DESCRIPTION

The AZ100ELT21 is a differential PECL to CMOS/TTL translator. Because PECL (Positive ECL) levels are used, only V_{CC} and ground are required. The small outline 8-lead packaging and the single gate of the ELT21 makes it ideal for those applications where space, performance and low power are at a premium.

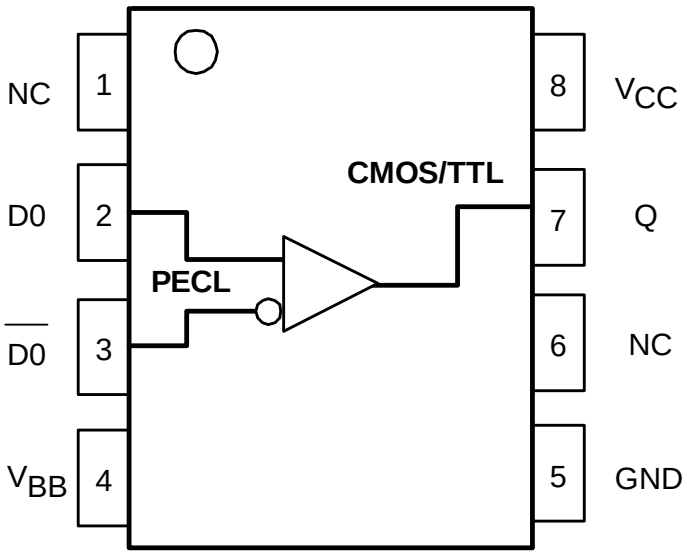

The ELT21 provides a V_{BB} output for single-ended use or a DC bias reference for AC coupling to the device. For single-ended input applications, the V_{BB} reference should be connected to one side of the D0/$\overline{D0}$ differential input pair. The input signal is then fed to the other D0/$\overline{D0}$ input. The V_{BB} pin should be used only as a bias for the ELT21 as its sink/source capability is limited. When used, the V_{BB} pin should be bypassed to ground via a 0.01µF capacitor.

NOTE: Specifications in the ECL/PECL tables are valid when thermal equilibrium is established.
