

INA27x Voltage Output, Unidirectional Measurement Current-Shunt Monitor

1 Features

- Wide Common-Mode Range: -16 V to $+80\text{ V}$
- CMRR: 120 dB
- Accuracy:
 - $\pm 0.5\text{-mV}$ Offset (typ)
 - $\pm 0.2\%$ Gain Error (typ)
 - $2.5\text{ }\mu\text{V}/^\circ\text{C}$ Offset Drift (typ)
 - $50\text{ ppm}/^\circ\text{C}$ Gain Drift (max)
- Bandwidth: Up to 130 kHz
- Two Gain Options Available:
 - 14 V/V (INA270)
 - 20 V/V (INA271)
- Quiescent Current: $700\text{ }\mu\text{A}$ (typ)
- Power Supply: $+2.7\text{ V}$ to $+18\text{ V}$
- Provision for Filtering

2 Applications

- Power Management
- Automotive
- Telecom Equipment
- Notebook Computers
- Battery Chargers
- Cell Phones
- Welding Equipment

3 Description

The INA270 and INA271 family of voltage-output, current-sense amplifiers can sense drops across shunt resistors at common-mode voltages from -16 V to $+80\text{ V}$, independent of the supply voltage. The INA270 and INA271 pinouts readily enable filtering.

The INA270 and INA271 are available with two gain options: 14 V/V and 20 V/V. The 130-kHz bandwidth simplifies use in current-control loops.

The INA270 and INA271 operate from a single $+2.7\text{-V}$ to $+18\text{-V}$ supply, drawing $700\text{ }\mu\text{A}$ (typical) of supply current. The devices are specified over the extended operating temperature range of -40°C to $+125^\circ\text{C}$ and are offered in an SOIC-8 package.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
INA27x	SOIC (8)	4.90 mm $\times$ 3.91 mm

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision C (May 2010) to Revision D	Page
• Changed format to meet latest data sheet standards	1
• Added <i>Handling Rating</i> , <i>Pin Descriptions</i> , and <i>Recommended Operating Conditions</i> tables and <i>Feature Description</i> , <i>Device Functional Modes</i> , <i>Application and Implementation</i> , <i>Power Supply Recommendations</i> , <i>Layout</i> , <i>Device and Documentation Support</i> , and <i>Mechanical, Packaging, and Orderable Information</i> sections	1
• Changed <i>Accuracy</i> and <i>Quiescent Current</i> Features bullets: changed from max specifications and values to typical	1
• Changed wording in <i>Two Gain Options Available</i> Features bullet	1
• Changed <i>Description</i> section for clarification	1
• Added Device Information table	1
• Deleted Ordering Information table	3
• Changed Input, <i>Full-Scale Input Voltage</i> parameter conditions in Electrical Characteristics table	5
• Changed title of <i>First- or Second-Order Filtering</i> section	12
• Changed title of <i>Power Supply Recommendations</i> section	17

Changes from Revision B (July 2008) to Revision C	Page
• Corrected Figure 17 y-axis	14
• Corrected Figure 18 y-axis	14

INA271	20 V/V

6 Pin Configuration and Functions

NOTE (1): NC denotes no internal connection.

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
BUF IN	4	Analog input	Connect to output of filter from PRE OUT
GND	2	Analog	Ground
IN–	1	Analog input	Connect to load side of shunt resistor
IN+	8	Analog input	Connect to supply side of shunt resistor
NC	7	—	Connect to ground
OUT	5	Analog output	Output voltage
PRE OUT	3	Analog output	Connect to input of filter to BUF IN
V+	6	Analog input	Power supply, +2.7 V to +18 V

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾

	MIN	MAX	UNIT
Supply voltage (V_S)		+18	V
Analog inputs, V_{IN+} , V_{IN-} :	Differential, $(V_{IN+}) - (V_{IN-})$		V
	Common-mode		V
Analog output: OUT and PRE OUT pins	GND – 0.3	(V+) + 0.3	V
Input current into any pin		5	mA
Operating temperature	–55	+150	°C
Junction temperature		+150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

8 Detailed Description

8.1 Overview

The INA270 and INA271 family of current-shunt monitors with voltage output can sense drops across current shunts at common-mode voltages from -16 V to $+80\text{ V}$, independent of the supply voltage. The INA270 and INA271 pinouts readily enable filtering.

The INA270 and INA271 are available with two output voltage scales: 14 V/V and 20 V/V . The 130-kHz bandwidth simplifies use in current-control loops.

The INA270 and INA271 operate from a single $+2.7\text{-V}$ to $+18\text{-V}$ supply, drawing a maximum of $900\text{ }\mu\text{A}$ of supply current. The devices are specified over the extended operating temperature range of -40°C to $+125^{\circ}\text{C}$ and are offered in an SOIC-8 package.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Basic Connection

Figure 15 shows the basic connection of the INA270 and INA271. Connect the input pins (IN+ and IN–) as closely as possible to the shunt resistor to minimize any resistance in series with the shunt resistance.

Power-supply bypass capacitors are required for stability. Applications with noisy or high-impedance power supplies may require additional decoupling capacitors to reject power-supply noise. Place minimum bypass capacitors of 0.01 μF and 0.1 μF in value close to the supply pins. Although not mandatory, an additional 10-mF electrolytic capacitor placed in parallel with the other bypass capacitors may be useful in applications with particularly noisy supplies.

Figure 15. INA270 Basic Connections

8.3.2 Selecting R_S

The value chosen for the shunt resistor, R_S , depends on the application and is a compromise between small-signal accuracy and maximum permissible voltage loss in the measurement line. High values of R_S provide better accuracy at lower currents by minimizing the effects of offset, while low values of R_S minimize voltage loss in the supply line. For most applications, best performance is attained with an R_S value that provides a full-scale shunt voltage range of 50 mV to 100 mV. Maximum input voltage for accurate measurements is $(V_S - 0.2) / \text{Gain}$.

8.3.3 Transient Protection

The –16-V to +80-V common-mode range of the INA270 and INA271 is ideal for withstanding automotive fault conditions ranging from 12-V battery reversal up to +80-V transients because no additional protective components are needed up to those levels. In the event that the INA270 and INA271 are exposed to transients on the inputs in excess of their ratings, external transient absorption with semiconductor transient absorbers (zeners or Transzorbs) are necessary.

Feature Description (continued)

Use of MOVs or VDRs is not recommended except when they are used in addition to a semiconductor transient absorber. Select the transient absorber such that it never allows the INA270 and INA271 to be exposed to transients greater than 80 V (that is, allow for transient absorber tolerance, as well as additional voltage because of transient absorber dynamic impedance). Despite the use of internal zener-type ESD protection, the INA270 and INA271 are not suited to using external resistors in series with the inputs because the internal gain resistors can vary up to $\pm 30\%$, but are tightly matched (if gain accuracy is not important, then resistors can be added in series with the INA270 and INA271 inputs with two equal resistors on each input).

8.4 Device Functional Modes

8.4.1 First- or Second-Order Filtering

The output of the INA270 and INA271 is accurate within the output voltage swing range set by the power-supply pin, $V+$.

The INA270 and INA271 readily enable the inclusion of filtering between the preamp output and buffer input. Single-pole filtering can be accomplished with a single capacitor because of the 96-k Ω output impedance at PRE OUT on pin 3, as shown in Figure 16a.

The INA270 and INA271 readily lend themselves to second-order Sallen-Key configurations, as shown in Figure 16b. When designing these configurations consider that the PRE OUT 96-k Ω output impedance exhibits an initial variation of $\pm 30\%$ with the addition of a $-2200\text{-ppm}/^\circ\text{C}$ temperature coefficient.

NOTE: Remember to use the appropriate buffer gain (INA270 = 1.4, INA271 = 2) when designing Sallen-Key configurations.

Figure 16. The INA270–INA271 can be Easily Connected for First- or Second-Order Filtering

Device Functional Modes (continued)

8.4.2 Accuracy Variations as a Result of V_{SENSE} and Common-Mode Voltage

The accuracy of the INA270 and INA271 current shunt monitors is a function of two main variables: V_{SENSE} ($V_{IN+} - V_{IN-}$) and common-mode voltage (V_{CM}) relative to the supply voltage, V_S . V_{CM} is expressed as $(V_{IN+} + V_{IN-}) / 2$; however, in practice, V_{CM} is used as the voltage at V_{IN+} because the voltage drop across V_{SENSE} is usually small.

This section addresses the accuracy of these specific operating regions:

Normal Case 1: $V_{SENSE} \geq 20 \text{ mV}$, $V_{CM} \geq V_S$

Normal Case 2: $V_{SENSE} \geq 20 \text{ mV}$, $V_{CM} < V_S$

Low V_{SENSE} Case 1:

$V_{SENSE} < 20 \text{ mV}$, $-16 \text{ V} \leq V_{CM} < 0$

Low V_{SENSE} Case 2:

$V_{SENSE} < 20 \text{ mV}$, $0 \text{ V} \leq V_{CM} \leq V_S$

Low V_{SENSE} Case 3:

$V_{SENSE} < 20 \text{ mV}$, $V_S < V_{CM} \leq 80 \text{ V}$

8.4.2.1 Normal Case 1: $V_{SENSE} \geq 20 \text{ mV}$, $V_{CM} \geq V_S$

This region of operation provides the highest accuracy. Here, the input offset voltage is characterized and measured using a two-step method. First, the gain is determined by [Equation 1](#).

$$G = \frac{V_{OUT1} - V_{OUT2}}{100\text{mV} - 20\text{mV}}$$

where

- V_{OUT1} = Output voltage with $V_{SENSE} = 100 \text{ mV}$ and
- V_{OUT2} = Output voltage with $V_{SENSE} = 20 \text{ mV}$. (1)

Then the offset voltage is measured at $V_{SENSE} = 100 \text{ mV}$ and referred to the input (RTI) of the current shunt monitor, as shown in [Equation 2](#).

$$V_{OS\text{RTI}} (\text{Referred-To-Input}) = \left[\frac{V_{OUT1}}{G} \right] - 100\text{mV} \quad (2)$$

In the [Typical Characteristics](#), the *Output Error vs Common-Mode Voltage* curve ([Figure 6](#)) shows the highest accuracy for the this region of operation. In this plot, $V_S = 12 \text{ V}$; for $V_{CM} \geq 12 \text{ V}$, the output error is at its minimum. This case is also used to create the $V_{SENSE} \geq 20 \text{ mV}$ output specifications in the [Electrical Characteristics](#) table.

8.4.2.2 Normal Case 2: $V_{SENSE} \geq 20 \text{ mV}$, $V_{CM} < V_S$

This region of operation has slightly less accuracy than [Normal Case 1](#) as a result of the common-mode operating area in which the device functions, as illustrated in the *Output Error vs Common-Mode Voltage* curve ([Figure 6](#)). As noted, for this graph $V_S = 12 \text{ V}$; for $V_{CM} < 12 \text{ V}$, the output error increases when V_{CM} becomes less than 12 V , with a typical maximum error of 0.005% at the most negative $V_{CM} = -16 \text{ V}$.

8.4.2.3 Low V_{SENSE} Case 1: $V_{SENSE} < 20 \text{ mV}$, $-16 \text{ V} \leq V_{CM} < 0$; and Low V_{SENSE} Case 3: $V_{SENSE} < 20 \text{ mV}$, $V_S < V_{CM} \leq 80 \text{ V}$

Although the INA270 family of devices are not designed for accurate operation in either of these regions, some applications are exposed to these conditions. For example, when monitoring power supplies that are switched on and off while V_S is still applied to the INA270 or INA271, knowing what the behavior of the devices is in these regions is important.

Device Functional Modes (continued)

When V_{SENSE} approaches 0 mV, in these V_{CM} regions, the device output accuracy degrades. A larger-than-normal offset can appear at the current shunt monitor output with a typical maximum value of $V_{OUT} = 60$ mV for $V_{SENSE} = 0$ mV. When V_{SENSE} approaches 20 mV, V_{OUT} returns to the expected output value with accuracy as specified in the [Electrical Characteristics](#). Figure 17 shows this effect using the INA271 (gain = 20).

Figure 17. Example For Low V_{SENSE} Cases 1 and 3 (INA271, Gain = 20)

8.4.2.4 Low V_{SENSE} Case 2: $V_{SENSE} < 20$ mV, 0 V $\leq V_{CM} \leq V_S$

This region of operation is the least accurate for the INA270 family. To achieve the wide input common-mode voltage range, these devices use two op amp front ends in parallel. One op amp front end operates in the positive input common-mode voltage range, and the other in the negative input region. For this case, neither of these two internal amplifiers dominates and overall loop gain is very low. Within this region, V_{OUT} approaches voltages close to linear operation levels for [Normal Case 2](#).

This deviation from linear operation becomes greatest the closer V_{SENSE} approaches 0 V. Within this region, when V_{SENSE} approaches 20 mV, device operation is closer to that described by [Normal Case 2](#). Figure 18 shows this behavior for the INA271. The V_{OUT} maximum peak for this case is determined by maintaining a constant V_S , setting $V_{SENSE} = 0$ mV, and sweeping V_{CM} from 0 V to V_S . The exact V_{CM} at which V_{OUT} peaks during this case varies from device to device. The maximum peak voltage for the INA270 is 0.28 V; for the INA271, the maximum peak voltage is 0.4 V.

NOTE: (1) INA271 V_{OUT} Limit = 0.4V. INA270 V_{OUT} Limit = 0.28V.

Figure 18. Example for Low V_{SENSE} Case 2 (INA271, Gain = 20)

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The INA270 and INA271 measures the voltage developed across a current-sensing resistor when current passes through it. The ability to drive the reference terminal to adjust the functionality of the output signal offers multiple configurations discussed throughout this section. There is also a filtering feature to remove unwanted transients and smooth the output voltage.

9.2 Typical Application

Figure 19. Filtering Configuration

9.2.1 Design Requirements

In this application, the device is configured to measure a triangular periodic current at 10 kHz with filtering. The average current through the shunt is the information that is desired. This current can be either solenoid current or inductor current where current is being pulsed through.

Selecting the capacitor size is based on the lowest frequency component to be filtered out. The amount of signal that is filtered out is dependant on this cutoff frequency. From the cutoff frequency, the attention is 20 dB per decade.

Typical Application (continued)

9.2.2 Detailed Design Procedure

Without this filtering capability, an input filter must be used. When series resistance is added to the input, large errors also come into play because the resistance must be large to create a low cutoff frequency. By using a 10-nF capacitor for the single-pole filter capacitor, the 10-kHz signal is averaged. The cutoff frequency made by the capacitor is set at 166 Hz frequency. This frequency is well below the periodic frequency and reduces the ripple on the output and the average current can easily be measured.

9.2.3 Application Curves

Figure 20 shows the output waveform without filtering. The output signal tracks the input signal with a large ripple. If this current is sampled by an ADC, many samples must be taken to average the current digitally. This process takes additional time to sample and average and is very time consuming, thus is unwanted for this application.

Figure 21 shows the output waveform with filtering. The output signal is filtered and the average can easily be measured with a small ripple. If this current is sampled by an ADC, only a few samples must be taken to average. Digital averaging is now not required and the time required is significantly reduced.

Figure 20. Without Filtering

Figure 21. With Filtering

10 Power Supply Recommendations

The input circuitry of the INA270 and INA271 can accurately measure beyond its power-supply voltage, $V+$. For example, the $V+$ power supply can be 5 V, whereas the load power-supply voltage is up to +80 V. The output voltage range of the OUT terminal, however, is limited by the voltages on the power-supply pin.

10.1 Shutdown

The INA270 and INA271 do not provide a shutdown pin; however, because these devices consume a quiescent current less than 1 mA, they can be powered by either the output of logic gates or by transistor switches to supply power. Driving the gate low shuts down the INA270 and INA271. Use a totem-pole output buffer or gate that can provide sufficient drive along with a 0.1- μ F bypass capacitor, preferably ceramic with good high-frequency characteristics. This gate must have a supply voltage of 3 V or greater because the INA270 and INA271 require a minimum supply greater than 2.7 V. In addition to eliminating quiescent current, this gate also turns off the 10- μ A bias current present at each of the inputs. Note that the IN+ and IN– inputs are able to withstand full common-mode voltage under all powered and under-powered conditions. An example shutdown circuit is shown in Figure 22.

Figure 22. INA270-INA271 Example Shutdown Circuit

11 Layout

11.1 Layout Guidelines

- Connect the input pins to the sensing resistor using a Kelvin or 4-wire connection. This connection technique ensures that only the current-sensing resistor impedance is detected between the input pins. Poor routing of the current-sensing resistor commonly results in additional resistance present between the input pins. Given the very low ohmic value of the current resistor, any additional high-current carrying impedance can cause significant measurement errors.
- Place the power-supply bypass capacitor as closely as possible to the supply and ground pins. The recommended value of this bypass capacitor is 0.1 μF . Additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.

11.1.1 RFI and EMI

Attention to good layout practices is always recommended. Keep traces short and, when possible, use a printed circuit board (PCB) ground plane with surface-mount components placed as close to the device pins as possible. Small ceramic capacitors placed directly across amplifier inputs can reduce RFI and EMI sensitivity. PCB layout must locate the amplifier as far away as possible from RFI sources. Sources can include other components in the same system as the amplifier itself, such as inductors (particularly switched inductors handling a lot of current and at high frequencies). RFI can generally be identified as a variation in offset voltage or dc signal levels with changes in the interfering RF signal. If the amplifier cannot be located away from sources of radiation, shielding may be needed. Twisting wire input leads makes them more resistant to RF fields. The difference in input pin location of the INA270 and INA271 versus the [INA193 to INA198](#) may provide different EMI performance.

All trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
INA270AID	ACTIVE	SOIC	D	8	75	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 125	I270A	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
 - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
