DS1302
Trickle Charge Timekeeping Chip

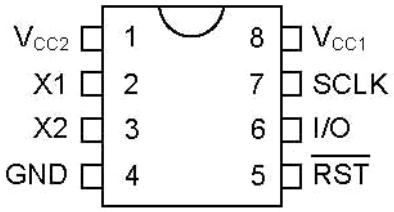
FEATURES

- Real time clock counts seconds, minutes hours, date of the month, month, day of the week, and year with leap year compensation valid up to 2100
- 31 x 8 RAM for scratchpad data storage
- Serial I/O for minimum pin count
- 2.0-5.5V full operation
- Uses less than 300nA at 2.0V
- Single –byte or multiple-byte (burst mode) data transfer for read or write of clock or RAM data
- 8-pin DIP or optional 8-pin SOICs for surface mount
- Simple 3-wire interface
- TTL-compatible (Vcc=5V)
- Optional industrial temperature range -40℃ to +85℃
- DS1202 compatible
- Recognized by Underwriters Laboratory

ORDERING INFORMATION

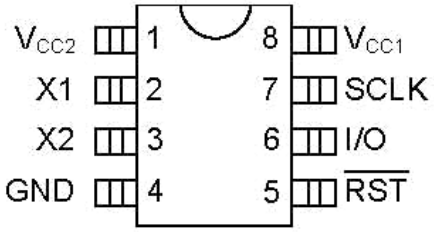
PART#	DESCRIPTION
DS1302	8-Pin DIP
DS1302N	8-Pin DIP (Industrial)
DS1302S	8-Pin SOIC (200 mil)
DS1302SN	8-Pin SOIC (Industrial)
DS1302Z	8-Pin SOIC (150 mil)
DS1302ZN	8-Pin SOIC (Industrial)
DS1302S-16	16-Pin SOIC (300 mil)
DS1302SN-16	16-Pin SOIC (Industrial)

PIN ASSIGNMENT



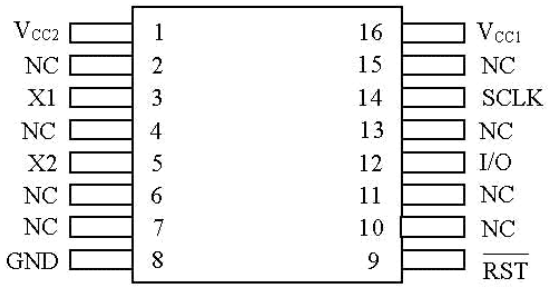
DS1302

8-Pin DIP (300 mil)



DS1302S 8-Pin SOIC (200 mil)

DS1302Z 8-Pin SOIC (150 mil)



16-Pin SOIC

PIN DESCRIPTION

X1,X2	-32.768 kHz Crystal Pins
GND	-Ground
$\overline{RST}$	-Reset
I/O	-Data Input/Output
SCLK	-Serial Clock
V_{CC1}, V_{CC2}	-Power Supply Pins

DESCRIPTION

The DS1302 Trickle Charge Timekeeping Chip contains a real time clock/calendar and 31 bytes of static RAM. It communicates with a microprocessor via a simple serial interface. The real time clock/calendar provides seconds, minutes, hours, day, date, month, and year information. The end of the month date is automatically adjusted for months with less than 31 days, including corrections for leap year. The clock operates in either the 24-hour or 12-hour format with an AM/PM indicator.

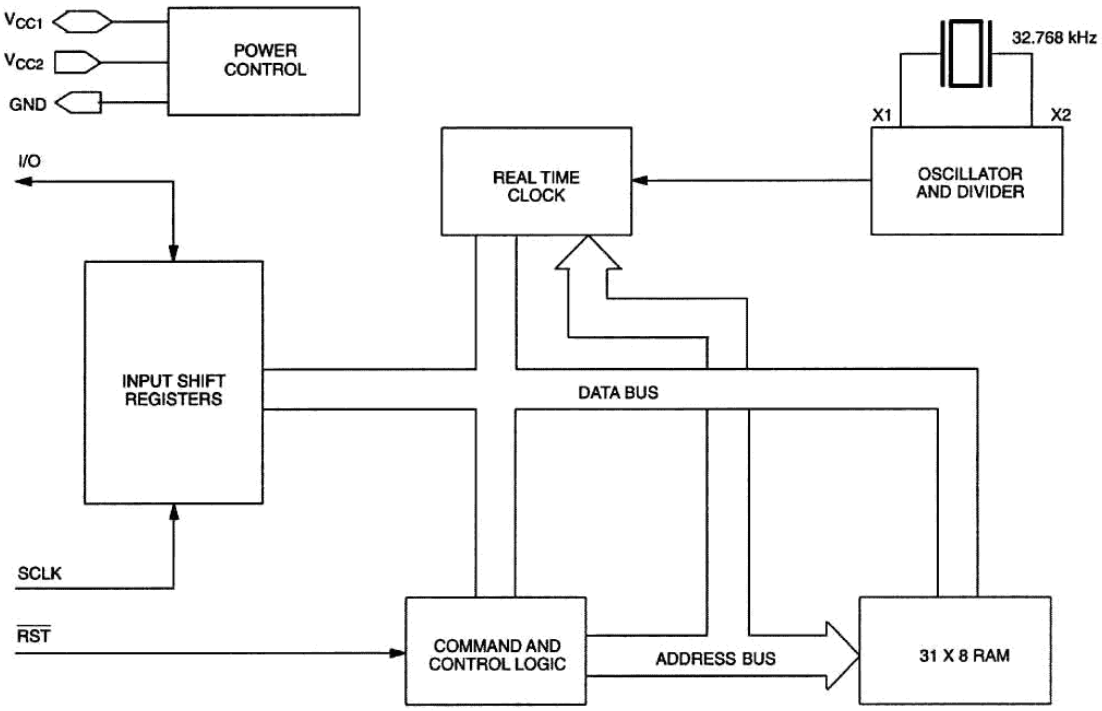
Interfacing the DS1302 with a microprocessor is simplified by using synchronous serial communication. Only three wires are required to communicate with the clock/RAM: (1) $\overline{RST}$(Reset), (2) I/O (Data line), and (3) SCLK (Serial Clock). Data can be transferred to and from the clock/RAM 1 byte at a time or in a burst of up 31 bytes. The DS1302 is designed to operate on very low power and retain data and clock information on less than 1 microwatt.

The DS1302 is the successor to the DS1202. In addition to the basic timekeeping functions of the DS1202, the DS1302 has the additional features of dual power pins for primary and back-up power supplies, programmable trickle charger for V_{CC1}, and seven additional bytes of scratchpad memory.

OPERATION

The main elements of the Serial Timekeeper are shown in Figure 1: shift register, control logic, oscillator, real time clock, and RAM.

DS1302 BLOCK DIAGRAM Figure 1



SIGNAL DESCRIPTIONS

Vcc1-Vcc1 provides low power operation in single supply and battery operated systems as well as low power battery backup. In systems using the trickle charger, the rechargeable energy source is connected to this pin.

Vcc2-Vcc2 is the primary power supply pin in a dual supply configuration. Vcc1 is connected to a backup source to maintain the time and date in the absence of primary power.

The DS1302 will operate from the larger of Vcc1 or Vcc2. When Vcc2 is greater than Vcc1+0.2V, Vcc2 will power the DS1302. When Vcc2 is less than Vcc1, Vcc1 will power the DS1302.

SCLK (Serial Clock Input) – SCLK is used to synchronize data movement on the serial interface.

I/O (Data Input/Output) –The I/O pin is the bi-directional data pin for the 3-wire interface.

$\overline{RST}$ **(Reset)** –The reset signal must be asserted high during a read or a write.

X1, X2 –Connections for a standard 32.768 kHz quartz crystal. The internal oscillator is designed for operation with a crystal having a specified load capacitance of 6 pF. For more information on crystal selection and crystal layout considerations, please consult Application Note 58, “Crystal Considerations with ARTSCHIP Real Time Clocks.” The DS1302 can also be driven by an external 32.768 kHz oscillator. In this configuration, the x1 pin is connected to the external oscillator signal and the X2 pin is floated.

COMMAND BYTE

The command byte is shown is Figure 2. Each data transfer is initiated by a command byte. The MSB (Bit 7) must be a logic 1. If it is 0, writes to the DS1302 will be disabled. Bit 6 specifies clock/calendar data if logic 0 or RAM data if logic 1. Bits 1 through 5 specify the designated registers to be input or output, and the LSB (bit 0) specifies a write operation (input) if logic 0 or read operation (output) if logic 1. The command byte is always input starting with the LSB (bit 0).

ADDRESS/COMMAND BYTE Figure 2

RESET AND CLOCK CONTROL

All data transfers are initiated by driving the $\overline{RST}$ input high. The $\overline{RST}$ input serves two functions. First, $\overline{RST}$ turns on the control logic which allows access to the shift register for the address/command sequence. Second, the $\overline{RST}$ signal provides a method of terminating either single byte or multiple byte data transfer.

A clock cycle is a sequence of a falling edge followed by a rising edge. For data inputs, data must be valid during the rising edge of the clock and data bits are output on the falling edge of clock. If the $\overline{RST}$ input is low all data transfer terminates and the I/O pin goes to a high impedance state. Data transfer is illustrated in Figure 3. At power-up, $\overline{RST}$ must be a logic 0 until Vcc >2.0 volts. Also SCLK must be at a logic 0 when $\overline{RST}$ is driven to a logic 1 state.

DATA INPUT

Following the eight SCLK cycles that input a write command byte, a data byte is input on the rising edge of the next eight SCLK cycles. Additional SCLK cycles are ignored should they inadvertently occur. Data is input starting with bit 0.

DATA OUTPUT

Following the eight SCLK cycles that input a read command byte, a data byte is output on the falling edge of the next eight SCLK cycles. Note that the first data bit to be transmitted occurs on the first falling edge after the last bit of the command byte is written. Additional SCLK cycles retransmit the data bytes should they inadvertently occur so long as $\overline{RST}$ remains high. This operation permits continuous burst mode read capability. Also, the I/O pin is tri-stated upon each rising edge of SCLK. Data is output starting with bit 0.

BURST MODE

Burst mode may be specified for either the clock/calendar or the RAM registers by addressing location 31 decimal (address/command bits 1 through 5 = logic 1). As before, bit 6 specifies clock or RAM and bit 0 specifies read or write. There is no data storage capacity at locations 9 through 31 in the Clock/Calendar Registers or location 31 in the RAM registers. Reads or writes in burst mode start with bit 0 of address 0.

When writing to the clock registers in the burst mode, the first eight registers must be written in order for the data to be transferred. However, when writing to RAM in burst mode it is not necessary to write all 31 bytes for the data to transfer. Each byte that is written to will be transferred to RAM regardless or whether all 31 bytes are written or not.

CLOCK/CALENDAR

The clock/calendar is contained in seven write/read registers as shown in Figure 4. Data contained in the clock/calendar registers is in binary coded decimal format (BCD).

CLOCK HALT FLAG

Bit 7 of the seconds register is defined as the clock halt flag. When this bit is set to logic 1, the clock oscillator is stopped and the DS1302 is placed into a low-power standby mode with a current drain of less than 100 nanoamps. When this bit is written to logic 0, the clock will start. The initial power on state is not defined.

AM-PM/12-14 MODE

Bit 7 of the hours register is defined as the 12- or 24-hour mode select bit. When high, the 12-hour mode is selected. In the 12-hour mode, bit 5 is the AM/PM bit with logic high being PM. In the 24-hour mode, bit 5 is the second 10-hour bit (20-23 hours).

WRITE PROTECT BIT

Bit 7 of the control register is the write-protect bit. The first seven bits (bits 0-6) are forced to 0 and will always read a 0 when read. Before any write operation to the clock or RAM, bit 7 must be 0. when high, the write protect bit prevents a write operation to any other register. The initial power on state is not defined, therefore the WP bit should be cleared before attempting to write to the device.

TRICKLE CHARGE REGISTER

This register controls the trickle charge characteristics of the DS1302. The simplified schematic of Figure 5 shows the basic components of the trickle charger. The trickle charge select (TCS) bits (bits 4-7) control the selection of the trickle charger. In order to prevent accidental enabling, only a pattern of 1010 will enable the trickle charger. All other patterns will disable the trickle charger. The DS1302 powers up with the trickle charger disabled. The diode select (DS) bits (bits 2-3) select whether one diode or two diodes are connected between Vcc2 and Vcc1. If DS is 01, one diode is selected or if DS is 10, two diodes are selected. If DS is 00 or 11, the trickle charger is disabled independently of TCS. The RS bits (bits 0-1) select the resistor that is connected between Vcc2 and Vcc1. The resistor selected by the resistor select (RS) bit is as follows.

RS Bits	Resistor	Typical Value
00	None	None
01	R1	2KΩ
10	R2	4KΩ
11	R3	8KΩ

If RS is 00, the trickle charger is disabled independently of TCS.

Diode and resistor selection is determined by the user according to the maximum current desired for battery or super cap charging. The maximum charging current can be calculated as illustrated in the following example. Assume that a system power supply of 5 volt is applied to Vcc2 and a super cap is connected to Vcc1. Also assume that the trickle charger has been enabled with one diode and resistor R1 between Vcc2 and Vcc1. The maximum current Imax would therefore be calculated as follows:

Imax =(5.0V – diode drop)/R1

~(5.0V -0.7V)/2KΩ

~2.2mA

Obviously, as the super cap charges, the voltage drop between Vcc2 and Vcc1 will decrease and therefore the charge current will decrease.

CLOCK/CALENDAR BURST MODE

The clock/calendar command byte specifies burst mode operation. In this mode the first eight clock/calendar registers can be consecutively read or written (see Figure 4) starting with bit 0 of address 0.

If the write protect bit is set high when a write clock/calendar burst mode is specified, no data transfer will occur to any of the eight clock/calendar registers (this includes the control register). The trickle charger is not accessible in burst mode.

At the beginning of a clock burst read, the current time is transferred to a second set of registers. The time information is read from these secondary registers, while the clock may continue to run. This eliminates the need to re-read the registers in case of an update of the main registers during a read.

RAM

The static RAM is 31 x 8 bytes addressed consecutively in the RAM address space.

RAM BURST MODE

The RAM command byte specifies burst mode operation. In this mode, the 31 RAM registers can be consecutively read or written (see Figure 4) starting with bit 0 of address 0.

REGISTER SUMMARY

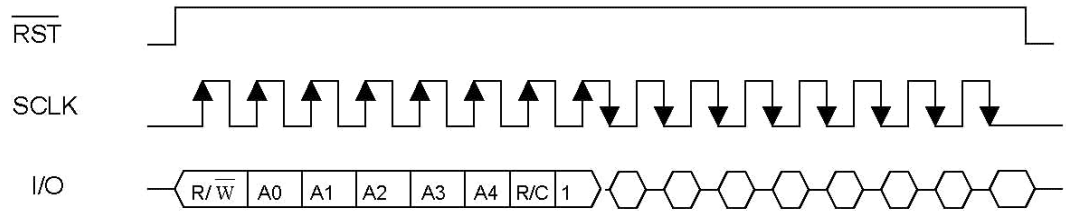
A register data format summary is shown in Figure 4.

CRYSTAL SELECTION

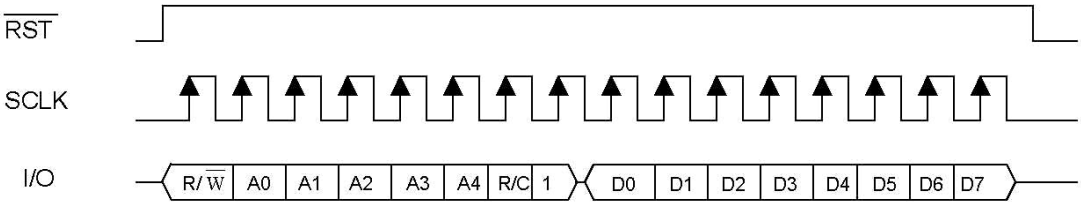
A 32.768 kHz crystal can be directly connected to the DS1302 via X1 and X2. The crystal selected for use should have a specified load capacitance (CL) of 6 pF. For more information on crystal selection and crystal layout consideration, please consult Application Note 58, “Crystal Considerations with ARTSCHIP Real Time Clocks.”

DATA TRANSFER SUMMARY Figure 3

SINGLE BYTE READ



SINGLE BYTE WRITE



In burst mode, $\overline{RST}$ is kept high and additional SCLK cycles are sent until the end of the burst.

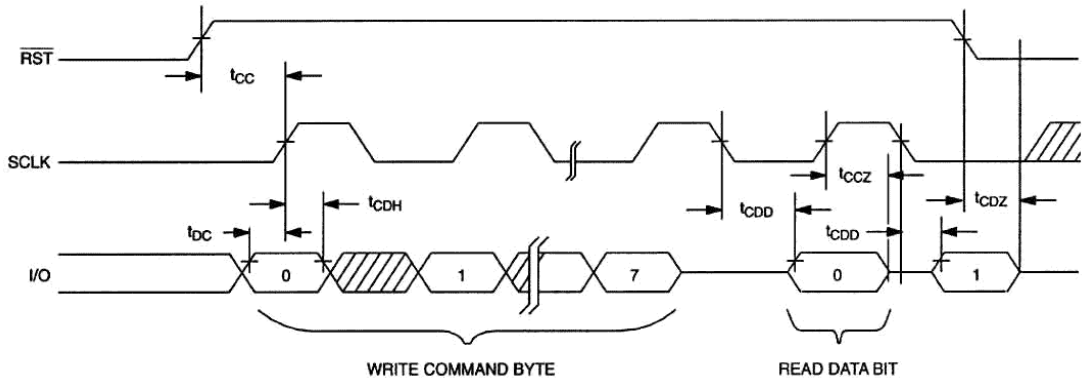
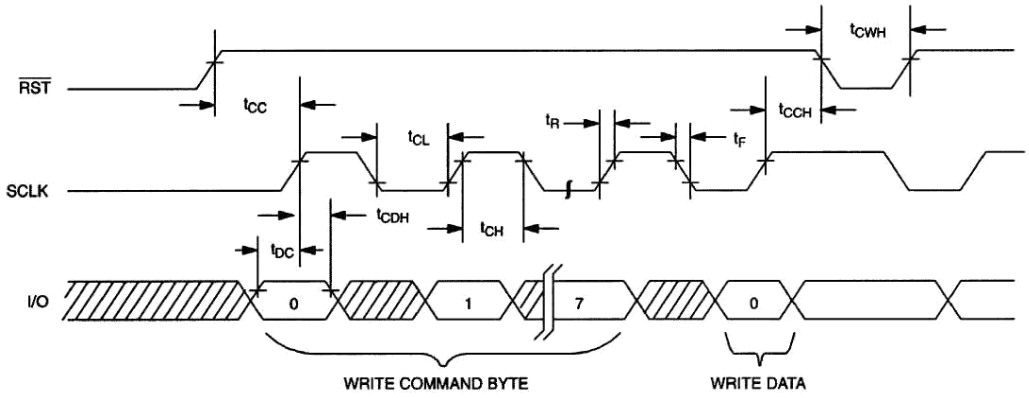
TIMING DIAGRAM: READ DATA TRANSFER Figure 5



TIMING DIAGRAM: WRITE DATA TRANSFER Figure 6



NOTES:

1. All voltage are referenced to ground.
2. Logic one voltages are specified at a source current of 1 mA at Vcc=5V and 0.4mA at Vcc=2.0V, V_{OH} =Vcc for capacitive loads.
3. Logic zero voltages are specified at a sink current of 4 mA at Vcc=5V and 1.5mA at Vcc=2.0V, V_{OL}=GND for capacitive loads.
4. I_{CC1T} and L_{CC2T} are specified with I/O open, $\overline{RST}$ set to a logic " 0" , and clock halt flag=0 (oscillator enabled).
5. I_{CC1A} and I_{CC2A} are specified with the I/O pin open, $\overline{RST}$ high, SCLK=2 MHz at Vcc=5V; SCLK=500KHz, Vcc=2.0V and clock halt flag=0 (oscillator enabled).
6. $\overline{RST}$, SCLK, and I/O all have 40kΩ pull-down resistors to ground.
7. Measured at V_{IH} = 2.0V or V_{IL} =0.8V and 10 ns maximum rise and fall time.
8. Measured at V_{OH}=2.4V or V_{OL}=0.4V.
9. Load capacitance=50pF.
10. I_{CC1S} and I_{CC2S} are specified with $\overline{RST}$, I/O, and SCLK open. The clock halt flag must be set to logic one (oscillator disabled).
11. Vcc=Vcc2. when Vcc2>Vcc1 +0.2V; Vcc=Vcc1, when Vcc1>Vcc2.
12. Vcc1=0V.
13. Vcc1=0V.
14. Typical values are at 25℃.
