Atmel | SMART SAMA5D2 Series

SAMA5D2 Xplained Ultra Evaluation Kit

USER GUIDE

Introduction

This user guide introduces the Atmel® SAMA5D2 Xplained Ultra evaluation kit (SAMA5D2-XULT) and describes the development and debugging capabilities for applications running on the Atmel | SMART SAMA5D2 ARM® Cortex®-A5-based embedded microprocessor unit (eMPU).

Scope

This guide provides details on the SAMA5D2-XULT. It is made up of five main sections:

- Section 1. describes the evaluation kit content and its main features.
- Section 2. provides instructions to power up the SAMA5D2-XULT board.
- Section 3. provides information on obtaining sample code and technical support.
- Section 4. provides an overview of the SAMA5D2-XULT board.
- Section 5. describes the SAMA5D2-XULT board components.

Kit Contents

The SAMA5D2-XULT includes:

- Board
  - One SAMA5D2-XULT board
- Cables
  - One Micro-AB type USB cable
- Welcome letter

Table of Contents

1. Evaluation Kit Specifications

Table 1-1. Evaluation Kit Specifications

Characteristic		Specifications
Board		SAMA5D2-XULT
Board supply voltage		USB and/or Battery powered
Temperature	Operating	0°C to +70°C
	Storage	-40°C to +85°C
Relative Humidity		0 to 90% (non-condensing)
Dimensions: Main board		135 × 88 × 20 mm
RoHS status		Compliant
Board Identification		SAMA5D2 XPLAINED ULTRA

1.1 Electrostatic Warning

ESD-Sensitive Electronic Equipment!

The evaluation kit is shipped in a protective anti-static package. The board system must not be subject to high electrostatic potentials.

We recommend using a grounding strap or similar ESD protective device when handling the board in hostile ESD environments (offices with synthetic carpet, for example). Avoid touching the component pins or any other metallic element on the board.

1.2 Power Supply Warning

Hardware Power Supply Limitation

Powering the board with voltages higher than 5 VCC (e.g., the 12 VCC power adapters from other kits such as Arduino kits) may damage the board.

Hardware Power Budget

Using the USB as the main power source (max. 500 mA) is acceptable only with the use of the on-board peripherals and low-power LCD extension.

When external peripheral or add-on boards need to be powered, we recommend the use of an external power adapter connected to the USB Micro-AB connectors (can provide up to 1.2A on the 3.3V node).

2. Power Source

Several options are available to power up the SAMA5D2-XULT board:

- USB-powered through the USB Micro-AB connector (J23 - default configuration)
- Powered through a rechargeable battery Li-polymer 3.7V connected to J3 or J4
- Powered through the USB Micro-AB connector on the Atmel Embedded Debugger (EDBG) interface (J14)

Unlike Arduino Uno boards, the SAMA5D2-XULT board runs at 3.3V. The maximum voltage that the I/O pins can tolerate is 3.3V. Providing higher voltages (e.g., 5V) to an I/O pin could damage the board.

2.1 Power up the Board

Unpack the board, taking care to avoid electrostatic discharge. Connect the USB Micro-AB cable to the connector (J23). Then connect the other end of the cable to a free USB port of your PC.

Table 2-1. Electrical Characteristics

Electrical Parameter	Value
Input voltage	5 VCC
Maximum Input voltage (limits)	6 VCC
Maximum DC 3.3V current available	1.2A
I/O voltage	3.3V only

3. Sample Code and Technical Support

After boot up, you can run some sample code or your own application on the development kit. You can download sample code and get technical support from www.atmel.com.

Linux software and demos can be found on http://www.at91.com/linux4sam/bin/view/Linux4SAM/.

Please make sure to load the latest software version before starting your evaluation. For more information, please go to http://www.at91.com/linux4sam/bin/view/Linux4SAM/.

4. Hardware Overview

4.1 Introduction

The Atmel SAMA5D2XULT is a full-featured evaluation platform for the Atmel SAMA5D2 series ARM-based embedded microprocessor units (eMPU). It allows users to extensively evaluate, prototype and create application-specific designs.

4.2 Equipment List

The SAMA5D2-XULT board is based on the integration of an ARM Cortex-A5-based microprocessor with external memory, one Ethernet physical layer transceiver, one SD/MMC interface, one host USB port and one device USB port, one 24-bit RGB LCD and debug interfaces.

Seven headers, compatible with Arduino R3 (Uno, Due) and two Xplained headers are available for various shield connections.

4.3 Board Features

Table 4-1. Board Specifications

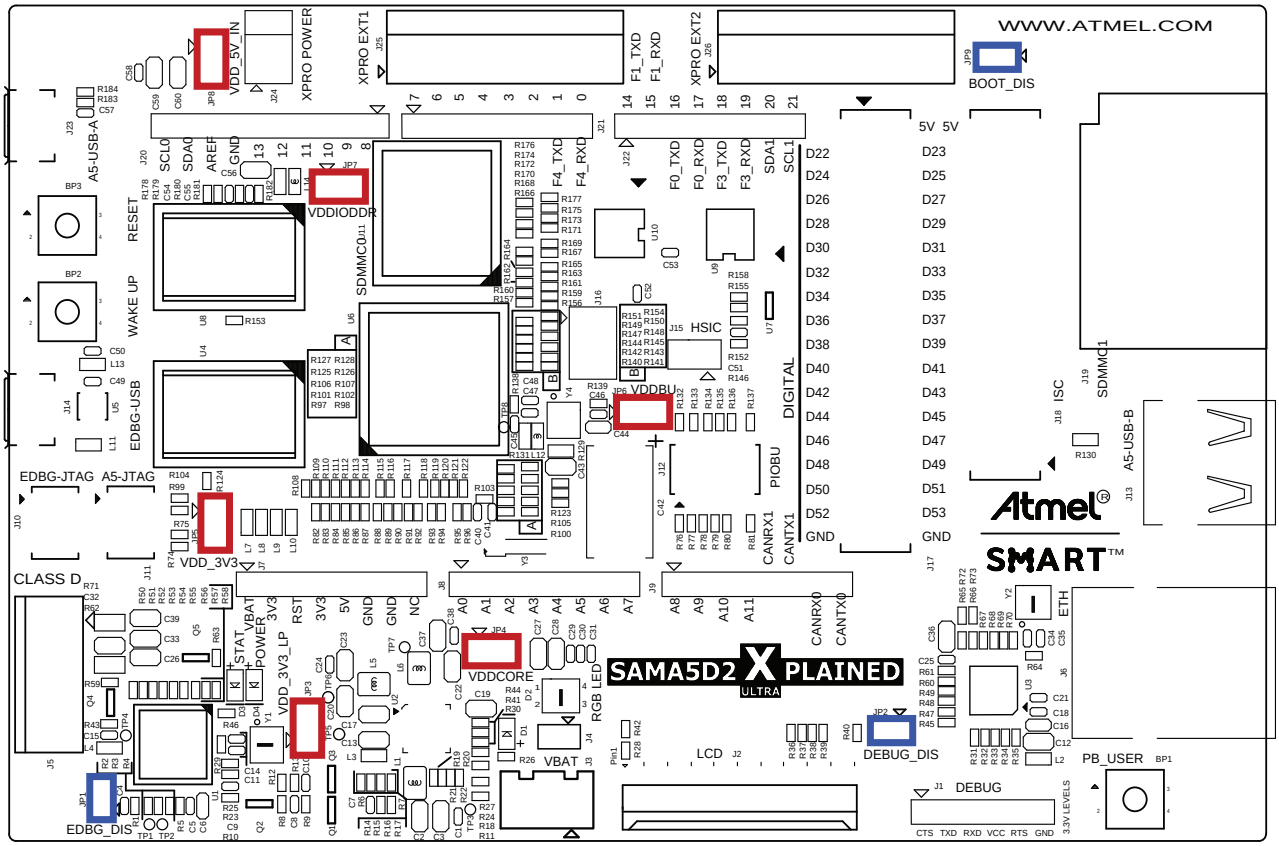
Characteristics	Specifications
Dimensions (L x W x H)	135 x 88 x 20 mm
Processor	SAMA5D27 (289-ball BGA package), 14x14 mm body, 0.8 mm ball pitch
Oscillators	MPU, EDBG: 12 MHz crystal RTC: 32.768 kHz PHY: 25 MHz
Main Memory	2 x DDR3L SDRAM 2 Gbit - 16 Mbit x 16 x 8 banks (total 4 Gbit = 512 Mbyte) 1 x eMMC NAND Flash 4 Gbit
Accessory memories	One Serial EEPROM SPI One optional QSPI Serial Flash One EEPROM with MAC Address and Serial Number
SD/MMC	One 4-bit SD card connector
USB	One USB Host with power switch One Micro-AB USB device
Display	One LCD interface connector, LCD TFT Controller with overlay, alpha-blending, rotation, scaling and color space conversion
Image Sensor	One ISC interface and connector
Ethernet	One Ethernet PHY (RMII 10/100 MHz)
Debug port	One JTAG interface connector One EDBG interface with CDC One serial debug console interface (3v3 level)
Expansion connector	Arduino R3 compatible set of connectors XPRO set of connectors
Board supply voltage	5V from USB On-board power regulation by PMIC External Battery powered capability
Battery	On-board PowerCap
User interface	Reset, Wake-up and free user push button One tri-color user LED (red, green, blue)

5. Board Components

5.1 Board Overview

The fully-featured SAMA5D2-XULT board integrates multiple peripherals and interface connectors as shown in Figure 5-1.

Figure 5-1. SAMA5D2-XULT Board Overview



5.1.1 Default Jumper Settings

Figure 5-1 shows the default jumper settings. Blue jumpers are configuration items. Red jumpers are current measurement points. Table 5-2 describes the functionality of the jumpers.

Table 5-1. SAMA5D2-XULT Jumper Settings

Jumper	Default	Function
JP1	OPEN	Disable EDBG
JP2	OPEN	Disable Debug
JP3	CLOSE	VDD_3V3_LP current measurement
JP4	CLOSE	VDDCORE current measurement
JP5	CLOSE	VDDISC + VDDIOP0/1/2 current measurement
JP6	CLOSE	VDDBU current measurement
JP7	CLOSE	VDDIODDR_MPU current measurement
JP8	CLOSE	VDD_5V_IN current measurement
JP9	OPEN	Disable CS of SPI&QSPI&eMMC memories

5.2 Connectors on board

Table 5-2 describes the interface connectors on the SAMA5D2-XULT.

Table 5-2. SAMA5D2-XULT Board Interface Connectors

Connector	Interfaces to
J23	USB A Device. Supports USB device using a type Micro-AB connector
J13	USB Host B. Supports USB host using a type A connector
J1	Serial DBGU (3.3V level)
J11	JTAG, 10 pin IDC connector
J14	EDBG USB connector
J15	USB C (not populated)
J6	Ethernet
J2	Expansion connector with all LCD controller signals for display module connection (QTouch®, TFT LCD display with touchscreen and backlight)
J19	SDHCI SD/MMC connector
J3, J4	Battery connectors
J12	Tamper connector (not populated)
J7, J8, J9, J16, J17, J20, J21, J22	Expansion connectors with Arduino R3 compatible PIO signals
J24, J25, J26	Xplained Pro Expansion connectors
J10	EDBG JTAG (not populated)
J18	ISC interface
J5	Class-D amplifier output

5.3 Function Blocks

5.3.1 Processor

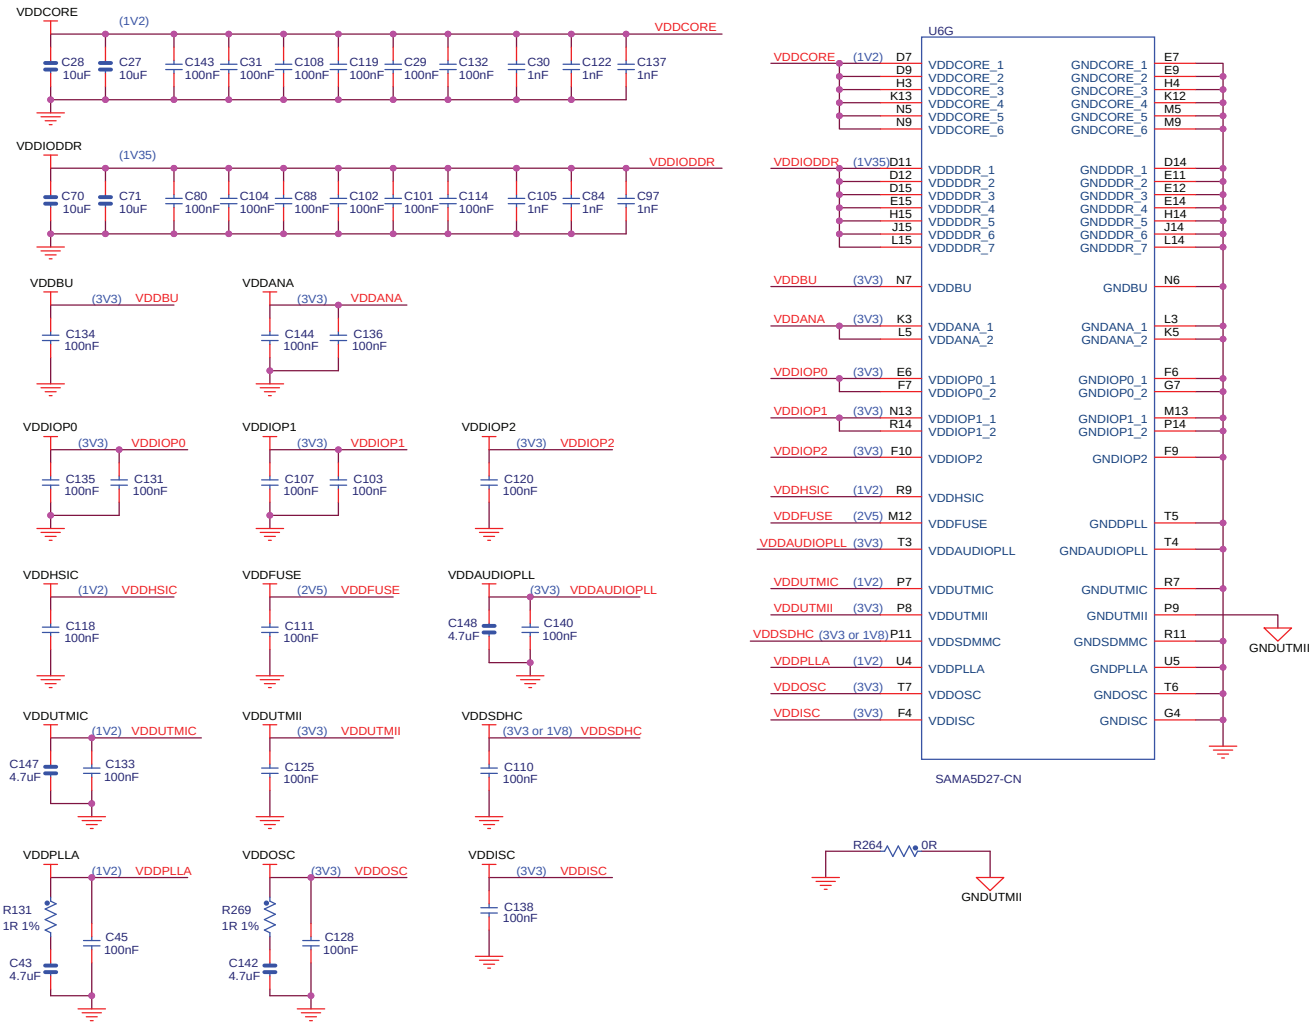
The Atmel® | SMART SAMA5D2 Series is a high-performance, power-efficient embedded MPU based on the ARM® Cortex®-A5 processor. Please refer to the SAMA5D2 Series datasheet for more information.

5.3.2 Power Supply Topology and Power Distribution

5.3.2.1 Power Supplies

Detailed information on the device power supplies is provided in the tables “SAMA5D2 Power Supplies” and “Power Supply Connections” in the SAMA5D2 Series datasheet.

Figure 5-2. Processor Power Lines Supplies



5.3.2.2 Power-up and Power-down Considerations

Power-up and power-down considerations are described in section “Power Considerations” of the SAMA5D2 Series datasheet.

WARNING **The power-up sequence provided in the SAMA5D2 Series datasheet must be respected for reliable operation.**

5.3.2.3 ACT8945A Power Management IC

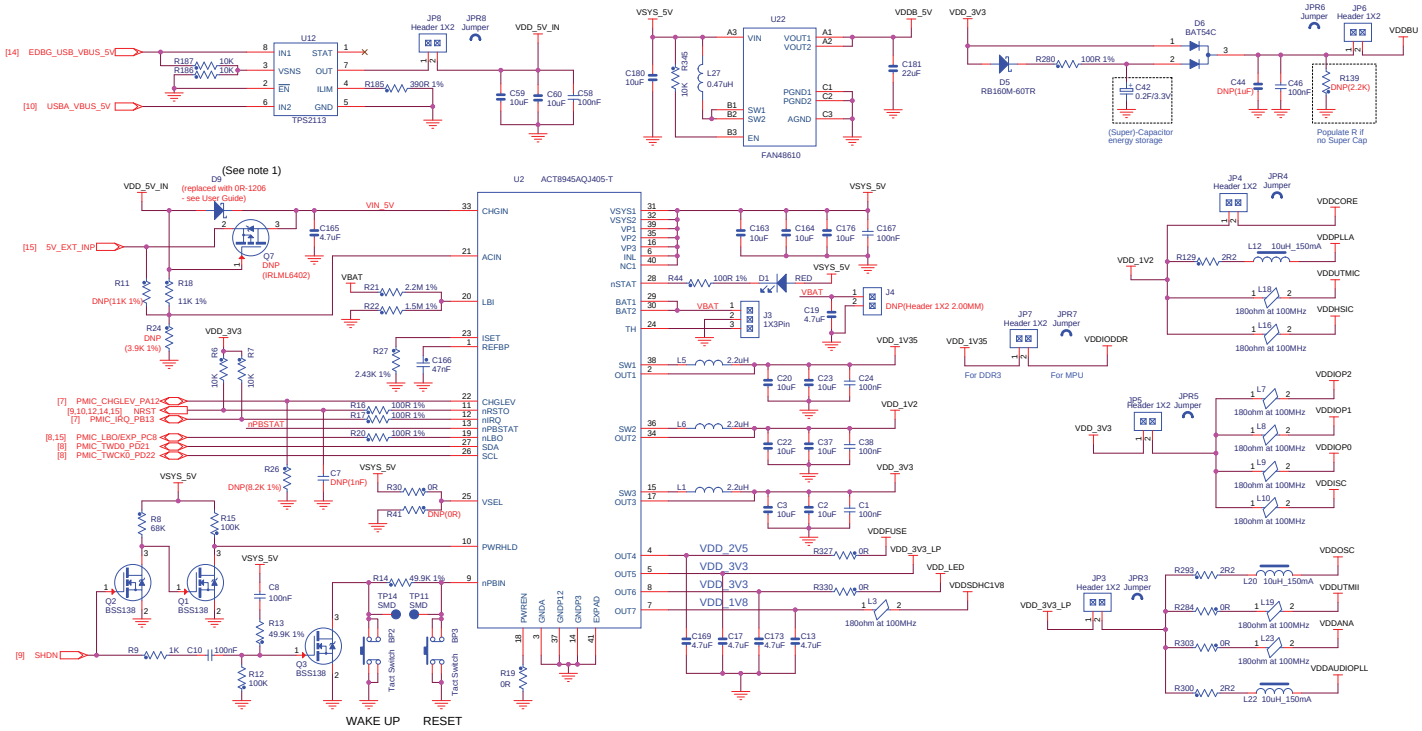
The ACT8945A is a complete, cost-effective and highly-efficient ActivePMU™ power management solution, optimized to provide a single-chip power solution and voltage sequencing for Atmel SAMA5D2/SAMA5D3/SAMA5D4 and SAM9 series MPUs. It also meets the control requirements of these devices.

The ACT8945A features three step-down DC-DC converters and four low-noise, low-dropout linear regulators along with a complete battery charging solution featuring the advanced ActivePath™ system-power selection function.

WARNING **Refer to the ACT8945A datasheet at www.active-semi.com for more details.**

The three DC-DC converters utilize a high efficiency, fixed-frequency (2 MHz), current-mode PWM control architecture that requires a minimum number of external components. Two DC-DC converters are capable of supplying up to 1100 mA of output current, while the third supports up to 1200 mA. All four low-dropout linear regulators are high performance, low-noise regulators that supply up to 320 mA of output current.

Figure 5-3. Board Power Management



Note: 1. Occasional board startup problems occurred when powered from a USB source having a weak VBUS level below 4.8V. To avoid the voltage drop and consequential startup problems, production boards were assembled with a 0 Ω resistor in place of the Schottky diode D9 shown here.

Supply Group Configuration

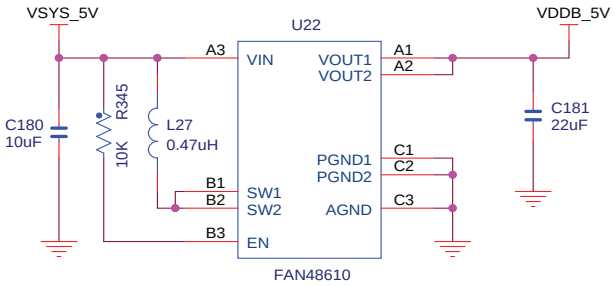
The ACT8945A provides:

- All power supplies required by the SAMA5D2 device:
  - 1.2V VDDCORE, VDDPLLA, VDDUTMIC, VDDHSIC
  - 1.35V VDDIODDR
  - 2.0V VDDBU
  - 3.3V VDDIOP, VDDISC, VDDEDBG
  - 2.5V VDDFUSE
  - 3.3V VDDOSC, VDDUTMI, VDDANA, VDDAUDIOPLL
- Power supplies to external chips on the main board:
  - 1.8V VDDSDHC1V8
  - 2.5V VDDLED
  - 4.8V VSYS_5V

5.3.2.4 Power Boost 5V

To generate a true 5V voltage from the PMIC output (4.8V typical), a FAN48610 low-power boost regulator is integrated into the design. This feeds the 5V USB host and the 5V LCD.

Figure 5-4. Power Boost 5V



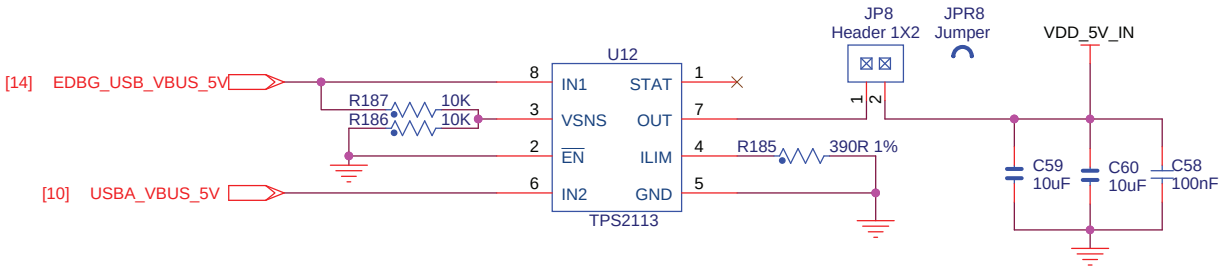
5.3.2.5 Input Power Options

There are several power options for the SAMA5D2-XULT board.

The USB-powered operation is the default configuration. It comes from the USB device port connected to a PC or a 5V DC supply. The USB supply is sufficient to power the board in most applications. It is important to note that when the USB supply is used, the USB-B Host port has limited power. If USB Host port is required for the application, it is recommended that an external DC supply be used.

Figure 5-5 provides the schematics of power options.

Figure 5-5. Input Powering Scheme



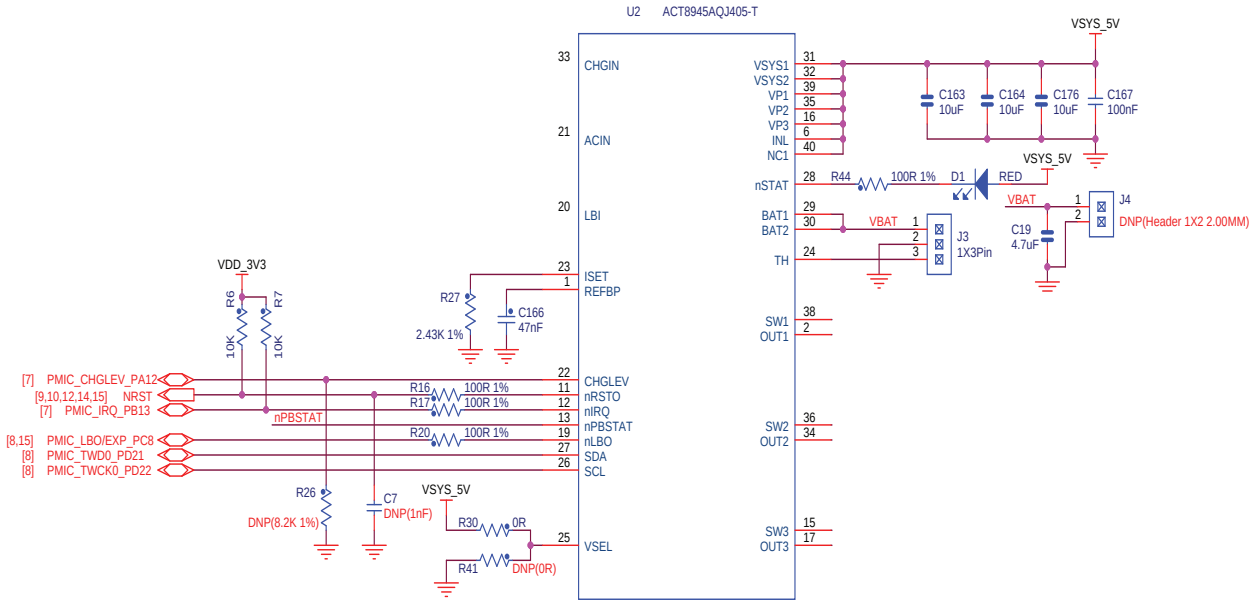
Note: USB-powered operation eliminates additional wires and batteries. It is the preferred mode of operation for any project that requires only a 5V source at up to 500 mA.

5.3.2.6 Battery Supply Source

The ACT8945A features an advanced battery charger that incorporates the ActivePath architecture for system power selection. This combination of circuits provides a complete, advanced battery-management system that automatically selects the best available input supply, manages charge current to ensure system power availability, and provides a complete, high accuracy (±0.5%), thermally regulated, full-featured single-cell linear Li+ charger.

The ActivePath circuitry monitors the state of the input supply, the battery, and the system, and automatically reconfigures itself to optimize the power system. If a valid input supply is present, ActivePath powers the system from the input while charging the battery in parallel. This allows the battery to charge as quickly as possible, while supplying the system. If a valid input supply is not present, ActivePath powers the system from the battery. Finally, if the input is present and the system current requirement exceeds the capability of the input supply, ActivePath allows system power to be drawn from both the battery and the input supply.

Figure 5-6. Battery Powering Scheme



Charger Input Interrupts

In order to ease input supply detection and eliminate the size and cost of external detection circuitry, the charger has the ability to generate interrupts based upon the status of the input supply. This function is capable of generating an interrupt when the input is connected, disconnected, or both, when the charger state machine transitions.

Charge Status Indicator

The charger provides a charge-status indicator output, nSTAT. nSTAT is an open-drain output which sinks current when the charger is in an active-charging state, and is high-Z otherwise. nSTAT features an internal 8 mA current limit, and is capable of directly driving a LED (D1).

Precision Voltage Detector

The LBI input connects to one input of a precision voltage comparator, which can be used to monitor a system voltage such as the battery voltage. An external resistive-divider network can be used to set voltage monitoring thresholds. The output of the comparator is present at the nLBO open-drain output and connected to the led red D1.

Table 5-3. PIOs Used to Control the Battery Charger

PIO	Function
PA12	CHGLEV: Charge Current Selection Input
PB13	nIRQ: Open-Drain Interrupt Output. nIRQ is asserted any time an unmasked fault condition exists or a charger interrupt occurs.
PC8	nLBO: Low Battery Indicator Output. nLBO is asserted low whenever the voltage at LBI is lower than1.2V; it is high-Z otherwise.

Figure 5-7. Battery Connector J3 and Optional J4

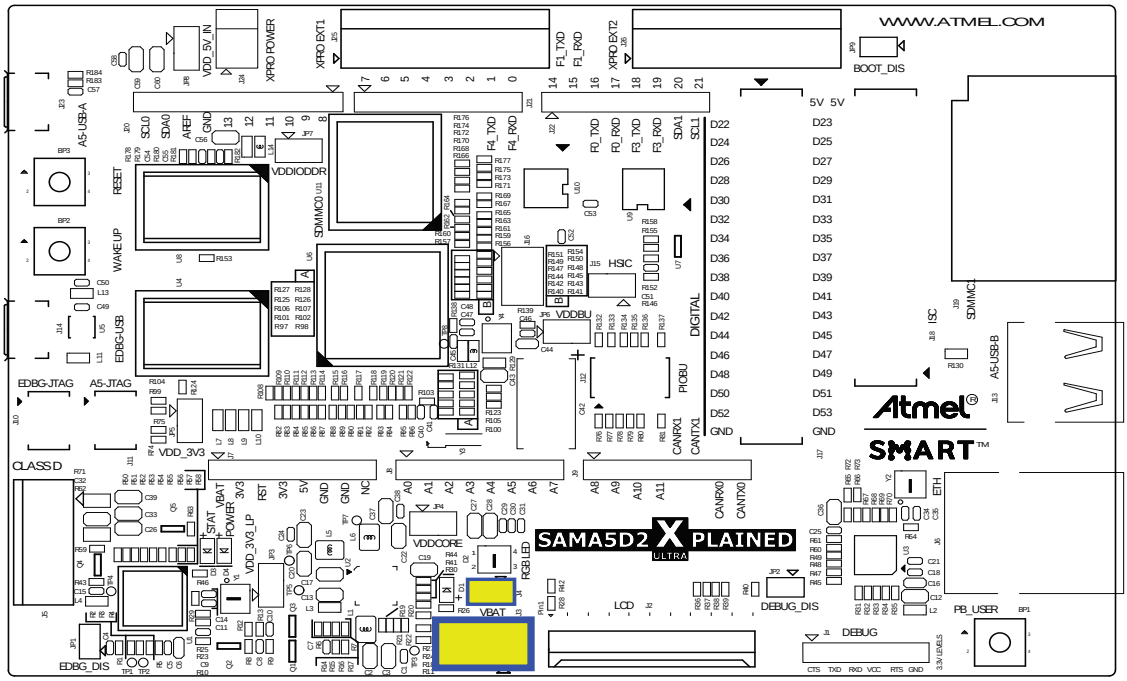


Table 5-4. Battery J3 Signal Descriptions

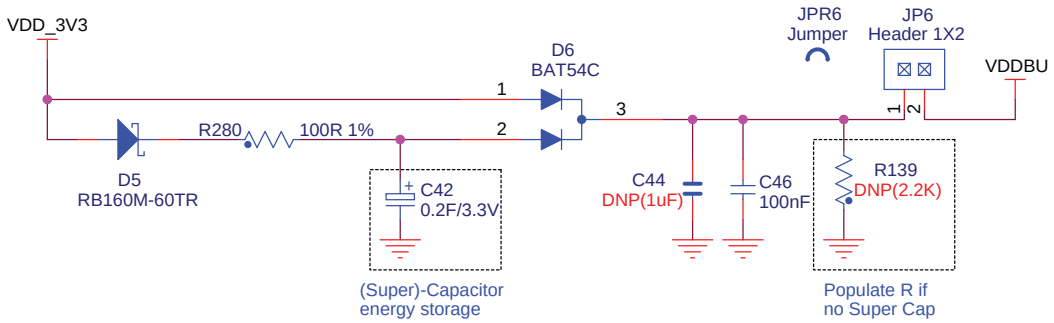
Pin	Mnemonic	Signal Description
1	VBAT	Battery I/O (exploitation and charging). Connect this pin directly to the battery anode (+ terminal)
2	GND	Common ground
3	TH	Temperature Sensing Input. Connect to battery thermistor. TH is pulled up with a 102 µA (typical) current internally.

5.3.2.7 Backup Power Supply

The SAMA5D2-XULT board requires a power source in order to permanently power the backup part of the SAMA5D2 device (refer to SAMA5D2 Series datasheet). A super capacitor sustains such permanent power to VDDBU when all system power sources are off.

Figure 5-8. VDDBU Powering Scheme Option



5.3.2.8 Power Supply Control

In the ACT8945A, three DC-DC converters (1.8V, 1.2V, 3.3V) and two LDO outputs are available.

All ACT8945A outputs can be controlled by the TWI interface through software.

The three DC-DC outputs can be enabled or disabled by the SAMA5D2 SHDN output:

- SHDN = 0: The DC-DC output is disabled.
- SHDN = 1: The DC-DC output is enabled.

Two push buttons are also available:

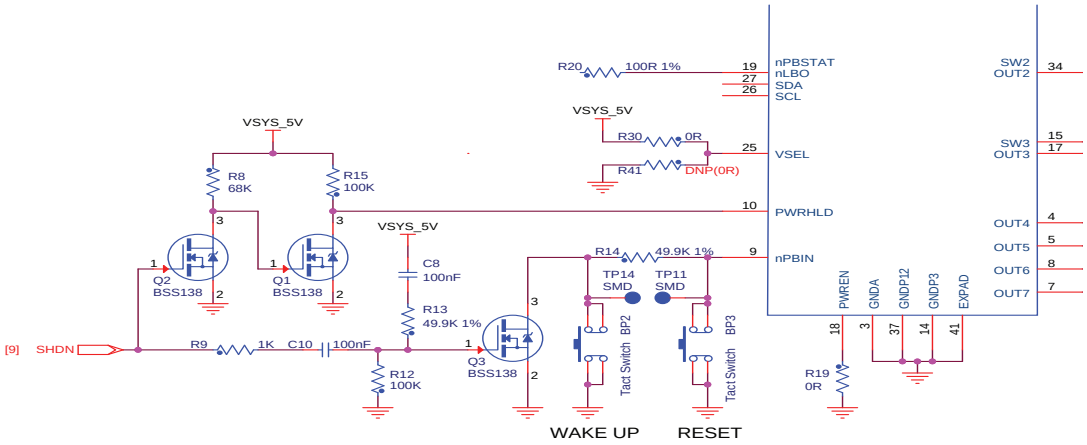
- Wakeup push button: When pressed, the ACT8945A power outputs are restarted if the ACT8945A is in shutdown mode.
- Reset push button: When pressed, the ACT8945A transfers the reset signal to the MPU.

5.3.3 Reset Circuitry

The reset sources for SAMA5D2-XULT board are:

- Power-on reset from the power management unit (PMIC)
- Push button reset BP3
- External reset from Arduino connectors
- JTAG or EDBG reset from an in-circuit emulator

Figure 5-9. Reset/Wakeup and Shutdown Control

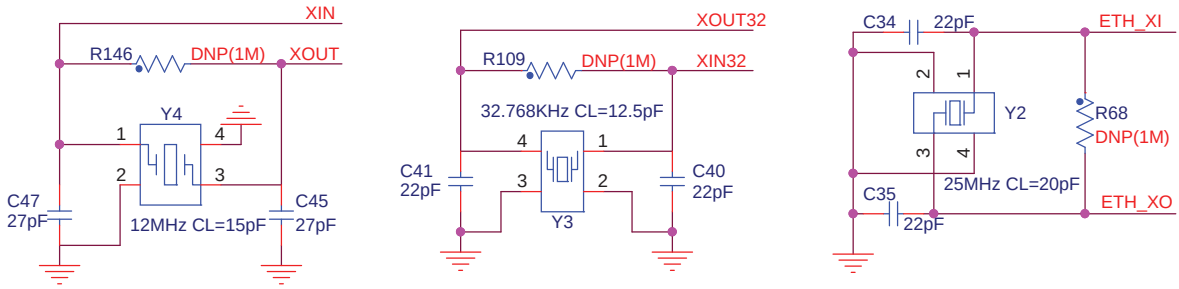


5.3.4 Clock Circuitry

The SAMA5D2-XULT board includes four clock sources:

- Two clocks are alternatives for the SAMA5D2 processor (12 MHz, 32 kHz)
- One crystal oscillator used for the Ethernet RMII chip (25 MHz)
- One crystal oscillator used for the EDBG (12 MHz)

Figure 5-10. Clock Circuitry



5.3.5 Memory

5.3.5.1 Memory Organization

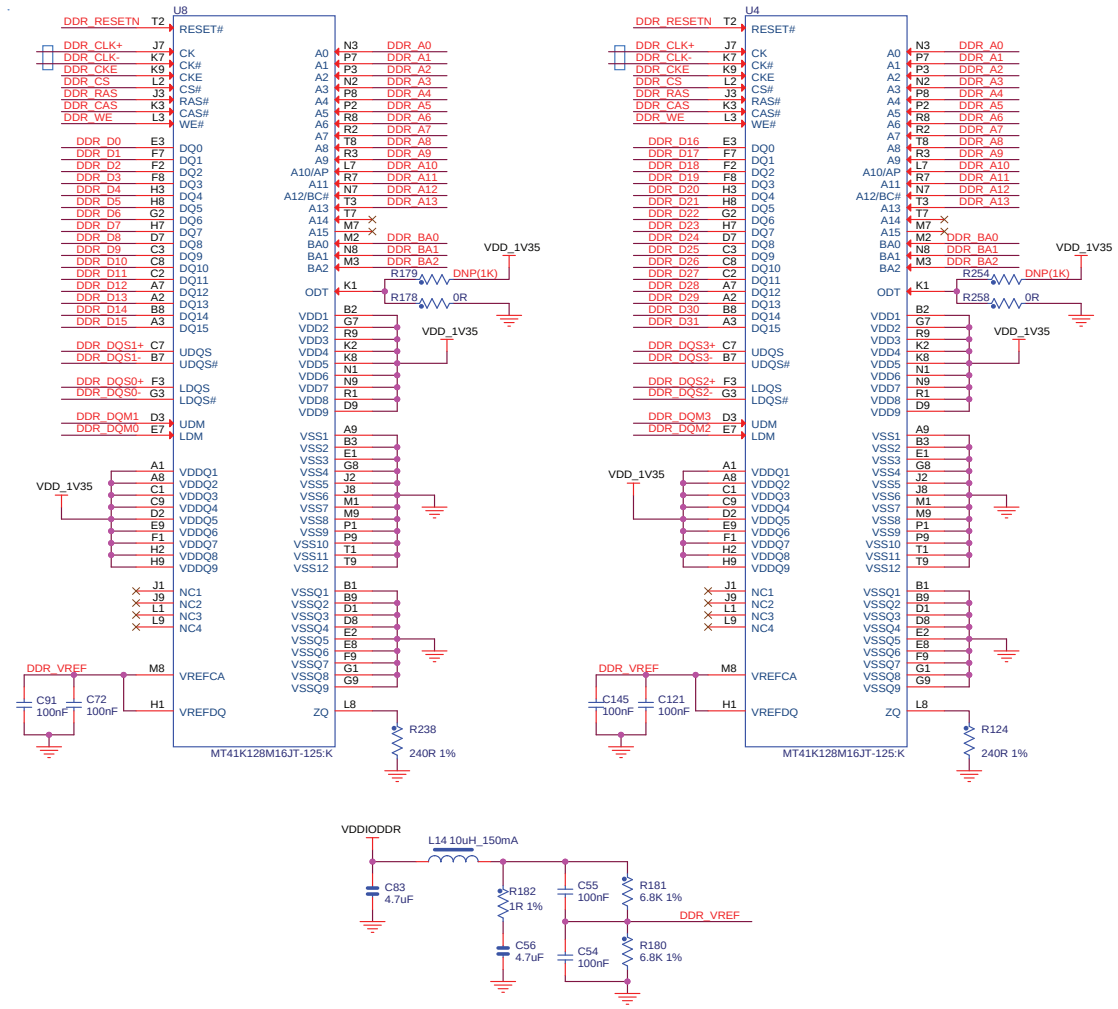
The SAMA5D2 features a DDR/SDR memory interface and an External Bus Interface (EBI) to permit interfacing to a wide range of external memories and to almost any kind of parallel peripheral.

This section describes the memory devices that equip the SAMA5D2-XULT board.

5.3.5.2 DDR3/SDRAM

Two DDR3L/SDRAM (MT41H128M16JT-125-K - 2 Gbit = 16 Mbit x 16 x 8 banks) are used as main system memory and totalling 4 Gbit of SDRAM on the board. The memory bus is 32 bits wide and operates with a frequency of up to 166 MHz.

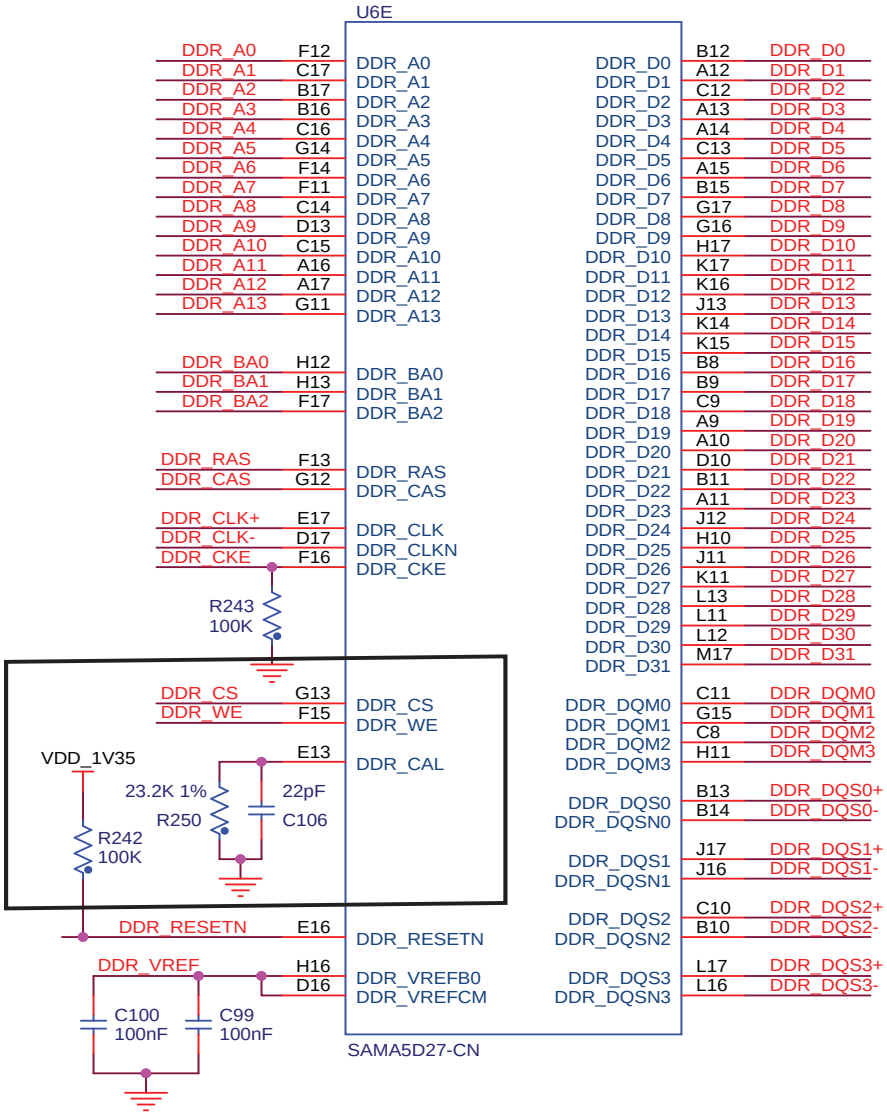
Figure 5-11. DDR3L



5.3.5.3 DDR_CAL Analog Input

One specific analog input, DDR_CAL, is used to calibrate all DDR I/Os.

Figure 5-12. DDR Signals and CAL Analog Input



5.3.5.4 eMMC

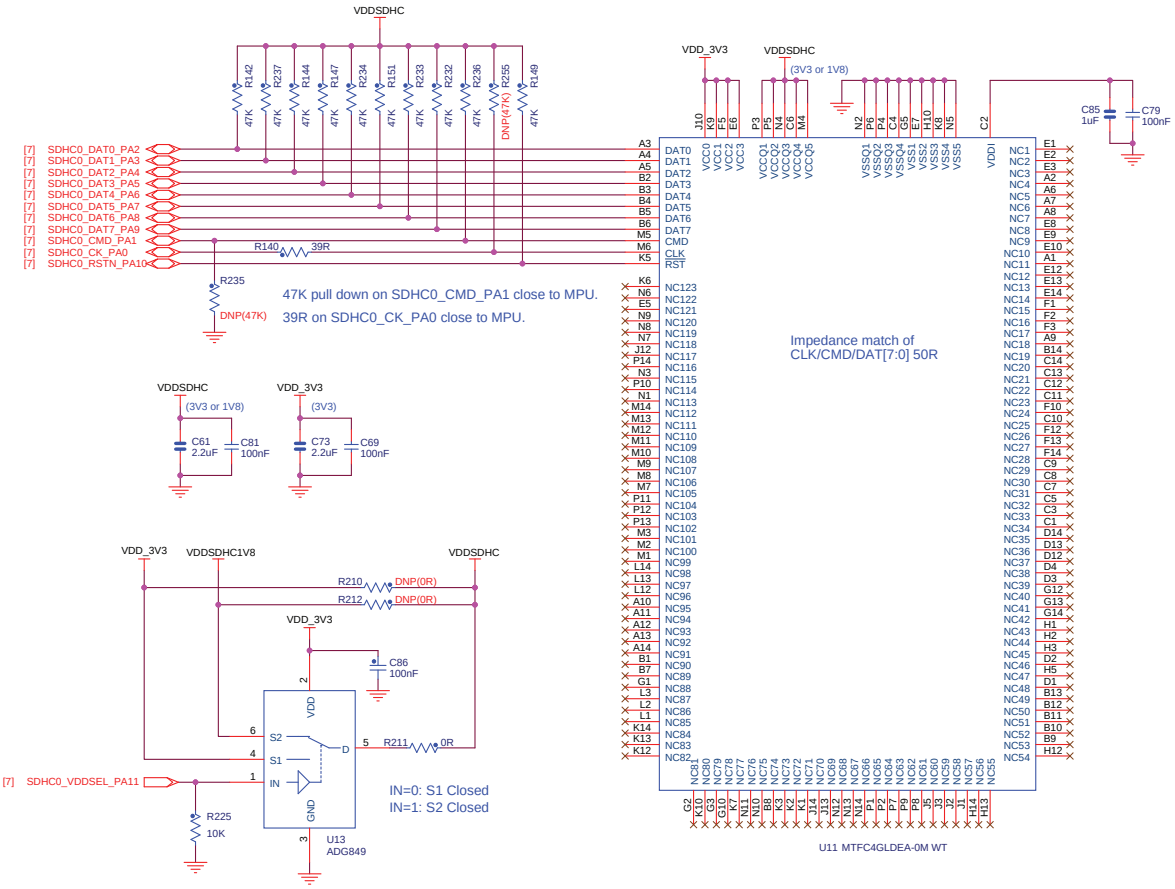
The Secure Digital Multimedia Card (SDMMC) Controller supports the Embedded MultiMedia Card (*e*.MMC) Specification V4.41, the SD Memory Card Specification V3.0, and the SDIO V3.0 specification. It is compliant with the SD Host Controller Standard V3.0 specification

One MTFC4GLDEA 4 GB eMMC is connected to the processor through the SDMMC0 port.

Table 5-5. SDMMC Reference Documents

Name	Link
SD Host Controller Simplified Specification V3.00	www.sdcard.org
SDIO Simplified Specification V3.00	www.sdcard.org
Physical Layer Simplified Specification V3.01	www.sdcard.org
Embedded MultiMedia Card (*e*.MMC) Electrical Standard 4.51	www.jedec.org

Figure 5-13. eMMC



5.3.5.5 CS Disable

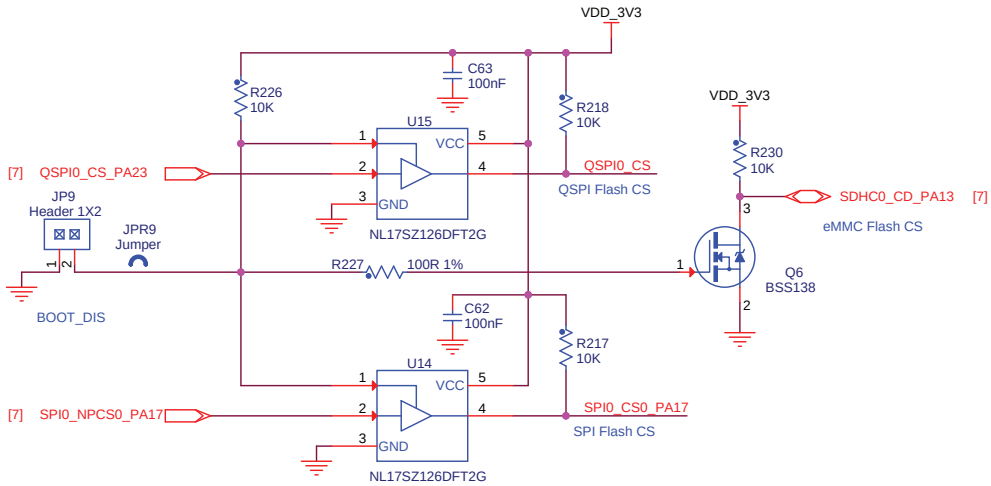
The SAMA5D2 device boots according to the following sequence:

1. SD CARD connected on SDHC1
2. DataFlash connected on NPCS0 SPI0
3. Optional QSPI flash connected on QSPI0 QSPI_CS0
4. eMMC connected to SDHC0

In this sequence, the first device found with bootable contents is selected as the boot source. The others are disregarded.

On-board jumper (JP9) controls the selection (CS#) of the on-board bootable memory components (eMMC and Serial DataFlash) using a non-inverting 3-state buffer.

Figure 5-14. CS Disable



The rule of operation is:

- JP9 = OFF (default) → enable normal boot from eMMC or serial Flash if mounted
- JP9 = ON → booting from optional serial DataFlash or eMMC is disabled

Refer to the SAMA5D2 Series datasheet for more information on standard boot strategies and sequencing.

5.3.6 Additional Memories

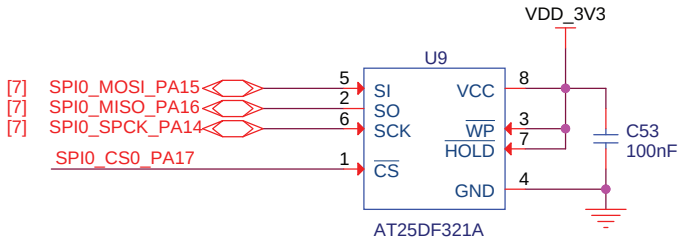
5.3.6.1 Serial Data Flash

The SAMA5D2 provides two high-speed Serial Peripheral Interface (SPI) controllers. One port is used to interface with the on-board serial DataFlash.

The four main signals used in the SPI are Clock, Data In, Data Out, and Chip Select. The SPI is a serial interface similar to the I^2C bus interface but with three main differences:

- It operates at a higher speed.
- Transmit and receive data lines are separate.
- Device access is chip select-based instead of address-based.

Figure 5-15. Serial DataFlash



5.3.6.2 QSPI Serial Flash

The SAMA5D2 provides two Quad Serial Peripheral Interfaces (QSPI). One port is used to interface with the optional on-board QSPI serial DataFlash.

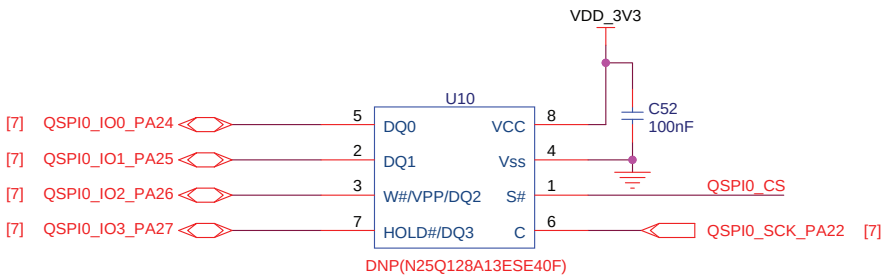
The Quad SPI Interface (QSPI) is a synchronous serial data link that provides communication with external devices in Master mode.

The QSPI can be used in SPI mode to interface to serial peripherals (such as ADCs, DACs, LCD controllers, CAN controllers and sensors), or in Serial Memory mode to interface to serial Flash memories.

The QSPI allows the system to execute code directly from a serial Flash memory (XIP) without code shadowing to RAM. The serial Flash memory mapping is seen in the system as other memories (ROM, SRAM, DRAM, embedded Flash memory, etc.).

With the support of the Quad SPI protocol, the QSPI allows the system to use high-performance serial Flash memories which are small and inexpensive, in place of larger and more expensive parallel Flash memories

Figure 5-16. Optional QSPI Serial DataFlash



5.3.6.3 Serial EEPROM with Unique MAC Address

The SAMA5D2-XULT board embeds one Atmel AT24MAC402/602 EEPROM using a TWI1 interface.

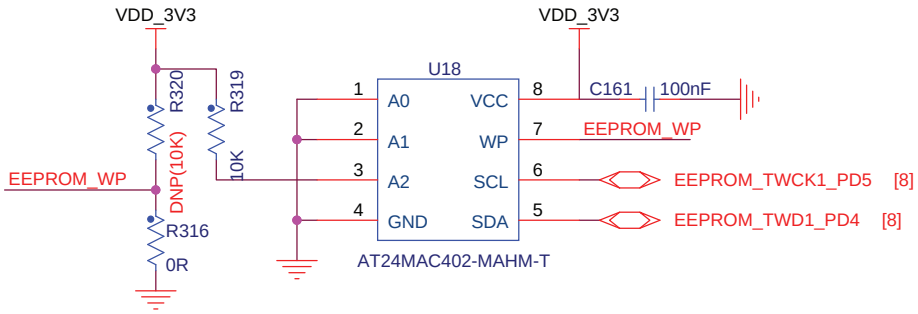
The AT24MAC402/602 provides 2048 bits of Serial Electrically-Erasable Programmable Read-Only Memory (EEPROM) organized as 256 words of eight bits each and is accessed via an I^2C-compatible (2-wire) serial interface. In addition, the AT24MAC402/602 incorporates an easy and inexpensive method to obtain a globally unique MAC or EUI address (EUI-48 or EUI-64).

The EUI-48/64 addresses can be assigned as the actual physical address of a system hardware device or node, or it can be assigned to a software instance. These addresses are factory-programmed by Atmel and guaranteed unique. They are permanently write-protected in an extended memory block located outside of the standard 2-Kbit memory array.

In addition, the AT24MAC402/602 provides the value-added feature of a factory-programmed, also guaranteed unique 128-bit serial number located in the extended memory block (same area as the EUI address values).

WARNING The EEPROM device is used as a “software label” to store board information such as chip type, manufacture name and production date, using the last two 16-byte blocks in memory. **The information contained in these blocks should not be modified.**

Figure 5-17. EEPROM



5.4 PIO Usage and Interface Connectors

5.4.1 Secure Digital Multimedia Card Interface (SDMMC)

5.4.1.1 Secure Digital Multimedia Card (SDMMC) Controller

The SAMA5D2-XULT board has two Secure Digital Multimedia Card (SDMMC) interfaces that support the MultiMedia Card (e.MMC) Specification V4.41, the SD Memory Card Specification V3.0, and the SDIO V3.0 specification. It is compliant with the SD Host Controller Standard V3.0 specification.

- SDMMC0 interface is connected to the eMMC.
- SDMMC1 Interface based on a 7-pin interface (clock, command, 4-bit data, power lines).

5.4.1.2 SDMMC1 Card Connector

A standard MMC/SD card connector, connected to SDMMC1, is mounted on the top side of the board. It includes a card detection switch.

Figure 5-18. SDMMC1

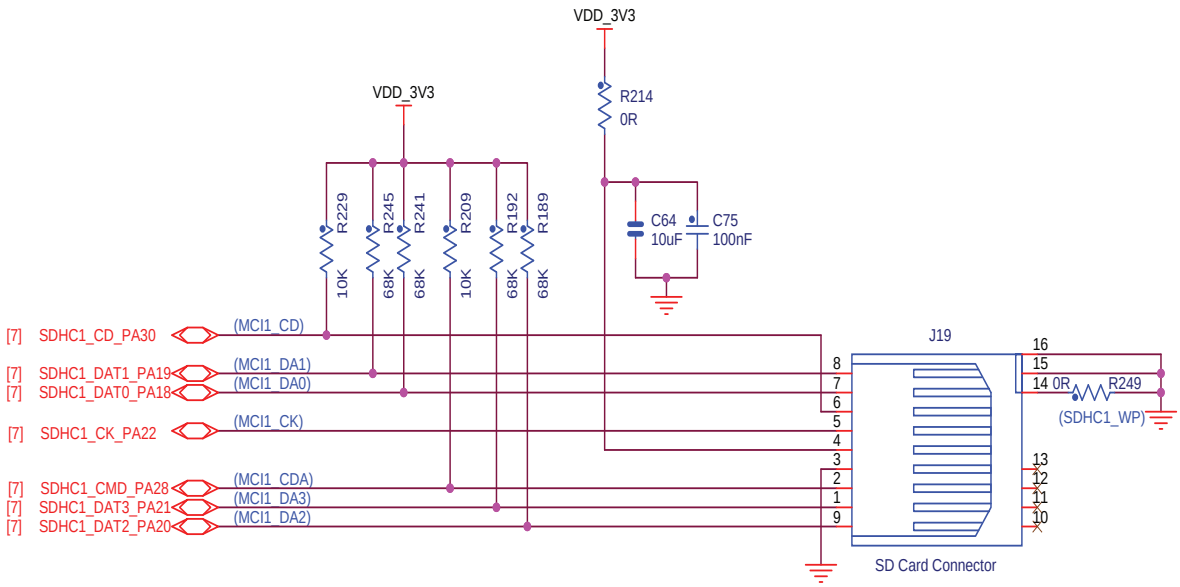


Figure 5-19. Standard SD Socket J19

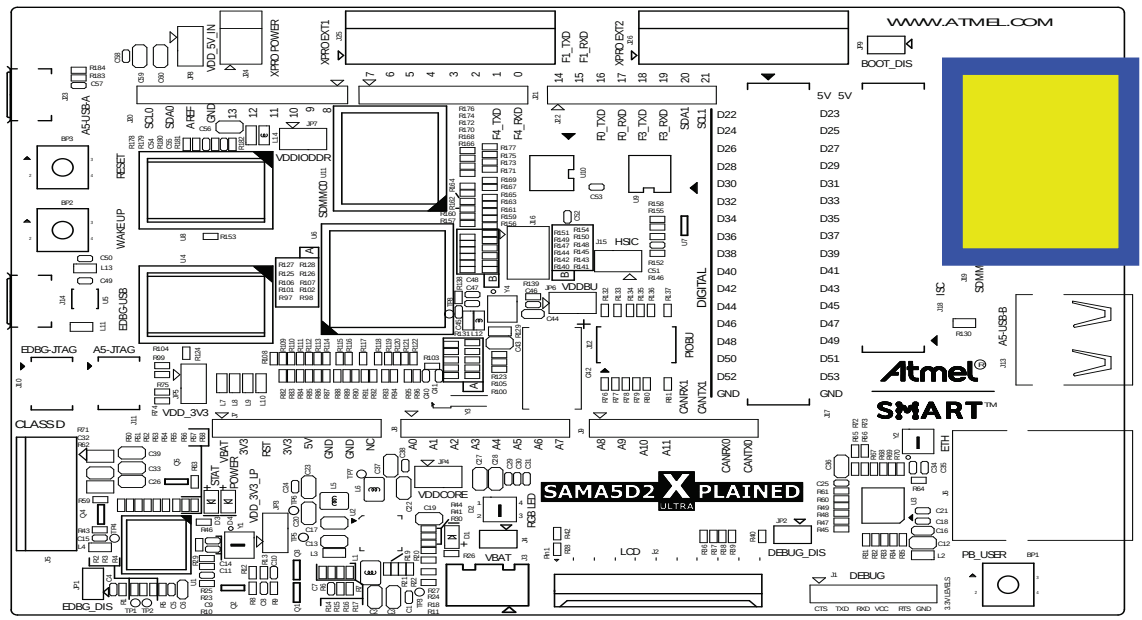

Table 5-6. Standard SD Socket J19 Signal Descriptions

Pin	Mnemonic	PIO	Signal Description
1	DAT3	PA21	Data Bit 3

8	DAT1	PA19	Data Bit 1
9	DAT2	PA20	Data Bit 2
10	GND	–	Common ground

5.4.2 Communication Interfaces

The SAMA5D2-XULT board is equipped with GMAC and USB Host/Device communication interfaces.

5.4.2.1 Ethernet 10/100 (GMAC) Port

The SAMA5D2-XULT board contains a MICREL PHY device (KSZ8081) operating at 10/100 Mb/s. The board supports RMII interface modes. The Ethernet interface consists of two pairs of low-voltage differential pair signals designated from GRX± and GTX± plus control signals for link activity indicators. These signals can be used to connect to a 10/100 Base-T RJ45 connector integrated on SAMA5D2-XULT board.

Additionally, for monitoring and control purposes, LED functionality is carried on the RJ45 connectors to indicate activity, link, and speed status information.

For more information about the Ethernet controller device, refer to the MICREL KSZ8081RN controller manufacturer's datasheet.

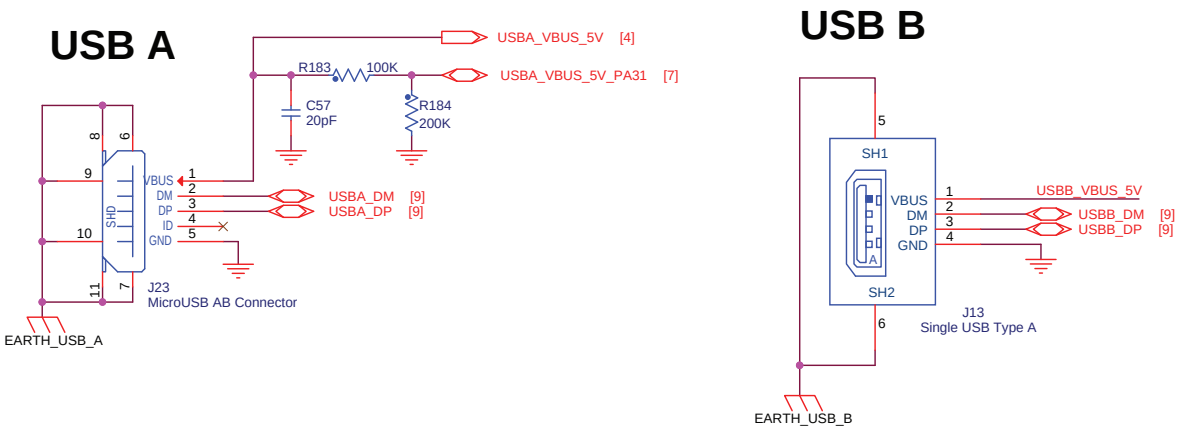
5.4.2.2 USB Host/Device A, B

The SAMA5D2-XULT board features three USB communication ports:

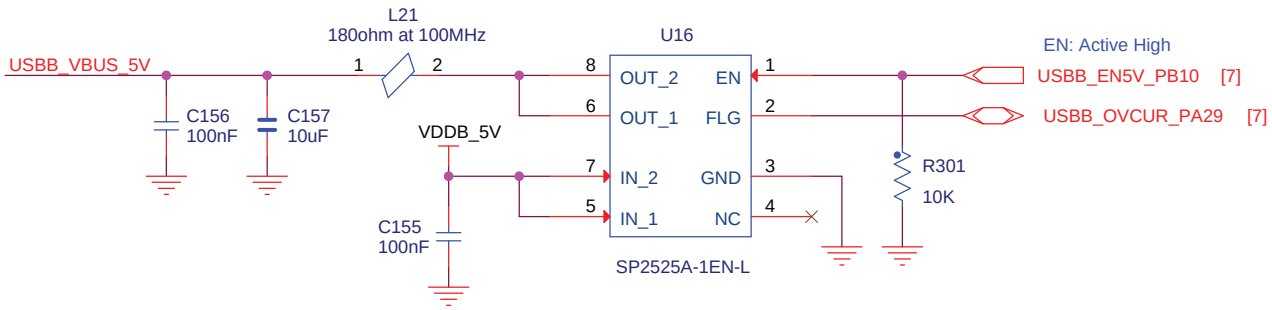
- USB Host B High- and Full-speed Interface
  - One USB host type A connector.
- USB A Device Interface
  - One USB device standard micro-AB connector. This port has a VBUS detection function made through the resistor ladder R183 and R184.
- UBC C high-speed host port
  - One USB high-speed host port with a High-Speed Inter-Chip (HSIC) interface. This port is connected to a single 2-pin jumper.

Figure 5-22. USB-B Host & USB-A Device Interface



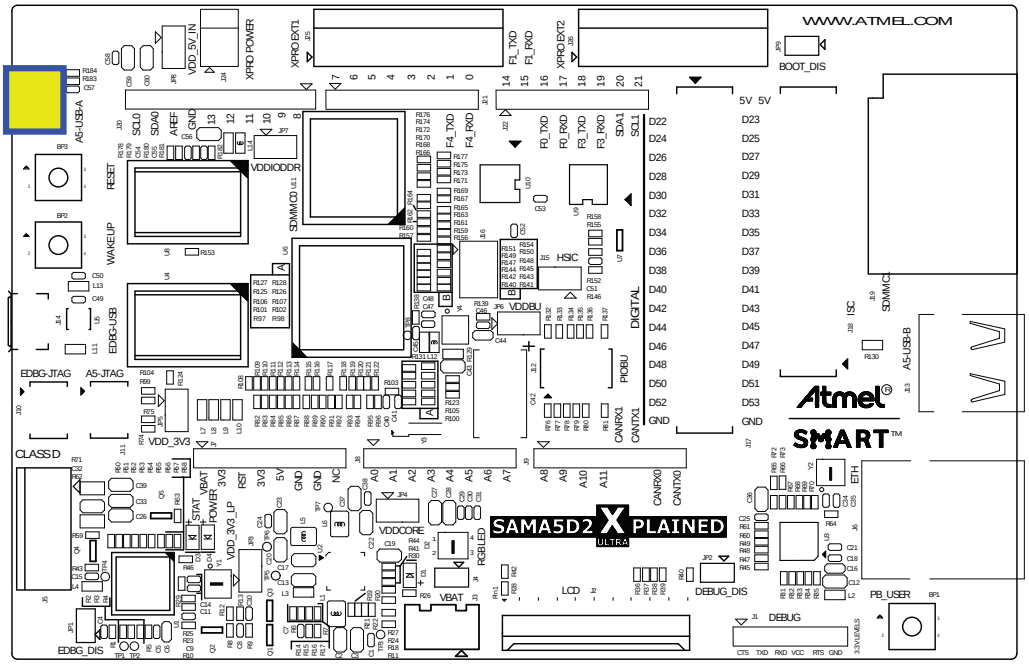
The USB B Host port is equipped with 500 mA high-side power switch for self-powered and bus-powered applications.

Figure 5-23. USB power switch



5.4.3 USB-A Micro-AB Connector J23

Figure 5-24. USB-A Connector J23



5.4.4 USB-B Type B Connector J13

The USB-B host port A (J13) features a VBUS insert detection function through the ladder-type resistors R26 and R27.

Figure 5-25. USB B Connector J13

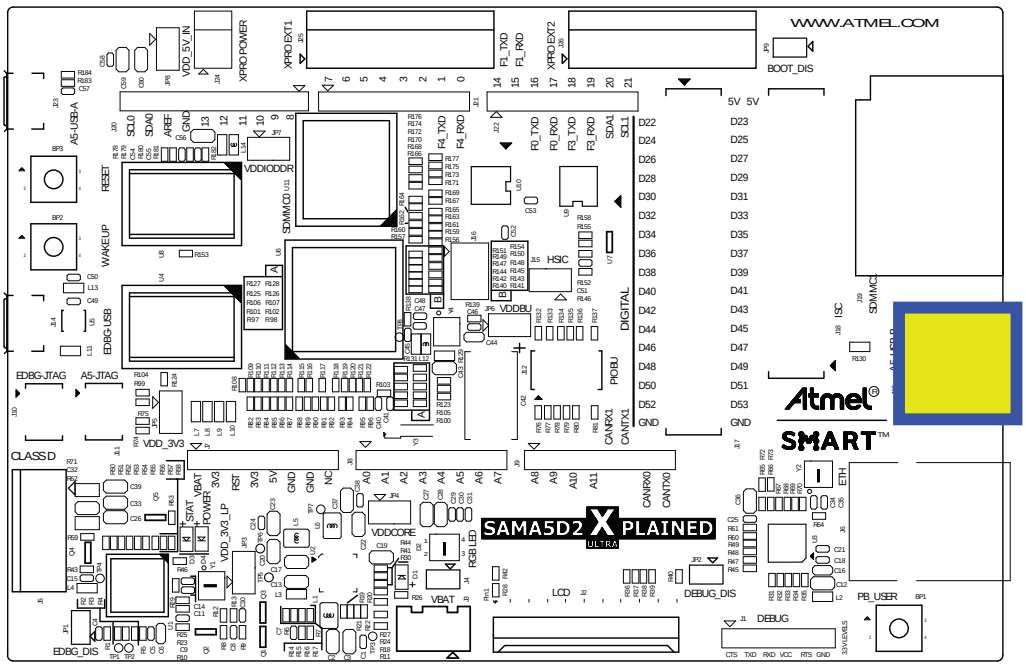


Table 5-8. USB A&B Connector Signal Descriptions

Pin	Mnemonic	Signal Description
1	VBUS	5V power
2	DM	Data minus
3	DP	Data plus

5	GND	Common ground

5.4.5 LCD TFT Interface

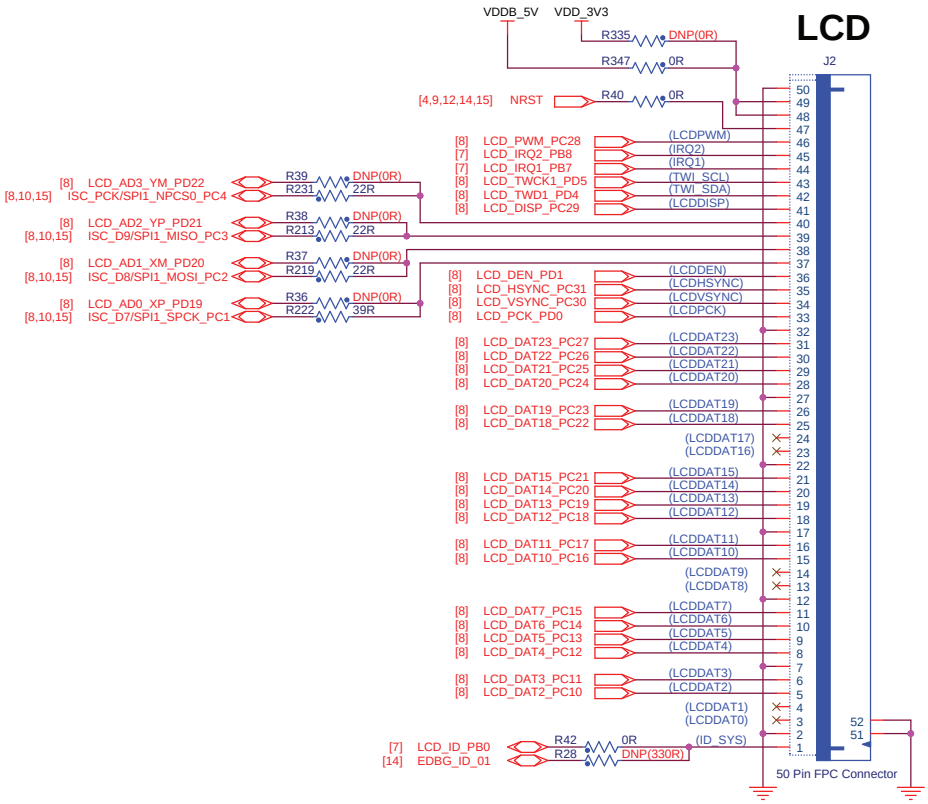
5.4.5.1 LCD

The SAMA5D2-XULT board provides 18 bits of data and control signals to the LCD interface. Other signals are used to control the LCD and are available on connector J2: TWI, SPI, two GPIOs for interrupt, 1-Wire and power supply lines.

5.4.5.2 LCD Expansion Header

J2 is a 1.27mm pitch 50-pin header. It gives access to the LCD signals.

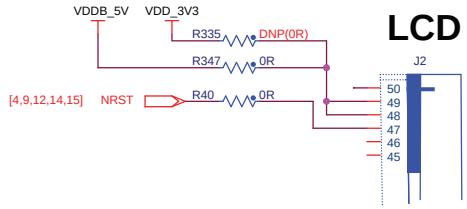
Figure 5-26. LCD Expansion Header Interface Schematic



5.4.5.3 LCD Power

In order to operate correctly out of the processor with various LCD modules, two voltage lines are available: 3.3V and 5 VCC (default), both selected by 0R resistors R335 and R347.

Figure 5-27. LCD Power



5.4.5.4 LCD Connector J2

5.4.6 ISC

The Image Sensor Controller (ISC) system manages incoming data from a parallel or serial csi-2 based CMOS/CCD sensor. It supports a single active interface. It supports the ITU-R BT 656/1120 422 protocol with a data width of 8 bits or 10 bits and raw Bayer format. The internal image processor includes adjustable white balance, color filter array interpolation, color correction, gamma correction, 12 bits to 10 bits compression, programmable color space conversion, horizontal and vertical chrominance subsampling module.

Figure 5-29. ISC J18

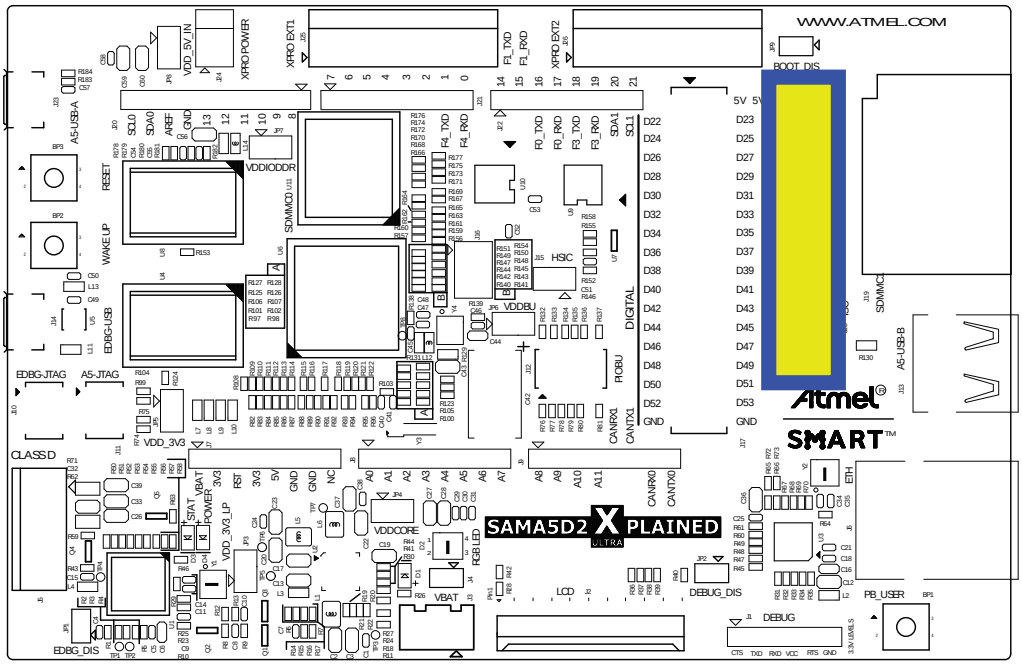

Table 5-10. ISC J18 Signal Descriptions

WARNING

The connector ISC J18 has been laid out to be compatible with former evaluation kits and existing extensions in 8-bit modes. Hence, the 8-bit image data [7:0] are aligned with ISC_D[11:4] in the table above. Refer to the SAMA5D2 Series datasheet for an in-depth description of the ISC bussing scheme. A summary is also provided below.

Table 5-11 shows how ISC_DATA[11:0] is routed to image data D[11:0] in relation to the bit mode.

Table 5-11. ISC Interface - ISC_DATA to Image Data

Interface	12-bit	11-bit	10-bit	9-bit	8-bit
isc_data[11](MSB)	D[11]	D[10]	D[9]	D[8]	D[7]
isc_data[10]	D[10]	D[9]	D[8]	D[7]	D[6]
isc_data[9]	D[9]	D[8]	D[7]	D[6]	D[5]
isc_data[8]	D[8]	D[7]	D[6]	D[5]	D[4]

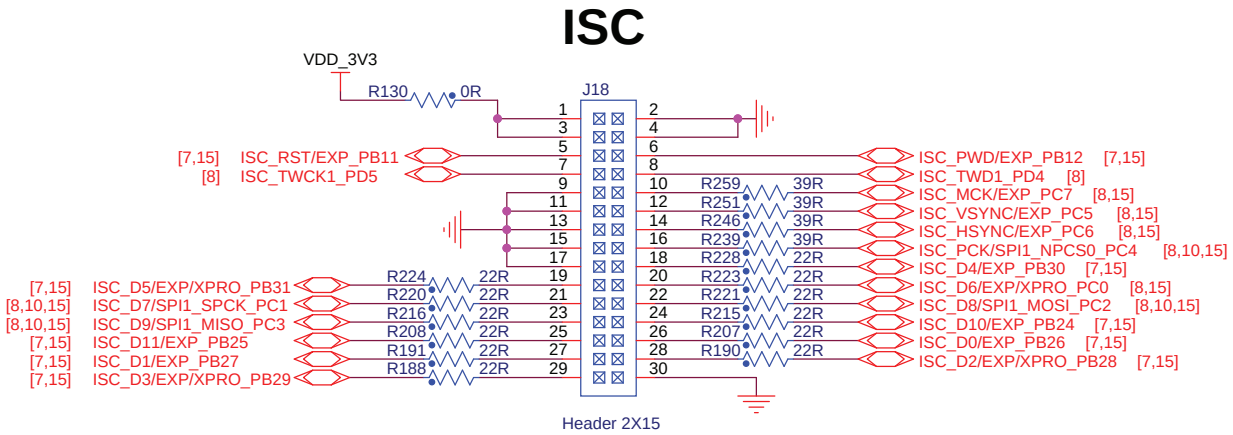
Figure 5-30. ISC J18 Header



5.4.7 Audio Class D Amplifier

The Audio Class D Amplifier (CLASSD) is a digital input, Pulse Width Modulated (PWM) output stereo Class D amplifier. It features a high quality interpolation filter embedding a digitally controlled gain, an equalizer and a de-emphasis filter.

On its input side, the CLASSD is compatible with most common audio data rates. On the output side, its PWM output can drive either:

- high-impedance single-ended or differential output loads (Audio DAC application) or,
- external MOSFETs through an integrated non-overlapping circuit (Class D power amplifier application).

Figure 5-31. Audio PWM Class D MOSFET Mono Amplifier

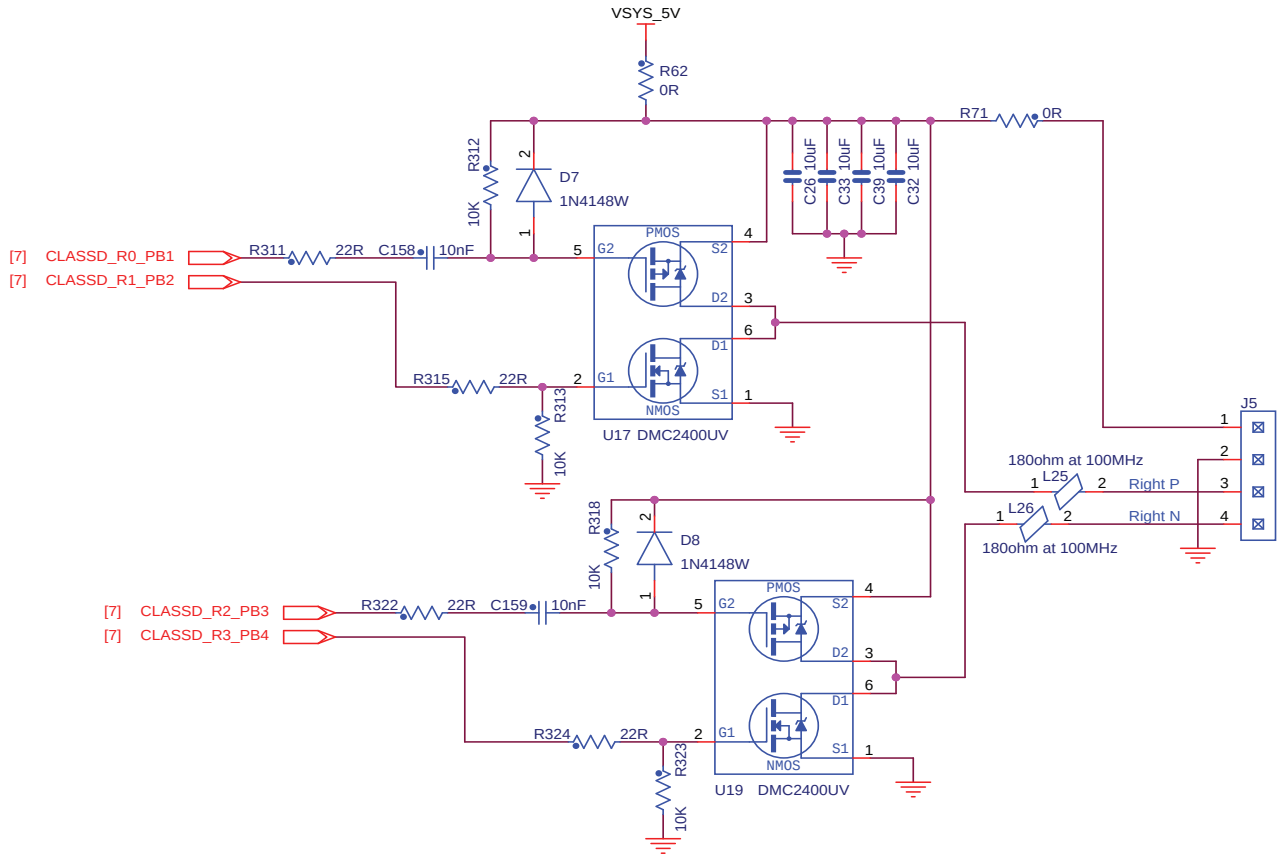


Figure 5-32. CLASSD Output Connector J5

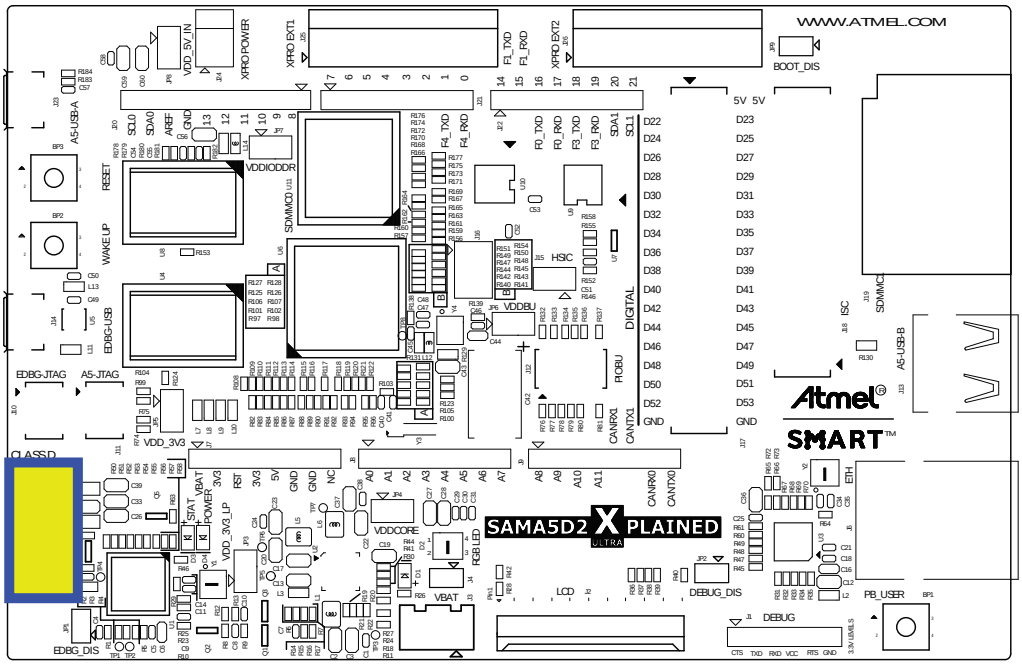

Table 5-12. CLASSD Output Connector J5 Signal Descriptions

Pin	Mnemonic	Signal Description
1	VSYS_5V	Power
2	GND	GND
3	OUTPUT RIGHT P	Positive Level
4	OUTPUT RIGHT N	Negative Level

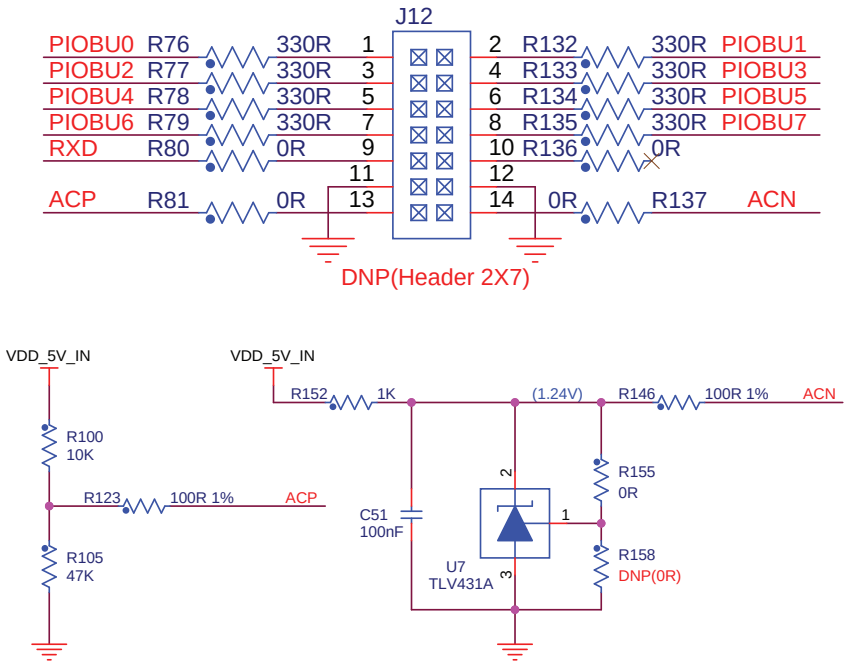
5.4.8 Tamper Interface

The SAMA5D2-XULT board features eight tamper pins for static or dynamic intrusion detections, UART reception, and two analog pins for comparison.

Intrusion detection is described in the document “Security Module”, Atmel literature No. 44036. This document is available under Non-Disclosure Agreement (NDA).

Contact an Atmel Sales Representative for further details.

Figure 5-33. Tamper Pin Connector J12



5.4.9 Tamper Connector

Figure 5-34. Tamper Connector J12

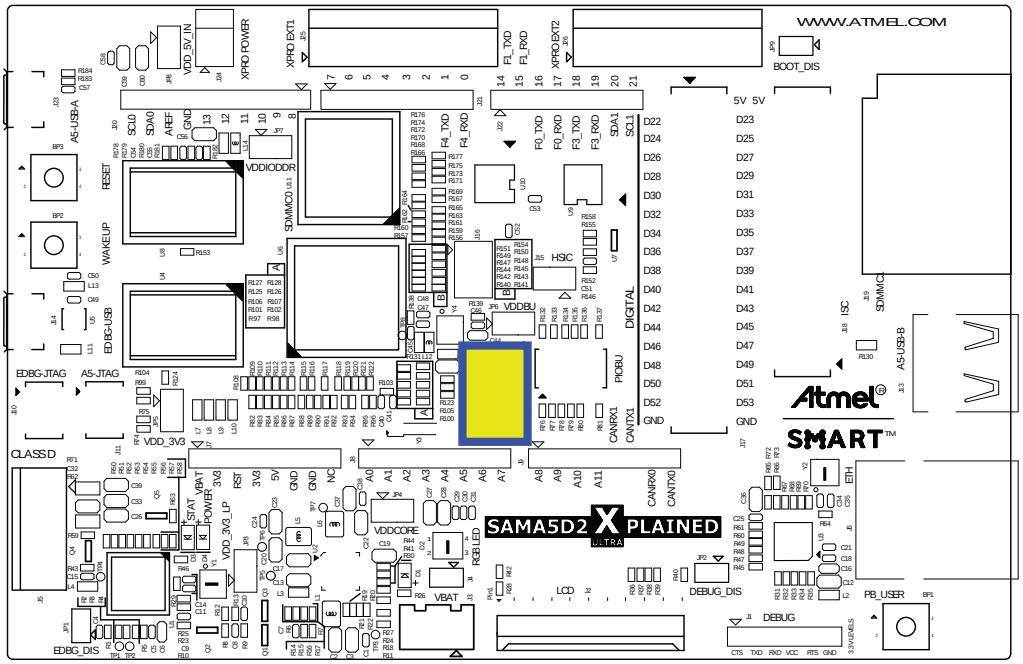


Table 5-13. Tamper Connector J12 Signal Descriptions

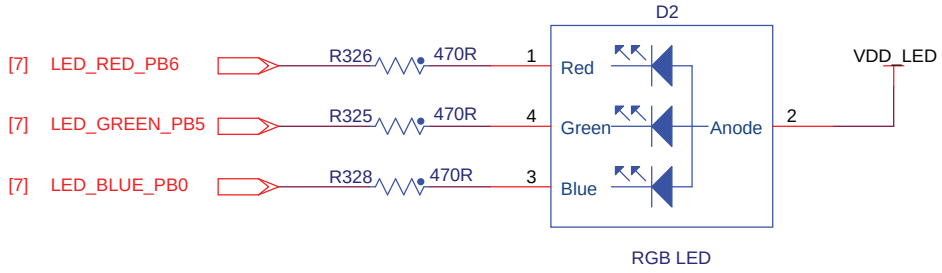
Signal	Pin No.		Signal
PIOBU0	1	2	PIOBU1
PIOBU2	3	4	PIOBU3
PIOBU4	5	6	PIOBU5
PIOBU6	7	8	PIOBU7
RXD	9	10	NC
GND	11	12	GND
ACP	13	14	ACN

5.4.10 RGB LED

There is one RGB LED on the SAMA5D2-XULT board; it can be controlled by the user. The three LED cathodes are controlled via GPIO PWM pins.

Figure 5-35. RGB LED Indicators

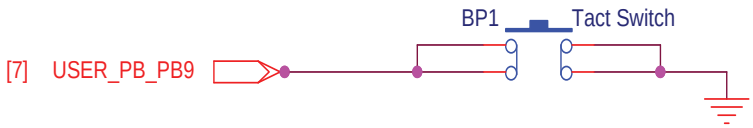


5.4.11 Push Button Switches

The SAMA5D2-XULT features three push buttons:

- One board Reset button (BP3) connected to the PMIC ACT8945A. When pressed and released, it causes a power-on reset of the board.
- One Wakeup push button connected to the PMIC ACT8945A, used to exit the processor from low-power mode (BP2).
- One User momentary push button (BP1).

Figure 5-36. User Push Buttons (BP1)



5.4.12 Debug Interfaces

The SAMA5D2-XULT board includes a JTAG, a Debug serial COM port and an EDBG interface port, to provide debug level access to the SAMA5D2.

5.4.12.1 Debug JTAG

A 10-pin JTAG header is provided on the SAMA5D2-XULT board to facilitate the software development and debugging by using various JTAG emulators. The interface signals have a voltage level of 3.3V.

Figure 5-37. JTAG Interface

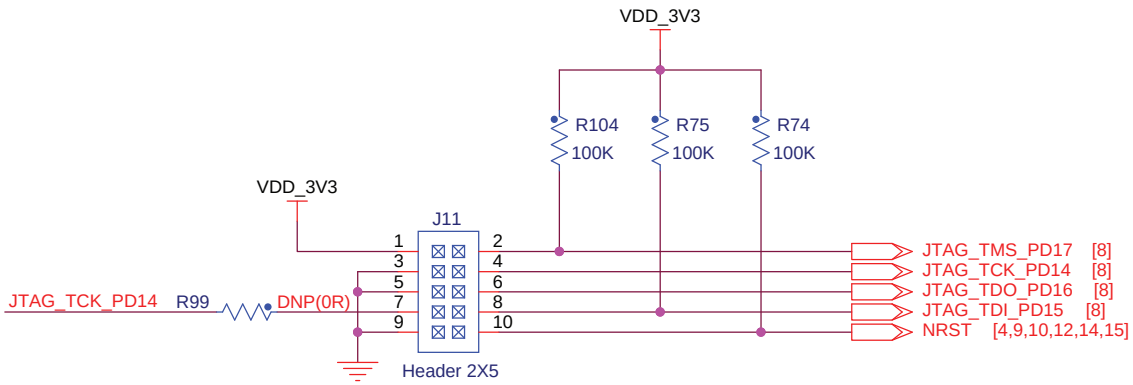


Figure 5-38. JTAG J11

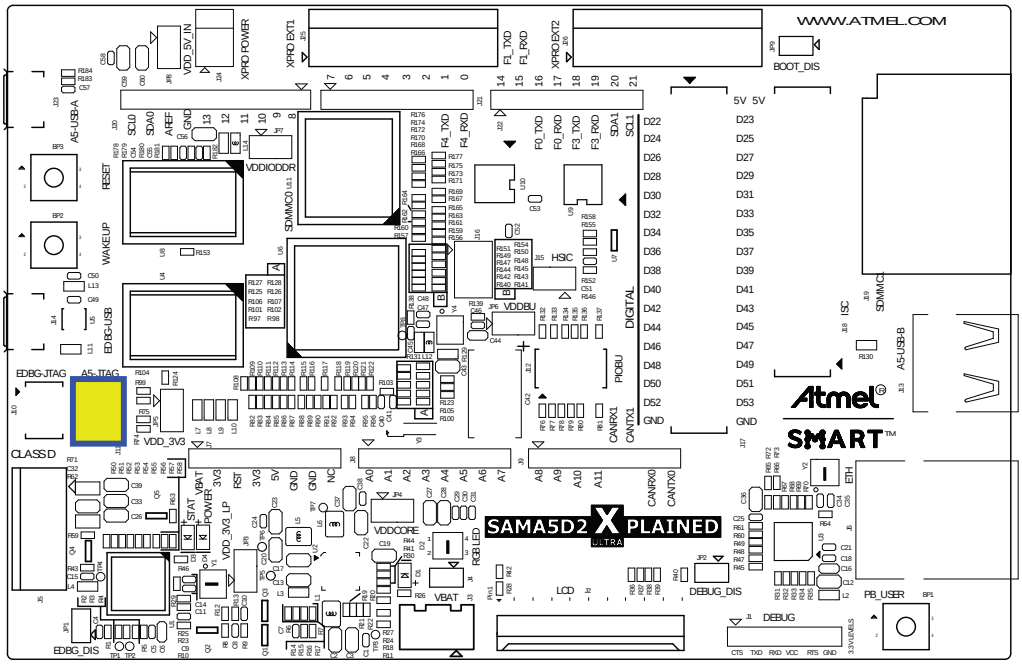

Table 5-14. JTAG/ICE Connector J11 Signal Descriptions

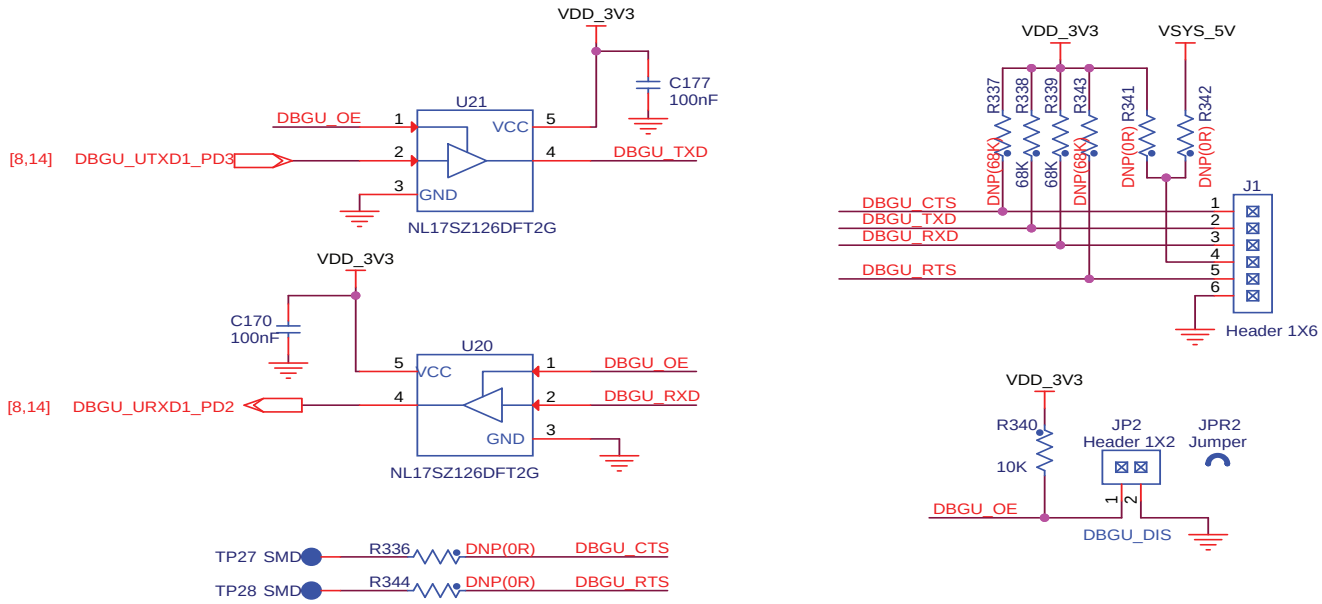
Pin	Mnemonic	Signal Description
1	VTref. 3.3V power	This is the target reference voltage (main 3.3V).
2	TMS TEST MODE SELECT	JTAG mode set input into target CPU
3	GND	Common ground
4	TCK TEST CLOCK - Output timing signal, for synchronizing test logic and control register access	JTAG clock signal into target CPU
5	GND	Common ground
6	TDO JTAG TEST DATA OUTPUT - Serial data input from the target	JTAG data output from target CPU
7	RTCK - Input Return test clock signal from the target	Some targets having too slow system clock must synchronize the JTAG inputs to internal clocks. In present case such synchronization is unneeded and TCK merely looped back into RTCK.
8	TDI TEST DATA INPUT - Serial data output line, sampled on the rising edge of the TCK signal	JTAG data input into target CPU
9	GND	Common ground
10	nSRST RESET	Active-low reset signal. Target CPU reset signal.

5.4.12.2 Serial Console Port

The SAMA5D2-XULT board has a dedicated serial port for debugging, which is accessible through the 6-pin male header J1. Various interfaces can be used as USB/Serial DBGU port bridge, such as FTDI TTL-232R USB to TTL serial cable or basic breakout board for the RS232/USB converter.

Figure 5-39. Debug Com Port for Console



A jumper (JP2) is available to disable the Debug communication interface.

R341 and R342 are optional (not implemented) resistors that can be used for power selection. Power can be delivered either by the SAMA5D2-XULT board or by the debug interface tool. To avoid malfunction between the debug interface (e.g., FTDI) and the on-board power system, ensure that the voltage level selected corresponds to application requirements.

WARNING **With SAMA5D2-XULT (ES) ROM code, the default baud rate on the Serial Console port is 57600.**

Figure 5-40. DEBUG Connector J1

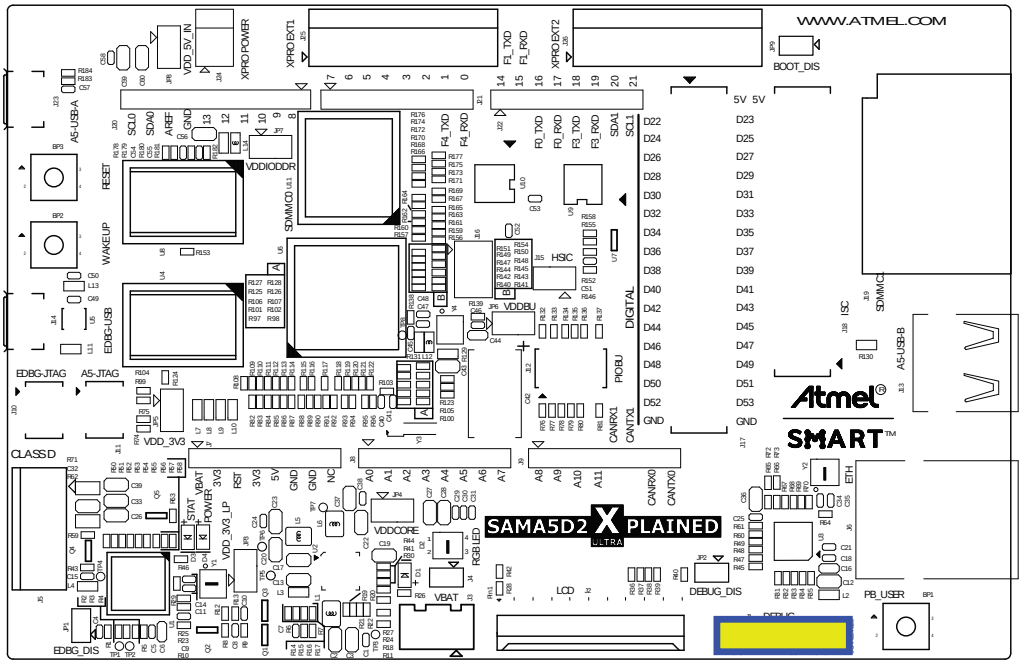


Table 5-15. DEBUG Connector J1 Signal Descriptions

Pin	Mnemonic	PIO	Signal Description
1	CTS	RFU	Handshake input
2	TXD1 (Transmitted Data)	PD3	RS232 serial data output signal
3	RXD1 (Received Data)	PD2	RS232 serial data input signal
4	Power	–	5V/3.3V (selected by resistors)
5	RTS	RFU	Handshake output
6	GND	–	Common ground

WARNING **When using a console connected to the DEBUG interface J1, the jumper JP2 DEBUG_DIS should be OFF.**

5.4.13 Embedded Debugger (EDBG) Interface

The Atmel Embedded Debugger (EDBG) (1) is an intuitive plug-and-play solution which adds full programming and debugging support to embedded hardware kits containing Atmel microcontrollers. It enables seamless integration between the target hardware and the Atmel Studio front end.

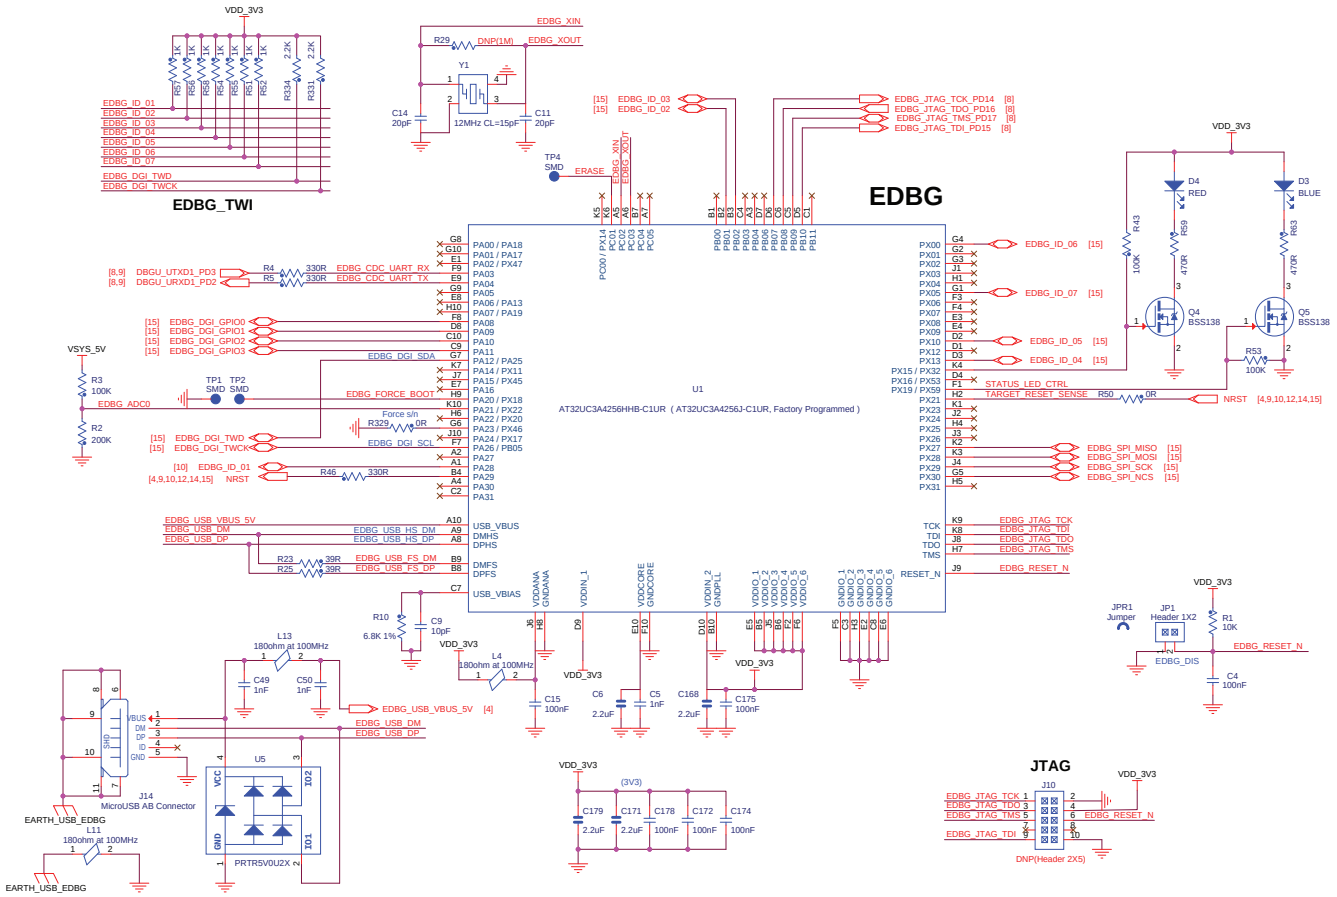
In addition to the Virtual COM port which provides a UART bridge to the target device, the EDBG provides a Data Gateway Interface, through which the target device and host PC can communicate, facilitating high-level application debugging, monitoring, graphing and logging of system information in real-time.

1. Device and Ordering Information—The EDBG is a factory-programmed AT32UC3A4256J-C1UR standard microcontroller with ordering code AT32UC3A4256HHB-C1UR. For further information please contact edbg@atmel.com.

The EDBG is based on the Atmel AT32UC3A4256J high-performance low-power 32-bit AVR microcontroller running at up to 60 MHz. The device includes an on-chip USB 2.0 high-speed hardware module with dedicated DMA channels, making it ideal for data communications.

By default, the EDBG is in Reset state and not usable. To use the EDBG interface, remove the jumper JP1. To avoid any conflicts with the debug signals, do not use the JTAG and EDBG at the same time.

Figure 5-41. EDBG Interface



5.4.14 CDC Debug Interface

This feature is enabled only if pin J9 (RESET_N) of the microcontroller is not tied to ground. The pin is normally pulled high and controlled by jumper JP1.

- Jumper JP1 not installed: The CDC device is enabled.
- Jumper JP1 installed: The CDC device is disabled.

WARNING **The default baud rate CDC is 57600 (57600/N/8/1).**

WARNING **When using a console with the EDBG-CDC, the jumper JP2 DEBUG_DIS should be ON.**

5.4.15 EDBG USB Type Micro-AB

Figure 5-42. EDBG USB Type Micro-AB Connector J14

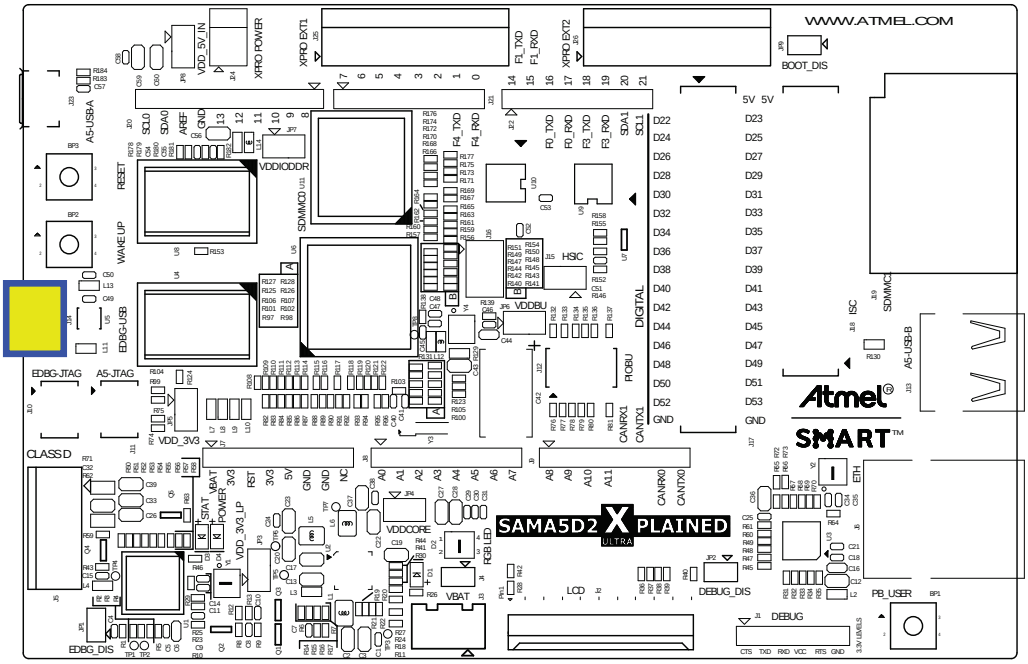


Table 5-16. USB Connector J14 Signal Descriptions

Pin	Mnemonic	Signal Description
1	VBUS	5V power
2	DM	Data minus
3	DP	Data plus
4	ID	On-the-go identification
5	GND	Common ground

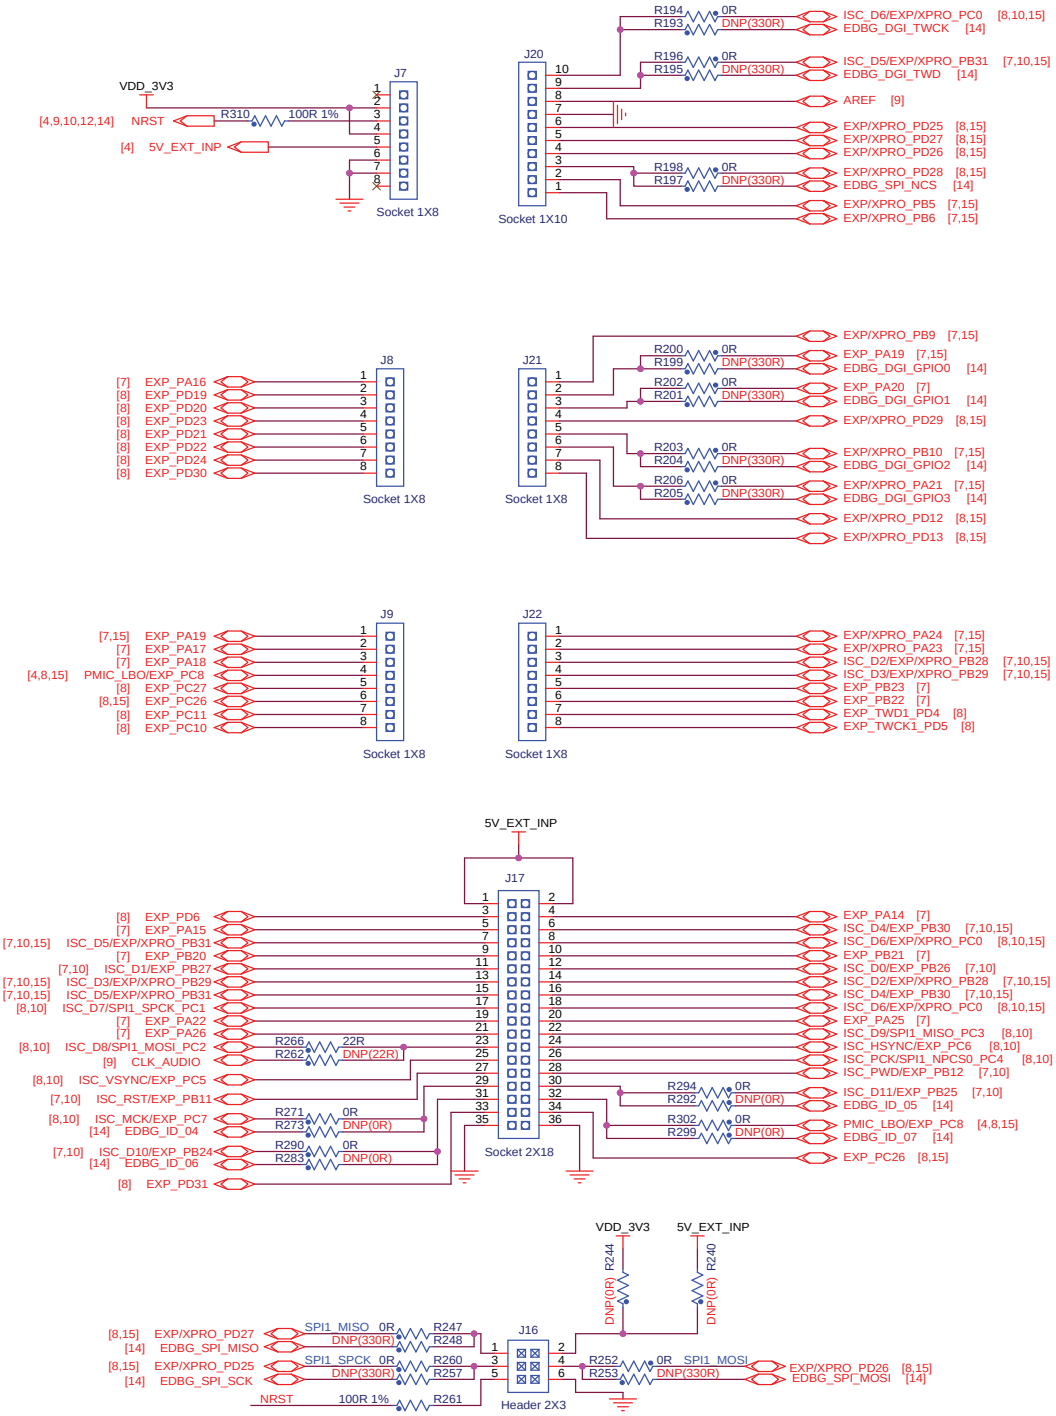
5.5 PIO Usage on Expansion Connectors

5.5.1 Arduino Connectors

Five 8-pin, one 6-pin, one 10-pin and one 36-pin headers (J7, J8, J9, J16, J17, J20, J21, J22) are provided on the SAMA5D2-XULT board to enable the PIO connection of various expansion cards. These headers' physical and electrical implementation match the Arduino R3 extension ("shields") system.

Due to I/O multiplexing, different signals can be provided on each pin.

Figure 5-43. Expansion Boards Connectors



5.5.1.1 Functions Available Through the Arduino Headers

The multiplexing of the SAMA5D27 I/Os (standard parallel I/O and up to three peripheral functions per pin) makes it possible to route alternate signals via Arduino extension headers. To enable these signals, SAMA5D27 PIO multiplexing must be properly configured. For more details, refer to Section 5.6 “SAMA5D2-XULT Board Schematics” and the section PIO Controller (PIO) in the SAMA5D2 Series datasheet.

Table 5-17 to Table 5-23, together with the connector schematics, provide the alternate signals available for use with Arduino connectors.

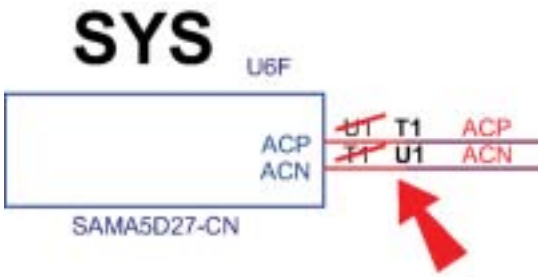
6. Errata

6.1 Pins swapped on schematic

Issue: **U1 and T1 pins swapped on SAMA5D27 schematic**

The schematic symbol of the SAMA5D27 has pins U1 and T1 swapped:



The practical consequences for the SAMA5D2-XULT user are minor: the polarity of the internal comparator (ACC) is inverted. This can be re-inverted by setting the bit INV in the ACC Mode register (ACC_MR).

The replacement symbol (recommended for new designs) can be found at either of the following URLs:

http://www.atmel.com/tools/atsama5d2-xult.aspx?tab=documents

http://www.atmel.com/Images/SAMA5D2-FIXED.zip

Workaround: None.

7. Revision History

Table 7-1. SAMA5D2 Xplained Ultra User Guide Revision History

Doc. Revision	Changes
C	Table 5-19 “J9 Connector Signals”: corrected PC10 and PC11 muxing details. Added Section 6. “Errata”: “U1 and T1 pins swapped on SAMA5D27 schematic”
B	Updated Figure 5-2 “Processor Power Lines Supplies” Section 5.6 “SAMA5D2-XULT Board Schematics”: updated all drawings (Figure 5-54 to Figure 5-67)
A	First issue.
