

# IS41C8205 IS41LV8205

## 2M x 8 (16-MBIT) DYNAMIC RAM WITH FAST PAGE MODE

JUNE, 2001

### FEATURES

- Fast Page Mode Access Cycle
- TTL compatible inputs and outputs
- Refresh Interval:  
-- 2,048 cycles/32 ms
- Refresh Mode:  $\overline{\text{RAS}}$ -Only,  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  (CBR), and Hidden
- Single power supply:  
5V $\pm$ 10% or 3.3V  $\pm$  10%
- Byte Write and Byte Read operation via two  $\overline{\text{CAS}}$
- Industrial temperature range -40°C to 85°C

### PRODUCT SERIES OVERVIEW

| Part No.   | Refresh | Voltage        |
|------------|---------|----------------|
| IS41C8205  | 2K      | 5V $\pm$ 10%   |
| IS41LV8205 | 2K      | 3.3V $\pm$ 10% |

### PIN CONFIGURATION

28 Pin SOJ, TSOP (Type II)

### DESCRIPTION

The *ISSI* IS41C8205 and IS41LV8205 are 2,097,152 x 8-bit high-performance CMOS Dynamic Random Access Memory. The Fast Page Mode allows 2,048 random accesses within a single row with access cycle time as short as 20 ns per 4-bit word.

These features make the IS41C8205 and IS41LV8205 ideally suited for high-bandwidth graphics, digital signal processing, high-performance computing systems, and peripheral applications.

The IS41C8205 and IS41LV8205 are packaged in 28-pin 300-mil SOJ and 28-pin TSOP (Type II) with JEDEC standard pinouts.

### KEY TIMING PARAMETERS

| Parameter                                                | -50 | -60 | Unit |
|----------------------------------------------------------|-----|-----|------|
| $\overline{\text{RAS}}$ Access Time ( $t_{\text{RAC}}$ ) | 50  | 60  | ns   |
| $\overline{\text{CAS}}$ Access Time ( $t_{\text{CAC}}$ ) | 13  | 15  | ns   |
| Column Address Access Time ( $t_{\text{AA}}$ )           | 25  | 30  | ns   |
| Fast Page Mode Cycle Time ( $t_{\text{PC}}$ )            | 20  | 25  | ns   |
| Read/Write Cycle Time ( $t_{\text{RC}}$ )                | 84  | 104 | ns   |

### PIN DESCRIPTIONS

|                         |                       |
|-------------------------|-----------------------|
| A0-A10                  | Address Inputs        |
| I/O0-7                  | Data Inputs/Outputs   |
| $\overline{\text{WE}}$  | Write Enable          |
| $\overline{\text{OE}}$  | Output Enable         |
| $\overline{\text{RAS}}$ | Row Address Strobe    |
| $\overline{\text{CAS}}$ | Column Address Strobe |
| Vcc                     | Power                 |
| GND                     | Ground                |
| NC                      | No Connection         |

**Note:**  
1. EARLY WRITE only.

## Functional Description

The IS41C8205 and IS41LV8205 are CMOS DRAMs optimized for high-speed bandwidth, low power applications. During READ or WRITE cycles, each bit is uniquely addressed through the 11 address bits. These are entered 11 bits (A0-A10) at a time. The row address is latched by the Row Address Strobe ( $\overline{\text{RAS}}$ ). The column address is latched by the Column Address Strobe ( $\overline{\text{CAS}}$ ).  $\overline{\text{RAS}}$  is used to latch the first nine bits and  $\overline{\text{CAS}}$  is used the latter ten bits.

## Memory Cycle

A memory cycle is initiated by bring  $\overline{\text{RAS}}$  LOW and it is terminated by returning both  $\overline{\text{RAS}}$  and  $\overline{\text{CAS}}$  HIGH. To ensure proper device operation and data integrity any memory cycle, once initiated, must not be ended or aborted before the minimum  $t_{\text{RAS}}$  time has expired. A new cycle must not be initiated until the minimum precharge time  $t_{\text{RP}}$ ,  $t_{\text{CP}}$  has elapsed.

## Read Cycle

A read cycle is initiated by the falling edge of  $\overline{\text{CAS}}$  or  $\overline{\text{OE}}$ , whichever occurs last, while holding  $\overline{\text{WE}}$  HIGH. The column address must be held for a minimum time specified by  $t_{\text{AR}}$ . Data Out becomes valid only when  $t_{\text{RAC}}$ ,  $t_{\text{AA}}$ ,  $t_{\text{CAC}}$  and  $t_{\text{OEA}}$  are all satisfied. As a result, the access time is dependent on the timing relationships between these parameters.

## Write Cycle

A write cycle is initiated by the falling edge of  $\overline{\text{CAS}}$  and  $\overline{\text{WE}}$ , whichever occurs last. The input data must be valid at or before the falling edge of  $\overline{\text{CAS}}$  or  $\overline{\text{WE}}$ , whichever occurs last.

## Auto Refresh Cycle

To retain data, 2,048 refresh cycles are required in each 32 ms period. There are two ways to refresh the memory:

1. By clocking each of the 2,048 row addresses (A0 through A10) with  $\overline{\text{RAS}}$  at least once every 32 ms. Any read, write, read-modify-write or  $\overline{\text{RAS}}$ -only cycle refreshes the addressed row.
2. Using a  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycle.  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh is activated by the falling edge of  $\overline{\text{RAS}}$ , while holding  $\overline{\text{CAS}}$  LOW. In  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycle, an internal 9-bit counter provides the row addresses and the external address inputs are ignored.

$\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  is a refresh-only mode and no data access or device selection is allowed. Thus, the output remains in the High-Z state during the cycle.

## Power-On

After application of the  $V_{\text{CC}}$  supply, an initial pause of 200  $\mu\text{s}$  is required followed by a minimum of eight initialization cycles (any combination of cycles containing a  $\overline{\text{RAS}}$  signal).

During power-on, it is recommended that  $\overline{\text{RAS}}$  track with  $V_{\text{CC}}$  or be held at a valid  $V_{\text{IH}}$  to avoid current surges.

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

| Symbol           | Parameters                                                           |            | Rating                       | Unit |

### Note:

1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## RECOMMENDED OPERATING CONDITIONS (Voltages are referenced to GND.)

| Symbol          | Parameter                      |      | Min. | Typ. | Max.                  | Unit |

### Notes:

1. An initial pause of 200 μs is required after power-up followed by eight  $\overline{RAS}$  refresh cycles ( $\overline{RAS}$ -Only or CBR) before proper device operation is assured. The eight  $\overline{RAS}$  cycles wake-up should be repeated any time the t<sub>REF</sub> refresh requirement is exceeded.
2. Dependent on cycle rates.
3. Specified values are obtained with minimum cycle time and the output open.
4. Column-address is changed once each Fast Page cycle.
5. Enables on-chip refresh and address counters.

## AC TEST CONDITIONS

Output load: Two TTL Loads and 50 pF ( $V_{CC} = 5.0V \pm 10\%$ )  
One TTL Load and 50 pF ( $V_{CC} = 3.3V \pm 10\%$ )

Input timing reference levels:  $V_{IH} = 2.4V$ ,  $V_{IL} = 0.8V$  ( $V_{CC} = 5.0V \pm 10\%$ );  
 $V_{IH} = 2.0V$ ,  $V_{IL} = 0.8V$  ( $V_{CC} = 3.3V \pm 10\%$ )

Output timing reference levels:  $V_{OH} = 2.0V$ ,  $V_{OL} = 0.8V$  ( $V_{CC} = 5V \pm 10\%$ ,  $3.3V \pm 10\%$ )

**Notes:**

1. An initial pause of 200  $\mu$ s is required after power-up followed by eight  $\overline{\text{RAS}}$  refresh cycle ( $\overline{\text{RAS}}$ -Only or CBR) before proper device operation is assured. The eight  $\overline{\text{RAS}}$  cycles wake-up should be repeated any time the  $t_{\text{REF}}$  refresh requirement is exceeded.
2.  $V_{\text{IH}}$  (MIN) and  $V_{\text{IL}}$  (MAX) are reference levels for measuring timing of input signals. Transition times, are measured between  $V_{\text{IH}}$  and  $V_{\text{IL}}$  (or between  $V_{\text{IL}}$  and  $V_{\text{IH}}$ ) and assume to be 1 ns for all inputs.
3. In addition to meeting the transition rate specification, all input signals must transit between  $V_{\text{IH}}$  and  $V_{\text{IL}}$  (or between  $V_{\text{IL}}$  and  $V_{\text{IH}}$ ) in a monotonic manner.
4. If  $\overline{\text{CAS}}$  and  $\overline{\text{RAS}} = V_{\text{IH}}$ , data output is High-Z.
5. If  $\overline{\text{CAS}} = V_{\text{IL}}$ , data output may contain data from the last valid READ cycle.
6. Measured with a load equivalent to one TTL gate and 50 pF.
7. Assumes that  $t_{\text{RCD}} - t_{\text{RCD}} (\text{MAX})$ . If  $t_{\text{RCD}}$  is greater than the maximum recommended value shown in this table,  $t_{\text{RAC}}$  will increase by the amount that  $t_{\text{RCD}}$  exceeds the value shown.
8. Assumes that  $t_{\text{RCD}} \bullet t_{\text{RCD}} (\text{MAX})$ .
9. If  $\overline{\text{CAS}}$  is LOW at the falling edge of  $\overline{\text{RAS}}$ , data out will be maintained from the previous cycle. To initiate a new cycle and clear the data output buffer,  $\overline{\text{CAS}}$  and  $\overline{\text{RAS}}$  must be pulsed for  $t_{\text{CP}}$ .
10. Operation with the  $t_{\text{RCD}} (\text{MAX})$  limit ensures that  $t_{\text{RAC}} (\text{MAX})$  can be met.  $t_{\text{RCD}} (\text{MAX})$  is specified as a reference point only; if  $t_{\text{RCD}}$  is greater than the specified  $t_{\text{RCD}} (\text{MAX})$  limit, access time is controlled exclusively by  $t_{\text{CAC}}$ .
11. Operation within the  $t_{\text{RAD}} (\text{MAX})$  limit ensures that  $t_{\text{RCD}} (\text{MAX})$  can be met.  $t_{\text{RAD}} (\text{MAX})$  is specified as a reference point only; if  $t_{\text{RAD}}$  is greater than the specified  $t_{\text{RAD}} (\text{MAX})$  limit, access time is controlled exclusively by  $t_{\text{AA}}$ .
12. Either  $t_{\text{RCH}}$  or  $t_{\text{RRH}}$  must be satisfied for a READ cycle.
13.  $t_{\text{OFF}} (\text{MAX})$  defines the time at which the output achieves the open circuit condition; it is not a reference to  $V_{\text{OH}}$  or  $V_{\text{OL}}$ .
14.  $t_{\text{WCS}}$ ,  $t_{\text{RWD}}$ ,  $t_{\text{AWD}}$  and  $t_{\text{CWD}}$  are restrictive operating parameters in LATE WRITE and READ-MODIFY-WRITE cycle only. If  $t_{\text{WCS}} \bullet t_{\text{WCS}} (\text{MIN})$ , the cycle is an EARLY WRITE cycle and the data output will remain open circuit throughout the entire cycle. If  $t_{\text{RWD}} \bullet t_{\text{RWD}} (\text{MIN})$ ,  $t_{\text{AWD}} \bullet t_{\text{AWD}} (\text{MIN})$  and  $t_{\text{CWD}} \bullet t_{\text{CWD}} (\text{MIN})$ , the cycle is a READ-WRITE cycle and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of I/O (at access time and until  $\overline{\text{CAS}}$  and  $\overline{\text{RAS}}$  or  $\overline{\text{OE}}$  go back to  $V_{\text{IH}}$ ) is indeterminate.  $\overline{\text{OE}}$  held HIGH and  $\overline{\text{WE}}$  taken LOW after  $\overline{\text{CAS}}$  goes LOW result in a LATE WRITE ( $\overline{\text{OE}}$ -controlled) cycle.
15. Output parameter (I/O) is referenced to corresponding  $\overline{\text{CAS}}$  input.
16. During a READ cycle, if  $\overline{\text{OE}}$  is LOW then taken HIGH before  $\overline{\text{CAS}}$  goes HIGH, I/O goes open. If  $\overline{\text{OE}}$  is tied permanently LOW, a LATE WRITE or READ-MODIFY-WRITE is not possible.
17. Write command is defined as  $\overline{\text{WE}}$  going low.
18. LATE WRITE and READ-MODIFY-WRITE cycles must have both  $t_{\text{OD}}$  and  $t_{\text{OEH}}$  met ( $\overline{\text{OE}}$  HIGH during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycle. The I/Os will provide the previously written data if  $\overline{\text{CAS}}$  remains LOW and  $\overline{\text{OE}}$  is taken back to LOW after  $t_{\text{OEH}}$  is met.
19. The I/Os are in open during READ cycles once  $t_{\text{OD}}$  or  $t_{\text{OFF}}$  occur.
20. Determined by falling edge of  $\overline{\text{CAS}}$ .
21. Determined by rising edge of  $\overline{\text{CAS}}$ .
22. These parameters are referenced to  $\overline{\text{CAS}}$  leading edge in EARLY WRITE cycles and  $\overline{\text{WE}}$  leading edge in LATE WRITE or READ-MODIFY-WRITE cycles.
23.  $\overline{\text{CAS}}$  must meet minimum pulse width.
24. The 3 ns minimum is a parameter guaranteed by design.
25. Enables on-chip refresh and address counters.

## READ CYCLE

### Note:

1.  $t_{\text{OFF}}$  is referenced from rising edge of  $\overline{\text{RAS}}$  or  $\overline{\text{CAS}}$ , whichever occurs last.

# READ WRITE CYCLE (LATE WRITE and READ-MODIFY-WRITE CYCLES)

**EARLY WRITE CYCLE** ( $\overline{OE}$  = DON'T CARE)

The diagram illustrates the timing relationships for a 32Kbit 1M16M16M DRAM. The signals shown are  $\overline{\text{RAS}}$ ,  $\overline{\text{CAS}}$ , ADDRESS,  $\overline{\text{WE}}$ ,  $\overline{\text{OE}}$ , and I/O. The ADDRESS bus is divided into Row and Column segments. The I/O bus shows data output (OUT) during read operations. Various timing parameters are indicated by arrows and labels, such as  $t_{\text{RAS}}$  (RAS access time),  $t_{\text{RCD}}$  (RAS-to-CAS delay),  $t_{\text{CAS}}$  (CAS access time),  $t_{\text{AR}}$  (RAS hold time),  $t_{\text{AD}}$  (RAS delay),  $t_{\text{CAH}}$  (CAS hold time),  $t_{\text{AS}}$  (CAS setup time),  $t_{\text{CP}}$  (CAS pulse width),  $t_{\text{CPWD}}$  (CAS precharge delay),  $t_{\text{RSH}}$  (RAS setup time),  $t_{\text{CRP}}$  (CAS recovery time),  $t_{\text{RAH}}$  (RAS hold time),  $t_{\text{ASR}}$  (CAS setup time),  $t_{\text{RC}}$  (RAS refresh time),  $t_{\text{AA}}$  (RAS-to-ADDRESS delay),  $t_{\text{AC}}$  (RAS-to-CAS delay),  $t_{\text{OE}}$  (RAS-to-OE delay),  $t_{\text{TR}}$  (RAS-to-TR delay),  $t_{\text{CLZ}}$  (RAS-to-CLZ delay), and  $t_{\text{OED}}$  (RAS-to-OED delay).

**FAST-PAGE-MODE READ WRITE CYCLE (LATE WRITE and READ-MODIFY-WRITE Cycles)**

# FAST PAGE MODE EARLY WRITE CYCLE

**RAS-ONLY REFRESH CYCLE** ( $\overline{OE}$ ,  $\overline{WE}$  = DON'T CARE)

**CBR REFRESH CYCLE** (Addresses;  $\overline{WE}$ ,  $\overline{OE}$  = DON'T CARE)

**HIDDEN REFRESH CYCLE<sup>(1)</sup>** ( $\overline{WE}$  = HIGH;  $\overline{OE}$  = LOW)

**ORDERING INFORMATION**

**Commercial Range: 0°C to 70°C**  
**Voltage: 5V**

| Speed (ns) | Order Part No. | Package     |
|------------|----------------|-------------|
| 50         | IS41C8205-50J  | 300-mil SOJ |
| 60         | IS41C8205-60J  | 300-mil SOJ |

**Voltage: 3.3V**

| Speed (ns) | Order Part No. | Package     |
|------------|----------------|-------------|
| 50         | IS41LV8205-50J | 300-mil SOJ |
| 60         | IS41LV8205-60J | 300-mil SOJ |

**ORDERING INFORMATION**

**Industrial Range: -40°C to 85°C**
