

FEATURES

Resolution of up to 8192 angle steps per sine/cosine period
 Binary and decimal resolution settings, e.g. 500, 512, 1000, 1024; programmable angle hysteresis
 Conversion time of just 250 ns including amplifier settling
 Count-safe vector follower principle, realtime system with 70 MHz sampling rate
 Direct sensor connection; selectable input gain
 Front-end signal conditioning features offset (8 bit), amplitude ratio (5 bit) and phase (6 bit) calibration
 250 kHz input frequency
 Absolute angle output via fast SSI interface
 A QUAD B incremental outputs with selectable minimum transition distance (e.g. 0.25 μ s for 1 MHz at A)
 Index signal processing adjustable in position and width
 Fault monitoring: frequency, amplitude, configuration (CRC)
 Setup via serial EEPROM
 ESD protection and TTL-/CMOS-compatible outputs

APPLICATIONS

Interpolator IC for position data acquisition from analog sine/cosine sensors
 Optical linear/rotary encoders
 MR sensor systems

PACKAGES

TSSOP20

BLOCK DIAGRAM

DESCRIPTION

iC-NQL is a monolithic A/D converter which, by applying a count-safe vector follower principle, converts sine/cosine sensor signals with a selectable resolution and hysteresis into angle position data. This absolute value is output via a synchronous-serial SSI interface and trails a master clock rate of up to 4 Mbit/s.

At the same time any changes in output data are converted into incremental A QUAD B encoder signals. Here, the minimum transition distance can be adapted to suit the system on hand (cable length, external counter). A synchronised zero index is generated and output to Z if enabled by the PZERO and NZERO inputs.

The front-end amplifiers are configured as instrumentation amplifiers, permitting sensor bridges to be di-

rectly connected without the need for external resistors. Various programmable D/A converters are available for the conditioning of sine/cosine sensor signals with regard to offset, amplitude ratio and phase errors. Front-end gain can be set in stages graded to suit all common differential sensor signals from approximately 20 mVpp to 1.5 Vpp, and also single-ended sensor signals from 40 mVpp to 3 Vpp respectively.

The device reads its configuration data via the serial EEPROM interface when cycling power, respectively following an undervoltage reset. The read in cycle is repeated up to three times when data correctness is not confirmed by a CRC validation. A permanent CRC error as well as the configuration phase itself is displayed at the error message output NERR by a low level signal.

PACKAGES TSSOP20 (according to JEDEC Standard)
PIN CONFIGURATION

TSSOP20 4.4 mm, lead pitch 0.65 mm

PIN FUNCTIONS

No.	Name	Function
1	PCOS	Input Cosine +
2	NCOS	Input Cosine -
3	VDDA	+5 V Supply Voltage (analog)
4	GNDA	Ground (analog)
5	VREF	Reference Voltage Output
6	A	Incremental Output A Analog signal COS+ (TMA mode) PWM signal for Offset Sine (Calib.)
7	B	Incremental Output B Analog signal COS- (TMA mode) PWM signal for Offset Cosine (Calib.)
8	Z	Output Index Z PWM signal for Phase/Ratio (Calib.)
9	GND	Ground
10	VDD	+5 V Supply Voltage (digital)
11	TEST	Test Input
12	CLK	SSI interface, clock line
13	DATA	SSI interface, data output
14	SDA	EEPROM interface, data line Analog signal SIN+ (TMA mode)
15	SCL	EEPROM interface, clock line Analog signal SIN- (TMA mode)
16	NERR	Error Input/Output, active low
17	PZERO	Input Zero Signal +
18	NZERO	Input Zero Signal -
19	PSIN	Input Sine +
20	NSIN	Input Sine -

External connections linking VDDA to VDD and GND to GNDA are required. The test input may remain unwired or can be linked to VDD (please note the hints given by chapter Design Review regarding the signal of pin DATA).

ABSOLUTE MAXIMUM RATINGS

These ratings do not imply operating conditions; functional operation is not guaranteed. Beyond these ratings device damage may occur.

Item No.	Symbol	Parameter	Conditions	Min. Max.		Unit
G001	VDDA	Voltage at VDDA		-0.3	6	V
G002	VDD	Voltage at VDD		-0.3	6	V

SIGNAL CONDITIONING

Input stages SIN and COS are configured as instrumentation amplifiers. The amplifier gain must be selected in accordance with the sensor signal level and

programmed to register GAIN according to the following table. Half of the supply voltage is output to VREF as center voltage to help DC level adaptation.

GAIN		Adr 0x08, Bit 7:4			
Code	Amplification	Sine/Cosine Input Signal Levels Vin()			
		Amplitude		Average value (DC)	
		Differential	Single-ended	Differential	Single-ended
0x0F	80.000	up to 50 mVpp	up to 100 mVpp	0.7 V ... VDDA - 1.2 V	0.8 V ... VDDA - 1.2 V
0x0E	66.667	up to 60 mVpp	up to 120 mVpp	0.7 V ... VDDA - 1.2 V	0.8 V ... VDDA - 1.2 V

Notes	^{*1} Not useful with incremental A quad B output. ^{*2,4,8} The internal converter resolution is higher by a factor of 2, 4 or 8.	

Table 12: Decimal Resolutions

HYS ADR 0x01, Bit 7:5			
Code	Hysteresis in degree	Hysteresis in LSB	Absolute Angle Error*
0x00	0°		
0x01	0.0879°	1 LSB @ 12 bit	0.044°
0x02	0.1758°	1/2 LSB @ 10 bit	0.088°
0x03	0.3516°	1 LSB @ 10 bit	0.176°
0x04	0.7031°	1/2 LSB @ 8 bit	0.352°
0x05	1.4063°	1 LSB @ 8 bit	0.703°
0x06	5.625°		2.813°
0x07	45°	only recommended for calibration	22.5°
Notes	*) The absolute angle error is equivalent to one half the angle hysteresis		

Table 13: Hysteresis

MAXIMUM POSSIBLE CONVERTER FREQUENCY

The converter frequency automatically adjusts to the value necessary for the input frequency and resolution. This value ranges from zero to a maximum dependent on the oscillator frequency which can be set using register FCTR.

Serial data output

For SSI output the maximum possible converter frequency can be adjusted to suit the maximum input frequency; an automatic converter resolution step-down

feature can be enabled via the FCTR register. Should the input frequency exceed the frequency limit of the selected converter resolution, the LSB is kept stable and not resolved any further; the interpolation resolution halves.

If the next frequency limit is overshoot, the LSB and the LSB+1 are kept stable and so on. When the input frequency again sinks below this frequency limit, the fine resolution automatically returns.

Max. Possible Converter Frequency For Serial Data Output

Notes	*) Calculated with $f_{osc}()min$ taken from Electrical Characteristics item A01.								

Table 14: Maximum converter frequency for serial data output.

Incremental output to A, B and Z

There are two criteria which must be considered when setting the maximum possible converter frequency via the FCTR register:

1. The maximum input frequency
2. System limitations, e.g. due to slow counters or cable transmission

nals. A digital zero-delay glitch filter then takes care of a temporal edge-to-edge separation, guaranteeing spike-free output signals after an ESD impact to the sensor, for instance.

A serial data output is simultaneously possible at any time. However, for the transfer of angle data to the output register the incremental output is halted for one period of the clock signal applied to pin CLK.

When facing system limitations it is useful to pre-select a minimum transition distance for the output sig-

1. Max. Possible Converter Frequency Defined By The Maximum Input Frequency						
FCTR	Output Frequency f_{out} @ $f_{in_{max}}$	Resolution Requirem.		Maximum Input Frequency $f_{in_{max}}$	Restrictions at high input frequency	Examples* $f_{in_{max}}$ [kHz] at resol.
	A, B	bin	dec			8192 1024 200

Error Indication at NERR	
Failure Mode	Pin signal NERR
No error	HI
Amplitude error	LO/HI = 75 %
Frequency error	LO/HI = 50 %
Configuration	LO
Undervoltage	LO
System error	NERR = low by external error signal

Table 27: Error indication at NERR

Figure 12: Signal monitoring of minimum amplitude.

Figure 13: $\text{Sin}^2 + \text{Cos}^2$ signal monitoring.

To enable the diagnosis of faults, the various types of error are signaled at NERR using a PWM code as given in the key table.

Two error bits are provided to enable communication via the SSI interface; these bits can decode four different types of error. If NERR is held at low by an external source, such as an error message from the system, for example, this can also be verified via the SSI interface.

Error events are stored for the SSI data output and deleted afterwards. Errors at NERR are displayed for a minimum of ca. 10 ms, as far as no SSI readout causes a deletion.

If an error in amplitude occurs the conversion process is terminated and the incremental output signals halted. An error in amplitude rules out the possibility of an error in frequency.

Error Messages SSI	
Failure Mode	Error bits E1, E0 (active low)
No error	1, 1
Amplitude error	0, 1
Frequency error	1, 0
Configuration	0, 0
System error	0, 0 (NERR pulled low by external signal)
Line Signal SLO	iC-NQL_3: Data output is deactivated and SLO permanently high in case of: configuration phase, invalid configuration, undervoltage.

TEST FUNCTIONS

TMODE	Adr 0x06, Bit 3:1	
Code	Signal at Z	Description
0x00	Z	no test mode
0x01	A xor B	Output A EXOR B
0x02	ENCLK	iC-Haus device test
0x03	NLOCK	iC-Haus device test
0x04	CLK	iC-Haus device test
0x05	DIVC	iC-Haus device test
0x06	PZERO - NZERO	iC-Haus device test
0x07	TP	iC-Haus device test
Condition	CFGABZ = 0x00	

Table 29: Test Mode

Figure 14: Calibrated signals with TMA mode.

TMA	Adr 0x06, Bit 0			
Code	Pin A	Pin B	Pin SDA	Pin SCL
0x00	A	B	SDA	SCL
0x01	COS+	COS-	SIN+	SIN-
Notes	To permit the verification of GAIN and OFFSET settings, the input amplifier outputs are available at the pins. To operate the converter a signal of 4 Vpp is the ideal here and should not be exceeded. Pin loads above 1 MΩ are advisable for accurate measurements.			

Table 30: Analog Test Mode

Parameter GAIN ideally adjusts the signal levels to ca. 4 Vpp and should not be touched afterwards.

Both scope display modes are feasible for OFFS (positive values) or RATIO adjustments; regarding the adjustment of PHASE the X/Y mode may be preferred.

For OFFS adjustment towards negative values the test signals COS- (pin B) and SIN- (pin SCL) are relevant.

SSI INTERFACE

After each communication cycle the SSI interface returns to its idle state when the monoflop timeout t_{tos} has elapsed. This temporal condition also determines up to which clock line pause duration the iC-NQL retains the current data output cycle - the master may thus not undershoot a minimum clock frequency of $f(\text{CLK})_{\text{min}}$.

CFGTOS Adr 0x06, Bit 5:4			
Code	Timeout t_{tos}	Ref. clock counts	$f(\text{CLK})_{\text{min}}^*$
0x00	Design iC-NQL X3: typ. 128 μs	256-259	11 kHz
0x01	typ. 16 μs	32-35	88 kHz
0x02	typ. 4 μs	8-11	352 kHz
0x03	typ. 1 μs	2-5	1.41 MHz
0x00	Design iC-NQL 3: typ. 20 μs	46-46	50 kHz
0x01	typ. 20 μs	46-47	50 kHz
0x02	typ. 1.5 μs	3-4	660 kHz
0x03	typ. 1.5 μs	3-4	660 MHz
Notes	A ref. clock count is equal to $\frac{32}{f_{osc}}$ (see El. Char., A01). The permissible max. clock frequency is specified by E05. *) A low clock frequency can reduce the permissible maximum input frequency since conversion is paused after the first falling edge on CLK for a half clock cycle.		

Table 31: Monoflop Time (SSI Timeout)

The iC-NQL position data output contains the angle value (S) with a bit length of 2 to 13 bits (depending on SELRES), and up to 3 add-on bits (error messages E1 and E0 plus a zero bit). Generally, the data output is in binary format starting with the MSB.

Signal Names	
Name	Description
S	Sensor data (S0 is LSB)
E	Error messages
Stop	Low signal

Table 32: Signal Names

The angle conversion is halted for a half clock cycle as soon as the interface receives the first falling edge on CLK, what is the trigger signal to output updated position data. The halt duration must be taken into consideration when calculating the maximum input frequency.

CFGSSI Adr 0x03, Bit 7:6

Table 34: SSI Output Formats

EEPROM INTERFACE and STARTUP BEHAVIOUR

Serial EEPROM components permitting operation from 3.3 V to 5 V can be connected (such as 24C02, for example). When the device is switched on the memory area of bytes 0 to 15 is mapped onto iC-NQL's registers.

After the supply has been turned on (power on reset), iC-NQL reads the configuration data from the EEPROM and during this phase halts error pin NERR actively on a low signal (open drain output).

After a successful CRC the data output to SLO is released and the error indication at pin NERR reset; an external pull-up resistor can supply a high signal. iC-NQL then switches to normal operation and determines the current angle position, providing that a sensor is connected up to it and there is no amplitude error (or this is deactivated).

Should the CRC prove unsuccessful due to a data error (disrupted transmission, no EEPROM or the EEPROM is not programmed), the configuration phase is automatically repeated. After a third failed attempt, the procedure is aborted and error pin NERR remains active, displaying a permanent low.

After startup, iC-NQL does not recognize a defined configuration; the configuration RAM can contain any values.

Example of CRC Calculation Routine

```

unsigned char ucDataStream = 0;
int iCRCPoly = 0x127;
unsigned char ucCRC=0;
int i = 0;

ucCRC = 0; // start value !!!
for (iReg = 0; iReg<15; iReg ++ )
{
    ucDataStream = ucGetValue(iReg);
    for (i=0; i<=7; i++) {
        if ((ucCRC & 0x80) != (ucDataStream & 0x80))
            ucCRC = (ucCRC << 1) ^ iCRCPoly;
        else
            ucCRC = (ucCRC << 1);
        ucDataStream = ucDataStream << 1;
    }
}

```

CRC_E2P Adr 0x0F, Bit 7:0

DESIGN REVIEW: Notes On Chip Functions

iC-NQL X3		
No.	Function, Parameter/Code	Description and Application Hints
1	ZPOS Illegal settings: 0x01...0x07, 0x09...0x0F, 0x11...0x17, 0x19...0x1F	Illegal settings of ZPOS delay accurate converter operation following power on. Depending on the sin/cos input signals (phase angle) the A/B outputs can provide pulses causing an external counter to alternately count up and down. This may disturb the startup of a drive if the motion controller tolerates only single A/B edges during standstill checking. The converter operation is again accurate when the sin/cos input signals have changed, by a maximum of 45 angular degrees.
2	Pin DATA	When cycling power pin DATA may show high or low level initially. With pin TEST = low (e.g. pin open) at least a single low pulse at pin CLK is required to trigger pin DATA to show a high level after the timeout has elapsed. When continuing the clock signal after completion of data output, additional zero bits are output. With pin TEST = high (e.g. pin wired to VDD) only the timeout needs to elapse to trigger pin DATA showing high level. When continuing the clock signal after completion of data output, additional one bits are output.
3	M2S obsolete	Bits 5 to 7 of address 0x00 must be programmed to zero; period counting is not available.

Table 36: Notes on chip functions iC-NQL_X3

iC-NQL 3		
No.	Function, Parameter/Code	Description and Application Hints
1	Pin DATA	When cycling power pin DATA shows high level initially and remains on a permanent high if CRC verification does not confirm the configuration data.
3	M2S obsolete	Bits 5 to 7 of address 0x00 must be programmed to zero; period counting is not available.

iC-Haus expressly reserves the right to change its products and/or specifications. An info letter gives details as to any amendments and additions made to the relevant current specifications on our internet website www.ichaus.de/infoletter; this letter is generated automatically and shall be sent to registered users by email.

Copying – even as an excerpt – is only permitted with iC-Haus' approval in writing and precise reference to source.

iC-Haus does not warrant the accuracy, completeness or timeliness of the specification and does not assume liability for any errors or omissions in these materials.

The data specified is intended solely for the purpose of product description. No representations or warranties, either express or implied, of merchantability, fitness for a particular purpose or of any other nature are made hereunder with respect to information/specification or the products to which information refers and no guarantee with respect to compliance to the intended use is given. In particular, this also applies to the stated possible applications or areas of applications of the product.

iC-Haus conveys no patent, copyright, mask work right or other trade mark right to this product. iC-Haus assumes no liability for any patent and/or other trade mark rights of a third party resulting from processing or handling of the product and/or any other use of the product.

As a general rule our developments, IPs, principle circuitry and range of Integrated Circuits are suitable and specifically designed for appropriate use in technical applications, such as in devices, systems and any kind of technical equipment, in so far as they do not infringe existing patent rights. In principle the range of use is limitless in a technical sense and refers to the products listed in the inventory of goods compiled for the 2008 and following export trade statistics issued annually by the Bureau of Statistics in Wiesbaden, for example, or to any product in the product catalogue published for the 2007 and following exhibitions in Hanover (Hannover-Messe).

We understand suitable application of our published designs to be state-of-the-art technology which can no longer be classed as inventive under the stipulations of patent law. Our explicit application notes are to be treated only as mere examples of the many possible and extremely advantageous uses our products can be put to.
