— Graphics

GHB— Global History Buffer

GIC— Secure interrupt controller

GMII— Gigabit Media Independent Interface

GP— General-purpose

GPIO— General Purpose Input/Output

GPMC— General Purpose Memory Controller

GPU— Graphics-processing unit

GT/s— Gigatransfers per second

GZ— Ground Zero

H

H.263— Video Codec Standard

H.264— Video Codec Standard

H/W— Hardware

H2D— Host to Device transfer of a FIS

HAL— Hardware Abstraction Layer

HBA— Host bus adapter

HBP— Horizontal Back Porch

HC— Host Controller

HCI— Host Controller Interface

HD— High Definition

HDCP— High-bandwidth Digital Content Protection

HDD— Hard-disk drive

Copyright © 2015–2017, Texas Instruments Incorporated

HDMI— High-Definition Multimedia Interface

HDTV— High-Definition Television

HFP— Horizontal Front Porch

HLOS— High-Level Operating System

HMI— Human Machine Interface

HNP— Host Negotiation Protocol (OTG feature)

HPF— High-Pass Filter

HS— High-Speed

HSDPA— High Speed Downlink Packet Access

HSSCLL— High-Speed Serial Control Channel

HSUPA— High Speed Uplink Packet Access

HSW— Horizontal Synchronization Pulse Width

HSYNC— Horizontal Synchronization.

HW— Hardware

HWA— Hardware Accelerators.

HWOBS— Hardware Observability

I

I/F— Interface

I/O— Input/Output

I2C— Inter-Integrated Circuit

I2S— Inter-IC Sound

IA— Identifier Address

IATU— Internal Address Translation Unit (PCIe controller)

IBR— An ATU Inbound Region (PCIe)

ICE— In-Circuit Emulation

ICEPICK— Generic TAP for emulation control

ICLK— Interface Clock

ICONT— Imaging Controller

ICR— Intersystem Communication Registers

ID— Identification

IDCT— Inverse Discrete Cosine Transform. See DCT.

IDE— Integrated Development Environment. A programming environment integrated into an application.

IDO— ID-based Ordering (PCIe)

IIS— Inter–IC Sound

ILF3— Improved Loop Filter engine

Copyright © 2015–2017, Texas Instruments Incorporated

IM— Initiator Module. A module is an initiator whenever it is able to initiate read and write requests to the chip interconnect (typically: processors, DMA, etc.).

IME3— Improved Motion Estimation engine

INT— Interrupt

INTC— Interrupt Controller

IP— Intellectual Property

IPC— Interprocessor Communication. Also referred to as "mailbox" on occasion

IPE3— Intra Prediction Estimation engine

IPU— Image-processing unit

IQ— Inverse Quantization

IR— Incremental Redundancy Buffer

IRQ— Interrupt Request.

ISA— Instruction Set Architecture

ISE— I/O Space Enable: (PCI CFG bit)

ISO— Isochronous.

ISP— Image Signal Processor

ISR— Interrupt Service Routine.

IST— Interrupt Service Thread.

ITCCHEN— Intermediate transfer completion chaining enable.

ITCINTEN— Intermediate transfer completion interrupt enable.

ITCM— Instruction Tightly Coupled Memory

IVA— Image and Video Accelerator

IVA-HD— High Definition Image and Video Accelerator

IrDA— Infrared Data Association.

J

JEDEC— Joint Electronic Devices Engineering Council

JPEG— Joint Photographics Experts Group

JTAG— Joint Test Action Group.

K

KB— Kilobyte, 1024 Bytes

Kbps— Kilobits per second

L

L1— Level 1 cache/memory

L2— Level 2 cache/memory

L3— First level of interconnect

Copyright © 2015–2017, Texas Instruments Incorporated

L4— Second level of interconnect

LA— Logical Address

LAN— Local Area Network

LBA— Logical Block Addressing

LC— Logical Channel

LCD— Liquid Crystal Display.

LCRC— Link Cyclic Redundancy Check (mandatory, compare ECRC)

LCh— Logical DMA Channel. Also LCH

LD— Lens Distortion

LDO— Low Dropout

LE— Little Endian.

LEC— Line End Code

LED— Light Emitting Diode.

LF— Loop Filter

LFPS— Low Frequency Periodic Signaling defined in USB 3.0 SuperSpeed standard

LFSR— Linear-Feedback Shift Register

LH— Local Host

LINK— Link Layer Device

LISA— Local Interconnect and Synchronization Agent

LLC— Link Layer Control

LLP— Low-Level Protocol

LP— Low-Power, operation mode for PHY

LPAE— Large Physical Address Extensions

LPM— Low Power Mode (also known as LPMODE)

LPP— Lines Per Panel

LRU— Least Recently Used

LS— Low-Speed

LSB— Least Significant Bit

LSE— IVA Load and Store Engine

LSM— LISA Section Manager

LSR— Linear Shift Register

LSW— Least Significant Word

LTR— Latency Tolerance Reporting (PCIe)

LTSSM— Link Training and Status State Machine: In PCIe - PM FSM of PCIe physical layer

LUT— Look-up Table

Copyright © 2015–2017, Texas Instruments Incorporated

LVCMOS— Low Voltage Complementary Metal Oxide Semiconductor

LVDS— Low-Voltage Differential Signaling

M

M2— Micro Memory

MAC— Message Authentication Code

MAP— Maximum a posteriori algorithm

MB— Megabyte, 1024 KB

MBAFF— MB-Level Adaptive Frame/Field

MBMS— Multimedia Broadcast Multicast Service

MC3— Motion Compensation Engine

McSPI— Multichannel Serial Peripheral Interface

MCU— Microcontroller Unit. Refers to the MPU.

MDIO— Management Data Input/Output

MDMA— Modem DMA. Also Master DMA port of the DSPSS TMS320C66x CorePac.

MDT— Motion Detection

ME— Motion Estimation

MEMIF— Memory Interface

MIF— Memory InterFace

MII— Media Independent Interface

MIPI— Mobile Industry Processor Interface

MIR— Medium Infrared

MJPEG— Motion JPEG

MMR— Memory Mapped Register

MMU— Memory Management Unit.

MP3— MPEG Layer 3.

MPEG— Motion Pictures Expert Group.

MPEG1— The first MPEG compression scheme specification.

MPS— Maximum Packet Size

MPU— Microprocessor Unit.

MRRS— Maximum Read Request Size (PCIe)

MS— Memory Stick

MSB— Most Significant Bit

MSGIF— Message Interface

MUX— Multiplex/Multiplexer

MV— Motion Value

Copyright © 2015–2017, Texas Instruments Incorporated

Mb— Megabit

Mbps— Mega bits per second

Modem— Modulator Demodulator

MuxMode— 3 bits field of the PIN/PAD Control register field which enables to change the mode. Mode programming is assumed by software and selects a function on the device external interface.

N

N/A— Not Applicable. Also Not Available.

NAC— Network Access Control

NAND— NAND Flash memory.

NIU— Network Interface Unit

NMI— Nonmaskable Interrupt. An interrupt that can be neither masked nor disabled.

NOP— No OPeration (DSP/CPU instruction)

NOR— A type of flash memory

NRZ— Non-Return-to-Zero

NTSC— National Television System Committee. Television broadcast system.

NVIC— Nested Vectored Interrupt Controller

O

OCM— On-chip Memory

OCMC— On-chip Memory Controller

OCP— Open-Core Protocol

OE— Output Enable

OMAP— Open Multimedia Application Platform

OOB— Out of Band signaling

OPP— Operating Performance Point

OS— Operating System

P

PA— Program Address

PATA— Parallel-ATA

PBIAS— PMOS Bias transistor to provide the bias voltage to extended drain IOs

PC— Program Counter

PCI— Peripheral Component Interconnect.

PCLK— Pixel Clock

PCM— Pulse Code Modulation.

PCS— Physical Coding Sublayer (component related to PCIePHY)

PD— Program Data

Copyright © 2015–2017, Texas Instruments Incorporated

PDA— Personal Digital Assistant

PDC— Power-down Controller

PE— Parity Error

PFPW— Prefetch and Prewrite posting engine

PHY— Physical Layer Device

PI— Pixel Interpolation

PID— Protocol Identifier. The PID register is used in Windows CE mode only.

PIO— A programmed input/output transfer supported by IDE devices

PIPE3— Physical Interface for PCI Express rev.3.0

PLD— Programmable Logic Devices

PLL— Phase–Locked Loop.

PM— Programming Model

PMA— Physical Media Attachment sublayer

PMEM— Program Memory

PMFW— Power Management FrameWork

PMIC— Power management Integrated Circuit

PMP— Power Management Port

PMU— Performance Monitoring Unit

POR— Power–On Reset

PPA— Primary Protected Application.

PPC— Palm–size PC

PPI— Physical Layer Protocol Interface

PPL— Pixels per Line

PPM— Parts per million

PRCM— Power, Reset and Clock Management

PRD— Physical Region Descriptor

PRM— Power and Reset manager

PRT— PRD Table

PS— Packet Start

PSC— Prescaler Counter

PSS— Program Suspend Status

PT— Packet Type

PTI— Parallel Trace Interface

PTV— Prescale Clock Timer Value. Sets the value of the divisor used in scaling the clock.

Copyright © 2015–2017, Texas Instruments Incorporated

PWL— Pulse Width Light (modulator). A 4096-bit randomsequence generator that provides control of the LCD backlighting and keypad.

PWM— Pulse Width Modulation

PaRAM— Programmable RAM that stores 32-byte channel transfer definition that EDMA channels, QDMA channels, and linking uses.

Q

QDMA— Quick DMA

QIQ— Quantization and Inverse Quantization

QOS— Quality of Service

QP— Quantization Parameter

QSPI— Quad Serial Peripheral Interface

R

R/W— Read/Write. Also RW.

R5— Release 5 of 3GPP specifications on IMS and HSDPA standards

R6— Release 6 of 3GPP specifications on Wireless LAN networks, HSUPA, MBMS and enhancements to IMS standards

RAM— Random Access Memory.Fast-access but volatile memory type.

RC— PCIe Root Complex

RDR— Receive Data Register

RE— Read Enable

REQ— Request

RF— Radio Frequency

RFF— Retention Flip-Flop

RFU— Reserved for Future Use

RGB— Red Green Blue

RGBA— Red Green Blue Alpha

RGMII— Reduced Gigabit Media Independent Interface

RI— Ring Indicator

RISC— Reduced Instruction Set Computing. A CPU whose instruction set and related decode mechanism are much simpler than those of microprogrammed complex instruction set computers. The result is a higher instruction throughput and a faster real–time interrupt service response from a smaller, cost-effective chip.

RM— Reed-Muller code

RMII— Reduced Media Independent Interface

RNG— Random Number Generator

RO— Read Only

ROM— Read Only Memory. A semiconductor storage element containing permanent data that cannot be changed.

Copyright © 2015–2017, Texas Instruments Incorporated

RSS— Reset System Simulator

RST— Reset

RT— Real–Time

RTA— Retention Till Access

RTL— Register Transfert Level

RTOS— Real–Time Operating System

RTS— Request to Send

RV— RealVideo (codec)

RVLC— Reversible Variable Length Coder

RX— Receive/Receiver

RXD— Receive Data

RXN— PHY differential receiver (de-serializer) negative line

RXP— PHY differential receiver (de-serializer) positive line

S

S/PDIF— Sony/Philips Digital Interface

S/W— Software

SAF— Standby Associated Function

SAM— Signal Amplitude Modulation

SAR— Save and Restore. Hardware context saving for power saving.

SAV— Start of Active Video

SB— Silicon Backplane (Trade Mark)

SBC— Stream Buffer Controller

SBH— Synchronization Box Handler

SCL— Serial Clock. Programmable serial clock used in the I2C interface. Also SCLK.

SCM— System Control Module

SCP— Serial Configuration Port

SCTM— System Counter Timer Module

SCU— Snoop Control Unit

SD— Also Standard Definition (television system).

SDA— Serial Data. Serial data bus in the I2C interface.

SDMA— The Slave DMA port of the DSPSS TMS320C66x CorePac

SDP— Software Development Platform

SDR— Single Data Rate

SDRAM— Synchronous Dynamic Random Access Memory

SDRC— SDRAM Controller.

Copyright © 2015–2017, Texas Instruments Incorporated

SDTV— Standard Definition Television

SE— Secure Environment.Execution environment inside a device, which is protected against tampering

SEC— Single Error Correction

SECDED— Single-Error Correction Dual-Error Detection

SFI— Serial Flash Interface

SGX— Accronym for Grafics Accelerator

SIF— Source Input Format

SIMD— Single Instruction-Stream, Multiple Data-Stream

SIR— Slow Infrared

SL2— Shared Level 2 (memory/interface)

SL2IF— Shared L2 Interface

SLC— Single Level Cell devices

SLM— Static Leakage Management

SMC— Secure Monitor Call

SMP— Symmetric Multiprocessor Platform

SMPS— Switch Mode Power Supply

SMSET— Software Message and System Event Trace module

SOC— System-On-a-Chip

SOF— Start Of Frame

SP— Serial Port or Small Page

SPC— Serial Port Control

SPI— Serial Peripheral Interface. A signaling protocol for exchanging serial data.

SR— SmartReflex

SR3-APG— SmartReflex3 Automatic Power Gating

SRAM— Static Random Access Memory

SRC— Sample Rate Conversion

SRMD— Single Request, Multiple Data

SRP— Session Request Protocol (OTG feature)

SS— Subsystem

SSC— Spread Spectrum Clocking

SSD— Solid State Drive

ST— Start Timer

STC— Store from Coprocessor (to memory) or System Time Clock, which is the master clock in an MPEG2 encoder or decoder system.

STM— Synchronous Transfer Mode or Store Multiple.

Copyright © 2015–2017, Texas Instruments Incorporated

STN— Super-Twist Nematic. A technique for improving LCD display screens by twisting light rays.

SVC— Supervisor Call

SW— Software

SWI— Software Interrupt

SXGA— Super eXtended Graphics Array

SYNCDIM— Transfer synchronization dimension.

SYSCTRL— IVA System Control module

T

TA— Target Agent

TAP— Test Access Port

TC— Traffic Controller. Allows asynchronous operation among the external memory interface, the MPU, and the DSP. Also, in PCI Express context this means Traffic Class, mapped to a virtual channel

TCCHEN— Transfer complete chaining enable.

TCINTEN— Transfer complete interrupt enable.

TCK— Test Clock

TCM— Tightly Coupled Memory

TD— Transfer Descriptor, in PCI Express this means TLP Digest (see also ECRC)

TDI— Test Data Input

TDM— Time Division Multiplex/Multiplexing

TDO— Test Data Output

TERC4— TMDS Error Reduction Coding

TFT— Thin Film Transistor. A type of LCD flat panel display screen in which each pixel is controlled by one to four transistors.

TI— Texas Instruments

TILER— Tiling Isometric Lightweight Engine for Rotation

TLB— Translation Lookaside Buffer. A cache that contains entries for virtual-to-physical address translation and access permission checking.

TLP— Transaction Layer Packet: PCIe (compare PLP, DLLP)

TM— Target Module. A target module cannot generate read/write requests to the chip interconnects, but respond to these requests. However it may generate interrupts or DMA request to the system (typically: peripherals, memory controllers).

TMDS— Transition Minimized Differential Signaling. A technology for transmitting high-speed serial data and is used by the DVI and HDMI video interfaces.

TMS— Test Mode Select

TOC— Table of Contents

TP— Tiny Page

TPH— TLP Processing Hints (PCIe)

Copyright © 2015–2017, Texas Instruments Incorporated

TPIU— Trace Port Interface Unit

TR— Tranfer Request

TRM— Technical Reference Manual

TRST— Test Reset

TS— Transmission Start

TSHUT— Temperature Shutdown.

TTL— Transistor Transistor Logic

TWL— Table Walking Logic

TX— Transmit//Transmitter

TXD— Transmit Data

TXN— PHY differential transmitter (serializer) negative line

TXP— PHY differential transmitter (serializer) positive line

U

UART— Universal Asynchronous Receiver/Transmitter. Another name for the asynchronous serial port.

USB— Universal Serial Bus.

USSE— Universal Scalable Shader Engine

V

VA— Virtual Address

VBP— Vertical Back Porch

VBUF— Virtual Frame Buffer

VC— Virtual Channel

VC-1— Video Codec Standard

VCA— Via Channel Array technology

VCO— Voltage Controlled Oscillator

VDMA— Video Direct Memory Access module

VESA— Video Electronics Standards Association

VFP— Vertical Front Porch

VGA— Video Graphics Array. An industry standard for video cards.

VID— VLAN Identifier

VIP— Video Input Port

VLAN— Virtual Local Area Network

VLC— Variable Length Decoder

VLD— Variable Length Coder

VLIW— Very Long Instruction Word

VMODE— Bi-level voltage control interface

Copyright © 2015–2017, Texas Instruments Incorporated

VPE— Video Processing Engine

VR— Voice Recognition

VS— Vertical Synchronization

VSW— Vertical Synchronization Pulse Width

VSYNC— Vertical Synchronization. A bidirectional vertical timing signal occurring once per frame with a pulse-width defined as an integral number of lines (half-lines for interlaced mode). Also VS.

W

WB— Write Buffer

WC— Word Count

WD— Watchdog. A timer that requires the user program or OS periodically write to the count register before the counter underflows and triggers a reset.

WDT— Watchdog Timer. See WD.

WE— Write Enable

WFI— Wait For Interrupt

WIR— Wait In Reset

WNP— Write Non-Posted

WP— Write Protect

WT— Write Through

WTBU— Wireless Terminal Business Unit

Word16— 16 bits word

X

X-LOADER— A user-defined pre-operating system bootstrap code that resides at the beginning of the external flash.

XIP— eXecution In Place

XMC— Extended Memory Controller (a functional entity in the TMS320C66X DSP CorePac)

Y

YUV— Luminance-Bandwidth-Chrominance

e

eCAP— Enhanced Capture Module

x

xHCI— Extensible Host Controller Interface

Copyright © 2015–2017, Texas Instruments Incorporated

Extended Revision History

Copyright © 2015–2017, Texas Instruments Incorporated

AM571x (SR2.0, SR1.0) and AM570x (SR2.0) TRM Extended Revision History Introduction

Reading rules:

~~Strike through~~ = removed.
Highlighted in yellow = added or updated

Tables and Figures refer to the previous TRM version. In the new TRM version their numbering may change due to addition or removal of Tables or Figures.

Copyright © 2015–2017, Texas Instruments Incorporated

Preface

No difference.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 1: Introduction

1.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

1.2 Updated Package Descriptions

DESCRIPTION

Some package descriptions are updated.

CORRECTION

1.5 AM571x, AM570x Device Identification

Table 1-3. AM571x, AM570x Part Number Identifier

CTRL_WKUP_STD_FUSE_DIE_ID_2 [31:0] STD_FUSE_DIE_ID_2	Value and Description	Comment
[17:16] Package	2 = ABC 23×23 ~~Solder Flip Chip~~ (AM571x) 1 = CBD 17×17 (AM570x) Others = Reserved	Refer to device DM for details on packaging.

1.6 AM571x, AM570x Package Characteristics Overview

The AM571x die will be offered with the following characteristics:

• Package type:
– Body: 23 × 23mm
– Technology: Ball Grid Array (BGA) package
– Ball pitch: 0.8-mm ball pitch ~~with Via Channel™ Array (VCA) technology~~
– Pattern: partial grid
– Pins: 760 total device pins

The AM570x die will be offered with the following characteristics:

• Package type:
– Body: 17 × 17mm
– Technology: Ball Grid Array (BGA) package
– Ball pitch: 0.65-mm ball pitch
– Pattern: partial grid
– Pins: 538 total device pins

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 2: Memory Mapping

2.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 3: Power, Reset, and Clock Management

3.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

3.2 Removed Dual References from Cortex-A15 MPU Subsystem

DESCRIPTION

Dual references from Cortex-A15 MPU Subsystem is removed.

CORRECTION

3.1.2.6 SR3-APG (Automatic Power Gating)

It is controlled by the PRCM_MPU. For more information, see Chapter 4, ~~*Dual*~~ *Cortex-A15 MPU Subsystem*.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 4: Cortex-A15 MPU Subsystem

4.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

4.2 Removed Dual References from Cortex-A15 MPU Subsystem

DESCRIPTION

Dual references from Cortex-A15 MPU Subsystem is removed.

CORRECTION

4.4.1 Cortex-A15 MPU Subsystem Instance Summary

Table 4-8. ~~Dual~~ Cortex-A15 MPU Subsystem Instance Summary

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 5: DSP Subsystems

5.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 6: IVA Subsystem

No difference.

Chapter 7: Dual Cortex-M4 IPU Subsystem

No difference.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 8: Camera Interface Subsystem

8.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 9: Video Input Port

No difference.

Chapter 10: Video Processing Engine

No difference.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 11: Display Subsystem

11.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 12: 3D Graphics Accelerator

12.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 13: 2D Graphics Accelerator

No difference.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 14: Interconnect

14.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 15: Memory Subsystem

No difference.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 16: DMA Controllers

16.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 17: Interrupt Controllers

17.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 18: Control Module

18.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 19: Mailbox

No difference.

Chapter 20: Memory Management Units

No difference.

Chapter 21: Spinlock

No difference.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 22: Timers

22.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 23: Real-Time Clock (RTC)

23.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 24: Serial Communication Interfaces

24.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 25: eMMC/SD/SDIO

No difference.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 26: Shared PHY Component Subsystems

26.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 27: General-Purpose Interface

No difference.

Chapter 28: Keyboard Controller

No difference.

Chapter 29: Pulse-Width Modulation Subsystem

No difference.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 30: Programmable Real-Time Unit and Industrial Communication Subsystem

30.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 31: Viterbi-Decoder Coprocessor

NOTE: Viterbi-Decoder Coprocessor (VCP) is not supported in this family of devices.

Chapter 32: Audio Tracking Logic

NOTE: Audio Tracking Logic (ATL) is not supported in this family of devices.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 33: Initialization

33.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

Copyright © 2015–2017, Texas Instruments Incorporated

Chapter 34: On-Chip Debug Support

34.1 Added AM570x Device Specifics

DESCRIPTION

Added notes to highlight the features (not) supported on new AM570x family of devices.

CORRECTION

Notes highlighting the features (not) supported on new AM570x device are added throughout this chapter.

34.2 Removed Dual References from Cortex-A15 MPU Subsystem

DESCRIPTION

Dual references from Cortex-A15 MPU Subsystem is removed.

CORRECTION

34.10.3.1 MPU Software Instrumentation

This programmable register is part of the MPU_WUGEN address map (see Chapter 4, ~~*Dual*~~ *Cortex-A15 MPU Subsystem*, for its description).

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (http://www.ti.com/sc/docs/stdterms.htm) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
