## Integrated 3-Port 10/100 Managed Switch with PHYs

---

### Features

- **Integrated 3-Port 10/100 Ethernet Switch**
  - 2nd Generation Switch with Three MACs and Two PHYs Fully Compliant to IEEE 802.3u Standard
  - Non-Blocking Switch Fabric Ensures Fast Packet Delivery by Utilizing a 1K MAC Address Lookup Table and a Store-and-Forward Architecture
  - Full-Duplex IEEE 802.3x Flow Control (PAUSE) with Force Mode Option
  - Half-Duplex Back Pressure Flow Control
  - Automatic MDI/MDI-X Crossover with Disable and Enable Option
  - 100BASE-FX Support on Port 1
  - MII Interface Supports Both MAC Mode and PHY Mode
  - 7-Wire Serial Network Interface (SNI) Support for Legacy MAC
  - Comprehensive LED Indicator Support for Link, Activity, Full-/Half-Duplex and 10/100 Speed
- **Comprehensive Configuration Register Access**
  - Serial Management Interface (SMI) to All Internal Registers
  - MII Management (MIIM) Interface to PHY Registers
  - SPI and I<sup>2</sup>C Interface to all internal registers
  - I/O Pins Strapping and EEPROM to Program Selective Registers in Unmanaged Switch Mode
  - Control Registers Configurable on the Fly (Port-Priority, 802.1p/d/q, AN, etc.)
- **QoS/CoS Packet Prioritization Support**
  - Per Port, 802.1p, and DiffServ-Based
  - Re-Mapping of 802.1p Priority Field Per Port Basis
  - Four Priority Levels
- **Advanced Switch Features**
  - IEEE 802.1q VLAN Support for Up to 16 Groups (Full Range of VLAN IDs)
  - VLAN ID Tag/Untag Options, Per Port Basis
  - IEEE 802.1p/q Tag Insertion or Removal on a Per Port Basis (Egress)
  - Programmable Rate Limiting from 0 Mbps to 100 Mbps at the Ingress and Egress Port, Rate Options for High and Low Priority Per Port Basis
  - Broadcast Storm Protection with Percent Control (Global and Per Port Basis)
  - IEEE 802.1d Spanning Tree Protocol Support
  - Upstream Special Tagging Mode to Inform the Processor which Ingress Port Receives the Packet
  - IGMP V1/V2 Snooping Support for Multicast Packet Filtering
  - Double-Tagging Support
- **Switch Management Features**
  - Port Mirroring/Monitoring/Sniffing: Ingress and/or Egress Traffic to Any Port or MII
  - Management Information Base Counters for Fully Compliant Statistics Gathering, 34 MIB Counters Per Port
  - Loopback Modes for Remote Diagnostic of Failure
- **Low Power Dissipation**
  - <0.8 Watts (includes PHY transmit drivers)
  - Full-Chip Hardware Power-Down (Register Configuration Not Saved)
  - Per Port Based Software Power-Save on PHY (Idle Link Detection, Register Configuration Preserved)
  - Voltages: Core 1.8V, I/O and Transceiver 3.3V (Use KSZ8993ML for 3.3V-Only Operation)
- **Available in a 128-Pin PQFP Package**

### Applications

- Universal Solutions
  - Broadband Gateway/Firewall/VPN
  - Integrated DSL or Cable Modem Multi-Port Router
  - Wireless LAN Access Point + Gateway
  - Residential and Enterprise VoIP Gateway/Phone
  - Set-Top/Game Box
  - Home Networking Expansion
  - Standalone 10/100 Switch
  - FTTx Customer Premises Equipment
  - Fiber Broadband Gateway
- Upgradeable Solutions ([Note 1](#))
  - Unmanaged Switch with Future Option to Migrate to a Managed Solution
  - Single PHY Alternative with Future Expansion Option for Two Ports
- Industrial Solutions
  - Applications that Require Port Redundancy and Port Monitoring
  - Sensor Devices in Redundant Ring Topology

**Note 1:** The cost and time of PCB re-spin.

## TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at [docerrors@microchip.com](mailto:docerrors@microchip.com). We welcome your feedback.

### Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

### Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include -literature number) you are using.

### Customer Notification System

Register on our web site at [www.microchip.com](http://www.microchip.com) to receive the most current information on all of our products.

# KSZ8993M

## 1.0 INTRODUCTION

### 1.1 General Description

The KSZ8993M, a highly integrated Layer 2 managed switch, is designed for low port count, cost-sensitive 10/100 Mbps switch systems. It offers an extensive feature set that includes tag/port-based VLAN, quality of service (QoS) priority, management, management information base (MIB) counters, MII/SNI, and CPU control/data interfaces to effectively address a wide range of Fast Ethernet applications.

The KSZ8993M contains two 10/100 transceivers with patented mixed-signal low-power technology, three media access control (MAC) units, a high speed non-blocking switch fabric, a dedicated address lookup engine, and an on-chip frame buffer memory.

Both PHY units support 10BASE-T and 100BASE-TX. In addition, one of the PHY unit supports 100BASE-FX.

The KSZ8993ML is the single supply version with the same features of the KSZ8993M.

## 3.0 FUNCTIONAL DESCRIPTION

The KSZ8993M contains two 10/100 physical layer transceivers and three MAC units with an integrated Layer 2 managed switch.

The KSZ8993M has the flexibility to be used as either a managed or unmanaged design. In a managed design, the host processor has complete control of the KSZ8993M via the SMI interface, MIIM interface, SPI bus, or I<sup>2</sup>C bus. An unmanaged design is achieved through I/O strapping and/or EEPROM programming at system reset time.

On the media side, the KSZ8993M supports IEEE 802.3 10BASE-T and 100BASE-TX on both PHY ports, and 100BASE-FX on PHY port 1. The KSZ8993M can be used as a media converter.

The KSZ8993ML is the single-supply version with all the same features of the KSZ8993M. In the KSZ8993ML version, pin 22 provides 1.8V output power to the KSZ8993ML's V<sub>D</sub>DC, V<sub>D</sub>DA, and V<sub>D</sub>DAP power pins.

Refer to [Table 2-1](#) for information about pin 22.

Physical signal transmission and reception are enhanced through the use of patented analog circuitries that make the design more efficient and allow for lower power consumption and smaller chip die size.

### 3.1 Physical Layer Transceiver

#### 3.1.1 100BASE-TX TRANSMIT

The 100BASE-TX transmit function performs parallel-to-serial conversion, 4B/5B coding, scrambling, NRZ-to-NRZI conversion, MLT3 encoding and transmission. The circuit starts with a parallel-to-serial conversion, which converts the MII data from the MAC into a 125 MHz serial bit stream. The data and control stream is then converted into 4B/5B coding and followed by a scrambler. The serialized data is further converted from NRZ to NRZI format, and then transmitted in MLT3 current output. The output current is set by an external 1% 3.01 kΩ resistor for the 1:1 transformer ratio. It has a typical rise/fall time of 4 ns and complies with the ANSI TP-PMD standard regarding amplitude balance, overshoot, and timing jitter. The wave-shaped 10BASE-T output is also incorporated into the 100BASE-TX transmitter.

#### 3.1.2 100BASE-TX RECEIVE

The 100BASE-TX receiver function performs adaptive equalization, DC restoration, MLT3-to-NRZI conversion, data and clock recovery, NRZI-to-NRZ conversion, de-scrambling, 4B/5B decoding, and serial-to-parallel conversion.

The receiving side starts with the equalization filter to compensate for inter-symbol interference (ISI) over the twisted pair cable. Because the amplitude loss and phase distortion is a function of the cable length, the equalizer must adjust its characteristics to optimize performance. In this design, the variable equalizer makes an initial estimation based on comparisons of incoming signal strength against some known cable characteristics, and then tunes itself for optimization. This is an ongoing process and self-adjusts against environmental changes such as temperature variations.

Next, the equalized signal goes through a DC restoration and data conversion block. The DC restoration circuit is used to compensate for the effect of baseline wander and to improve the dynamic range. The differential data conversion circuit converts the MLT3 format back to NRZI. The slicing threshold is also adaptive.

The clock recovery circuit extracts the 125 MHz clock from the edges of the NRZI signal. This recovered clock is then used to convert the NRZI signal into the NRZ format. This signal is sent through the de-scrambler followed by the 4B/5B decoder. Finally, the NRZ serial data is converted to the MII format and provided as the input data to the MAC.

#### 3.1.3 PLL CLOCK SYNTHESIZER

The KSZ8893M generates 125 MHz, 31.25 MHz, 25 MHz, and 10 MHz clocks for system timing. Internal clocks are generated from an external 25 MHz crystal or oscillator.

#### 3.1.4 SCRAMBLER/DE-SCRAMBLER (100BASE-TX ONLY)

The purpose of the scrambler is to spread the power spectrum of the signal to reduce electromagnetic interference (EMI) and baseline wander. Transmitted data is scrambled through the use of an 11-bit wide linear feedback shift register (LFSR). The scrambler generates a 2047-bit non-repetitive sequence, and the receiver then de-scrambles the incoming data stream using the same sequence as at the transmitter.

## 3.1.5 100BASE-FX OPERATION

100BASE-FX operation is similar to 100BASE-TX operation with the differences being that the scrambler/de-scrambler and MLT3 encoder/decoder are bypassed on transmission and reception. In 100BASE-FX mode, the auto negotiation feature is bypassed since there is no standard that supports fiber auto negotiation. The auto-MDI/MDI-X feature is also disabled.

## 3.1.6 100BASE-FX SIGNAL DETECTION

In 100BASE-FX operation, the FXSD1 (fiber signal detect) input pin is usually connected to the fiber transceiver's SD (signal detect) output pin. 100BASE-FX mode is activated when the FXSD1 input pin is greater than 1V. When FXSD1 is between 1V and 1.8V, no fiber signal is detected and a far-end fault (FEF) is generated. When FXSD1 is over 2.2V, the fiber signal is detected.

Alternatively, the designer may choose not to implement the FEF feature. In this case, the FXSD1 input pin is tied high to force 100BASE-FX mode.

100BASE-FX signal detection is summarized in [Table 3-1](#).

**TABLE 3-1: FX AND TX MODE SELECTION**

| FXSD1 Input Voltage                 | Mode                                                     |
|-------------------------------------|----------------------------------------------------------|
| Less than 0.2V                      | TX mode                                                  |
| Greater than 1V, but less than 1.8V | FX mode<br>No signal detected<br>Far-end fault generated |
| Greater than 2.2V                   | FX mode<br>Signal detected                               |

To ensure proper operation, a resistive voltage divider is recommended to adjust the fiber transceiver's SD output voltage swing to match the FXSD1 pin's input voltage threshold.

## 3.1.7 100BASE-FX FAR-END FAULT

An FEF occurs when the signal detection is logically false on the receive side of the fiber transceiver. The KSZ8993M detects a FEF when its FXSD1 input is between 1.0V and 1.8V. When an FEF occurs, the transmission side signals the other end of the link by sending 84 1's followed by a zero in the idle period between frames.

Upon receiving an FEF, the LINK will go down (even when a fiber signal is detected) to indicate a fault condition. The transmitting side is not affected when an FEF is received and will continue to send out its normal transmit pattern from the MAC. By default, FEF is enabled. The FEF feature can be disabled through register setting.

## 3.1.8 10BASE-T TRANSMIT

The output 10BASE-T driver is incorporated into the 100BASE-T driver to allow transmission with the same magnetic. They are internally wave-shaped and pre-emphasized into outputs with a typical 2.3V amplitude. The harmonic contents are at least 27 dB below the fundamental when driven by an all-ones Manchester-encoded signal.

## 3.1.9 10BASE-T RECEIVE

On the receive side, input buffers and level detecting squelch circuits are employed. A differential input receiver circuit and a phase-locked loop (PLL) perform the decoding function. The Manchester-encoded data stream is separated into clock signal and NRZ data. A squelch circuit rejects signals with levels less than 400 mV or with short pulse widths to prevent noise at the RXP-or-RXM input from falsely triggering the decoder. When the input exceeds the squelch limit, the PLL locks onto the incoming signal and the KSZ8993M decodes a data frame. The receiver clock is maintained active during idle periods in between data reception.

## 3.1.10 POWER MANAGEMENT

The KSZ8993M features a per-port power down mode. To save power, the user can power down ports that are not in use by setting the port control registers or MII control registers. In addition, there is a full-chip power down mode. When activated, the entire chip will be shut down.

### 3.1.11 MDI/MDI-X AUTO CROSSOVER

The KSZ8993M supports MDI/MDI-X auto crossover. This facilitates the use of either a straight connection CAT-5 cable or a crossover CAT-5 cable. The auto-sense function will detect remote transmit and receive pairs, and correctly assign the transmit and receive pairs from the KSZ8993M device. This feature can be extremely useful when end users are unaware of cable types and can also save on an additional uplink configuration connection. The auto-crossover feature can be disabled through the port control registers.

The IEEE 802.3u standard MDI and MDI-X definitions are illustrated in [Table 3-2](#).

**TABLE 3-2: MDI/MDI-X PIN DEFINITIONS**

| MDI        |         | MDI-X      |         |
|------------|---------|------------|---------|
| RJ-45 Pins | Signals | RJ-45 Pins | Signals |
| 1          | TD+     | 1          | RD+     |

#### 3.1.11.1 Straight Cable

A straight cable connects an MDI device to an MDI-X device, or an MDI-X device to an MDI device. [Figure 3-1](#) depicts a typical straight cable connection between a NIC card (MDI) and a switch or hub (MDI-X).

**FIGURE 3-1: TYPICAL STRAIGHT CABLE CONNECTION**

## 3.1.11.2 Crossover Cable

A crossover cable connects an MDI device to another MDI device, or an MDI-X device to another MDI-X device. [Figure 3-2](#) shows a typical crossover cable connection between two switches or hubs (two MDI-X devices).

**FIGURE 3-2: TYPICAL CROSSOVER CABLE CONNECTION**

## 3.1.12 AUTO-NEGOTIATION

The KSZ8993M conforms to the auto-negotiation protocol as described by the 802.3 committee. Auto-negotiation allows unshielded twisted pair (UTP) link partners to select the best common mode of operation. In auto-negotiation, the link partners advertise capabilities across the link to each other. If auto-negotiation is not supported or the link partner to the KSZ8993M is forced to bypass auto-negotiation, then the mode is set by observing the signal at the receiver. This is known as parallel mode because while the transmitter is sending auto-negotiation advertisements, the receiver is listening for advertisements or a fixed signal protocol.

The link up process is shown in [Figure 3-3](#).

**FIGURE 3-3: AUTO-NEGOTIATION AND PARALLEL OPERATION**

## 3.2 MAC and Switch

### 3.2.1 ADDRESS LOOKUP

The internal lookup table stores MAC addresses and their associated information. It contains a 1K unicast address table plus switching information. The KSZ8993M is guaranteed to learn 1K addresses and distinguishes itself from hash-based lookup tables, which, depending on the operating environment and probabilities, may not guarantee the absolute number of addresses that can be learned.

### 3.2.2 LEARNING

The internal lookup engine updates its table with a new entry if the following conditions are met:

- The received packet's source address (SA) does not exist in the lookup table.
- The received packet is good; the packet has no receiving errors and is of legal length.

The lookup engine inserts the qualified SA into the table, along with the port number and time stamp. If the table is full, the last entry of the table is deleted to make room for the new entry.

## 3.2.3 MIGRATION

The internal lookup engine also monitors whether a station has moved. If a station has moved, it will update the table accordingly. Migration happens when the following conditions are met:

- The received packet's SA is in the table, but the associated source port information is different.
- The received packet is good; the packet has no receiving errors and is of legal length.

The lookup engine will update the existing record in the table with the new source port information.

## 3.2.4 AGING

The lookup engine updates the time stamp information of a record whenever the corresponding SA appears. The time stamp is used in the aging process. If a record is not updated for a period of time, the lookup engine removes the record from the table. The lookup engine constantly performs the aging process and will continuously remove aging records. The aging period is about 200 seconds. This feature can be enabled or disabled through register 3 (0x03).

## 3.2.5 FORWARDING

The KSZ8993M forwards packets using the algorithm that is depicted in the following flowcharts. [Figure 3-4](#) shows stage one of the forwarding algorithm where the search engine looks up the VLAN ID, static table, and dynamic table for the destination address, and comes up with "port to forward 1" (PTF1). PTF1 is then further modified by spanning tree, IGMP snooping, port mirroring, and port VLAN processes to come up with "port to forward 2" (PTF2), as shown in [Figure 3-5](#). The packet is sent to PTF2.

**FIGURE 3-4: DESTINATION ADDRESS LOOKUP FLOW CHART, STAGE 1**

**FIGURE 3-5: DESTINATION ADDRESS RESOLUTION FLOW CHART, STAGE 2**

The KSZ8993M will not forward the following packets:

- Error packets: These include framing errors, Frame Check Sequence (FCS) errors, alignment errors, and illegal size packet errors.
- 802.3x pause frames. The KSZ8993M will intercept these packets and perform the appropriate actions.
- "Local" packets: Based on destination address (DA) lookup. If the destination port from the lookup table matches the port from which the packet originated, the packet is defined as local.

## 3.2.6 SWITCHING ENGINE

The KSZ8993M features a high-performance switching engine to move data to and from the MACs' packet buffers. It operates in store and forward mode, while the efficient switching mechanism reduces overall latency.

The KSZ8993M has a 32 kB internal frame buffer. This resource is shared between all three ports. The buffer sharing mode can be programmed through Global Register 2 (0x02). In one mode, ports are allowed to use any free buffers in the buffer pool. In the second mode, each port is only allowed to use one third of the total buffer pool. There are a total of 250 buffers available. Each buffer is sized at 128B.

## 3.2.7 MAC OPERATION

The KSZ8993M strictly abides by IEEE 802.3 standards to maximize compatibility.

### 3.2.7.1 Inter Packet Gap (IPG)

If a frame is successfully transmitted, the 96 bits time IPG is measured between the two consecutive MTXEN. If the current packet is experiencing collision, the 96 bits time IPG is measured from MCRS and the next MTXEN.

### 3.2.7.2 Back-Off Algorithm

The KSZ8993M implements the IEEE 802.3 standard for the binary exponential back-off algorithm, and optional "aggressive mode" back-off. After 16 collisions, the packet is optionally dropped depending on the chip configuration in Global Register 3 (0x03).

## 3.2.7.3 Late Collision

If a transmit packet experiences collisions after 512 bit times of the transmission, the packet is dropped.

## 3.2.7.4 Illegal Frames

The KSZ8993M discards frames less than 64 bytes and can be programmed to accept frames up to 1536 bytes in Global Register 4 (0x04). For special applications, the KSZ8993M can also be programmed to accept frames up to 1916 bytes in the same global register. Because the KSZ8993M supports VLAN tags, the maximum sizing is adjusted when these tags are present. See the EEPROM section for programming options.

## 3.2.7.5 Flow Control

The KSZ8993M supports standard 802.3x flow control frames on both transmit and receive sides.

On the receive side, if the KSZ8993M receives a pause control frame, the KSZ8993M will not transmit the next normal frame until the timer, specified in the pause control frame, expires. If another pause frame is received before the current timer expires, the timer will be updated with the new value in the second pause frame. During this period (being flow controlled), only flow control packets from the KSZ8993M will be transmitted.

On the transmit side, the KSZ8993M has intelligent and efficient ways to determine when to invoke flow control. The flow control is based on availability of the system resources, including available buffers, available transmit queues and available receive queues.

The KSZ8993M will flow control a port, which just received a packet, if the destination port resource is being used up. The KSZ8993M will issue a flow control frame (XOFF), containing the maximum pause time defined in IEEE standard 802.3x. Once the resource is freed up, the KSZ8993M will send out the other flow control frame (XON) with zero pause time to turn off the flow control (turn on transmission to the port). A hysteresis feature is provided to prevent the flow control mechanism from being activated and deactivated too many times.

The KSZ8993M will flow control all ports if the receive queue becomes full.

## 3.2.7.6 Half-Duplex Backpressure

A half-duplex backpressure option (Note: not in IEEE 802.3 standards) is also provided. The activation and deactivation conditions are the same as the above in full-duplex mode. If backpressure is required, the KSZ8993M will send preambles to defer the other stations' transmission (carrier sense deference). To avoid jabber and excessive deference defined in 802.3 standard, after a certain time it will discontinue the carrier sense but it will raise the carrier sense quickly. This short silent time (no carrier sense) is to prevent other stations from sending out packets and keeps other stations in carrier sense deferred state. If the port has packets to send during a backpressure situation, the carrier sense type back pressure will be interrupted and those packets will be transmitted instead. If there are no more packets to send, carrier sense type backpressure will be active again until switch resources free up. If a collision occurs, the binary exponential back-off algorithm is skipped and carrier sense is generated immediately, reducing the chance of further colliding and maintaining carrier sense to prevent reception of packets.

To ensure no packet loss in 10 BASE-T or 100 BASE-TX half-duplex modes, the user must enable the following:

1. Aggressive back-off (Global Register 3 (0x03), bit 0 or external strap-in pin SMAC = high)
2. No excessive collision drop (Global Register 4 (0x04), bit 3 or external strap-in pin SMAC = high)

These bits are not set as defaults because this is not the IEEE standard.

## 3.2.7.7 Broadcast Storm Protection

The KSZ8993M has an intelligent option to protect the switch system from receiving too many broadcast packets. As the broadcast packets are forwarded to all ports except the source port, an excessive number of switch resources (bandwidth and available space in transmit queues) may be utilized. The KSZ8993M has the option to include "multicast packets" for storm control. The broadcast storm rate parameters are programmed globally, and can be enabled or disabled on a per port basis. The rate is based on a 67 ms interval for 100BT and a 500 ms interval for 10BT. At the beginning of each interval, the counter is cleared to zero, and the rate limit mechanism starts to count the number of bytes during the interval. The rate definition is described in register 6 (0x06) and 7 (0x07). The default setting is 0x63 (99 decimal). This is equal to a rate of 1%, calculated as follows:

$$148,800 \text{ frames/sec} \times 67 \text{ ms/interval} \times 1\% = 99 \text{ frames/interval (approx.)} = 0x63$$

# KSZ8993M

## 3.2.8 MII INTERFACE OPERATION

The MII is specified by the IEEE 802.3 standards committee and provides a common interface between physical layer and MAC layer devices. The MII Interface provided by the KSZ8993M is connected to the device's third MAC. The interface contains two distinct groups of signals: one for transmission and the other for reception. Table 3-3 describes the signals used by the MII bus.

**TABLE 3-3: MII SIGNALS**

| KSZ8993 Port 3 MAC3 PHY Mode Connections |                      | Pin Description     | KSZ8993 Port 3 MAC3 MAC Mode Connections |                           |
|------------------------------------------|----------------------|---------------------|------------------------------------------|---------------------------|
| External MAC MII Signals                 | KSZ8993M MII Signals |                     | External PHY MII Signals                 | KSZ8993M MAC3 MII Signals |
| MTXEN                                    | SMTXEN               | Transmit Enable     | MTXEN                                    | SMRXDV                    |
| MTXER                                    | SMTXER               | Transmit Error      | MTXER                                    | (NOT USED)                |
| MTXD3                                    | SMTXD[3]             | Transmit Data Bit 3 | MTXD3                                    | SMRXD[3]                  |
| MTXD2                                    | SMTXD[2]             | Transmit Data Bit 2 | MTXD2                                    | SMRXD[2]                  |
| MTXD1                                    | SMTXD[1]             | Transmit Data Bit 1 | MTXD1                                    | SMRXD[1]                  |
| MTXD0                                    | SMTXD[0]             | Transmit Data Bit 0 | MTXD0                                    | SMRXD[0]                  |
| MTXC                                     | SMTXC                | Transmit Clock      | MTXC                                     | SMRXC                     |
| MCOL                                     | SCOL                 | Collision Detection | MCOL                                     | SCOL                      |
| MCRS                                     | SCRS                 | Carrier Sense       | MCRS                                     | SCRS                      |
| MRXDV                                    | SMRXDV               | Receive Data Valid  | MRXDV                                    | SMTXEN                    |
| MRXER                                    | (NOT USED)           | Receive Error       | MRXER                                    | SMTXER                    |
| MRXD3                                    | SMRXD[3]             | Receive Data Bit 3  | MRXD3                                    | SMTXD[3]                  |
| MRXD2                                    | SMRXD[2]             | Receive Data Bit 2  | MRXD2                                    | SMTXD[2]                  |
| MRXD1                                    | SMRXD[1]             | Receive Data Bit 1  | MRXD1                                    | SMTXD[1]                  |
| MRXD0                                    | SMRXD[0]             | Receive Data Bit 0  | MRXD0                                    | SMTXD[0]                  |
| MRXC                                     | SMRXC                | Receive Clock       | MRXC                                     | SMTXC                     |

The MII operates in either PHY mode or MAC mode. The data interface is a nibble wide and runs at one-quarter the network bit rate (not encoded). Additional signals on the transmit side indicate when data is valid or when an error has occurred during transmission. Similarly, the receive side has signals that convey when the data is valid and without physical layer errors. For half-duplex operation, there is a signal that indicates a collision has occurred during transmission.

Note that the signal MRXER is not provided on the interface for PHY mode operation and the signal MTXER is not provided on the interface for MAC mode operation. Normally MRXER would indicate a receive error coming from the physical layer device. MTXER would indicate a transmit error from the MAC device. These signals are not appropriate for this configuration. For PHY mode operation, if the device interfacing with the KSZ8993M has an MRXER pin, it should be tied low. For MAC mode operation, if the device interfacing with the KSZ8993M has an MTXER pin, it should be tied low.

## 3.2.9 SNI (7-WIRE) OPERATION

The serial network interface (SNI), or 7-wire, is compatible with some controllers used for network layer protocol processing. In SNI mode, the KSZ8993M acts like a PHY and the external controller functions as the MAC. The KSZ8993M can interface directly with external controllers using the 7-wire interface. These signals are divided into two groups, one for transmission and the other for reception. The signals involved are described in the following table.

**TABLE 3-4: SNI SIGNALS**

| Pin Description      | External MAC Controller Signal | KSZ8993M PHY Signal |
|----------------------|--------------------------------|---------------------|
| Transmit enable      | TXEN                           | SMTXEN              |
| Serial transmit data | TXD                            | SMTXD[0]            |
| Transmit clock       | TXC                            | SMTXC               |
| Collision detection  | COL                            | SCOL                |

**TABLE 3-4: SNI SIGNALS (CONTINUED)**

| Pin Description     | External MAC Controller Signal | KSZ8993M PHY Signal |
|---------------------|--------------------------------|---------------------|
| Carrier sense       | CRS                            | SMRXDV              |
| Serial receive data | RXD                            | SMRXD[0]            |
| Receive clock       | RXC                            | SMRXC               |

The SNI interface is a bit wide data interface and, therefore, runs at the network bit rate (not encoded). An additional signal on the transmit side indicates when data is valid. Similarly, the receive side has an indicator that conveys when the data is valid.

For half-duplex operation, the SCOL signal is used to indicate that a collision has occurred during transmission.

## 3.2.10 MII MANAGEMENT (MIIM) INTERFACE

The KSZ8993M supports the IEEE 802.3 MII Management Interface, also known as the Management Data Input/Output (MDIO) Interface. This interface allows upper-layer devices to monitor and control the states of the KSZ8993M. An external device with MDC/MDIO capability is used to read the PHY status or configure the PHY settings. Further details on the MIIM interface can be found in Clause 22.2.4.5 of the IEEE 802.3u Specification.

The MIIM interface consists of the following:

- A physical connection that incorporates the data line (MDIO) and the clock line (MDC).
- A specific protocol that operates across the aforementioned physical connection that allows an external controller to communicate with the KSZ8993M device.
- Access to a set of eight 16-bit registers, consisting of six standard MIIM registers [0:5].

The MIIM Interface can operate up to a maximum clock speed of 5 MHz.

Table 3-5 depicts the MII Management Interface frame format.

**TABLE 3-5: MII MANAGEMENT INTERFACE FRAME FORMAT**

|              | Preamble | Start of Frame | Read/Write OP Code | PHY Address Bits[4:0] | REG Address Bits[4:0] | TA | Data Bits[15:0]   | Idle |
|--------------|----------|----------------|--------------------|-----------------------|-----------------------|----|-------------------|------|
| <b>Read</b>  | 32 1's   | 01             | 10                 | xx0AA                 | RRRRR                 | Z0 | DDDDDDDD_DDDDDDDD | Z    |
| <b>Write</b> | 32 1's   | 01             | 01                 | xx0AA                 | RRRRR                 | 10 | DDDDDDDD_DDDDDDDD | Z    |

For the KSZ8993M, MIIM register access is selected when bit 2 of the PHY address is set to '0'. PHY address bits [4:3] are not defined for MIIM register access, and can be set to either 0's or 1's in read/write operation.

## 3.2.11 SERIAL MANAGEMENT INTERFACE (SMI)

The SMI is the KSZ8993M non-standard MIIM interface that provides access to all KSZ8993M configuration registers. This interface allows an external device to completely monitor and control the states of the KSZ8993M.

The SMI interface consists of the following:

- A physical connection that incorporates the data line (MDIO) and the clock line (MDC).
- A specific protocol that operates across the aforementioned physical connection that allows an external controller to communicate with the KSZ8993M device.
- Access to all KSZ8993M configuration registers. Register access includes the Global, Port, and Advanced Control Registers 0-127 (0x00 – 0x7F), and indirect access to the standard MIIM registers [0:5].

Table 3-6 depicts the SMI frame format.

**TABLE 3-6: SERIAL MANAGEMENT INTERFACE (SMI) FRAME FORMAT**

|              | Preamble | Start of Frame | Read/Write OP Code | PHY Address Bits[4:0] | REG Address Bits[4:0] | TA | Data Bits[15:0]     | Idle |
|--------------|----------|----------------|--------------------|-----------------------|-----------------------|----|---------------------|------|
| <b>Read</b>  | 32 1's   | 01             | 10                 | RR1xx                 | RRRRR                 | Z0 | 0000_0000_DDDD_DDDD | Z    |
| <b>Write</b> | 32 1's   | 01             | 01                 | RR1xx                 | RRRRR                 | 10 | xxxx_xxxx_DDDD_DDDD | Z    |

For the KSZ8993M, SMI register access is selected when bit 2 of the PHY address is set to '1'. PHY address bits [1:0] are not defined for SMI register access, and can be set to either 0's or 1's in read/write operation.

To access the KSZ8993M registers 0-127 (0x00 – 0x7F), the following applies:

- PHYAD[4:3] and REGAD[4:0] are concatenated to form the 7-bits address; that is, {PHYAD[4:3], REGAD[4:0]} = bits [6:0] of the 7-bits address.
- Registers are 8 data bits wide.
  - For read operation, data bits [15:8] are read back as 0's.
  - For write operation, data bits [15:8] are not defined, and can be set to either '0's or '1's.

SMI register access is the same as the MIIM register access, except for the register access requirements presented in this section.

## 3.3 Advanced Switch Functions

### 3.3.1 SPANNING TREE SUPPORT

To support spanning tree, port 3 is designated as the processor port.

The other ports (port 1 and port 2) can be configured in one of the five spanning tree states via “transmit enable”, “receive enable”, and “learning disable” register settings in registers 18 and 34 for ports 1 and 2, respectively. [Table 3-7](#) shows the port setting and software actions taken for each of the five spanning tree states.

**TABLE 3-7: SPANNING TREE STATES**

| Disable State                                                               | Port Setting                                                          | Software Action                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------------------|-----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The port should not forward or receive any packets. Learning is disabled.   | “transmit enable = 0,<br>receive enable = 0,<br>learning disable = 1” | The processor should not send any packets to the port. The switch may still send specific packets to the processor (packets that match some entries in the “Static MAC table” with “overriding bit” set) and the processor should discard those packets. Address learning is disabled on the port in this state. Note: processor is connected to port 3 via MII interface.                                                 |
| Blocking State                                                              | Port Setting                                                          | Software Action                                                                                                                                                                                                                                                                                                                                                                                                            |
| Only packets to the processor are forwarded. Learning is disabled.          | “transmit enable = 0,<br>receive enable = 0,<br>learning disable = 1” | The processor should not send any packets to the port(s) in this state. The processor should program the “Static MAC table” with the entries that it needs to receive (for example, BPDU packets). The “overriding” bit should also be set so that the switch will forward those specific packets to the processor. Address learning is disabled on the port in this state.                                                |
| Listening State                                                             | Port Setting                                                          | Software Action                                                                                                                                                                                                                                                                                                                                                                                                            |
| Only packets to and from the processor are forwarded. Learning is disabled. | “transmit enable = 0,<br>receive enable = 0,<br>learning disable = 1” | The processor should program the “Static MAC table” with the entries that it needs to receive (for example, BPDU packets). The “overriding” bit should be set so that the switch will forward those specific packets to the processor. The processor may send packets to the port(s) in this state. See <a href="#">Upstream Special Tagging Mode</a> for details. Address learning is disabled on the port in this state. |
| Learning State                                                              | Port Setting                                                          | Software Action                                                                                                                                                                                                                                                                                                                                                                                                            |
| Only packets to and from the processor are forwarded. Learning is enabled.  | “transmit enable = 0,<br>receive enable = 0,<br>learning disable = 0” | The processor should program the “Static MAC table” with the entries that it needs to receive (for example, BPDU packets). The “overriding” bit should be set so that the switch will forward those specific packets to the processor. The processor may send packets to the port(s) in this state. See <a href="#">Upstream Special Tagging Mode</a> for details. Address learning is enabled on the port in this state.  |
| Forwarding State                                                            | Port Setting                                                          | Software Action                                                                                                                                                                                                                                                                                                                                                                                                            |
| Packets are forwarded and received normally. Learning is enabled.           | “transmit enable = 1,<br>receive enable = 1,<br>learning disable = 0” | The processor programs the “Static MAC table” with the entries that it needs to receive (for example, BPDU packets). The “overriding” bit is set so that the switch forwards those specific packets to the processor. The processor can send packets to the port(s) in this state. See <a href="#">Upstream Special Tagging Mode</a> for details. Address learning is enabled on the port in this state.                   |

## 3.3.2 UPSTREAM SPECIAL TAGGING MODE

Upstream Special Tagging Mode is designed for spanning tree protocol IGMP snooping and is flexible for use in other applications. Upstream Special Tagging, similar to 802.1Q Tagging, requires software to change network drivers to insert/modify/strip/interpret the special tag. This mode is enabled by setting both register 11 bit [0] and register 48 bit [2] to '1'.

**TABLE 3-8: UPSTREAMSPECIAL TAGGING MODE FORMAT**

| 802.1Q Tag Format                            | Special Tag Format                                                  |
|----------------------------------------------|---------------------------------------------------------------------|
| TPID (tag protocol identifier, 0x8100) + TCI | STPID (special tag identifier, 0x810 + 4 bit for "port mask") + TCI |

The STPID is only seen and used by the port 3 interface, which should be connected to a processor. The KSZ8993M uses a non-zero "port mask" to bypass the lookup result and override any port setting, regardless of port states (disable, blocking, listening, learning).

For packets from regular ports (port 1 & port 2) to port 3, the port mask is used to tell the processor which port the packets were received on, defined as follows:

- "0001", from port 1
- "0010", from port 2

No port mask values, other than the previous two defined ones, should be received in Upstream Special Tagging Mode. [Table 3-9](#) below shows the processor to switch egress rules when dealing with STPID.

**TABLE 3-9: STPID EGRESS RULES (PROCESSOR TO SWITCH PORT 3)**

| Ingress Tag Field        | Egress Action to Tag Field                                                                                                                                                                                                                          |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tagged with 0x8100 + TCI | <ul style="list-style-type: none"> <li>- Modify TPID to 0x810 + "port mask", which indicates source port.</li> <li>- Recalculate CRC.</li> <li>- No change to TCI if VID is not null.</li> <li>- Replace null VID with ingress port VID.</li> </ul> |
| Not tagged               | <ul style="list-style-type: none"> <li>- Insert TPID to 0x810 + "port mask", which indicates source port.</li> <li>- Insert TCI with ingress port VID.</li> <li>- Recalculate CRC.</li> </ul>                                                       |

## 3.3.3 IGMP SUPPORT

For IGMP support in layer 2, the KSZ8993M provides two components:

### 3.3.3.1 IGMP Snooping

The KSZ8993M traps IGMP packets and forwards them only to the processor (port 3). The IGMP packets are identified as IP packets (either Ethernet IP packets, or IEEE 802.3 SNAP IP packets) with IP version = 0x4 and protocol version number = 0x2.

### 3.3.3.2 Multicast Address Insertion in the Static MAC Table

Once the multicast address is programmed in the Static MAC Table, the multicast session is trimmed to the subscribed ports, instead of broadcasting to all ports.

To enable IGMP support, set register 5 bit [6] to '1'. Also, Special Tagging Mode needs to be enabled, so that the processor knows which port the IGMP packet was received on. This is achieved by setting both register 11 bit [0] and register 48 bit [2] to '1'.

## 3.3.4 PORT MIRRORING SUPPORT

KSZ8993M supports port mirroring comprehensively as:

- **"Receive Only" mirror on a port:** All the packets received on the port are mirrored on the sniffer port. For example, port 1 is programmed to be "receive sniff" and port 3 is programmed to be the "sniffer port". A packet received on port 1 is destined to port 2 after the internal lookup. The KSZ8993M forwards the packet to both port 2 and port 3. The KSZ8993M can optionally even forward "bad" received packets to the "sniffer port".
- **"Transmit Only" mirror on a port:** All the packets transmitted on the port are mirrored on the sniffer port. For example, port 1 is programmed to be "transmit sniff" and port 3 is programmed to be the "sniffer port". A packet received on port 2 is destined to port 1 after the internal lookup. The KSZ8993M forwards the packet to both port 1

and port 3.

- **“Receive and Transmit” mirror on two ports:** All the packets received on port A and transmitted on port B are mirrored on the sniffer port. To turn on the “AND” feature, set register 5 bit [0] to ‘1’. For example, port 1 is programmed to be “receive sniff”, port 2 is programmed to be “transmit sniff”, and port 3 is programmed to be the “sniffer port”. A packet received on port 1 is destined to port 2 after the internal lookup. The KSZ8993M forwards the packet to both port 2 and port 3.

Multiple ports can be selected as “receive sniff” or “transmit sniff”. In addition, any port can be selected as the “sniffer port”. All these per port features can be selected through registers 17, 33, and 49 for ports 1, 2, and 3, respectively.

### 3.3.5 IEEE 802.1Q VLAN SUPPORT

The KSZ8993M supports 16 active VLANs out of the 4096 possible VLANs specified in the IEEE 802.1Q specification. KSZ8993M provides a 16-entry VLAN Table, which converts the 12-bits VLAN ID (VID) to the 4-bits Filter ID (FID) for address lookup. If a non-tagged or null-VID-tagged packet is received, the ingress port default VID is used for look-up. In VLAN mode, the look-up process starts with VLAN Table lookup to determine whether the VID is valid. If the VID is not valid, the packet is dropped and its address is not learned. If the VID is valid, the FID is retrieved for further lookup. The FID + Destination Address (FID+DA) are used to determine the destination port. The FID + Source Address (FID+SA) are used for address learning.

**TABLE 3-10: FID+DA LOOKUP IN VLAN MODE**

| DA Found in Static MAC Table? | Use FID Flag? | FID Match? | FID+DA Found in Dynamic MAC Table? | Action                                                                               |
|-------------------------------|---------------|------------|------------------------------------|--------------------------------------------------------------------------------------|
| No                            | Don't care    | Don't care | No                                 | Broadcast to the membership ports defined in the VLAN Table bits [18:16]             |
| No                            | Don't care    | Don't care | Yes                                | Send to the destination port defined in the Dynamic MAC Address Table bits [53:52]   |
| Yes                           | 0             | Don't care | Don't care                         | Send to the destination port(s) defined in the Static MAC Address Table bits [50:48] |
| Yes                           | 1             | No         | No                                 | Broadcast to the membership ports defined in the VLAN Table bits [18:16]             |
| Yes                           | 1             | No         | Yes                                | Send to the destination port defined in the Dynamic MAC Address Table bits [53:52]   |
| Yes                           | 1             | Yes        | Don't care                         | Send to the destination port(s) defined in the Static MAC Address Table bits [50:48] |

**TABLE 3-11: FID+SA LOOKUP IN VLAN MODE**

| FID+SA Found in Dynamic MAC Table? | Action                                                |
|------------------------------------|-------------------------------------------------------|
| No                                 | Learn and add FID+SA to the Dynamic MAC Address Table |
| Yes                                | Update time stamp                                     |

Advanced VLAN features, such as “Ingress VLAN filtering” and “Discard Non PVID packets” are also supported by the KSZ8993M. These features can be set on a per port basis, and are defined in register 18, bit 6 and bit 5, respectively for port 1.

### 3.3.6 QOS PRIORITY SUPPORT

The KSZ8993M provides Quality of Service (QoS) for applications such as VoIP and video conferencing. The KSZ8993M per port transmit queue could be split into two priority queues: a high priority queue and a low priority queue. Bit 0 of registers 16, 32 and 48 is used to enable split transmit queues for ports 1, 2 and 3, respectively. Optionally, the Px\_TXQ2 strap-in pins can be used to enable this feature. With split transmit queues, high priority packets will be placed in the high priority queue and low priority packets will be placed in the low priority queue.

For split transmit queues, the KSZ8993M provides four priority schemes:

- Transmit all high priority packets before low priority packets; i.e., a low priority packet can be transmitted only when the high priority queue is empty.
- Transmit high priority packets and low priority packets at 10:1 ratio; i.e., transmit a low priority packet after 10 high priority packets have been transmitted, if both queues are busy.
- Transmit high priority packets and low priority packets at 5:1 ratio.
- Transmit high priority packets and low priority packets at 2:1 ratio.

If a port's transmit queue is not split, both high priority packets and low priority packets have equal priority in the transmit queue. Register 5 bits [3:2] are used to select the desired priority scheme. Optionally, the PRSEL1 and PRSEL0 strap-in pins can be used.

3.3.7 PORT-BASED PRIORITY

With port-based priority, each ingress port is individually classified as a high priority receiving port. All packets received at the high priority receiving port are marked as high priority and are sent to the high-priority transmit queue if the corresponding transmit queue is split. Bits [4:3] of registers 16, 32, and 48 are used to enable port-based priority for ports 1, 2, and 3, respectively. Optionally, the Px\_PP strap-in pins can be used to enable this feature.

3.3.8 802.1P-BASED PRIORITY

For 802.1p-based priority, the KSZ8993M examines the ingress (incoming) packets to determine whether they are tagged. If tagged, the 3-bit priority field in the VLAN tag is retrieved and compared against the "priority base" value, as specified by register 2 bits [6:4]. The "priority base" value is programmable; its default value is 0x4.

Figure 3-6 illustrates how the 802.1p priority field is embedded in the 802.1Q VLAN tag.

FIGURE 3-6: 802.1P PRIORITY FIELD FORMAT

If an ingress packet has an equal or higher priority value than the "priority base" value, the packet will be placed in the high priority transmit queue if the corresponding transmit queue is split. 802.1p based priority is enabled by bit 5 of registers 16, 32 and 48 for ports 1, 2 and 3, respectively. Optionally, the Px\_1PEN strap-in pins can be used to enable this feature.

The KSZ8993M provides the option to insert or remove the priority tagged frame's header at each individual egress port. This header, consisting of the 2 bytes VLAN Protocol ID (VPID) and the 2 bytes Tag Control Information field (TCI), is also referred to as the 802.1Q VLAN Tag.

Tag Insertion is enabled by bit 2 of registers 16, 32, and 48 for ports 1, 2, and 3, respectively. Optionally, the Px\_TAGINS strap-in pins can be used to enable this feature. At the egress port, untagged packets are tagged with the ingress port's default tag. The default tags are programmed in register sets {19,20}, {35,36}, and {51,52} for ports 1, 2, and 3, respectively. The KSZ8993M will not add tags to already tagged packets.

# KSZ8993M

---

Tag Removal is enabled by bit 1 of registers 16, 32, and 48 for ports 1, 2, and 3, respectively. Optionally, the Px\_TAGRM strap-in pins can be used to enable this feature. At the egress port, tagged packets will have their 802.1Q VLAN Tags removed. The KSZ8993M will not modify untagged packets.

The CRC is recalculated for both tag insertion and tag removal.

802.1p Priority Field Re-mapping is a QoS feature that allows the KSZ8993M to set the “User Priority Ceiling” at any ingress port. If the ingress packet’s priority field has a higher priority value than the default tag’s priority field of the ingress port, the packet’s priority field is replaced with the default tag’s priority field. The “User Priority Ceiling” is enabled by bit 3 of registers 16, 32, and 48 for ports 1, 2, and 3, respectively.

## 3.3.9 DIFFSERV-BASED PRIORITY

DiffServ-based priority uses registers 96 to 103. More details are provided at the beginning of the Advanced Control Registers section.

## 3.3.10 RATE LIMITING SUPPORT

The KSZ8993M supports hardware rate limiting independently on the “receive side” and on the “transmit side” on a per port basis. Rate limiting is supported in both priority and non-priority environment. The rate limit starts from 0 kbps and goes up to the line rate in steps of 32 kbps. The KSZ8993M uses “one second” as the rate limiting interval. At the beginning of each interval, the counter is cleared to zero, and the rate limit mechanism starts to count the number of bytes during the interval.

On the “receive side”, if the number of bytes exceeds the programmed limit, the switch will stop receiving packets on the port until the “one second” interval expires. Flow control can be enabled to prevent packet loss. If the rate limit is programmed greater than or equal to 128 kbps and the byte counter is 8 Kbytes below the limit, flow control will be triggered. If the rate limit is programmed lower than 128 kbps and the byte counter is 2 Kbytes below the limit, flow control will also be triggered.

On the “transmit side”, if the number of bytes exceeds the programmed limit, the switch will stop transmitting packets on the port until the “one second” interval expires.

If priority is enabled, the KSZ8993M can be programmed to support different rate limits for high priority packets and low priority packets.

## 3.4 Configuration Interface

The KSZ8993M can operate as both a managed switch and an unmanaged switch.

In unmanaged mode, the KSZ8993M is typically programmed using an EEPROM. If no EEPROM is present, the KSZ8993M is configured using its default register settings. Some default settings are configured via strap-in pin options. The strap-in pins are indicated in [Table 2-1](#).

### 3.4.1 I<sup>2</sup>C MASTER SERIAL BUS CONFIGURATION

With an additional I<sup>2</sup>C (“2-wire”) EEPROM, the KSZ8993M can perform more advanced switch features like “broadcast storm protection” and “rate control” without the need of an external processor.

For KSZ8993M I<sup>2</sup>C Master configuration, the EEPROM stores the configuration data for register 0 to register 109 (as defined in the KSZ8993M register map) with the exception of the “Read Only” status registers. After the de-assertion of reset, the KSZ8993M sequentially reads in the configuration data for all 110 registers, starting from register 0. The configuration access time ( $t_{\text{prgm}}$ ) is less than 15 ms, as depicted in [Figure 3-7](#).

**FIGURE 3-7: EEPROM CONFIGURATION TIMING DIAGRAM**

The following is a sample procedure for programming the KSZ8993M with a pre-configured EEPROM:

1. Connect the KSZ8993M to the EEPROM by joining the SCL and SDA signals of the respective devices. For the KSZ8993M, SCL is pin 97 and SDA is pin 98.
2. Enable I<sup>2</sup>C master mode by setting the KSZ8993M strap-in pins, PS[1:0] (pins 100 and 101, respectively) to "00".
3. Check to ensure that the KSZ8993M reset signal input, RST\_N (pin 67), is properly connected to the external reset source at the board level.
4. Program the desired configuration data into the EEPROM.
5. Place the EEPROM on the board and power up the board.
6. Assert an active-low reset to the RSTN pin of the KSZ8993M. After reset is de-asserted, the KSZ8993M begins reading the configuration data from the EEPROM. The KSZ8993M checks that the first byte read from the EEPROM is "93". If this value is correct, EEPROM configuration continues. If not, EEPROM configuration access is denied and all other data sent from the EEPROM is ignored by the KSZ8993M. The configuration access time ( $t_{prgm}$ ) is less than 15 ms.

For proper operation, ensure that the KSZ8993M PWRDN input signal (pin 36) is not asserted during the reset operation. The PWRDN input is active-low.

### 3.4.2 I<sup>2</sup>C SLAVE SERIAL BUS CONFIGURATION

In managed mode, the KSZ8993M can be configured as an I<sup>2</sup>C slave device. In this mode, an I<sup>2</sup>C master device (external controller/CPU) has complete programming access to the KSZ8993M's 128 registers. Programming access includes the Global Registers, Port Registers, Advanced Control Registers, and indirect access to the "Static MAC Table", "VLAN Table", "Dynamic MAC Table," and "MIB Counters." The tables and counters are indirectly accessed via registers 110 to 120.

In I<sup>2</sup>C slave mode, the KSZ8993M operates like other I<sup>2</sup>C slave devices. Addressing the KSZ8993M's 8-bit registers is similar to addressing the Microchip AT24C02 EEPROM's memory locations. Details of I<sup>2</sup>C read/write operations and related timing information can be found in the AT24C02 data sheet.

Two fixed 8-bit device addresses are used to address the KSZ8993M in I<sup>2</sup>C slave mode. One is for read; the other is for write. The addresses are as follows:

- 1011\_1111 <read>
- 1011\_1110 <write>

The following is a sample procedure for programming the KSZ8993M using the I<sup>2</sup>C slave serial bus:

1. Enable I<sup>2</sup>C slave mode by setting the KSZ8993M strap-in pins PS[1:0] (pins 100 and 101, respectively) to "01".
2. Power up the board and assert reset to the KSZ8993M. After reset, the "Start Switch" bit (register 1 bit [0]) is set to '0'.
3. Configure the desired register settings in the KSZ8993M using the I<sup>2</sup>C write operation.
4. Read back and verify the register settings in the KSZ8993M using the I<sup>2</sup>C read operation.
5. Write a '1' to the "Start Switch" bit to start the KSZ8993M with the programmed settings.

# KSZ8993M

The “Start Switch” bit cannot be set to ‘0’ to stop the switch after a ‘1’ is written to this bit. Thus, it is recommended that all switch configuration settings are programmed before the “Start Switch” bit is set to ‘1’.

Some of the configuration settings, such as “Aging Enable”, “Auto Negotiation Enable”, “Force Speed”, and “Power down” can be programmed after the switch has been started.

## 3.4.3 SPI SLAVE SERIAL BUS CONFIGURATION

In managed mode, the KSZ8993M can be configured as a SPI slave device. In this mode, a SPI master device (external controller/CPU) has complete programming access to the KSZ8993M’s 128 registers. Programming access includes the Global Registers, Port Registers, Advanced Control Registers and indirect access to the “Static MAC Table”, “VLAN Table”, “Dynamic MAC Table” and “MIB Counters”. The tables and counters are indirectly accessed via registers 110 to 120.

The KSZ8993M supports two standard SPI commands: ‘0000\_0011’ for data read and ‘0000\_0010’ for data write. SPI multiple read and multiple write are also supported by the KSZ8993M to expedite register read back and register configuration, respectively.

SPI multiple read is initiated when the master device continues to drive the KSZ8993M SPIS\_N input pin (SPI Slave Select signal) low after a byte (a register) is read. After the read, the KSZ8993M internal address counter increments automatically to the next byte (next register) after the read. The next byte at the next register address is shifted out onto the KSZ8993M SPIQ output pin. SPI multiple read continues until the SPI master device terminates it by deasserting the SPIS\_N signal to the KSZ8993M.

Similarly, SPI multiple write is initiated when the master device continues to drive the KSZ8993M SPIS\_N input pin low after a byte (a register) is written. The KSZ8993M internal address counter increments automatically to the next byte (next register) after the write. The next byte that is sent from the master device to the KSZ8993M SDA input pin will be written to the next register address. SPI multiple write will continue until the SPI master device terminates it by de-asserting the SPIS\_N signal to the KSZ8993M.

For both SPI multiple read and multiple write, the KSZ8993M internal address counter wraps back to register address zero once the highest register address is reached. This feature allows all 128 KSZ8993M registers to be read or written with a single SPI command from any initial register address.

The KSZ8993M is capable of supporting a 5 MHz SPI bus.

The following is a sample procedure for programming the KSZ8993M using the SPI bus:

1. At the board level, connect the KSZ8993M pins as follows:

**TABLE 3-12: SPI CONNECTIONS**

| Pin Number | Signal Name | External Processor Signal Description    |
|------------|-------------|------------------------------------------|
| 99         | SPIS N      | SPI Slave Select                         |
| 97         | SCL (SPIC)  | SPI Clock                                |
| 98         | SDA (SPID)  | SPI Data<br>(Master output; Slave input) |
| 96         | SPIQ        | SPI Data<br>(Master input; Slave output) |

2. Enable SPI slave mode by setting the KSZ8993M strap-in pins PS[1:0] (pins 100 and 101, respectively) to “10”.
3. Power up the board and assert reset to the KSZ8993M. After reset, the “Start Switch” bit (register 1 bit [0]) is set to ‘0’.
4. Configure the desired register settings in the KSZ8993M using the SPI write or multiple write command.
5. Read back and verify the register settings in the KSZ8993M using the SPI read or multiple read command.
6. Write a ‘1’ to the “Start Switch” bit to start the KSZ8993M with the programmed settings.

The “Start Switch” bit cannot be set to ‘0’ to stop the switch after a ‘1’ is written to this bit. Thus, it is recommended that all switch configuration settings are programmed before the “Start Switch” bit is set to ‘1’.

Some of the configuration settings, such as “Aging Enable,” “Auto Negotiation Enable,” “Force Speed,” and “Power Down” can be programmed after the switch has been started.

The following four figures illustrate the SPI data cycles for “Write,” “Read,” “Multiple Write,” and “Multiple Read.” The read data is registered out of SPIQ on the falling edge of SPIC, and the data input on SPID is registered on the rising edge of SPIC.

FIGURE 3-8: SPI WRITE DATA CYCLE

FIGURE 3-9: SPI READ DATA CYCLE

FIGURE 3-10: SPI MULTIPLE WRITE

FIGURE 3-11: SPI MULTIPLE READ

### 3.5 Loopback Support

The KSZ8993M provides loopback support for remote diagnostic of failure. In loopback mode, the speed at both PHY ports needs to be set to 100BASE-TX, and the “Priority Buffer reserve” bit needs to be set to 48 preallocated buffers per output queue. The latter is required to prevent loopback packet drops and is achieved by setting register 4 bit 0 to ‘1’.

Bit 0 of registers 29 and 45 is used to enable loopback for ports 1 and 2, respectively.

Alternatively, the MII Management register 0, bit 14 can be used to enable loopback.

Loopback is conducted between the KSZ8993M's two PHY ports. The loopback path starts at the “Originating.” PHY ports receive inputs (RXP/RXM), wraps around at the “loopback” PHY port's PMD/PMA, and ends at the “Originating” PHY port's transmit outputs (TXP/TXM). The KSZ8993M loopback path is illustrated in the following figure.

**FIGURE 3-12: LOOPBACK PATH**

## 4.0 REGISTER DESCRIPTIONS

### 4.1 MII Management (MIIM) Registers

The MIIM interface is used to access the MII PHY registers defined in this section. The SPI, I<sup>2</sup>C, and SMI interfaces can also be used to access these registers. The latter three interfaces use a different mapping mechanism than the MIIM interface.

As defined in the IEEE 802.3 specification, the “PHYAD” are assigned as “0x1” for PHY port 1 and “0x2” for PHY port 2. The “REGAD” supported are 0,1,2,3,4, and 5.

**TABLE 4-1: MIIM REGISTERS FOR KSZ8993M**

| Register Number | Description                                    |
|-----------------|------------------------------------------------|
| 0x0             | Basic Control Register                         |
| 0x1             | Basic Status Register                          |
| 0x2             | Physical Identifier I                          |
| 0x3             | Physical Identifier II                         |
| 0x4             | Auto-Negotiation Advertisement Register        |
| 0x5             | Auto-Negotiation Link Partner Ability Register |
| 0x6 – 0x1F      | Not supported                                  |

### 4.2 Register Descriptions

**TABLE 4-2: REGISTER DESCRIPTIONS**

| Bit                                  | Name                  | R/W | Description                                                                                 | Default | Reference                        |

# KSZ8993M

The following registers are used to enable features that are assigned on a per port basis. The register bit assignments are the same for all ports, but the address for each port is different, as indicated.

**TABLE 4-7: PORT REGISTERS (REGISTERS 16 - 95)**

| Bit                                                                                                                                       | Name                                      | R/W | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              | Default                                                                                   |

## 4.5 Advanced Control Registers (Registers 96-127)

The IPv4 Type of Service (TOS) Priority Control Registers implement a fully decoded, 64-bit Differentiated Services Code Point (DSCP) register set that is used to determine priority from the 6-bit TOS field in the IP header. The most significant 6 bits of the TOS field are fully decoded into 64 possibilities, and the singular code that results is compared against the corresponding bits in the DSCP register to determine the priority. If the register bit is a 1, the priority is high; if it is a 0, the priority is low.

## 4.6 Static MAC Address Table

The KSZ8993M has both a static and a dynamic MAC address table. When a destination address (DA) lookup is requested, both tables are searched to make a packet forwarding decision. When a SA lookup is requested, only the dynamic table is searched for aging, migration and learning purposes. The static DA lookup result will have precedence over the dynamic DA lookup result. If there is a DA match in both tables, the result from the static table will be used. The static table can be accessed and controlled by an external processor via the SMI, SPI, and I<sup>2</sup>C interfaces. The external processor performs all addition, modification and deletion of static table entries. These entries in the static table will not be aged out by the KSZ8993M.

**TABLE 4-9: FORMAT OF STATIC MAC TABLE (8 ENTRIES)**

| Bit   | Name     | R/W | Description                                                                                    | Default |
|-------|----------|-----|------------------------------------------------------------------------------------------------|---------|
| 57-54 | FID      | R/W | Filter VLAN ID – identifies one of the 16 active VLANs                                         | 0000    |
| 53    | Use FID  | R/W | 1 = Use (FID+MAC) for static table look ups<br>0 = Use MAC only for static table look ups      | 0       |
| 52    | Override | R/W | 1 = Override port setting “transmit enable=0” or “receive enable=0” setting<br>0 = No override | 0       |
| 51    | Valid    | R/W | 1 = This entry is valid, the lookup result will be used<br>0 = This entry is not valid         | 0       |

**TABLE 4-9: FORMAT OF STATIC MAC TABLE (8 ENTRIES) (CONTINUED)**

| Bit   | Name             | R/W | Description                                                                                                                                                                                                                                                                                        | Default              |
|-------|------------------|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| 50-48 | Forwarding Ports | R/W | These 3 bits control the forwarding port(s):<br>001 = Forward to port 1<br>010 = Forward to port 2<br>100 = Forward to port 3<br>011 = Forward to port 1 and port 2<br>110 = Forward to port 2 and port 3<br>101 = Forward to port 1 and port 3<br>111 = Broadcasting (excluding the ingress port) | 000                  |
| 47-0  | MAC Address      | R/W | 48-bit MAC Address                                                                                                                                                                                                                                                                                 | 0x0000_0000<br>_0000 |

Examples:

1. Static Address Table Read (Read the 2nd Entry)

Write to reg. 110 with 0x10 // Read static table selected

Write to reg. 111 with 0x01 // Trigger the read operation

Then,

Read reg. 113, static table bits [57:56]

Read reg. 114, static table bits [55:48]

Read reg. 115, static table bits [47:40]

Read reg. 116, static table bits [39:32]

Read reg. 117, static table bits [31:24]

Read reg. 118, static table bits [23:16]

Read reg. 119, static table bits [15:8]

Read reg. 120, static table bits [7:0]

2. Static Address Table Write (Write the 8th Entry)

Write to reg. 113, static table bits [57:56]

Write to reg. 114, static table bits [55:48]

Write to reg. 115, static table bits [47:40]

Write to reg. 116, static table bits [39:32]

Write to reg. 117, static table bits [31:24]

Write to reg. 118, static table bits [23:16]

Write to reg. 119, static table bits [15:8]

Write to reg. 120, static table bits [7:0]

Write to reg. 110 with 0x00 // Write static table selected

Write to reg. 111 with 0x07 // Trigger the write operation

## 4.7 VLAN Table

If 802.1Q VLAN mode is enabled (Register 5, Bit 7 = '1'), the VLAN table will be used to retrieve the VLAN information that is associated with the ingress packet. This information includes FID (filter ID), VID (VLAN ID), and VLAN membership as described in the following table.

**TABLE 4-10: FORMAT OF STATIC VLAN TABLE (16 ENTRIES)**

| Bit | Name  | R/W | Description                                | Default |
|-----|-------|-----|--------------------------------------------|---------|
| 19  | Valid | R/W | 1 = Entry is valid<br>0 = Entry is invalid | 1       |

**TABLE 4-10: FORMAT OF STATIC VLAN TABLE (16 ENTRIES) (CONTINUED)**

| Bit   | Name       | R/W | Description                                                                                                                                                                                                                                                    | Default |
|-------|------------|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| 18-16 | Membership | R/W | Specify which ports are members of the VLAN. If a DA lookup fails (no match in both static and dynamic tables), the packet associated with this VLAN will be forwarded to ports specified in this field. For example, 101 means port 3 and 1 are in this VLAN. | 111     |
| 15-12 | FID        | R/W | Filter ID. KSZ8993M supports 16 active VLANs represented by these four bit fields. FID is the mapped ID. If 802.1Q VLAN is enabled, the look up will be based on FID+DA and FID+SA.                                                                            | 0x0     |
| 11-0  | VID        | R/W | IEEE 802.1Q 12 bits VLAN ID                                                                                                                                                                                                                                    | 0x001   |

If 802.1Q VLAN mode is enabled, KSZ8993M will assign a VID to every ingress packet. If the packet is untagged or tagged with a null VID, the packet is assigned with the default port VID of the ingress port. If the packet is tagged with non null VID, the VID in the tag will be used. The lookup process will start from the VLAN table lookup. If the VID is not valid, the packet will be dropped and no address learning will take place. If the VID is valid, the FID is retrieved. The FID+DA and FID+SA lookups are performed. The FID+DA lookup determines the forwarding ports. If FID+DA fails, the packet will be broadcast to all the members (excluding the ingress port) of the VLAN. If FID+SA fails, the FID+SA will be learned.

Examples:

1. VLAN Table Read (read the 3rd entry)

Write to reg. 110 with 0x14 // Read VLAN table selected

Write to reg. 111 with 0x02 // Trigger the read operation

Then,

Read reg. 118, VLAN table bits [19:16]

Read reg. 119, VLAN table bits [15:8]

Read reg. 120, VLAN table bits [7:0]

2. VLAN Table Write (write the 7th entry)

Write to reg. 118, VLAN table bits [19:16]

Write to reg. 119, VLAN table bits [15:8]

Write to reg. 120, VLAN table bits [7:0]

Write to reg. 110 with 0x04 // Write VLAN table selected

Write to reg. 111 with 0x06 // Trigger the write operation

## 4.8 Dynamic MAC Address Table

The KSZ8993M maintains the dynamic MAC address table. Only read access is allowed.

**TABLE 4-11: FORMAT OF DYNAMIC MAC ADDRESS TABLE (1K ENTRIES)**

| Bit   | Name                    | R/W | Description                                                                                                                                                                  | Default      |
|-------|-------------------------|-----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| 71    | Data Not Ready          | RO  | 1 = Entry is not ready, continue retrying until this bit is set to 0<br>0 = Entry is ready                                                                                   | —            |
| 70-67 | Reserved                | RO  | Reserved                                                                                                                                                                     | —            |
| 66    | MAC Empty               | RO  | 1 = There is no valid entry in the table<br>0 = There are valid entries in the table                                                                                         | 1            |
| 65-56 | Number of Valid Entries | RO  | Indicates how many valid entries in the table<br>0x3FF means 1k entries<br>0x001 means 2 entries<br>0x000 and bit 66 = 0 means 1 entry<br>0x000 and bit 66 = 1 means 0 entry | 00_0000_0000 |

**TABLE 4-11: FORMAT OF DYNAMIC MAC ADDRESS TABLE (1K ENTRIES) (CONTINUED)**

| Bit   | Name        | R/W | Description                                                                           | Default              |
|-------|-------------|-----|---------------------------------------------------------------------------------------|----------------------|
| 55-54 | Time Stamp  | RO  | 2 bits counter for internal aging                                                     | —                    |
| 53-52 | Source Port | RO  | The source port where FID+MAC is learned<br>00 = Port 1<br>01 = Port 2<br>10 = Port 3 | 00                   |
| 51-48 | FID         | RO  | Filter ID                                                                             | 0x0                  |
| 47-0  | MAC Address | RO  | 48-bit MAC Address                                                                    | 0x0000_0000<br>_0000 |

Example:

Dynamic MAC Address Table Read (read the 1st entry and retrieve the MAC table size)

Write to reg. 110 with 0x18 // Read dynamic table selected

Write to reg. 111 with 0x00 // Trigger the read operation

Then,

Read reg. 112, dynamic table bits [71:64] // if bit 71 = 1, restart (reread) from this register

Read reg. 113, dynamic table bits [63:56]

Read reg. 114, dynamic table bits [55:48]

Read reg. 115, dynamic table bits [47:40]

Read reg. 116, dynamic table bits [39:32]

Read reg. 117, dynamic table bits [31:24]

Read reg. 118, dynamic table bits [23:16]

Read reg. 119, dynamic table bits [15:8]

Read reg. 120, dynamic table bits [7:0]

## 4.9 Management Information Base (MIB) Counters

The KSZ8993M provides 34 MIB counters per port. These counters are used to monitor the port activity for network management. The MIB counters have two format groups: “Per Port” and “All Port Dropped Packet.”

**TABLE 4-12: FORMAT OF “PER PORT” MIB COUNTERS**

| Bit  | Name           | R/W | Description                                                  | Default |
|------|----------------|-----|--------------------------------------------------------------|---------|
| 31   | Reserved       | RO  | Reserved                                                     | 0       |
| 30   | Count Valid    | RO  | 1 = Counter value is valid<br>0 = Counter value is not valid | 0       |
| 29-0 | Counter Values | RO  | Counter value                                                | 0       |

“Per Port” MIB counters are read using indirect memory access. The base address offsets and address ranges for all three ports are:

- Port 1, base is 0x00 and range is (0x00-0x1F)
- Port 2, base is 0x20 and range is (0x20-0x3F)
- Port 3, base is 0x40 and range is (0x40-0x5F)

Port 1 MIB counters are read using the indirect memory offsets in [Table 4-13](#).

**TABLE 4-13: PORT 1’S “PER PORT” MIB COUNTERS INDIRECT MEMORY OFFSETS**

| Offset | Counter Name     | Description                                                |
|--------|------------------|------------------------------------------------------------|
| 0x0    | RxLoPriorityByte | Rx lo-priority (default) octet count including bad packets |
| 0x1    | RxHiPriorityByte | Rx hi-priority octet count including bad packets           |
| 0x2    | RxUndersizePkt   | Rx undersize packets w/ good CRC                           |

**TABLE 4-13: PORT 1'S "PER PORT" MIB COUNTERS INDIRECT MEMORY OFFSETS**

| Offset | Counter Name         | Description                                                                                                                                                     |
|--------|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0x3    | RxFragments          | Rx fragment packets w/ bad CRC, symbol errors or alignment errors                                                                                               |
| 0x4    | RxOversize           | Rx oversize packets w/ good CRC (max: 1536 or 1522 bytes)                                                                                                       |
| 0x5    | RxJabbers            | Rx packets longer than 1522 bytes w/ either CRC errors, alignment errors, or symbol errors (depends on max packet size setting)                                 |
| 0x6    | RxSymbolError        | Rx packets w/ invalid data symbol and legal packet size.                                                                                                        |
| 0x7    | RxCRCError           | Rx packets within (64,1522) bytes w/ an integral number of bytes and a bad CRC (upper limit depends on max packet size setting)                                 |
| 0x8    | RxAlignmentError     | Rx packets within (64,1522) bytes w/ a non-integral number of bytes and a bad CRC (upper limit depends on max packet size setting)                              |
| 0x9    | RxControl8808Pkts    | Number of MAC control frames received by a port with 88-08h in Ether-Type field                                                                                 |
| 0xA    | RxPausePkts          | Number of PAUSE frames received by a port. PAUSE frame is qualified with EtherType (88-08h), DA, control opcode (00-01), data length (64B min), and a valid CRC |
| 0xB    | RxBroadcast          | Rx good broadcast packets (not including error broadcast packets or valid multicast packets)                                                                    |
| 0xC    | RxMulticast          | Rx good multicast packets (not including MAC control frames, error multicast packets or valid broadcast packets)                                                |
| 0xD    | RxUnicast            | Rx good unicast packets                                                                                                                                         |
| 0xE    | Rx64Octets           | Total Rx packets (bad packets included) that were 64 octets in length                                                                                           |
| 0xF    | Rx65to127Octets      | Total Rx packets (bad packets included) that are between 65 and 127 octets in length                                                                            |
| 0x10   | Rx128to255Octets     | Total Rx packets (bad packets included) that are between 128 and 255 octets in length                                                                           |
| 0x11   | Rx256to511Octets     | Total Rx packets (bad packets included) that are between 256 and 511 octets in length                                                                           |
| 0x12   | Rx512to1023Octets    | Total Rx packets (bad packets included) that are between 512 and 1023 octets in length                                                                          |
| 0x13   | Rx1024to1522Octets   | Total Rx packets (bad packets included) that are between 1024 and 1522 octets in length (upper limit depends on max packet size setting)                        |
| 0x14   | TxLoPriorityByte     | Tx lo-priority good octet count, including PAUSE packets                                                                                                        |
| 0x15   | TxHiPriorityByte     | Tx hi-priority good octet count, including PAUSE packets                                                                                                        |
| 0x16   | TxLateCollision      | The number of times a collision is detected later than 512 bit-times into the Tx of a packet                                                                    |
| 0x17   | TxPausePkts          | Number of PAUSE frames transmitted by a port                                                                                                                    |
| 0x18   | TxBroadcastPkts      | Tx good broadcast packets (not including error broadcast or valid multicast packets)                                                                            |
| 0x19   | TxMulticastPkts      | Tx good multicast packets (not including error multicast packets or valid broadcast packets)                                                                    |
| 0x1A   | TxUnicastPkts        | Tx good unicast packets                                                                                                                                         |
| 0x1B   | TxDeferred           | Tx packets by a port for which the 1st Tx attempt is delayed due to the busy medium                                                                             |
| 0x1C   | TxTotalCollision     | Tx total collision, half duplex only                                                                                                                            |
| 0x1D   | TxExcessiveCollision | A count of frames for which Tx fails due to excessive collisions                                                                                                |
| 0x1E   | TxSingleCollision    | Successfully Tx frames on a port for which Tx is inhibited by exactly one collision                                                                             |
| 0x1F   | TxMultipleCollision  | Successfully Tx frames on a port for which Tx is inhibited by more than one collision                                                                           |

**TABLE 4-14: FORMAT OF “ALL PORT DROPPED PACKET” MIB COUNTERS**

| Bit   | Name          | R/W | Description   | Default |
|-------|---------------|-----|---------------|---------|
| 30-16 | Reserved      | N/A | Reserved      | N/A     |
| 15-0  | Counter Value | RO  | Counter Value | 0       |

“All Port Dropped Packet” MIB counters are read using indirect memory access. The address offsets for these counters are shown in [Table 4-15](#).

**TABLE 4-15: “ALL PORT DROPPED PACKET” MIB COUNTERS INDIRECT MEMORY OFFSETS**

| Offset | Counter Name           | Description                                 |
|--------|------------------------|---------------------------------------------|
| 0x100  | Port 1 TX Drop Packets | TX packets dropped due to lack of resources |
| 0x101  | Port 2 TX Drop Packets | TX packets dropped due to lack of resources |
| 0x102  | Port 3 TX Drop Packets | TX packets dropped due to lack of resources |
| 0x103  | Port 1 RX Drop Packets | RX packets dropped due to lack of resources |
| 0x104  | Port 2 RX Drop Packets | RX packets dropped due to lack of resources |
| 0x105  | Port 3 RX Drop Packets | RX packets dropped due to lack of resources |

Examples:

1. MIB Counter Read (Read port 1 “Rx64Octets” Counter)

Write to reg. 110 with 0x1c // Read MIB counters selected

Write to reg. 111 with 0x0e // Trigger the read operation

Then

Read reg. 117, counter bits [30:24] // If bit 30 = 0, restart (reread) from this register

Read reg. 118, counter bits [23:16]

Read reg. 119, counter bits [15:8]

Read reg. 120, counter bits [7:0]

2. MIB Counter Read (Read port 2 “Rx64Octets” Counter)

Write to reg. 110 with 0x1c // Read MIB counter selected

Write to reg. 111 with 0x2e // Trigger the read operation

Then,

Read reg. 117, counter bits [30:24] // If bit 30 = 0, restart (reread) from this register

Read reg. 118, counter bits [23:16]

Read reg. 119, counter bits [15:8]

Read reg. 120, counter bits [7:0]

3. MIB Counter Read (Read “Port 1 TX Drop Packets” Counter)

Write to reg. 110 with 0x1D // Read MIB counter selected

Write to reg. 111 with 0x00 // Trigger the read operation

Then

Read reg. 119, counter bits [15:8]

Read reg. 120, counter bits [7:0]

#### 4.9.1 ADDITIONAL MIB COUNTER INFORMATION

“Per Port” MIB counters are designed as “read clear.” These counters will be cleared after they are read.

“All Port Dropped Packet” MIB counters are not cleared after they are accessed and do not indicate overflow or validity; therefore, the application must keep track of overflow and valid conditions.

To read out all the counters, the best performance over the SPI bus is  $(160+3) \times 8 \times 200 = 260$  ms, where there are 160 registers, 3 overheads, 8 clocks per access, at 5 MHz. In the heaviest condition, the counters will overflow in 2 minutes. It is recommended that the software read all the counters at least every 30 seconds.

# KSZ8993M

---

A high performance SPI master is also recommended to prevent counters overflow.

Per Port MIB counters are designed as “read clear.” That is, these counters will be cleared after they are read.

“All Port Dropped Packet” MIB counters are not cleared after they are read.

## 5.0 OPERATIONAL CHARACTERISTICS

### 5.1 Absolute Maximum Ratings\*

|                                                                |                 |
|----------------------------------------------------------------|-----------------|
| Supply Voltage                                                 |                 |
| (V <sub>DDA</sub> , V <sub>DDAP</sub> , V <sub>DDC</sub> )     | –0.5V to +2.4V  |
| (V <sub>DDATX</sub> , V <sub>DDARX</sub> , V <sub>DDIO</sub> ) | –0.5V to +4.0V  |
| Input Voltage (all inputs)                                     | –0.5V to +4.0V  |
| Output Voltage (all outputs)                                   | –0.5V to +4.0V  |
| Lead Temperature (soldering, 10s)                              | +260°C          |
| Storage Temperature (T <sub>S</sub> )                          | –55°C to +150°C |

\*Exceeding the absolute maximum rating may damage the device. Stresses greater than the absolute maximum rating may cause permanent damage to the device. Operation of the device at these or any other conditions above those specified in the operating sections of this specification is not implied. Maximum conditions for extended periods may affect reliability.

### 5.2 Operating Ratings\*\*

|                                                                     |                    |
|---------------------------------------------------------------------|--------------------|
| Supply Voltage                                                      |                    |
| (V <sub>DDA</sub> , V <sub>DDAP</sub> , V <sub>DDC</sub> )          | +1.710V to +1.890V |
| (V <sub>DDATX</sub> , V <sub>DDARX</sub> , V <sub>DDIO</sub> )      | +3.135V to +3.465V |
| Ambient Operating Temperature for M, ML Options (T <sub>A</sub> )   | 0°C to +70°C       |
| Ambient Operating Temperature for MI, MLI Options (T <sub>A</sub> ) | –40°C to +85°C     |
| Maximum Junction Temperature (T <sub>J</sub> )                      | +125°C             |
| Thermal Resistance (Note 5-1) (Θ <sub>JA</sub> )                    | +32°C/W            |

\*\*The device is not guaranteed to function outside its operating ratings.

**Note 5-1** No heat spreader (HS) in this package.

**Note:** Do not drive input signals without power supplied to the device.

## 6.0 ELECTRICAL CHARACTERISTICS

$T_A = 25^\circ\text{C}$ . Specification is for packaged product only. Current consumption is for the single 3.3V supply KSZ8893FQL device only, and includes the 1.2V supply voltages ( $V_{DDA}$ ,  $V_{DDAP}$ ,  $V_{DDC}$ ) that are provided by the KSZ8893FQL via power output pin 22. Each PHY port's transformer consumes an additional 45 mA @ 3.3V for 100BASE-TX and 70 mA @ 3.3V for 10BASE-T.

**TABLE 6-1: ELECTRICAL CHARACTERISTICS**

| Parameters                                                                 | Symbol      | Min. | Typ. | Max.      | Units         | Note                                                    |

| t <sub>s4</sub>   | Setup time              | 10   | —    | —    | ns    |
| t <sub>h4</sub>   | Hold time               | 10   | —    | —    | ns    |
| t <sub>ov4</sub>  | Output valid            | 0    | —    | 25   | ns    |

## 7.5 SPI Timing

FIGURE 7-9: SPI INPUT TIMING

TABLE 7-5: SPI INPUT TIMING PARAMETERS

| Parameter  | Description                | Min. | Max. | Units   |
|------------|----------------------------|------|------|---------|
| $f_C$      | Clock frequency            | —    | 5    | MHz     |
| $t_{CHSL}$ | SPIS_N inactive hold time  | 90   | —    | ns      |
| $t_{SLCH}$ | SPIS_N active setup time   | 90   | —    | ns      |
| $t_{CHSH}$ | SPIS_N active hold time    | 90   | —    | ns      |
| $t_{SHCH}$ | SPIS_N inactive setup time | 90   | —    | ns      |
| $t_{SHSL}$ | SPIS_N deselect time       | 100  | —    | ns      |
| $t_{DVCH}$ | Data input setup time      | 20   | —    | ns      |
| $t_{CHDX}$ | Data input hold time       | 30   | —    | ns      |
| $t_{CLCH}$ | Clock rise time            | —    | 1    | $\mu s$ |
| $t_{CHCL}$ | Clock fall time            | —    | 1    | $\mu s$ |
| $t_{DLDH}$ | Data input rise time       | —    | 1    | $\mu s$ |
| $t_{DHDL}$ | Data input fall time       | —    | 1    | $\mu s$ |

FIGURE 7-10: SPI OUTPUT TIMING

TABLE 7-6: SPI OUTPUT TIMING PARAMETERS

| Parameter  | Description             | Min. | Max. | Units |
|------------|-------------------------|------|------|-------|
| $f_C$      | Clock frequency         | —    | 5    | MHz   |
| $t_{CLQX}$ | SPIQ hold time          | 0    | 0    | ns    |
| $t_{CLQV}$ | Clock low to SPIQ valid | —    | 60   | ns    |
| $t_{CH}$   | Clock high time         | 90   | —    | ns    |
| $t_{CL}$   | Clock low time          | 90   | —    | ns    |
| $t_{QLQH}$ | SPIQ rise time          | —    | 50   | ns    |
| $t_{QHQL}$ | SPIQ fall time          | —    | 50   | ns    |
| $t_{SHQZ}$ | SPIQ disable time       | —    | 100  | ns    |

## 7.6 Reset Timing

As long as the stable supply voltages to reset high timing (minimum of 10 ms) are met, there is no power sequencing requirement for the KSZ8993M supply voltages (1.8V, 3.3).

It is recommended to wait 100  $\mu$ s after the de-assertion of reset before starting programming on the managed interface.

The reset timing requirement is summarized in [Figure 7-11](#) and [Table 7-7](#).

**FIGURE 7-11: RESET TIMING**

**TABLE 7-7: RESET TIMING PARAMETERS**

| Parameter | Description                          | Min. | Typ. | Max. | Units   |
|-----------|--------------------------------------|------|------|------|---------|
| $t_{SR}$  | Stable supply voltages to reset high | 10   | —    | —    | ms      |
| $t_{CS}$  | Configuration setup time             | 50   | —    | —    | ns      |
| $t_{CH}$  | Configuration hold time              | 50   | —    | —    | ns      |
| $t_{RC}$  | Reset to strap-in pin output         | 50   | —    | —    | $\mu$ s |

## 8.0 RESET CIRCUIT

Microchip recommends the following discrete reset circuit as shown in [Figure 8-1](#) when powering up the KSZ8993M/ML/MI device. For the application where the reset circuit signal comes from another device (e.g., CPU, FPGA, etc), we recommend the reset circuit as shown in [Figure 8-2](#).

**FIGURE 8-1: RECOMMENDED RESET CIRCUIT**

**FIGURE 8-2: RECOMMENDED RESET CIRCUIT FOR CPU/FPGA RESET**

At power-on-reset, R, C, and D1 provide the necessary ramp rise time to reset the device. The reset out from CPU/FPGA provides warm reset after power up. It is also recommended to power up the VDD core voltage earlier than VDDIO voltage. At worst case, the both VDD core and VDDIO voltages should come up at the same time.

## 9.0 SELECTION OF ISOLATION TRANSFORMERS

A 1:1 isolation transformer is required at the line interface. Use one with integrated common-mode chokes for designs exceeding FCC requirements.

Table 9-1 lists recommended transformer characteristics.

**TABLE 9-1: TRANSFORMER SELECTION CRITERIA**

| Parameter                       | Value                 | Test Conditions       |
|---------------------------------|-----------------------|-----------------------|
| Turns Ratio                     | 1 CT : 1 CT           | —                     |
| Open-Circuit Inductance (min.)  | 350 $\mu$ H           | 100 mV, 100 kHz, 8 mA |
| Leakage Inductance (max.)       | 0.4 $\mu$ H           | 1 MHz (min.)          |
| Interwinding Capacitance (max.) | 12 pF                 | —                     |
| D.C. Resistance (max.)          | 0.9 $\Omega$          | —                     |
| Insertion Loss (max.)           | 1.0 dB                | 0 MHz to 65 MHz       |
| HIPOT (min.)                    | 1500 V <sub>RMS</sub> | —                     |

**TABLE 9-2: QUALIFIED SINGLE-PORT MAGNETICS**

| Manufacturer       | Part Number  | Auto MDI-X |
|--------------------|--------------|------------|
| Bel Fuse           | S558-5999-U7 | Yes        |
| Bel Fuse (MagJack) | SI-46001     | Yes        |
| Bel Fuse (MagJack) | SI-50170     | Yes        |
| Delta              | LF8505       | Yes        |
| LanKom             | LF-H41S      | Yes        |
| Pulse              | H1102        | Yes        |
| Pulse (Low Cost)   | H1260        | Yes        |
| Transpower         | HB726        | Yes        |
| YCL                | LF-H41S      | Yes        |

**TABLE 9-3: TYPICAL REFERENCE CRYSTAL CHARACTERISTICS**

| Characteristic             | Value        |
|----------------------------|--------------|
| Frequency                  | 25 MHz       |
| Frequency Tolerance (max.) | $\pm 50$ ppm |
| Load Capacitance (max.)    | 20 pF        |
| Series Resistance          | 25 $\Omega$  |

## 10.0 PACKAGE OUTLINE

### 10.1 Package Marking Information

#### 128-Lead PQFP\*

#### Example

**Legend:** XX...X    Product code or customer-specific information  
Y            Year code (last digit of calendar year)  
YY          Year code (last 2 digits of calendar year)  
WW         Week code (week of January 1 is week '01')  
NNN        Alphanumeric traceability code  
Ⓔ3         Pb-free JEDEC® designator for Matte Tin (Sn)  
\*            This package is Pb-free. The Pb-free JEDEC designator (Ⓔ3) can be found on the outer packaging for this package.  
  
●, ▲, ▼    Pin one index is identified by a dot, delta up, or delta down (triangle mark).

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information. Package may or may not include the corporate logo.  
  
Underbar ( \_ ) and/or Overbar ( ¯ ) symbol may not be to scale.

## APPENDIX A: DATA SHEET REVISION HISTORY

TABLE A-1: REVISION HISTORY

| Revision               | Section/Figure/Entry | Correction                                                                                    |
|------------------------|----------------------|-----------------------------------------------------------------------------------------------|
| DS00003066A (10-04-19) | —                    | Converted Micrel data sheet KSZ8993M to Microchip DS00003066A. Minor text changes throughout. |

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at [www.microchip.com](http://www.microchip.com). This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at [www.microchip.com](http://www.microchip.com). Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

**Technical support is available through the web site at: <http://microchip.com/support>**

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
