ASM3P623S05/09A/B

Timing-Safe™ Peak EMI reduction IC

General Features

- Clock distribution with Timing-Safe™ Peak EMI Reduction
- Input frequency range: 20MHz - 50MHz
- Zero input - output propagation delay
- Low-skew outputs
  - Output-output skew less than 250pS
  - Device-device skew less than 700pS
- Less than 200pS cycle-to-cycle jitter is compatible with Pentium® based systems
- Available in 16pin, 150mil SOIC, 4.4mm TSSOP (ASM3P623S09A/B), and in 8pin, 150 mil SOIC, 4.4mm TSSOP Packages (ASM3P623S05A/B)
- 3.3V Operation
- Advanced CMOS technology
- The First True Drop-in Solution

Functional Description

ASM3P623S05/09A/B is a versatile, 3.3V zero-delay buffer designed to distribute high-speed Timing-Safe™ clocks with Peak EMI Reduction. ASM3P623S09A/B accepts one reference input and drives out nine low-skew clocks. It is available in a 16pin Package. The ASM3P623S05A/B is the eight-pin version and accepts one reference input and drives out five low-skew clocks.

All parts have on-chip PLLs that lock to an input clock on the CLKIN pin. The PLL feedback is on-chip and is obtained from the CLKOUT pad, internal to the device.

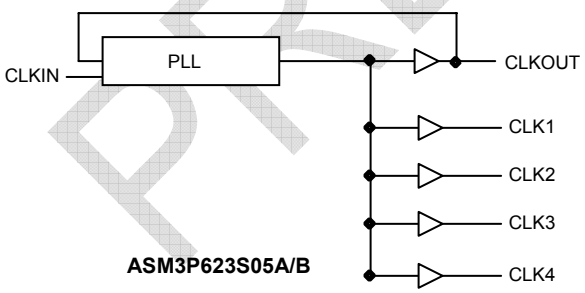

Multiple ASM3P623S05/09A/B devices can accept the same input clock and distribute it. In this case, the skew between the outputs of the two devices is guaranteed to be less than 700pS.

All outputs have less than 200pS of cycle-to-cycle jitter. The input and output propagation delay is guaranteed to be less than ±350pS, and the output-to-output skew is guaranteed to be less than 250pS.

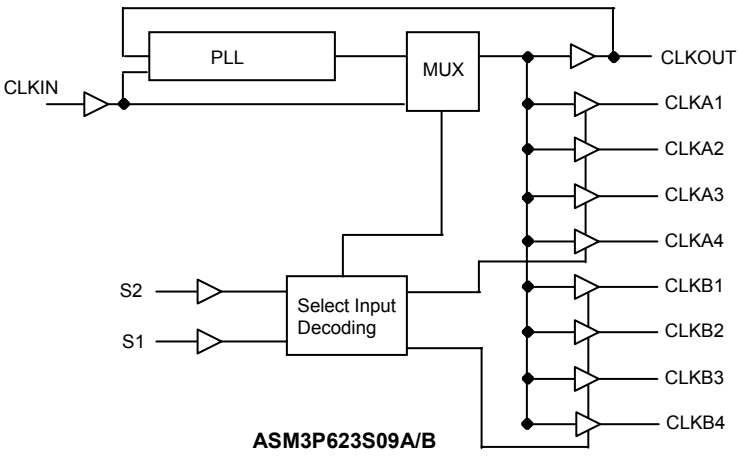

Refer "Spread Spectrum Control and Input-Output Skew Table" for deviations and Input-Output Skew for ASM3P623S05A/B and ASM3P623S09A/B devices

The ASM3P623S05A/B and ASM3P623S09A/B are available in two different packages, as shown in the ordering information table.

rev 0.3

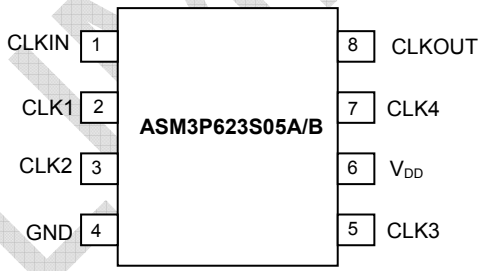

Spread Spectrum Frequency Generation

The clocks in digital systems are typically square waves with a 50% duty cycle and as frequencies increase the edge rates also get faster. Analysis shows that a square wave is composed of fundamental frequency and harmonics. The fundamental frequency and harmonics generate the energy peaks that become the source of EMI. Regulatory agencies test electronic equipment by measuring the amount of peak energy radiated from the equipment. In fact, the peak level allowed decreases as the frequency increases. The standard methods of reducing EMI are to use shielding, filtering, multi-layer PCBs etc. These methods are expensive. Spread spectrum clocking reduces the peak energy by reducing the Q factor of the clock. This is done by slowly modulating the clock frequency. The ASM3P623S05/09A/B uses the center modulation spread spectrum technique in which the modulated output frequency varies above and below the reference frequency with a specified modulation rate. With center modulation, the average frequency is the same as the unmodulated frequency and there is no performance degradation

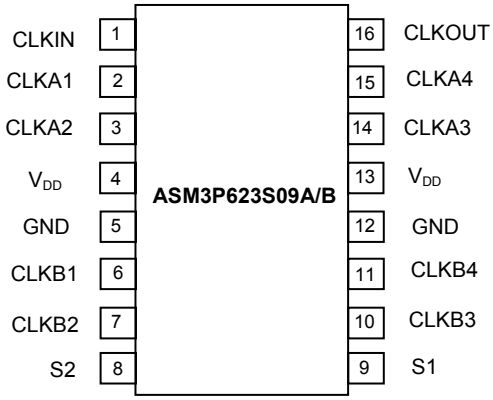

Timing-Safe™ technology

Timing-Safe™ technology is the ability to modulate a clock source with Spread Spectrum technology and maintain synchronization with any associated data path.

Pin Description for ASM3P623S05A/B

Pin #	Pin Name	Description
1	CLKIN	Input reference frequency, 5V-tolerant input
2	CLK1[1]	Buffered clock output
3	CLK2[1]	Buffered clock output
4	GND	Ground
5	CLK3[1]	Buffered clock output
6	V_{DD}	3.3V supply
7	CLK4[1]	Buffered clock output
8	CLKOUT[1,2]	Buffered clock output, internal feedback on this pin

Notes: 1. Weak pull-down on these outputs.
2. This output is driven and has an internal feedback for the PLL.
3. Buffered clock output is Timing-Safe™

Pin Description for ASM3P623S09A/B

Pin #	Pin Name	Description
1	CLKIN	Input reference frequency, 5V tolerant input
2	CLKA1[1]	Buffered clock output
3	CLKA2[1]	Buffered clock output
4	V_{DD}	3.3V supply
5	GND	Ground
6	CLKB1[1]	Buffered clock output
7	CLKB2[1]	Buffered clock output
8	S2[2]	Select Input, bit 2
9	S1[2]	Select Input, bit 1
10	CLKB3[1]	Buffered clock output
11	CLKB4[1]	Buffered clock output
12	GND	Ground
13	V_{DD}	3.3V supply
14	CLKA3[1]	Buffered clock output
15	CLKA4 [1]	Buffered clock output
16	CLKOUT[1,3]	Buffered output, Internal feedback on this pin

Notes: 1. Weak pull-down on all outputs.
2. Weak pull-up on these Inputs.
3. This output is driven and has an internal feedback for the PLL.

Spread Spectrum Control and Input-Output Skew Table
(Note: The values given in the table are for an input frequency of 32MHz)

Device	Deviation	Input-Output Skew($\pm T_{SKEW}$)
ASM3P623S05A	±0.25 %	0.125
ASM3P623S05B	±0.5 %	0.25
ASM3P623S09A	±0.25 %	0.125
ASM3P623S09B	±0.5 %	0.25

Note: T_{SKEW} is measured in units of the Clock Period

Absolute Maximum Ratings

Symbol	Parameter	Rating	Unit
VDD	Voltage on any pin with respect to Ground	-0.5 to +4.6	V
T_{STG}	Storage temperature	-65 to +125	°C
T_s	Max. Soldering Temperature (10 sec)	260	°C
T_J	Junction Temperature	150	°C
T_{DV}	Static Discharge Voltage (As per JEDEC STD22- A114-B)	2	KV

Note: These are stress ratings only and are not implied for functional use. Exposure to absolute maximum ratings for prolonged periods of time may affect device reliability.

Operating Conditions for ASM3P623S05A/B and ASM3P623S09A/B Devices

Parameter	Description	Min	Max	Unit
V_{DD}	Supply Voltage	3.0	3.6	V
T_A	Operating Temperature (Ambient Temperature)	-40	+85	°C
C_L	Load Capacitance		30	pF
C_{IN}	Input Capacitance		7	pF

Electrical Characteristics for ASM3P623S05A/B and ASM3P623S09A/B

Parameter	Description	Test Conditions	Min	Typ	Max	Unit
V_{IL}	Input LOW Voltage[1]				0.8	V
V_{IH}	Input HIGH Voltage[1]		2.0			V
I_{IL}	Input LOW Current	V_{IN} = 0V			50	µA
I_{IH}	Input HIGH Current	V_{IN} = V_{DD}			100	µA
V_{OL}	Output LOW Voltage[2]	I_{OL} = 8mA			0.4	V
V_{OH}	Output HIGH Voltage[2]	I_{OH} = -8mA	2.4			V
I_{DD}	Supply Current	Unloaded outputs		15		mA
Z_o	Output Impedance			23		Ω

Note: 1. CLKIN input has a threshold voltage of $V_{DD}/2$
2. Parameter is guaranteed by design and characterization. Not 100% tested in production

PRELIMINARY

Notice: The information in this document is subject to change without notice.

Switching Characteristics for ASM3P623S05A/B and ASM3P623S09A/B

Parameter	Description	Test Conditions	Min	Typ	Max	Unit
$1/t_1$	Output Frequency	30pF load	20		50	MHz
	Duty Cycle [2] = (t_2 / t_1) * 100	Measured at $V_{DD}/2$	40	50	60	%
t_3	Output Rise Time[1, 2]	Measured between 0.8V and 2.0V			2.5	nS
t_4	Output Fall Time[1, 2]	Measured between 2.0V and 0.8V			2.5	nS
t_5	Output-to-output skew [2]	All outputs equally loaded			250	pS
t_6	Delay, CLKIN Rising Edge to CLKOUT Rising Edge [2]	Measured at V_{DD} /2			±350	pS
t_7	Device-to-Device Skew [2]	Measured at $V_{DD}/2$ on the CLKOUT pins of the device			700	pS
t_J	Cycle-to-cycle jitter [2]	Loaded outputs			200	pS
t_{LOCK}	PLL Lock Time [2]	Stable power supply, valid clock presented on CLKIN pin			1.0	mS

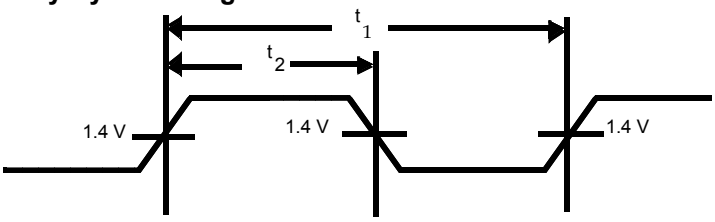

Note: 1. The parameters are specified with loaded outputs.
2. Parameter is guaranteed by design and characterization. Not 100% tested in production

Input-Output Skew

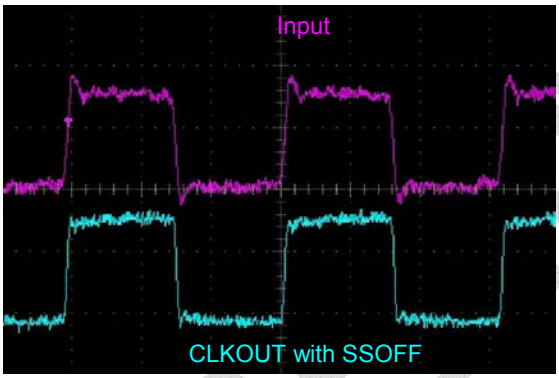

T_{SKEW} represents input-output skew when spread spectrum is ON

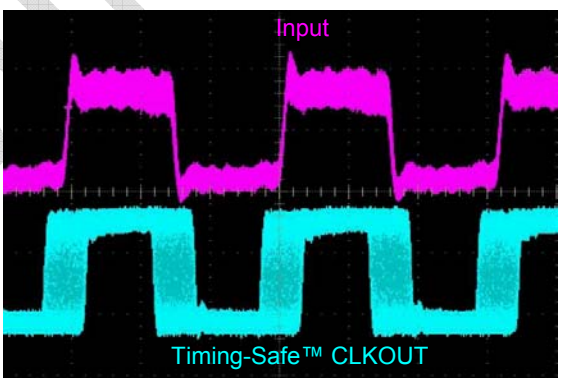

For example, T_{SKEW} = ± 0.125 for an Input clock 32MHz, translates in to (1/32MHz) * 0.125=3.90nS

Test Circuit

A Typical example of Timing-Safe™ waveform
