

## Features

- Very high speed: 45 ns
- Temperature ranges
  - Industrial: -40 °C to +85 °C
  - Automotive-A: -40 °C to +85 °C
- Wide voltage range: 2.20 V to 3.60 V
- Pin compatible with CY62146DV30
- Ultra low standby power
  - Typical standby current: 1 μA
  - Maximum standby current: 7 μA
- Ultra low active power
  - Typical active current: 2 mA at f = 1 MHz
- Easy memory expansion with  $\overline{CE}$  and  $\overline{OE}$  features
- Automatic power down when deselected
- Complementary metal oxide semiconductor (CMOS) for optimum speed and power
- Available in a Pb-free 48-ball very fine ball grid array (VFBGA) and 44-pin TSOP II Packages

## Functional Description

The CY62146EV30 is a high performance CMOS static RAM organized as 256K words by 16 bits. This device features an

advanced circuit design designed to provide an ultra low active current. Ultra low active current is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption by 80 percent when addresses are not toggling. The device can also be put into standby mode reducing power consumption by more than 99 percent when deselected ( $\overline{CE}$  HIGH). The input and output pins ( $I/O_0$  through  $I/O_{15}$ ) are placed in a high impedance state when the device is deselected ( $\overline{CE}$  HIGH), outputs are disabled ( $\overline{OE}$  HIGH), both Byte High Enable and Byte Low Enable are disabled ( $\overline{BHE}$ ,  $\overline{BLE}$  HIGH), or a write operation is in progress ( $\overline{CE}$  LOW and  $\overline{WE}$  LOW).

To write to the device, take Chip Enable ( $\overline{CE}$ ) and Write Enable ( $\overline{WE}$ ) input LOW. If Byte Low Enable ( $\overline{BLE}$ ) is LOW, then data from  $I/O$  pins ( $I/O_0$  through  $I/O_7$ ) is written into the location specified on the address pins ( $A_0$  through  $A_{17}$ ). If Byte High Enable ( $\overline{BHE}$ ) is LOW, then data from the  $I/O$  pins ( $I/O_8$  through  $I/O_{15}$ ) is written into the location specified on the address pins ( $A_0$  through  $A_{17}$ ).

To read from the device, take Chip Enable ( $\overline{CE}$ ) and Output Enable ( $\overline{OE}$ ) LOW while forcing the Write Enable ( $\overline{WE}$ ) HIGH. If Byte Low Enable ( $\overline{BLE}$ ) is LOW, then data from the memory location specified by the address pins appears on  $I/O_0$  to  $I/O_7$ . If Byte High Enable ( $\overline{BHE}$ ) is LOW, then data from memory appears on  $I/O_8$  to  $I/O_{15}$ . See the Truth Table on page 11 for a complete description of read and write modes.

### Notes

- NC pins are not connected on the die.
- Pins H1, G2, and H6 in the BGA package are address expansion pins for 8 Mb, 16 Mb and 32 Mb, respectively.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V<sub>CC</sub> = V<sub>CC(typ)</sub>, T<sub>A</sub> = 25 °C.

## Maximum Ratings

Exceeding the maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage temperature ..... -65 °C to + 150 °C

Ambient temperature with power applied ..... -55 °C to + 125 °C

Supply voltage to ground potential ..... -0.3 V to + 3.9 V ( $V_{CCmax} + 0.3$  V)

DC voltage applied to outputs in High-Z state <sup>[4, 5]</sup> ..... -0.3 V to 3.9 V ( $V_{CCmax} + 0.3$  V)

DC input voltage <sup>[4, 5]</sup> ..... -0.3 V to 3.9 V ( $V_{CCmax} + 0.3$  V)

Output current into outputs (LOW) ..... 20 mA

Static Discharge Voltage (per MIL-STD-883, Method 3015) ..... >2001 V

Latch-up Current ..... >200 mA

## Operating Range

| Device      | Range                     | Ambient Temperature | $V_{CC}$ <sup>[6]</sup> |
|-------------|---------------------------|---------------------|-------------------------|
| CY62146EV30 | Industrial / Automotive-A | -40 °C to +85 °C    | 2.2 V to 3.6 V          |

| $I_{SB2}$ <sup>[8]</sup> | Automatic CE power down current – CMOS inputs | $CE \geq V_{CC} - 0.2$ V, $V_{IN} \geq V_{CC} - 0.2$ V or $V_{IN} \leq 0.2$ V, $f = 0$ , $V_{CC} = 3.60$ V                                                    | —                    | 1                  | 7              | $\mu$ A |

### Notes

4.  $V_{IL(min)}$  = -2.0 V for pulse durations less than 20 ns.

5.  $V_{IH(max)}$  =  $V_{CC} + 0.75$  V for pulse durations less than 20 ns.

6. Full device AC operation assumes a minimum of 100  $\mu$ s ramp time from 0 to  $V_{CC(min)}$  and 200  $\mu$ s wait time after  $V_{CC}$  stabilization.

7. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at  $V_{CC} = V_{CC(typ)}$ ,  $T_A = 25$  °C.

8. Chip enable (CE) and byte enables (BHE and BLE) need to be tied to CMOS levels to meet the  $I_{SB1}$  /  $I_{SB2}$  /  $I_{CCDR}$  spec. Other inputs can be left floating.

## Data Retention Waveform

Figure 4. Data Retention Waveform

### Notes

10. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at  $V_{CC} = V_{CC(typ)}$ ,  $T_A = 25\text{ }^\circ\text{C}$ .
11. Chip enable (CE) and byte enables (BHE and BLE) need to be tied to CMOS levels to meet the  $I_{SB1}/I_{SB2}/I_{CCDR}$  spec. Other inputs can be left floating.
12. Tested initially and after any design or process changes that may affect these parameters.
13. Full device operation requires linear  $V_{CC}$  ramp from  $V_{DR}$  to  $V_{CC(min)} \geq 100\text{ }\mu\text{s}$  or stable at  $V_{CC(min)} \geq 100\text{ }\mu\text{s}$ .

### Notes

14. Test conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns (1 V/ns) or less, timing reference levels of  $V_{CC(typ)}/2$ , input pulse levels of 0 to  $V_{CC(typ)}$ , and output loading of the specified  $I_{OL}/I_{OH}$  as shown in the [Figure 3 on page 5](#).
15. In an earlier revision of this device, under a specific application condition, READ and WRITE operations were limited to switching of the byte enable and/or chip enable signals as described in the Application Notes [AN13842](#) and [AN66311](#). However, the issue has been fixed and in production now, and hence, these Application Notes are no longer applicable. They are available for download on our website as they contain information on the date code of the parts, beyond which the fix has been in production.
16. At any given temperature and voltage condition,  $t_{HZCE}$  is less than  $t_{LZCE}$ ,  $t_{HZBE}$  is less than  $t_{LZBE}$ ,  $t_{HZOE}$  is less than  $t_{LZOE}$ , and  $t_{HZWE}$  is less than  $t_{LZWE}$  for any given device.
17.  $t_{HZOE}$ ,  $t_{HZCE}$ ,  $t_{HZBE}$ , and  $t_{HZWE}$  transitions are measured when the outputs enter a high impedance state.
18. The internal write time of the memory is defined by the overlap of  $\overline{WE}$ ,  $\overline{CE} = V_{IL}$ ,  $\overline{BHE}$  and/or  $\overline{BLE} = V_{IL}$ . All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.

## Switching Waveforms

**Figure 5. Read Cycle 1 (Address Transition Controlled)** [19, 20]

**Figure 6. Read Cycle No. 2 ( $\overline{\text{OE}}$  Controlled)** [20, 21]

### Notes

19. The device is continuously selected.  $\overline{\text{OE}}$ ,  $\overline{\text{CE}} = V_{\text{IL}}$ ,  $\overline{\text{BHE}}$  and/or  $\overline{\text{BLE}} = V_{\text{IL}}$ .

20.  $\overline{\text{WE}}$  is HIGH for read cycle.

21. Address valid before or similar to  $\overline{\text{CE}}$  and  $\overline{\text{BHE}}$ ,  $\overline{\text{BLE}}$  transition LOW.

## Switching Waveforms (continued)

**Figure 7. Write Cycle No. 1 ( $\overline{\text{WE}}$  Controlled)** [22, 23, 24]

**Figure 8. Write Cycle No. 2 ( $\overline{\text{CE}}$  Controlled)** [22, 23, 24]

### Notes

22. The internal write time of the memory is defined by the overlap of  $\overline{\text{WE}}$ ,  $\overline{\text{CE}} = V_{\text{IL}}$ ,  $\overline{\text{BHE}}$  and/or  $\overline{\text{BLE}} = V_{\text{IL}}$ . All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.

23. Data I/O is high impedance if  $\overline{\text{OE}} = V_{\text{IH}}$ .

24. If  $\overline{\text{CE}}$  goes HIGH simultaneously with  $\overline{\text{WE}} = V_{\text{IH}}$ , the output remains in a high impedance state.

25. During this period, the I/Os are in output state and input signals must not be applied.

## Switching Waveforms (continued)

**Figure 9. Write Cycle No. 3 ( $\overline{\text{WE}}$  Controlled,  $\overline{\text{OE}}$  LOW) [26]**

**Figure 10. Write Cycle No. 4 ( $\overline{\text{BHE/BLE}}$  Controlled,  $\overline{\text{OE}}$  LOW) [26]**

### Notes

26. If  $\overline{\text{CE}}$  goes HIGH simultaneously with  $\overline{\text{WE}} = V_{\text{IH}}$ , the output remains in a high impedance state.  
27. During this period, the I/Os are in output state and input signals must not be applied.

Cypress does not assume any liability arising out of the application or use of any product or circuit described herein. Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress' product in a life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Use may be limited by and subject to the applicable Cypress software license agreement.
