Low Frequency TIMING SAFE™ Peak EMI Reduction IC

Description

ASM3P622S00B/E is a versatile, 3.3 V Zero-delay buffer designed to distribute low frequency Timing-Safe clocks with Peak EMI reduction. ASM3P622S00B is an eight-pin version, accepts one reference input and drives out one low-skew Timing-Safe clock. ASM3P622S00E accepts one reference input and drives out eight low-skew Timing-Safe clocks.

ASM3P622S00B/E has an SS% that selects 2 different Deviation and associated Input-Output Skew (TSKEW). Refer to *Spread Spectrum Control* and *Input-Output Skew* table for details.

ASM3P622S00E has a CLKOUT for adjusting the Input-Output clock delay, depending upon the value of capacitor connected at this pin to GND.

ASM3P622S00B/E operates from a 3.3 V supply and is available in two different packages, as shown in the ordering information table, over commercial and Industrial temperature range.

Application

ASM3P622S00B/E is targeted for use in Displays and memory interface systems.

Features

- Low Frequency Clock Distribution with Timing-Safe Peak EMI Reduction
- Input Frequency Range: 4 MHz – 20 MHz
- 2 Different Spread Selection Options
- Spread Spectrum can be Turned ON/OFF
- External Input-Output Delay Control Option
- Supply Voltage: 3.3 V $\pm$ 0.3 V
- Commercial and Industrial Temperature Range
- Packaging Information:
 - ASM3P622S00B: 8 pin SOIC, and TSSOP
 - ASM3P622S00E: 16 pin SOIC, and TSSOP
- The First True Drop-in Solution
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Figure 1. General Block Diagram

Spread Spectrum Frequency Generation

The clocks in digital systems are typically square waves with a 50% duty cycle and as frequencies increase the edge rates also get faster. Analysis shows that a square wave is composed of fundamental frequency and harmonics. The fundamental frequency and harmonics generate the energy peaks that become the source of EMI. Regulatory agencies test electronic equipment by measuring the amount of peak energy radiated from the equipment. In fact, the peak level allowed decreases as the frequency increases. The standard methods of reducing EMI are to use shielding, filtering, multi-layer PCBs, etc. These methods are expensive. Spread spectrum clocking reduces the peak energy by reducing the Q factor of the clock. This is done by slowly modulating the clock frequency. The ASM3P622S00B/E uses the center modulation spread spectrum technique in which the modulated output frequency varies above and below the reference frequency with a specified modulation rate. With center modulation, the average frequency is the same as the unmodulated frequency and there is no performance degradation.

Zero Delay and Skew Control

All outputs should be uniformly loaded to achieve Zero Delay between input and output. Since the CLKOUT pin is the internal feedback to the PLL, its relative loading can adjust the input-output delay.

For applications requiring zero input-output delay, all outputs, including CLKOUT, must be equally loaded. Even if CLKOUT is not used, it must have a capacitive load equal to that on other outputs, for obtaining zero input-output delay.

Timing-Safe Technology

Timing-Safe technology is the ability to modulate a clock source with Spread Spectrum technology and maintain synchronization with any associated data path.
