128Mb (2M×4Bank×16) Double DATA RATE SDRAM

Features

- Internal Double-Date-Rate architecture with 2 Accesses per clock cycle.
- VDD/VDDQ= 2.5V ±0.2V for (-75 and -6)
- VDD/VDDQ= 2.6V ±0.1V for (-5)
- 2.5V SSTL-2 compatible I/O
- Burst Length (B/L) of 2, 4, 8
- 2,2.5,3 Clock read latency
- Bi-directional,intermittent data strobe(DQS)
- All inputs except data and DM are sampled at the positive edge of the system clock.
- Data Mask (DM) for write data
- Sequential & Interleaved Burst type available
- Auto Precharge option for each burst accesses
- DQS edge-aligned with data for Read cycles
- DQS center-aligned with data for Write cycles
- DLL aligns DQ & DQS transitions with CLK's
- Auto Refresh and Self Refresh
- 4,096 Refresh Cycles / 64ms

Description

The EM428M1644RTA is high speed Synchronous graphic RAM fabricated with ultra high performance CMOS process containing 134,217,728 bits which organized as 2Meg words x 4 banks by 16 bits.
The 128Mb DDR SDRAM uses a double data rate architecture to accomplish high-speed operation.
The data path internally prefetches multiple bits and It transfers the datafor both rising and falling edges of the system clock.It means the doubled data bandwidth can be achieved at the I/O pins.
Available packages:TSOPII 66P 400mil.

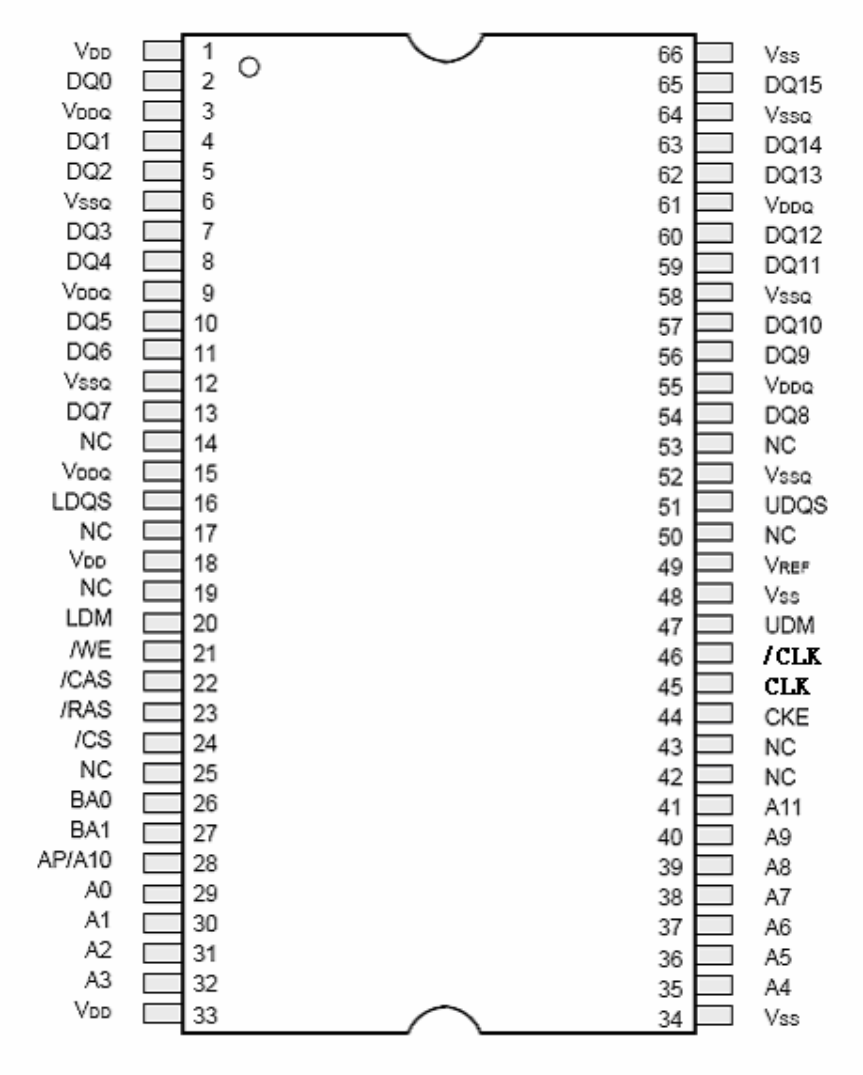
Pin Assignment



66pin TSOP-II / (400mil × 875mil) / (0.65mm Pin pitch)

Pin Description (Simplified)

Pin	Name	Function
45,46	CLK,/CLK	**(System Clock)** Clock input active on the Positive rising edge except for DQ and DM are active on both edge of the DQS. CLK and /CLK are differential clock inputs.
24	/CS	**(Chip Select)** /CS enables the command decoder when "L" and disable the command decoder when "H".The new command are over-Looked when the command decoder is disabled but previous operation will still continue.
44	CKE	**(Clock Enable)** Activates the CLK when "H" and deactivates when "L". When deactivate the clock,CKE low signifies the power down or self refresh mode.
28~32,35~41	A0~A11	**(Address)** Row address (A0 to A11) and Calumn address (CA0 to CA8) are multiplexed on the same pin. CA10 defines auto precharge at Calumn address.
26, 27	BA0, BA1	**(Bank Address)** Selects which bank is to be active.
23	/RAS	**(Row Address Strobe)** Latches Row Addresses on the positive rising edge of the CLK with /RAS "L". Enables row access & pre-charge.
22	/CAS	**(Column Address Strobe)** Latches Column Addresses on the positive rising edge of the CLK with /CAS low. Enables column access.
21	/WE	**(Write Enable)** Latches Column Addresses on the positive rising edge of the CLK with /CAS low. Enables column access.
16/51	LDQS/UDQS	**(Data Input/Output)** Data Inputs and Outputs are synchronized with both edge of DQS.
20/47	LDM/UDM	**(Data Input/Output Mask)** DM controls data inputs.LDM corresponds to the data on DQ0~DQ7.UDM corresponds to the data on DQ8~DQ15.
2, 4, 5, 7, 8, 10, 11, 13, 54, 56, 57, 59, 60, 62, 63, 65	DQ0~DQ15	**(Data Input/Output)** Data inputs and outputs are multiplexed on the same pin.
1,18,33/ 34,48,66	V_{DD}/V_{SS}	**(Power Supply/Ground)** V_{DD} and V_{SS} are power supply pins for internal circuits.
3, 9, 15, 55.61/ 6, 12, 52, 58,64	V_{DDQ}/V_{SSQ}	**(Power Supply/Ground)** V_{DDQ} and V_{SSQ} are power supply pins for the output buffers.
14,17,19,25,42, 43,50,53	NC/RFU	**(No Connection/Reserved for Future Use)** This pin is recommended to be left No Connection on the device.
49	V_{REF}	**(Input)** SSTL-2 Reference voltage for input buffer.

Absolute Maximum Rating

Symbol	Item	Rating		Units
V_{IN}, V_{OUT}	Input, Output Voltage	-0.3 ~ +3.6		V
V_{DD}, V_{DDQ}	Power Supply Voltage	-0.3 ~ +3.6		V

I_{OS}	Short Circuit Current	50		mA

Note: Caution Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

Remark: H = High level, L = Low level, X = High or Low level (Don't care)

Notes 1: After CKE's low to high transition to exist self refresh mode.And a time of t_{RC}(min) has to be Elapse after CKE's low to high transition to issue a new command.

Notes 2: CKE low to high transition is asynchronous as if restarts internal clock.

Notes 3: Power down and self refresh can be entered only from the idle state of all banks.

Mode Register Definition

Mode Register Set

The mode register stores the data for controlling the various operating modes of DDR SDRAM which contains addressing mode, burst length, /CAS latency, test mode, DLL reset and various vendor's specific opinions. The defaults values of the register is not defined, so the mode register must be written after EMRS setting for proper DDR SDRAM operation. The mode register is written by asserting low on /CS, /RAS, /CAS, /WE and BA0 (The DDR SDRAM should be in all bank precharge with CKE already high prior to writing into the mode register.) The state of the address pins A0-A12 in the same cycle as /CS, /RAS, /CAS, /WE and BA0 going low is written in the mode register. Two clock cycles are requested to complete the write operation in the mode register. The mode register contents can be changed using the same command and clock cycle requirements during operating as long as all banks are in the idle state. The mode register is divided into various fields depending on functionality. The burst length uses A0-A2, addressing mode uses A3, /CAS latency (read latency from column address) uses A4-A6. A7 is used for test mode. A8 is used for DDR reset. A7 must be set to low for normal MRS operation.

DLL Enable / Disable

The DLL must be enabled for normal operation. DLL enable is required during power-up initialization and upon returning to normal operation after having disable the DLL for the purpose of debug or evaluation (upon existing Self Refresh Mode, the DLL is enable automatically.) Any time the DLL is enabled, 200 clock cycles must occur before a READ command can be issued.

Output Drive Strength

The normal drive strength got all outputs is specified to be SSTL-2, Class II. Some vendors might also support a weak drive strength option, intended for lighter load and/or point to point environments.

Extended Mode Register Set (EMRS)

The Extended mode register stores the data enabling or disabling DLL. The value of the extended mode register is not defined, so the extended mode register must be written after power up for enabling or disabling DLL. The extended mode register is written by asserting low on /CS, /RAS, /CAS, /WE and high on BA0 (The DDR SDRAM should be in all bank precharge with CKE already prior to writing into the extended mode register.) The state of address pins A0-A10 and BA1 in the same cycle as /CS, /RAS, /CAS, and /WE going low is written in the extended mode register. The mode register contents can be changed using the same command and clock cycle requirements during operation as long as all banks are in the idle state. A0 is used for DLL enable or disable. High on BA0 is used for EMRS. All the other address pins except A0 and BA0 must be set to low for proper EMRS operation.
