

**LOW POWER DUAL OPERATIONAL AMPLIFIERS****AZ358/358C****General Description**

The AZ358/358C consists of two independent, high gain and internally frequency compensated operational amplifiers, it is specifically designed to operate from a single power supply. Operation from split power supply is also possible and the low power supply current drain is independent of the magnitude of the power supply voltages.

The AZ358/358C series are Compatible with Industry standard 358. AZ358C has more stringent input offset voltage than AZ358.

The AZ358/358C series are available in standard packages of DIP-8 and SOIC-8.

Features

- Internally Frequency Compensated for Unity Gain
- Large Voltage Gain: 100dB (Typical)
- Low Input Bias Current: 20nA (Typical)
- Low Input Offset Voltage: 2mV (Typical)
- Low Supply Current: 0.5mA (Typical)
- Wide Power Supply Voltage Range:
Single Supply: 3V to 18V
Dual Supplies: $\pm 1.5V$ to $\pm 9V$
- Input Common Mode Voltage Range Includes Ground
- Large Output Voltage Swing: 0V to $V_{CC}-1.5V$
- Power Drain Suitable for Battery Operation

Applications

- Battery Charger
- Cordless Telephone
- Switching Power Supply

BCD Semiconductor's Pb-free products, as designated with "E1" suffix in the part number, are RoHS compliant.

**LOW POWER DUAL OPERATIONAL AMPLIFIERS****AZ358/358C****Absolute Maximum Ratings (Note 1)**

Parameter	Symbol	Value		Unit
Power Supply Voltage	V_{CC}	20		V
Differential Input Voltage	V_{ID}	20		V
Input Voltage	V_{IC}	-0.3 to 20		V
Input Current ($V_{IN} < -0.3V$) (Note 2)	I_{IN}	50		mA
Output Short Circuit to Ground (One Amplifier) (Note 3) $V_{CC} \leq 12V$ and $T_A = 25^\circ C$		Continuous		
Power Dissipation ($T_A = 25^\circ C$)	P_D	DIP-8	830	mW
		SOIC-8	550	
Operating Junction Temperature	T_J	150		$^\circ C$
Storage Temperature Range	T_{STG}	-65 to 150		$^\circ C$
Lead Temperature (Soldering, 10 Seconds)	T_{LEAD}	260		$^\circ C$

Note 1: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device under these conditions is not implied. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability.

Note 2: This input current will only exist when the voltage at any of the input leads is driven negative. It is due to the collector-base junction of the input PNP transistors becoming forward biased and thereby acting as input diode clamps. In addition to this diode action, there is also lateral NPN parasitic transistor action on the IC chip. This transistor action can cause the output voltages of the op amps to go to the V_{CC} voltage level (or to ground for a large overdrive) for the time duration that an input is driven negative. This is not destructive and normal output states will re-establish when the input voltage, which was negative, again returns to a value greater than -0.3V (at $25^\circ C$)

Note 3: Short circuits from the output to V_{CC} can cause excessive heating and eventual destruction. When considering short circuits to ground, the maximum output current is approximately 40mA independent of the magnitude of V_{CC} . At values of supply voltage in excess of +12V, continuous short circuits can exceed the power dissipation ratings and cause eventual destruction. Destructive dissipation can result from simultaneous shorts on all amplifiers.

Power Supply Rejection Ratio	PSRR	$V_{CC}=5V$ to $15V$	70	90		dB
Channel Separation (Note 6)	CS	$f=1KHz$ to $20KHz$		-120		dB
Output Current	Source	I_{SOURCE}	$V_{IN+}=1V$, $V_{IN-}=0V$, $V_{CC}=15V$, $V_O=2V$	20	40	mA
	Sink	I_{SINK}	$V_{IN+}=0V$, $V_{IN-}=1V$, $V_{CC}=15V$, $V_O=2V$	10	18	mA
			$V_{IN+}=0V$, $V_{IN-}=1V$, $V_{CC}=15V$, $V_O=0.2V$	12	50	μA
Output Short Circuit to Ground	I_{SC}	$V_{CC}=15V$		40	60	mA
Output Voltage Swing	V_{OH}	$V_{CC}=15V$, $R_L=2K\Omega$	12			V
		$V_{CC}=15V$, $R_L=10K\Omega$	12.5	13.5		
	V_{OL}	$V_{CC}=5V$, $R_L=10K\Omega$		5	20	mV

Note 4: The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output so no loading change exists on the input lines.

Note 5: The input common-mode voltage of either input signal voltage should not be allowed to go negatively by more than 0.3V (at $25^{\circ}C$). The upper end of the common-mode voltage range is $V_{CC}-1.5V$ (at $25^{\circ}C$), but either or both inputs can go to +18V without damages, independent of the magnitude of the V_{CC} .

Note 6: Due to proximity of external components, insure that coupling is not originating via stray capacitors between these external parts. This typically can be detected as this type of capacitance increases at higher frequencies.

The circuit diagram shows a precision summing amplifier. It features an operational amplifier (op-amp) labeled '1/2 AZ358(C)'. The non-inverting input (+) is connected to ground through a resistor R5 (100K). The inverting input (-) is connected to the output through a feedback resistor R6 (100K). Four input voltages, V₁, V₂, V₃, and V₄, are applied to the inverting input through resistors R1 (100K), R2 (100K), R3 (100K), and R4 (100K) respectively. The output of the op-amp is V_o.
