Octal D-type flip-flop with 3-state outputs

HEF40374B
MSI

DESCRIPTION

The HEF40374B is an octal D-type flip-flop with 3-state buffered outputs with a common clock input (CP). The device is used primarily as an 8-bit positive edge-triggered storage register for interfacing with a 3-state bus. Data on the D-inputs is transferred to storage during the LOW-to-HIGH transition of the clock (CP) input. The 3-state output buffers are controlled by an active LOW output enable input ($\overline{EO}$). A HIGH on $\overline{EO}$ forces the eight outputs to a high impedance OFF-state. When $\overline{EO}$ is LOW, the data in the register appears at the outputs.

The output stages have high current output capability suitable for driving highly capacitive loads.

The device features hysteresis on the CP input to improve noise rejection.

Schmitt-trigger action in the E input makes the circuit highly tolerant to slower input rise and fall times.

The HEF40374B is pin and functionally compatible with the TTL '374' device.

Supply voltage range: 3 to 15 V.

Fig.1 Functional diagram.

Fig.2 Pinning diagram.

HEF40374BP(N): 20-lead DIL; plastic (SOT146-1)

HEF40374BD(F): 20-lead DIL; ceramic (cerdip) (SOT152)

HEF40374BT(D): 20-lead SO; plastic (SOT163-1)

(): Package Designator North America

PINNING

D₀ to D₇ data inputs
 CP clock input
 $\overline{EO}$ output enable input (active LOW)
 O₀ to O₇ 3-state buffered outputs

FUNCTION TABLE

OPERATING MODES	INPUTS			INTERNAL REGISTER	OUTPUTS O ₀ TO O ₇
	$\overline{EO}$	CP	D _n		
load & read register	L		l	L	L
	L		h	H	H
load register & disable outputs	H		l	L	Z
	H		h	H	Z

Notes

- H = HIGH state (the more positive voltage)
 h = HIGH state (one set-up time prior to the LOW-to-HIGH clock transition)
 L = LOW state (the less positive voltage)
 l = LOW state (one set-up time prior to the LOW-to-HIGH clock transition)
 Z = high impedance OFF-state
 = LOW-to-HIGH clock transition
