

5-TAP, 3.3V CMOS-INTERFACED FIXED DELAY LINE (SERIES DDU8C3)

FEATURES

- Five equally spaced outputs
- Fits standard 8-pin DIP socket
- Low profile
- Auto-insertable
- Input & outputs fully CMOS interfaced & buffered
- 10 T²L fan-out capability

FUNCTIONAL DESCRIPTION

The DDU8C3-series device is a 5-tap digitally buffered delay line. The signal input (IN) is reproduced at the outputs (T1-T5), shifted in time by an amount determined by the device dash number (See Table). For dash numbers 5020 and above, the total delay of the line is measured from IN to T5, and the nominal tap-to-tap delay increment is given by one-fifth of the total delay. For dash numbers below 5020, the total delay is measured from T1 to T5, and the delay increment is given by one-fourth of the total delay.

SERIES SPECIFICATIONS

- **Minimum input pulse width:** 40% of total delay
- **Output rise time:** 2ns typical
- **Supply voltage:** 3.3VDC $\pm$ 0.3V
- **Supply current:** I_{CCL} = 40 μ A typical
 I_{CCH} = 7mA typical
- **Operating temperature:** -40° to 85° C
- **Temp. coefficient of total delay:** 300 PPM/°C

APPLICATION NOTES

HIGH FREQUENCY RESPONSE

The DDU8C3 tolerances are guaranteed for input pulse widths and periods greater than those specified in the test conditions. Although the device will function properly for pulse widths as small as 40% of the total delay and periods as small as 80% of the total delay (for a symmetric input), the delays may deviate from their values at low frequency. However, for a given input condition, the deviation will be repeatable from pulse to pulse. Contact technical support at Data

Delay Devices if your application requires device testing at a specific input condition.

POWER SUPPLY BYPASSING

The DDU8C3 relies on a stable power supply to produce repeatable delays within the stated tolerances. A 0.1 μ f capacitor from VDD to GND, located as close as possible to the VDD pin, is recommended. A wide VDD trace and a clean ground plane should be used.
