- **Immediately.** The write value has immediate effect, and the hardware reacts immediately.
- **Locally Synchronized.** The write value does not affect the logic until the counter reaches the value zero at the end of the PWM cycle. In this case, the effect of the write is deferred, providing a guaranteed defined behavior and preventing overly short or overly long output PWM pulses.
- **Globally Synchronized.** The write value does not affect the logic until two sequential events have occurred: (1) the Update mode for the generator function is programmed for global synchronization in the **PWMnCTL** register, and (2) the counter reaches zero at the end of the PWM cycle. In this case, the effect of the write is deferred until the end of the PWM cycle following the end of all updates. This mode allows multiple items in multiple PWM generators to be updated simultaneously without odd effects during the update; everything runs from the old values until a point at which they all run from the new values. The Update mode of the load and comparator match values can be individually configured in each PWM generator block. It typically makes sense to use the synchronous update mechanism across PWM generator blocks when the timers in those blocks are synchronized, although this is not required in order for this mechanism to function properly.

The following registers provide either local or global synchronization based on the state of various Update mode bits and fields in the **PWMnCTL** register (LOADUPD; CMPAUPD; CMPBUPD):

- Generator Registers: **PWMnLOAD**, **PWMnCMPA**, and **PWMnCMPB**

The following registers default to immediate update, but are provided with the optional functionality of synchronously updating rather than having all updates take immediate effect:

- Module-Level Register: **PWMENABLE** (based on the state of the ENUPDn bits in the PWMENUPD register).
- Generator Register: **PWMnGENA**, **PWMnGENB**, **PWMnDBCTL**, **PWMnDBRISE**, and **PWMnDBFALL** (based on the state of various Update mode bits and fields in the **PWMnCTL** register (GENAUPD; GENBUPD; DBCTLUPD; DBRISEUPD; DBFALLUPD)).

All other registers are considered statically provisioned for the execution of an application or are used dynamically for purposes unrelated to maintaining synchronization and therefore do not need synchronous update functionality.

### 22.3.7 Fault Conditions

A fault condition is one in which the controller must be signaled to stop normal PWM function and then set the PWMn signals to a safe state. Two basic situations cause fault conditions:

- The microcontroller is stalled and cannot perform the necessary computation in the time required for motion control
- An external error or event is detected

The PWM unit can use the following inputs to generate a fault condition, including:

- FAULTn pin assertion
- A stall of the controller generated by the debugger
- The trigger of an ADC digital comparator

Fault conditions are calculated on a per-PWM generator basis. Each PWM generator configures the necessary conditions to indicate a fault condition exists. This method allows the development of applications with dependent and independent control.

Four fault input pins (FAULT0-FAULT3). These inputs may be used with circuits that generate an active High or active Low signal to indicate an error condition. A FAULTn pins may be individually programmed for the appropriate logic sense using the **PWMnFLTSEN** register.

The PWM generator's mode control, including fault condition handling, is provided in the **PWMnCTL** register. This register determines whether the FAULT0 input or a combination of FAULTn input signals and/or digital comparator triggers (as configured by the **PWMnFLTSRC0** and **PWMnFLTSRC1** registers) is used to generate a fault condition. The **PWMnCTL** register also selects whether the fault condition is maintained as long as the external condition lasts or if it is latched until the fault condition until cleared by software. Finally, this register also enables a counter that may be used to extend the period of a fault condition for external events to assure that the duration is a minimum length. The minimum fault period count is specified in the **PWMnMINFLTPER** register.

Status regarding the specific fault cause is provided in the **PWMnFLTSTAT0** and **PWMnFLTSTAT1** registers.

PWM generator fault conditions may be promoted to a controller interrupt using the **PWMINTEN** register.

### 22.3.8 Output Control Block

The output control block takes care of the final conditioning of the pwmA' and pwmB' signals before they go to the pins as the PWMn signals. Via a single register, the **PWM Output Enable (PWENABLE)** register, the set of PWM signals that are actually enabled to the pins can be modified. This function can be used, for example, to perform commutation of a brushless DC motor with a single register write (and without modifying the individual PWM generators, which are modified by the feedback control loop). In addition, the updating of the bits in the **PWENABLE** register can be configured to be immediate or locally or globally synchronized to the next synchronous update using the **PWM Enable Update (PWMENUUPD)** register.

During fault conditions, the PWM output signals, PWMn, usually must be driven to safe values so that external equipment may be safely controlled. The **PWMFAULT** register specifies whether during a fault condition, the generated signal continues to be passed driven or to an encoding specified in the **PWMFAULTVAL** register.

A final inversion can be applied to any of the PWMn signals, making them active Low instead of the default active High using the **PWM Output Inversion (PWMINVERT)**. The inversion is applied even if a value has been enabled in the **PWMFAULT** register and specified in the **PWMFAULTVAL** register. In other words, if a bit is set in the **PWMFAULT**, **PWMFAULTVAL**, and **PWMINVERT** registers, the output on the PWMn signal is 0, not 1 as specified in the **PWMFAULTVAL** register.

## 22.4 Initialization and Configuration

The following example shows how to initialize PWM Generator 0 with a 25-kHz frequency, a 25% duty cycle on the PWM0 pin, and a 75% duty cycle on the PWM1 pin. This example assumes the system clock is 20 MHz.

1. Enable the PWM clock by writing a value of 0x0010.0000 to the **RCGC0** register in the System Control module (see page 172).
2. Enable the clock to the appropriate GPIO module via the **RCGC2** register in the System Control module (see page 189).
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register. To determine which GPIOs to configure, see Table 25-4 on page 1091.
4. Configure the PMCN fields in the **GPIOPCTL** register to assign the PWM signals to the appropriate pins (see page 368 and Table 25-5 on page 1099).
5. Configure the **Run-Mode Clock Configuration (RCC)** register in the System Control module to use the PWM divide (USEPWMDIV) and set the divider (PWMDIV) to divide by 2 (000).
6. Configure the PWM generator for countdown mode with immediate updates to the parameters.
  - Write the **PWM0CTL** register with a value of 0x0000.0000.
  - Write the **PWM0GENA** register with a value of 0x0000.008C.
  - Write the **PWM0GENB** register with a value of 0x0000.080C.
7. Set the period. For a 25-KHz frequency, the period = 1/25,000, or 40 microseconds. The PWM clock source is 10 MHz; the system clock divided by 2. Thus there are 400 clock ticks per period.

Use this value to set the **PWM0LOAD** register. In Count-Down mode, set the LOAD field in the **PWM0LOAD** register to the requested period minus one.

- Write the **PWM0LOAD** register with a value of 0x0000.018F.
8. Set the pulse width of the PWM0 pin for a 25% duty cycle.
    - Write the **PWM0CMPA** register with a value of 0x0000.012B.
  9. Set the pulse width of the PWM1 pin for a 75% duty cycle.
    - Write the **PWM0CMPB** register with a value of 0x0000.0063.
  10. Start the timers in PWM generator 0.
    - Write the **PWM0CTL** register with a value of 0x0000.0001.
  11. Enable PWM outputs.
    - Write the **PWMENABLE** register with a value of 0x0000.0003.

## 22.5 Register Map

Table 22-3 on page 985 lists the PWM registers. The offset listed is a hexadecimal increment to the register's address, relative to the PWM base address of 0x4002.8000. Note that the PWM module clock must be enabled before the registers can be programmed (see page 172).

**Table 22-3. PWM Register Map**

| Offset | Name        | Type  | Reset       | Description                       | See page |
|--------|-------------|-------|-------------|-----------------------------------|----------|
| 0x000  | PWMCTL      | R/W   | 0x0000.0000 | PWM Master Control                | 988      |
| 0x004  | PWMSYNC     | R/W   | 0x0000.0000 | PWM Time Base Sync                | 989      |
| 0x008  | PWMENABLE   | R/W   | 0x0000.0000 | PWM Output Enable                 | 990      |
| 0x00C  | PWMINVERT   | R/W   | 0x0000.0000 | PWM Output Inversion              | 992      |
| 0x010  | PWMFAULT    | R/W   | 0x0000.0000 | PWM Output Fault                  | 994      |
| 0x014  | PWMINTEN    | R/W   | 0x0000.0000 | PWM Interrupt Enable              | 996      |

## 22.6 Register Descriptions

The remainder of this section lists and describes the PWM registers, in numerical order by address offset.

**Register 1: PWM Master Control (PWMCTL), offset 0x000**

This register provides master control over the PWM generation blocks.

**PWM Master Control (PWMCTL)**

Base 0x4002.8000

Offset 0x000

Type R/W, reset 0x0000.0000

## Register 2: PWM Time Base Sync (PWMSYNC), offset 0x004

This register provides a method to perform synchronization of the counters in the PWM generation blocks. Setting a bit in this register causes the specified counter to reset back to 0; setting multiple bits resets multiple counters simultaneously. The bits auto-clear after the reset has occurred; reading them back as zero indicates that the synchronization has completed.

**Register 3: PWM Output Enable (PWMENABLE), offset 0x008**

This register provides a master control of which generated pwmA' and pwmB' signals are output to the PWMn pins. By disabling a PWM output, the generation process can continue (for example, when the time bases are synchronized) without driving PWM signals to the pins. When bits in this register are set, the corresponding pwmA' or pwmB' signal is passed through to the output stage. When bits are clear, the pwmA' or pwmB' signal is replaced by a zero value which is also passed to the output stage. The **PWMINVERT** register controls the output stage, so if the corresponding bit is set in that register, the value seen on the PWMn signal is inverted from what is configured by the bits in this register. Updates to the bits in this register can be immediate or locally or globally synchronized to the next synchronous update as controlled by the ENUPDn fields in the **PWMENUPD** register.

**Register 4: PWM Output Inversion (PWMINVERT), offset 0x00C**

This register provides a master control of the polarity of the PWMn signals on the device pins. The pwmA' and pwmB' signals generated by the PWM generator are active High; but can be made active Low via this register. Disabled PWM channels are also passed through the output inverter (if so configured) so that inactive signals can be High. In addition, if the **PWMFAULT** register enables a specific value to be placed on the PWMn signals during a fault condition, that value is inverted if the corresponding bit in this register is set.

**Register 5: PWM Output Fault (PWMFAULT), offset 0x010**

This register controls the behavior of the PWMn outputs in the presence of fault conditions. Both the fault inputs (FAULTn pins and digital comparator outputs) and debug events are considered fault conditions. On a fault condition, each pwmA' or pwmB' signal can be passed through unmodified or driven to the value specified by the corresponding bit in the **PWMFAULTVAL** register. For outputs that are configured for pass-through, the debug event handling on the corresponding PWM generator also determines if the pwmA' or pwmB' signal continues to be generated.

Fault condition control occurs before the output inverter, so PWM signals driven to a specified value on fault are inverted if the channel is configured for inversion (therefore, the pin is driven to the logical complement of the specified value on a fault condition).

**Register 6: PWM Interrupt Enable (PWMINTEN), offset 0x014**

This register controls the global interrupt generation capabilities of the PWM module. The events that can cause an interrupt are the fault input and the individual interrupts from the PWM generators.

**PWM Interrupt Enable (PWMINTEN)**

Base 0x4002.8000

Offset 0x014

Type R/W, reset 0x0000.0000

**Register 7: PWM Raw Interrupt Status (PWMRIS), offset 0x018**

This register provides the current set of interrupt sources that are asserted, regardless of whether they are enabled to cause an interrupt to be asserted to the interrupt controller. The fault interrupt is asserted based on the fault condition source that is specified by the **PWMnCTL**, **PWMnFLTSRC0** and **PWMnFLTSRC1** registers. The fault interrupt is latched on detection and must be cleared through the **PWM Interrupt Status and Clear (PWMISC)** register. The actual value of the FAULTn signals can be observed using the **PWMSTATUS** register.

The PWM generator interrupts simply reflect the status of the PWM generators and are cleared via the interrupt status register in the PWM generator blocks. If a bit is set, the event is active; if a bit is clear the event is not active.

**PWM Raw Interrupt Status (PWMRIS)**

Base 0x4002.8000

Offset 0x018

Type RO, reset 0x0000.0000

**Register 8: PWM Interrupt Status and Clear (PWMISC), offset 0x01C**

This register provides a summary of the interrupt status of the individual PWM generator blocks. If a fault interrupt is set, the corresponding FAULTn input has caused an interrupt. For the fault interrupt, a write of 1 to that bit position clears the latched interrupt status. If an block interrupt bit is set, the corresponding generator block is asserting an interrupt. The individual interrupt status registers, **PWMnISC**, in each block must be consulted to determine the reason for the interrupt and used to clear the interrupt.

**Register 10: PWM Fault Condition Value (PWMFAULTVAL), offset 0x024**

This register specifies the output value driven on the PWMn signals during a fault condition if enabled by the corresponding bit in the **PWMFAULT** register. Note that if the corresponding bit in the **PWMINVERT** register is set, the output value is driven to the logical NOT of the bit value in this register.

**PWM Fault Condition Value (PWMFAULTVAL)**

Base 0x4002.8000

|           |      |      |       | Value Description                                                                                                         |
|           |      |      |       | 1 The PWM0 output signal is driven High during fault conditions if the FAULT0 bit in the <b>PWMFAULT</b> register is set. |
|           |      |      |       | 0 The PWM0 output signal is driven Low during fault conditions if the FAULT0 bit in the <b>PWMFAULT</b> register is set.  |

**Register 11: PWM Enable Update (PWMENUPD), offset 0x028**

This register specifies when updates to the PWMnEn bit in the **PWMENABLE** register are performed. The PWMnEn bit enables the pwmA' or pwmB' output to be passed to the microcontroller's pin. Updates can be immediate or locally or globally synchronized to the next synchronous update.

**PWM Enable Update (PWMENUPD)**

**Register 12: PWM0 Control (PWM0CTL), offset 0x040****Register 13: PWM1 Control (PWM1CTL), offset 0x080****Register 14: PWM2 Control (PWM2CTL), offset 0x0C0**

These registers configure the PWM signal generation blocks (PWM0CTL controls the PWM generator 0 block, and so on). The Register Update mode, Debug mode, Counting mode, and Block Enable mode are all controlled via these registers. The blocks produce the PWM signals, which can be either two independent PWM signals (from the same counter), or a paired set of PWM signals with dead-band delays added.

The PWM0 block produces the PWM0 and PWM1 outputs, the PWM1 block produces the PWM2 and PWM3 outputs, and the PWM2 block produces the PWM4 and PWM5 outputs.

**PWM0 Control (PWM0CTL)**

|-----------|-----------|------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 17        | MINFLTPER | R/W  | 0     | <p>Minimum Fault Period</p> <p>This bit specifies that the PWM generator enables a one-shot counter to provide a minimum fault condition period.</p> <p>The timer begins counting on the rising edge of the fault condition to extend the condition for a minimum duration of the count value. The timer ignores the state of the fault condition while counting.</p> <p>The minimum fault delay is in effect only when the MINFLTPER bit is set. If a detected fault is in the process of being extended when the MINFLTPER bit is cleared, the fault condition extension is aborted.</p> <p>The delay time is specified by the <b>PWMnMINFLTPER</b> register MFP field value. The effect of this is to pulse stretch the fault condition input.</p> <p>The delay value is defined by the PWM clock period. Because the fault input is not synchronized to the PWM clock, the period of the time is <math>PWMClock * (MFP \text{ value} + 1)</math> or <math>PWMClock * (MFP \text{ value} + 2)</math>.</p> <p>The delay function makes sense only if the fault source is unlatched. A latched fault source makes the fault condition appear asserted until cleared by software and negates the utility of the extend feature. It applies to all fault condition sources as specified in the FLTSRC field.</p> <p>Value Description</p> <p>0 The FAULT input deassertion is unaffected.</p> <p>1 The <b>PWMnMINFLTPER</b> one-shot counter is active and extends the period of the fault condition to a minimum period.</p> |

**Register 15: PWM0 Interrupt and Trigger Enable (PWM0INTEN), offset 0x044**

**Register 16: PWM1 Interrupt and Trigger Enable (PWM1INTEN), offset 0x084**

**Register 17: PWM2 Interrupt and Trigger Enable (PWM2INTEN), offset 0x0C4**

These registers control the interrupt and ADC trigger generation capabilities of the PWM generators (**PWM0INTEN** controls the PWM generator 0 block, and so on). The events that can cause an interrupt or an ADC trigger are:

- The counter being equal to the load register
- The counter being equal to zero
- The counter being equal to the **PWMnCMPA** register while counting up
- The counter being equal to the **PWMnCMPA** register while counting down
- The counter being equal to the **PWMnCMBP** register while counting up
- The counter being equal to the **PWMnCMBP** register while counting down

Any combination of these events can generate either an interrupt or an ADC trigger, though no determination can be made as to the actual event that caused an ADC trigger if more than one is specified. The **PWMnRIS** register provides information about which events have caused raw interrupts.

#### PWM0 Interrupt and Trigger Enable (PWM0INTEN)

Base 0x4002.8000

Offset 0x044

Type R/W, reset 0x0000.0000

**Register 18: PWM0 Raw Interrupt Status (PWM0RIS), offset 0x048****Register 19: PWM1 Raw Interrupt Status (PWM1RIS), offset 0x088****Register 20: PWM2 Raw Interrupt Status (PWM2RIS), offset 0x0C8**

These registers provide the current set of interrupt sources that are asserted, regardless of whether they cause an interrupt to be asserted to the controller (**PWM0RIS** controls the PWM generator 0 block, and so on). If a bit is set, the event has occurred; if a bit is clear, the event has not occurred. Bits in this register are cleared by writing a 1 to the corresponding bit in the **PWMnISC** register.

**PWM0 Raw Interrupt Status (PWM0RIS)**

**Register 21: PWM0 Interrupt Status and Clear (PWM0ISC), offset 0x04C****Register 22: PWM1 Interrupt Status and Clear (PWM1ISC), offset 0x08C****Register 23: PWM2 Interrupt Status and Clear (PWM2ISC), offset 0x0CC**

These registers provide the current set of interrupt sources that are asserted to the interrupt controller (**PWM0ISC** controls the PWM generator 0 block, and so on). A bit is set if the event has occurred and is enabled in the **PWMnINTEN** register; if a bit is clear, the event has not occurred or is not enabled. These are R/W1C registers; writing a 1 to a bit position clears the corresponding interrupt reason.

**Register 24: PWM0 Load (PWM0LOAD), offset 0x050****Register 25: PWM1 Load (PWM1LOAD), offset 0x090****Register 26: PWM2 Load (PWM2LOAD), offset 0x0D0**

These registers contain the load value for the PWM counter (**PWM0LOAD** controls the PWM generator 0 block, and so on). Based on the counter mode configured by the **MODE** bit in the **PWMnCTL** register, this value is either loaded into the counter after it reaches zero or is the limit of up-counting after which the counter decrements back to zero. When this value matches the counter, a pulse is output which can be configured to drive the generation of the pwmA and/or pwmB signal (via the **PWMnGENA/PWMnGENB** register) or drive an interruptor ADC trigger (via the **PWMnINTEN** register).

If the Load Value Update mode is locally synchronized (based on the **LOADUPD** field encoding in the **PWMnCTL** register), the 16-bit **LOAD** value is used the next time the counter reaches zero. If the update mode is globally synchronized, it is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 988). If this register is re-written before the actual update occurs, the previous value is never used and is lost.

**Register 36: PWM0 Generator A Control (PWM0GENA), offset 0x060****Register 37: PWM1 Generator A Control (PWM1GENA), offset 0x0A0****Register 38: PWM2 Generator A Control (PWM2GENA), offset 0x0E0**

These registers control the generation of the pwmA signal based on the load and zero output pulses from the counter, as well as the compare A and compare B pulses from the comparators (**PWM0GENA** controls the PWM generator 0 block, and so on). When the counter is running in Count-Down mode, only four of these events occur; when running in Count-Up/Down mode, all six occur. These events provide great flexibility in the positioning and duty cycle of the resulting PWM signal.

The **PWM0GENA** register controls generation of the pwm0A signal; **PWM1GENA**, the pwm1A signal; and **PWM2GENA**, the pwm2A signal.

If a zero or load event coincides with a compare A or compare B event, the zero or load action is taken and the compare A or compare B action is ignored. If a compare A event coincides with a compare B event, the compare A action is taken and the compare B action is ignored.

If the Generator A update mode is immediate (based on the GENAUPD field encoding in the **PWMnCTL** register), the ACTCMPBD, ACTCMPBU, ACTCMPAD, ACTCMPAU, ACTLOAD, and ACTZERO values are used immediately. If the update mode is locally synchronized, these values are used the next time the counter reaches zero. If the update mode is globally synchronized, these values are used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 988). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 39: PWM0 Generator B Control (PWM0GENB), offset 0x064****Register 40: PWM1 Generator B Control (PWM1GENB), offset 0x0A4****Register 41: PWM2 Generator B Control (PWM2GENB), offset 0x0E4**

These registers control the generation of the pwmB signal based on the load and zero output pulses from the counter, as well as the compare A and compare B pulses from the comparators (**PWM0GENB** controls the PWM generator 0 block, and so on). When the counter is running in Count-Down mode, only four of these events occur; when running in Count-Up/Down mode, all six occur. These events provide great flexibility in the positioning and duty cycle of the resulting PWM signal.

The **PWM0GENB** register controls generation of the pwm0B signal; **PWM1GENB**, the pwm1B signal; and **PWM2GENB**, the pwm2B signal.

If a zero or load event coincides with a compare A or compare B event, the zero or load action is taken and the compare A or compare B action is ignored. If a compare A event coincides with a compare B event, the compare B action is taken and the compare A action is ignored.

If the Generator B update mode is immediate (based on the GENBUPD field encoding in the **PWMnCTL** register), the ACTCMPBD, ACTCMPBU, ACTCMPAD, ACTCMPAU, ACTLOAD, and ACTZERO values are used immediately. If the update mode is locally synchronized, these values are used the next time the counter reaches zero. If the update mode is globally synchronized, these values are used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 988). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**PWM0 Generator B Control (PWM0GENB)**

**Register 42: PWM0 Dead-Band Control (PWM0DBCTL), offset 0x068****Register 43: PWM1 Dead-Band Control (PWM1DBCTL), offset 0x0A8****Register 44: PWM2 Dead-Band Control (PWM2DBCTL), offset 0x0E8**

The **PWMnDBCTL** register controls the dead-band generator, which produces the Pwmn signals based on the pwmA and pwmB signals. When disabled, the pwmA signal passes through to the pwmA' signal and the pwmB signal passes through to the pwmB' signal. When dead-band control is enabled, the pwmB signal is ignored, the pwmA' signal is generated by delaying the rising edge(s) of the pwmA signal by the value in the **PWMnDBRISE** register (see page 1032), and the pwmB' signal is generated by inverting the pwmA signal and delaying the falling edge(s) of the pwmA signal by the value in the **PWMnDBFALL** register (see page 1033). The Output Control block outputs the pwm0A' signal on the PWM0 signal and the pwm0B' signal on the PWM1 signal. In a similar manner, PWM2 and PWM3 are produced from the pwm1A' and pwm1B' signals, and PWM4 and PWM5 are produced from the pwm2A' and pwm2B' signals.

If the Dead-Band Control mode is immediate (based on the DBCTLUPD field encoding in the **PWMnCTL** register), the ENABLE bit value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 988). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**PWM0 Dead-Band Control (PWM0DBCTL)**

**Register 45: PWM0 Dead-Band Rising-Edge Delay (PWM0DBRISE), offset 0x06C****Register 46: PWM1 Dead-Band Rising-Edge Delay (PWM1DBRISE), offset 0x0AC****Register 47: PWM2 Dead-Band Rising-Edge Delay (PWM2DBRISE), offset 0x0EC**

The **PWMnDBRISE** register contains the number of clock cycles to delay the rising edge of the pwmA signal when generating the pwmA' signal. If the dead-band generator is disabled through the **PWMnDBCTL** register, this register is ignored. If the value of this register is larger than the width of a High pulse on the pwmA signal, the rising-edge delay consumes the entire High time of the signal, resulting in no High time on the output. Care must be taken to ensure that the pwmA High time always exceeds the rising-edge delay.

If the Dead-Band Rising-Edge Delay mode is immediate (based on the DBRISEUPD field encoding in the **PWMnCTL** register), the 12-bit RISEDELAY value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 988). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**PWM0 Dead-Band Rising-Edge Delay (PWM0DBRISE)**

| 11:0      | RISEDELAY | R/W  | 0x000    | Dead-Band Rise Delay<br><br>The number of clock cycles to delay the rising edge of pwmA' after the rising edge of pwmA.                                                                       |

**Register 48: PWM0 Dead-Band Falling-Edge-Delay (PWM0DBFALL), offset 0x070****Register 49: PWM1 Dead-Band Falling-Edge-Delay (PWM1DBFALL), offset 0x0B0****Register 50: PWM2 Dead-Band Falling-Edge-Delay (PWM2DBFALL), offset 0x0F0**

The **PWMnDBFALL** register contains the number of clock cycles to delay the rising edge of the pwmB' signal from the falling edge of the pwmA signal. If the dead-band generator is disabled through the **PWMnDBCTL** register, this register is ignored. If the value of this register is larger than the width of a Low pulse on the pwmA signal, the falling-edge delay consumes the entire Low time of the signal, resulting in no Low time on the output. Care must be taken to ensure that the pwmA Low time always exceeds the falling-edge delay.

If the Dead-Band Falling-Edge-Delay mode is immediate (based on the DBFALLUP field encoding in the **PWMnCTL** register), the 12-bit FALLDELAY value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 988). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 51: PWM0 Fault Source 0 (PWM0FLTSRC0), offset 0x074****Register 52: PWM1 Fault Source 0 (PWM1FLTSRC0), offset 0x0B4****Register 53: PWM2 Fault Source 0 (PWM2FLTSRC0), offset 0x0F4**

This register specifies which fault pin inputs are used to generate a fault condition. Each bit in the following register indicates whether the corresponding fault pin is included in the fault condition. All enabled fault pins are ORed together to form the **PWMnFLTSRC0** portion of the fault condition. The **PWMnFLTSRC0** fault condition is then ORed with the **PWMnFLTSRC1** fault condition to generate the final fault condition for the PWM generator.

If the FLTSRC bit in the **PWMnCTL** register (see page 1009) is clear, only the Fault0 signal affects the fault condition generated. Otherwise, sources defined in **PWMnFLTSRC0** and **PWMnFLTSRC1** affect the fault condition generated.

**Register 57: PWM0 Minimum Fault Period (PWM0MINFLTPER), offset 0x07C****Register 58: PWM1 Minimum Fault Period (PWM1MINFLTPER), offset 0x0BC****Register 59: PWM2 Minimum Fault Period (PWM2MINFLTPER), offset 0x0FC**

If the MINFLTPER bit in the **PWMnCTL** register is set, this register specifies the 16-bit time-extension value to be used in extending the fault condition. The value is loaded into a 16-bit down counter, and the counter value is used to extend the fault condition. The fault condition is released in the clock immediately after the counter value reaches 0. The fault condition is asynchronous to the PWM clock; and the delay value is the product of the PWM clock period and the (MFP field value + 1) or (MFP field value + 2) depending on when the fault condition asserts with respect to the PWM clock. The counter decrements at the PWM clock rate, without pause or condition.

**Register 64: PWM0 Fault Status 0 (PWM0FLTSTAT0), offset 0x804****Register 65: PWM1 Fault Status 0 (PWM1FLTSTAT0), offset 0x884****Register 66: PWM2 Fault Status 0 (PWM2FLTSTAT0), offset 0x904**

Along with the **PWMnFLTSTAT1** register, this register provides status regarding the fault condition inputs.

If the LATCH bit in the **PWMnCTL** register is clear, the contents of the **PWMnFLTSTAT0** register are read-only (RO) and provide the current state of the FAULTn inputs.

If the LATCH bit in the **PWMnCTL** register is set, the contents of the **PWMnFLTSTAT0** register are read / write 1 to clear (R/W1C) and provide a latched version of the FAULTn inputs. In this mode, the register bits are cleared by writing a 1 to a set bit. The FAULTn inputs are recorded after their sense is adjusted in the generator.

The contents of this register can only be written if the fault source extensions are enabled (the FLTSRC bit in the **PWMnCTL** register is set).

**Register 67: PWM0 Fault Status 1 (PWM0FLTSTAT1), offset 0x808****Register 68: PWM1 Fault Status 1 (PWM1FLTSTAT1), offset 0x888****Register 69: PWM2 Fault Status 1 (PWM2FLTSTAT1), offset 0x908**

Along with the **PWMnFLTSTAT0** register, this register provides status regarding the fault condition inputs.

If the LATCH bit in the **PWMnCTL** register is clear, the contents of the **PWMnFLTSTAT1** register are read-only (RO) and provide the current state of the digital comparator triggers.

If the LATCH bit in the **PWMnCTL** register is set, the contents of the **PWMnFLTSTAT1** register are read / write 1 to clear (R/W1C) and provide a latched version of the digital comparator triggers. In this mode, the register bits are cleared by writing a 1 to a set bit. The contents of this register can only be written if the fault source extensions are enabled (the FLTSRC bit in the **PWMnCTL** register is set).

**PWM0 Fault Status 1 (PWM0FLTSTAT1)**

## 23 Quadrature Encoder Interface (QEI)

A quadrature encoder, also known as a 2-channel incremental encoder, converts linear displacement into a pulse signal. By monitoring both the number of pulses and the relative phase of the two signals, you can track the position, direction of rotation, and speed. In addition, a third channel, or index signal, can be used to reset the position counter.

The LM3S9L97 microcontroller includes two quadrature encoder interface (QEI) modules. Each QEI module interprets the code produced by a quadrature encoder wheel to integrate position over time and determine direction of rotation. In addition, it can capture a running estimate of the velocity of the encoder wheel.

The Stellaris<sup>®</sup> LM3S9L97 microcontroller includes two QEI modules providing control of two motors at the same time with the following features:

- Position integrator that tracks the encoder position
- Programmable noise filter on the inputs
- Velocity capture using built-in timer
- Interrupt generation on:
  - Index pulse
  - Velocity-timer expiration
  - Direction change
  - Quadrature error detection

### 23.1 Block Diagram

Figure 23-1 on page 1047 provides a block diagram of a Stellaris<sup>®</sup> QEI module.

Figure 23-1. QEI Block Diagram

## 23.2 Signal Description

Table 23-1 on page 1047 and Table 23-2 on page 1048 list the external signals of the QEI module and describe the function of each. The QEI signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for these QEI signals. The **AFSEL** bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 350) should be set to choose the QEI function. The number in parentheses is the encoding that must be programmed into the **PMCn** field in the **GPIO Port Control (GPIOPCTL)** register (page 368) to assign the QEI signal to the specified GPIO port pin. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 326.

Table 23-1. Signals for QEI (100LQFP)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description           |
|----------|------------|--------------------------|----------|--------------------------|-----------------------|

## 23.3 Functional Description

The QEI module interprets the two-bit gray code produced by a quadrature encoder wheel to integrate position over time and determine direction of rotation. In addition, it can capture a running estimate of the velocity of the encoder wheel.

The position integrator and velocity capture can be independently enabled, though the position integrator must be enabled before the velocity capture can be enabled. The two phase signals, PhA and PhB, can be swapped before being interpreted by the QEI module to change the meaning of forward and backward and to correct for miswiring of the system. Alternatively, the phase signals can be interpreted as a clock and direction signal as output by some encoders.

The QEI module input signals have a digital noise filter on them that can be enabled to prevent spurious operation. The noise filter requires that the inputs be stable for 3 consecutive clock cycles before updating the edge detector. The filter is enabled by the FILTEN bit in the **QEI Control (QEICTL)** register. The frequency of the input update is programmable using the FILTCNT bit field in the **QEICTL** register.

When the QE1 module is set to use the quadrature phase mode (SIGMODE bit is clear), the capture mode for the position integrator can be set to update the position counter on every edge of the PhA signal or to update on every edge of both PhA and PhB. Updating the position counter on every PhA and PhB edge provides more positional resolution at the cost of less range in the positional counter.

The positional counter is automatically reset on one of two conditions: sensing the index pulse or reaching the maximum position value. The reset mode is determined by the RESMODE bit of the **QEICTL** register.

When RESMODE is clear, the positional counter is constrained to the range [0:M], where M is the programmable maximum value. The index pulse is ignored by the positional counter in this mode.

Figure 23-2 on page 1049 shows how the Stellaris<sup>®</sup> quadrature encoder converts the phase input signals into clock pulses, the direction signal, and how the velocity predivider operates (in Divide by 4 mode).

PhA

PhB

clk

clkdiv

dir

pos

rel

The period of the timer is configurable by specifying the load value for the timer in the **QEI Timer Load (QEILOAD)** register. When the timer reaches zero, an interrupt can be triggered, and the hardware reloads the timer with the **QEILOAD** value and continues to count down. At lower encoder speeds, a longer timer period is required to be able to capture enough edges to have a meaningful result. At higher encoder speeds, both a shorter timer period and/or the velocity predivider can be used.

The following equation converts the velocity counter value into an rpm value:

$$\text{rpm} = (\text{clock} * (2 \wedge \text{VELDIV}) * \text{SPEED} * 60) \div (\text{LOAD} * \text{ppr} * \text{edges})$$

where:

clock is the controller clock rate

ppr is the number of pulses per revolution of the physical encoder

edges is 2 or 4, based on the capture mode set in the **QEICTL** register (2 for CAPMODE clear and 4 for CAPMODE set)

For example, consider a motor running at 600 rpm. A 2048 pulse per revolution quadrature encoder is attached to the motor, producing 8192 phase edges per revolution. With a velocity predivider of  $\div 1$  (VELDIV is clear) and clocking on both PhA and PhB edges, this results in 81,920 pulses per second (the motor turns 10 times per second). If the timer were clocked at 10,000 Hz, and the load value was 2,500 ( $\frac{1}{4}$  of a second), it would count 20,480 pulses per update. Using the above equation:

$$\text{rpm} = (10000 * 1 * 20480 * 60) \div (2500 * 2048 * 4) = 600 \text{ rpm}$$

Now, consider that the motor is sped up to 3000 rpm. This results in 409,600 pulses per second, or 102,400 every  $\frac{1}{4}$  of a second. Again, the above equation gives:

$$\text{rpm} = (10000 * 1 * 102400 * 60) \div (2500 * 2048 * 4) = 3000 \text{ rpm}$$

Care must be taken when evaluating this equation because intermediate values may exceed the capacity of a 32-bit integer. In the above examples, the clock is 10,000 and the divisor is 2,500; both could be predivided by 100 (at compile time if they are constants) and therefore be 100 and 25. In fact, if they were compile-time constants, they could also be reduced to a simple multiply by 4, cancelled by the  $\div 4$  for the edge-count factor.

---

**Important:** Reducing constant factors at compile time is the best way to control the intermediate values of this equation and reduce the processing requirement of computing this equation.

---

The division can be avoided by selecting a timer load value such that the divisor is a power of 2; a simple shift can therefore be done in place of the division. For encoders with a power of 2 pulses per revolution, the load value can be a power of 2. For other encoders, a load value must be selected such that the product is very close to a power of 2. For example, a 100 pulse-per-revolution encoder could use a load value of 82, resulting in 32,800 as the divisor, which is 0.09% above  $2^{14}$ . In this case a shift by 15 would be an adequate approximation of the divide in most cases. If absolute accuracy were required, the microcontroller's divide instruction could be used.

The QEI module can produce a controller interrupt on several events: phase error, direction change, reception of the index pulse, and expiration of the velocity timer. Standard masking, raw interrupt status, interrupt status, and interrupt clear capabilities are provided.

## 23.4 Initialization and Configuration

The following example shows how to configure the Quadrature Encoder module to read back an absolute position:

1. Enable the QEI clock by writing a value of 0x0000.0100 to the **RCGC1** register in the System Control module (see page 180).
2. Enable the clock to the appropriate GPIO module via the **RCGC2** register in the System Control module (see page 189).
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register. To determine which GPIOs to configure, see Table 25-4 on page 1091.
4. Configure the PMCN fields in the **GPIOCTL** register to assign the QEI signals to the appropriate pins (see page 368 and Table 25-5 on page 1099).
5. Configure the quadrature encoder to capture edges on both signals and maintain an absolute position by resetting on index pulses. A 1000-line encoder with four edges per line, results in 4000 pulses per revolution; therefore, set the maximum position to 3999 (0xF9F) as the count is zero-based.
  - Write the **QEICTL** register with the value of 0x0000.0018.
  - Write the **QEIMAXPOS** register with the value of 0x0000.0F9F.
6. Enable the quadrature encoder by setting bit 0 of the **QEICTL** register.
7. Delay until the encoder position is required.
8. Read the encoder position by reading the **QEI Position (QEIPOS)** register value.

## 23.5 Register Map

Table 23-3 on page 1051 lists the QEI registers. The offset listed is a hexadecimal increment to the register's address, relative to the module's base address:

- QEIO: 0x4002.C000
- QEI1: 0x4002.D000

Note that the QEI module clock must be enabled before the registers can be programmed (see page 180).

**Table 23-3. QEI Register Map**

| Offset | Name      | Type | Reset       | Description          | See page |
|--------|-----------|------|-------------|----------------------|----------|
| 0x000  | QEICTL    | R/W  | 0x0000.0000 | QEI Control          | 1053     |
| 0x004  | QEISTAT   | RO   | 0x0000.0000 | QEI Status           | 1056     |
| 0x008  | QEIPOS    | R/W  | 0x0000.0000 | QEI Position         | 1057     |
| 0x00C  | QEIMAXPOS | R/W  | 0x0000.0000 | QEI Maximum Position | 1058     |
| 0x010  | QEILOAD   | R/W  | 0x0000.0000 | QEI Timer Load       | 1059     |
| 0x014  | QEITIME   | RO   | 0x0000.0000 | QEI Timer            | 1060     |
| 0x018  | QEICOUNT  | RO   | 0x0000.0000 | QEI Velocity Counter | 1061     |
| 0x01C  | QEISPEED  | RO   | 0x0000.0000 | QEI Velocity         | 1062     |

**Table 23-3. QEI Register Map (continued)**

| Offset | Name    | Type  | Reset       | Description                    | See page |
|--------|---------|-------|-------------|--------------------------------|----------|
| 0x020  | QEINTEN | R/W   | 0x0000.0000 | QEI Interrupt Enable           | 1063     |
| 0x024  | QEIRIS  | RO    | 0x0000.0000 | QEI Raw Interrupt Status       | 1065     |
| 0x028  | QEISC   | R/W1C | 0x0000.0000 | QEI Interrupt Status and Clear | 1067     |

## 23.6 Register Descriptions

The remainder of this section lists and describes the QEI registers, in numerical order by address offset.

## Register 1: QEI Control (QEICTL), offset 0x000

This register contains the configuration of the QEI module. Separate enables are provided for the quadrature encoder and the velocity capture blocks; the quadrature encoder must be enabled in order to capture the velocity, but the velocity does not need to be captured in applications that do not need it. The phase signal interpretation, phase swap, Position Update mode, Position Reset mode, and velocity predivider are all set via this register.

### QEI Control (QEICTL)

QEIO base: 0x4002.C000

QEI1 base: 0x4002.D000

Offset 0x000

Type R/W, reset 0x0000.0000

## Register 2: QEI Status (QEISTAT), offset 0x004

This register provides status about the operation of the QEI module.

### QEI Status (QEISTAT)

QEI0 base: 0x4002.C000

QEI1 base: 0x4002.D000

Offset 0x004

Type RO, reset 0x0000.0000

Register 3: QEI Position (QEIP0S), offset 0x008

This register contains the current value of the position integrator. The value is updated by the status of the QEI phase inputs and can be set to a specific value by writing to it.

QEI Position (QEIP0S)

QEIP0 base: 0x4002.C000  
QEIP1 base: 0x4002.D000  
Offset 0x008  
Type R/W, reset 0x0000.0000

| Bit/Field | Name     | Type | Reset       | Description                                   |
|-----------|----------|------|-------------|-----------------------------------------------|
| 31:0      | POSITION | R/W  | 0x0000.0000 | Current Position Integrator Value             |
|           |          |      |             | The current value of the position integrator. |

Register 4: QEI Maximum Position (QEIMAXPOS), offset 0x00C

This register contains the maximum value of the position integrator. When moving forward, the position register resets to zero when it increments past this value. When moving in reverse, the position register resets to this value when it decrements from zero.

QEI Maximum Position (QEIMAXPOS)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x00C  
Type R/W, reset 0x0000.0000

| Bit/Field | Name   | Type | Reset       | Description                                                                        |
|-----------|--------|------|-------------|------------------------------------------------------------------------------------|
| 31:0      | MAXPOS | R/W  | 0x0000.0000 | Maximum Position Integrator Value<br>The maximum value of the position integrator. |

**Register 5: QEI Timer Load (QEILOAD), offset 0x010**

This register contains the load value for the velocity timer. Because this value is loaded into the timer on the clock cycle after the timer is zero, this value should be one less than the number of clocks in the desired period. So, for example, to have 2000 decimal clocks per timer period, this register should contain 1999 decimal.

**QEI Timer Load (QEILOAD)**

QEI0 base: 0x4002.C000

QEI1 base: 0x4002.D000

Offset 0x010

Type R/W, reset 0x0000.0000

|       |      |     |     |     |     |     |     |     |     |     |     |     |     |     |     |     |
|-------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|

| Reset | 0    | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   | 0   |

| Bit/Field | Name | Type | Reset       | Description                            |
|-----------|------|------|-------------|----------------------------------------|
| 31:0      | LOAD | R/W  | 0x0000.0000 | Velocity Timer Load Value              |
|           |      |      |             | The load value for the velocity timer. |

Register 6: QEI Timer (QEITIME), offset 0x014

This register contains the current value of the velocity timer. This counter does not increment when the VELEN bit in the QEICTL register is clear.

QEI Timer (QEITIME)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x014  
Type RO, reset 0x0000.0000

| Bit/Field | Name | Type | Reset       | Description                                                              |
|-----------|------|------|-------------|--------------------------------------------------------------------------|
| 31:0      | TIME | RO   | 0x0000.0000 | Velocity Timer Current Value<br>The current value of the velocity timer. |

## Register 7: QEI Velocity Counter (QEICOUNT), offset 0x018

This register contains the running count of velocity pulses for the current time period. Because this count is a running total, the time period to which it applies cannot be known with precision (that is, a read of this register does not necessarily correspond to the time returned by the **QEITIME** register because there is a small window of time between the two reads, during which either value may have changed). The **QESPEED** register should be used to determine the actual encoder velocity; this register is provided for information purposes only. This counter does not increment when the VELEN bit in the **QEICTL** register is clear.

### QEI Velocity Counter (QEICOUNT)

QEI0 base: 0x4002.C000  
 QEI1 base: 0x4002.D000  
 Offset 0x018  
 Type RO, reset 0x0000.0000

|       |       |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-------|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
|       | 31    | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|       | COUNT |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| Type  | RO    | RO | RO | RO | RO | RO | RO | RO | RO | RO | RO | RO | RO | RO | RO | RO |
| Reset | 0     | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  |

| Bit/Field | Name  | Type | Reset       | Description          |
|-----------|-------|------|-------------|----------------------|
| 31:0      | COUNT | RO   | 0x0000.0000 | Velocity Pulse Count |

The running total of encoder pulses during this velocity timer period.

Register 8: QEI Velocity (QEISPEED), offset 0x01C

This register contains the most recently measured velocity of the quadrature encoder. This value corresponds to the number of velocity pulses counted in the previous velocity timer period. This register does not update when the VELEN bit in the **QEICTL** register is clear.

QEI Velocity (QEISPEED)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x01C  
Type RO, reset 0x0000.0000

| Bit/Field | Name  | Type | Reset       | Description                                                                    |
|-----------|-------|------|-------------|--------------------------------------------------------------------------------|
| 31:0      | SPEED | RO   | 0x0000.0000 | Velocity<br>The measured speed of the quadrature encoder in pulses per period. |

## Register 9: QEI Interrupt Enable (QEINTEN), offset 0x020

This register contains enables for each of the QEI module interrupts. An interrupt is asserted to the interrupt controller if the corresponding bit in this register is set.

### QEI Interrupt Enable (QEINTEN)

QEIO base: 0x4002.C000

QEI1 base: 0x4002.D000

Offset 0x020

Type R/W, reset 0x0000.0000

## Register 10: QEI Raw Interrupt Status (QEIRIS), offset 0x024

This register provides the current set of interrupt sources that are asserted, regardless of whether they cause an interrupt to be asserted to the controller (configured through the **QEINTEN** register). If a bit is set, the latched event has occurred; if a bit is clear, the event in question has not occurred.

### QEI Raw Interrupt Status (QEIRIS)

## Register 11: QEI Interrupt Status and Clear (QEISC), offset 0x028

This register provides the current set of interrupt sources that are asserted to the controller. If a bit is set, the latched event has occurred and is enabled to generate an interrupt; if a bit is clear the event in question has not occurred or is not enabled to generate an interrupt. This register is R/W1C; writing a 1 to a bit position clears the bit and the corresponding interrupt reason.

### QEI Interrupt Status and Clear (QEISC)

## 24 Pin Diagram

The LM3S9L97 microcontroller pin diagrams are shown below.

Each GPIO signal is identified by its GPIO port unless it defaults to an alternate function on reset. In this case, the GPIO port name is followed by the default alternate function. To see a complete list of possible functions for each pin, see Table 25-5 on page 1099.

**Figure 24-1. 100-Pin LQFP Package Pin Diagram**

Figure 24-2. 108-Ball BGA Package Pin Diagram (Top View)

## 25 Signal Tables

The following tables list the signals available for each pin. Signals are configured as GPIOs on reset, except for those noted below. Use the **GPIOAMSEL** register (see page 366) to select analog mode. For a GPIO pin to be used for an alternate digital function, the corresponding bit in the **GPIOAFSEL** register (see page 350) must be set. Further pin muxing options are provided through the PMCx bit field in the **GPIOPCTL** register (see page 368), which selects one of several available peripheral functions for that GPIO.

**Important:** All GPIO pins are configured as GPIOs by default with the exception of the pins shown in the table below. A Power-On-Reset (POR) or asserting RST puts the pins back to their default state.

**Table 25-1. GPIO Pins With Default Alternate Functions**

| GPIO Pin | Default State     | GPIOAFSEL Bit | GPIOPCTL PMCx Bit Field |
|----------|-------------------|---------------|-------------------------|
| PA[1:0]  | UART0             | 1             | 0x1                     |
| PA[5:2]  | SSI0              | 1             | 0x1                     |
| PB[3:2]  | I <sup>2</sup> C0 | 1             | 0x1                     |
| PC[3:0]  | JTAG/SWD          | 1             | 0x3                     |

Table 25-2 on page 1072 shows the pin-to-signal-name mapping, including functional characteristics of the signals. Each possible alternate analog and digital function is listed for each pin.

Table 25-3 on page 1082 lists the signals in alphabetical order by signal name. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed. The "Pin Mux" column indicates the GPIO and the encoding needed in the PMCx bit field in the **GPIOPCTL** register.

Table 25-4 on page 1091 groups the signals by functionality, except for GPIOs. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed.

Table 25-5 on page 1099 lists the GPIO pins and their analog and digital alternate functions. The AINx and VREFA analog signals are not 5-V tolerant and go through an isolation circuit before reaching their circuitry. These signals are configured by clearing the corresponding DEN bit in the **GPIO Digital Enable (GPIODEN)** register and setting the corresponding AMSEL bit in the **GPIO Analog Mode Select (GPIOAMSEL)** register. Other analog signals are 5-V tolerant and are connected directly to their circuitry (C0-, C0+, C1-, C1+, USB0VBUS, USB0ID). These signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. The digital signals are enabled by setting the appropriate bit in the **GPIO Alternate Function Select (GPIOAFSEL)** and **GPIODEN** registers and configuring the PMCx bit field in the **GPIO Port Control (GPIOPCTL)** register to the numeric encoding shown in the table below. Table entries that are shaded gray are the default values for the corresponding GPIO pin.

## 25.1 100-Pin LQFP Package Pin Tables

Table 25-2. Signals by Pin Number

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                    |
|------------|----------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1          | PE7      | I/O      | TTL                      | GPIO port E bit 7.                                                                                                                                                                                                                                                                                             |
|            | AIN0     | I        | Analog                   | Analog-to-digital converter input 0.                                                                                                                                                                                                                                                                           |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                                                                                                                                                                                                                           |
|            | U1DCD    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                                                                                                                                                                                                                                                   |
| 2          | PE6      | I/O      | TTL                      | GPIO port E bit 6.                                                                                                                                                                                                                                                                                             |
|            | AIN1     | I        | Analog                   | Analog-to-digital converter input 1.                                                                                                                                                                                                                                                                           |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                                                                                                                                                                                                                                    |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                                                                                                                                                                                                                           |
|            | U1CTS    | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                                                                                                                                                                                                                                         |
| 3          | VDDA     | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                            |
| 4          | GNDA     | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                              |
| 5          | PE5      | I/O      | TTL                      | GPIO port E bit 5.                                                                                                                                                                                                                                                                                             |
|            | AIN2     | I        | Analog                   | Analog-to-digital converter input 2.                                                                                                                                                                                                                                                                           |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                                                                                                                                                                                                                         |
|            | I2S0TXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                                                                                                                                                                                                                                       |
| 6          | PE4      | I/O      | TTL                      | GPIO port E bit 4.                                                                                                                                                                                                                                                                                             |
|            | AIN3     | I        | Analog                   | Analog-to-digital converter input 3.                                                                                                                                                                                                                                                                           |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                                                                         |

|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                                                                                   |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                                                                                                                                                                                                                                |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                    |
| 7          | LDO      | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
| 8          | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |
| 9          | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |

Table 25-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 10         | PD0       | I/O      | TTL                      | GPIO port D bit 0.                                                          |
|            | AIN15     | I        | Analog                   | Analog-to-digital converter input 15.                                       |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                       |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | I2S0RXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                    |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                         |
|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                      |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 11         | PD1       | I/O      | TTL                      | GPIO port D bit 1.                                                          |
|            | AIN14     | I        | Analog                   | Analog-to-digital converter input 14.                                       |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | I2S0RXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                              |
|            | PWM1      | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | PhA0      | I        | TTL                      | QEI module 0 phase A.                                                       |
|            | PhB1      | I        | TTL                      | QEI module 1 phase B.                                                       |
|            | U1DCD     | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 12         | PD2       | I/O      | TTL                      | GPIO port D bit 2.                                                          |
|            | AIN13     | I        | Analog                   | Analog-to-digital converter input 13.                                       |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | PWM2      | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                        |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 13         | PD3       | I/O      | TTL                      | GPIO port D bit 3.                                                          |
|            | AIN12     | I        | Analog                   | Analog-to-digital converter input 12.                                       |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | PWM3      | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                        |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 14         | I2C1SCL   | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                            |
|            | PJ0       | I/O      | TTL                      | GPIO port J bit 0.                                                          |
|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |

Table 25-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| 15         | PH7      | I/O      | TTL                      | GPIO port H bit 7.                                                                                        |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                                                    |
| 16         | XTALPPHY | I        | Analog                   | Ethernet PHY XTALP 25-MHz oscillator crystal input.                                                       |
| 17         | XTALNPHY | O        | Analog                   | Ethernet PHY XTALN 25-MHz oscillator crystal output.                                                      |
| 18         | PG1      | I/O      | TTL                      | GPIO port G bit 1.                                                                                        |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | PWM1     | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                                      |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
| 19         | PG0      | I/O      | TTL                      | GPIO port G bit 0.                                                                                        |
|            | I2C1SCL  | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                          |
|            | PWM0     | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                                      |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                      |
|            | U2Rx     | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                                |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.          |
| 20         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                   |
| 21         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                  |
| 22         | PC7      | I/O      | TTL                      | GPIO port C bit 7.                                                                                        |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                               |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                     |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| 23         | PC6      | I/O      | TTL                      | GPIO port C bit 6.                                                                                        |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                     |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |

Table 25-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                      |
|------------|-----------|----------|--------------------------|--------------------------------------------------------------------------------------------------|
| 24         | PC5       | I/O      | TTL                      | GPIO port C bit 5.                                                                               |
|            | C0o       | O        | TTL                      | Analog comparator 0 output.                                                                      |
|            | C1+       | I        | Analog                   | Analog comparator 1 positive input.                                                              |
|            | C1o       | O        | TTL                      | Analog comparator 1 output.                                                                      |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                           |
|            | CCP3      | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                           |
|            | Fault2    | I        | TTL                      | PWM Fault 2.                                                                                     |
|            | USB0EPEN  | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |
| 25         | PC4       | I/O      | TTL                      | GPIO port C bit 4.                                                                               |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                           |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                           |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                           |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                           |
|            | PhA0      | I        | TTL                      | QEI module 0 phase A.                                                                            |
| 26         | PA0       | I/O      | TTL                      | GPIO port A bit 0.                                                                               |
|            | I2C1SCL   | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | U0Rx      | I        | TTL                      | UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.                       |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                       |
| 27         | PA1       | I/O      | TTL                      | GPIO port A bit 1.                                                                               |
|            | I2C1SDA   | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                  |
|            | U0Tx      | O        | TTL                      | UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
| 28         | PA2       | I/O      | TTL                      | GPIO port A bit 2.                                                                               |
|            | I2S0RXSD  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                                          |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                             |
|            | SSI0Clk   | I/O      | TTL                      | SSI module 0 clock.                                                                              |
| 29         | PA3       | I/O      | TTL                      | GPIO port A bit 3.                                                                               |
|            | I2S0RXCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                                                  |
|            | PWM5      | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | SSI0Fss   | I/O      | TTL                      | SSI module 0 frame.                                                                              |
| 30         | PA4       | I/O      | TTL                      | GPIO port A bit 4.                                                                               |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                                            |
|            | I2S0TXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                                        |
|            | SSI0Rx    | I        | TTL                      | SSI module 0 receive.                                                                            |
| 31         | PA5       | I/O      | TTL                      | GPIO port A bit 5.                                                                               |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                                           |
|            | I2S0TXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                  |
|            | SSI0Tx    | O        | TTL                      | SSI module 0 transmit.                                                                           |

Table 25-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| 32         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                   |
| 33         | ERBIAS   | O        | Analog                   | 12.4-kΩ resistor (1% precision) used internally for Ethernet PHY.                                         |
| 34         | PA6      | I/O      | TTL                      | GPIO port A bit 6.                                                                                        |
|            | CAN0RX   | I        | TTL                      | CAN module 0 receive.                                                                                     |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                    |
|            | I2C1SCL  | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                          |
|            | PWM0     | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                                      |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                      |
|            | U1CTS    | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                                    |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.          |
| 35         | PA7      | I/O      | TTL                      | GPIO port A bit 7.                                                                                        |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | PWM1     | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                                      |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |
|            | U1DCD    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                                              |
| 36         | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
|            | PG7      | I/O      | TTL                      | GPIO port G bit 7.                                                                                        |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | PhB1     | I        | TTL                      | QEI module 1 phase B.                                                                                     |
| 37         | RXIN     | I        | Analog                   | RXIN of the Ethernet PHY.                                                                                 |
| 38         | VDDC     | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.        |
| 39         | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                              |
|            | PJ2      | I/O      | TTL                      | GPIO port J bit 2.                                                                                        |
| 40         | RXIP     | I        | Analog                   | RXIP of the Ethernet PHY.                                                                                 |
| 41         | PF5      | I/O      | TTL                      | GPIO port F bit 5.                                                                                        |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                               |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                                                    |
| 42         | PF4      | I/O      | TTL                      | GPIO port F bit 4.                                                                                        |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                                                               |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                              |
|            | SSI1Rx   | I        | TTL                      | SSI module 1 receive.                                                                                     |
| 43         | TX0P     | O        | TTL                      | TX0P of the Ethernet PHY.                                                                                 |
| 44         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                   |

Table 25-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                    |
|------------|----------|----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 45         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                       |
| 46         | TX0N     | O        | TTL                      | TX0N of the Ethernet PHY.                                                                                                                                                                                                                      |
| 47         | PF0      | I/O      | TTL                      | GPIO port F bit 0.                                                                                                                                                                                                                             |
|            | CAN1RX   | I        | TTL                      | CAN module 1 receive.                                                                                                                                                                                                                          |
|            | I2S0TXSD | I/O      | TTL                      | I2S module 0 transmit data.                                                                                                                                                                                                                    |
|            | PWM0     | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                                                                                                                                                                           |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                                                                                                                                                          |
|            | U1DSR    | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                                                                                                                                                                                        |
| 48         | OSC0     | I        | Analog                   | Main oscillator crystal input or an external clock reference input.                                                                                                                                                                            |
| 49         | OSC1     | O        | Analog                   | Main oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                                      |
| 50         | WAKE     | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                                                                                                                                                               |
| 51         | HIB      | O        | OD                       | An open-drain output that indicates the processor is in Hibernate mode.                                                                                                                                                                        |
| 52         | XOSC0    | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register. |
| 53         | XOSC1    | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                        |
| 54         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                       |
| 55         | VBAT     | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                               |
| 56         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                        |
| 57         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                       |
| 58         | MDIO     | I/O      | OD                       | MDIO of the Ethernet PHY.                                                                                                                                                                                                                      |
| 59         | PF3      | I/O      | TTL                      | GPIO port F bit 3.                                                                                                                                                                                                                             |
|            | LED0     | O        | TTL                      | Ethernet LED 0.                                                                                                                                                                                                                                |
|            | PWM3     | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                                                                                                                                                                           |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                                                                                                                                                           |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame.                                                                                                                                                                                                                            |
| 60         | PF2      | I/O      | TTL                      | GPIO port F bit 2.                                                                                                                                                                                                                             |
|            | LED1     | O        | TTL                      | Ethernet LED 1.                                                                                                                                                                                                                                |
|            | PWM2     | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                                                                                                                                                                                           |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                                                                                                                                                           |
|            | SSI1Clk  | I/O      | TTL                      | SSI module 1 clock.                                                                                                                                                                                                                            |

Table 25-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                   |
|------------|-----------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 61         | PF1       | I/O      | TTL                      | GPIO port F bit 1.                                                                                                                                                                                                                                            |
|            | CAN1Tx    | O        | TTL                      | CAN module 1 transmit.                                                                                                                                                                                                                                        |
|            | CCP3      | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                                                                                                        |
|            | I2S0TXCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                                                                                                                                                                                                              |
|            | IDX1      | I        | TTL                      | QEI module 1 index.                                                                                                                                                                                                                                           |
|            | PWM1      | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                                                                                                                                                                                          |
|            | U1RTS     | O        | TTL                      | UART module 1 Request to Send modem output control line.                                                                                                                                                                                                      |
| 62         | PH6       | I/O      | TTL                      | GPIO port H bit 6.                                                                                                                                                                                                                                            |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                                                                                                                                                                          |
|            | SSI1Rx    | I        | TTL                      | SSI module 1 receive.                                                                                                                                                                                                                                         |

|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                                                                                                        |
|            | PWM2      | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                          |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                    |
|            | USB0ID    | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
| 67         | PB1       | I/O      | TTL                      | GPIO port B bit 1.                                                                                                                                                                                                                                            |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                                                                                                                                                                        |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                        |
|            | PWM3      | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                          |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                   |
|            | USB0VBUS  | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |
| 68         | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                       |
| 69         | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                      |
| 70         | USB0DM    | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification).                                                                                                                                                                                               |
| 71         | USB0DP    | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification).                                                                                                                                                                                               |

Table 25-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| 72         | PB2       | I/O      | TTL                      | GPIO port B bit 2.                                                                                        |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP3      | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | I2C0SCL   | I/O      | OD                       | I <sup>2</sup> C module 0 clock.                                                                          |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                                                       |
|            | USB0EPEN  | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.          |
| 73         | USB0RBIAS | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                  |
| 74         | PE0       | I/O      | TTL                      | GPIO port E bit 0.                                                                                        |
|            | CCP3      | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                      |
|            | SSI1C1k   | I/O      | TTL                      | SSI module 1 clock.                                                                                       |
|            | USB0PFLT  | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| 75         | PE1       | I/O      | TTL                      | GPIO port E bit 1.                                                                                        |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                    |
|            | Fault0    | I        | TTL                      | PWM Fault 0.                                                                                              |

|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                                                                                                                                                                                                                                                                       |
|            | VREFA     | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 27-2 on page 1133. |

Table 25-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 91         | PB5      | I/O      | TTL                      | GPIO port B bit 5.                                                          |
|            | AIN11    | I        | Analog                   | Analog-to-digital converter input 11.                                       |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                                 |
|            | C1-      | I        | Analog                   | Analog comparator 1 negative input.                                         |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 92         | PB4      | I/O      | TTL                      | GPIO port B bit 4.                                                          |
|            | AIN10    | I        | Analog                   | Analog-to-digital converter input 10.                                       |
|            | C0-      | I        | Analog                   | Analog comparator 0 negative input.                                         |
|            | CAN0Rx   | I        | TTL                      | CAN module 0 receive.                                                       |
|            | IDX0     | I        | TTL                      | QEI module 0 index.                                                         |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U2Rx     | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 93         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                     |
| 94         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                    |

Table 25-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 98         | PD5       | I/O      | TTL                      | GPIO port D bit 5.                                                          |
|            | AIN6      | I        | Analog                   | Analog-to-digital converter input 6.                                        |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | I2S0RXCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                             |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 99         | PD6       | I/O      | TTL                      | GPIO port D bit 6.                                                          |
|            | AIN5      | I        | Analog                   | Analog-to-digital converter input 5.                                        |
|            | Fault0    | I        | TTL                      | PWM Fault 0.                                                                |
|            | I2S0TXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                   |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 100        | PD7       | I/O      | TTL                      | GPIO port D bit 7.                                                          |
|            | AIN4      | I        | Analog                   | Analog-to-digital converter input 4.                                        |
|            | C0o       | O        | TTL                      | Analog comparator 0 output.                                                 |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                      |
|            | I2S0TXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                             |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                         |
|            | U1DTR     | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 25-3. Signals by Signal Name

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|----------|------------|--------------------------|----------|--------------------------|---------------------------------------|
| AIN0     | 1          | PE7                      | I        | Analog                   | Analog-to-digital converter input 0.  |
| AIN1     | 2          | PE6                      | I        | Analog                   | Analog-to-digital converter input 1.  |
| AIN2     | 5          | PE5                      | I        | Analog                   | Analog-to-digital converter input 2.  |
| AIN3     | 6          | PE4                      | I        | Analog                   | Analog-to-digital converter input 3.  |
| AIN4     | 100        | PD7                      | I        | Analog                   | Analog-to-digital converter input 4.  |
| AIN5     | 99         | PD6                      | I        | Analog                   | Analog-to-digital converter input 5.  |
| AIN6     | 98         | PD5                      | I        | Analog                   | Analog-to-digital converter input 6.  |
| AIN7     | 97         | PD4                      | I        | Analog                   | Analog-to-digital converter input 7.  |
| AIN8     | 96         | PE3                      | I        | Analog                   | Analog-to-digital converter input 8.  |
| AIN9     | 95         | PE2                      | I        | Analog                   | Analog-to-digital converter input 9.  |
| AIN10    | 92         | PB4                      | I        | Analog                   | Analog-to-digital converter input 10. |
| AIN11    | 91         | PB5                      | I        | Analog                   | Analog-to-digital converter input 11. |
| AIN12    | 13         | PD3                      | I        | Analog                   | Analog-to-digital converter input 12. |
| AIN13    | 12         | PD2                      | I        | Analog                   | Analog-to-digital converter input 13. |
| AIN14    | 11         | PD1                      | I        | Analog                   | Analog-to-digital converter input 14. |
| AIN15    | 10         | PD0                      | I        | Analog                   | Analog-to-digital converter input 15. |
| C0+      | 90         | PB6                      | I        | Analog                   | Analog comparator 0 positive input.   |

| USB0EPEN | 19<br>24<br>34<br>72<br>83       | PG0 (7)<br>PC5 (6)<br>PA6 (8)<br>PB2 (8)<br>PH3 (4)            | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |

Table 25-3. Signals by Signal Name (continued)

| Pin Name  | Pin Number                                  | Pin Mux / Pin Assignment                                                  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                               |
|-----------|---------------------------------------------|---------------------------------------------------------------------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USB0ID    | 66                                          | PB0                                                                       | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side).                                                             |
| USB0PFLT  | 22<br>23<br>35<br>65<br>74<br>76<br>87      | PC7 (6)<br>PC6 (7)<br>PA7 (8)<br>PB3 (8)<br>PE0 (9)<br>PH4 (4)<br>PJ1 (9) | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                                                                                 |
| USB0RBIAS | 73                                          | fixed                                                                     | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                                                                                  |
| USB0VBUS  | 67                                          | PB1                                                                       | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                                                                                        |
| VBAT      | 55                                          | fixed                                                                     | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                                                                                                          |
| VDD       | 8<br>20<br>32<br>44<br>56<br>68<br>81<br>93 | fixed                                                                     | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                   |
| VDDA      | 3                                           | fixed                                                                     | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                                       |
| VDDC      | 38<br>88                                    | fixed                                                                     | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                                        |
| VREFA     | 90                                          | PB6                                                                       | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 27-2 on page 1133. |
| WAKE      | 50                                          | fixed                                                                     | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                                                                                                                                                                                                                                          |
| XOSC0     | 52                                          | fixed                                                                     | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register.                                                                            |

**Table 25-3. Signals by Signal Name (continued)**

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                             |
|----------|------------|--------------------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------|
| XOSC1    | 53         | fixed                    | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source. |
| XTALNPHY | 17         | fixed                    | O        | Analog                   | Ethernet PHY XTALN 25-MHz oscillator crystal output.                                                    |
| XTALPPHY | 16         | fixed                    | I        | Analog                   | Ethernet PHY XTALP 25-MHz oscillator crystal input.                                                     |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

**Table 25-4. Signals by Function, Except for GPIO**

| Function | Pin Name | Pin Number | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                               |
|----------|----------|------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADC      | AIN0     | 1          | I        | Analog                   | Analog-to-digital converter input 0.                                                                                                                                                                                                                                                                                      |
|          | AIN1     | 2          | I        | Analog                   | Analog-to-digital converter input 1.                                                                                                                                                                                                                                                                                      |
|          | AIN2     | 5          | I        | Analog                   | Analog-to-digital converter input 2.                                                                                                                                                                                                                                                                                      |
|          | AIN3     | 6          | I        | Analog                   | Analog-to-digital converter input 3.                                                                                                                                                                                                                                                                                      |
|          | AIN4     | 100        | I        | Analog                   | Analog-to-digital converter input 4.                                                                                                                                                                                                                                                                                      |
|          | AIN5     | 99         | I        | Analog                   | Analog-to-digital converter input 5.                                                                                                                                                                                                                                                                                      |
|          | AIN6     | 98         | I        | Analog                   | Analog-to-digital converter input 6.                                                                                                                                                                                                                                                                                      |

|          | VREFA    | 90         | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 27-2 on page 1133. |

Table 25-4. Signals by Function, Except for GPIO (*continued*)

| Function | Pin Name | Pin Number                                  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                    |
|----------|----------|---------------------------------------------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power    | GND      | 9<br>21<br>45<br>54<br>57<br>69<br>82<br>94 | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |
|          | GNDA     | 4                                           | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                              |
|          | LDO      | 7                                           | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
|          | VDD      | 8<br>20<br>32<br>44<br>56<br>68<br>81<br>93 | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |
|          | VDDA     | 3                                           | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                            |
|          | VDDC     | 38<br>88                                    | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                             |

Table 25-4. Signals by Function, Except for GPIO (*continued*)

| Function | Pin Name  | Pin Number                             | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                   |
|----------|-----------|----------------------------------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USB      | USB0DM    | 70                                     | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification).                                                                                                                                                                                               |
|          | USB0DP    | 71                                     | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification).                                                                                                                                                                                               |
|          | USB0EPEN  | 19<br>24<br>34<br>72<br>83             | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                              |
|          | USB0ID    | 66                                     | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
|          | USB0PFLT  | 22<br>23<br>35<br>65<br>74<br>76<br>87 | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
|          | USB0RBIAS | 73                                     | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                      |
|          | USB0VBUS  | 67                                     | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 25-5. GPIO Pins and Alternate Functions

|            | USB0EPEN  | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                                                                                          |

Table 25-6. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| A12        | PE1      | I/O      | TTL                      | GPIO port E bit 1.                                                                                        |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                    |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                              |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame.                                                                                       |
| B1         | PE7      | I/O      | TTL                      | GPIO port E bit 7.                                                                                        |
|            | AIN0     | I        | Analog                   | Analog-to-digital converter input 0.                                                                      |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |
|            | U1DCD    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                                              |
| B2         | PE4      | I/O      | TTL                      | GPIO port E bit 4.                                                                                        |
|            | AIN3     | I        | Analog                   | Analog-to-digital converter input 3.                                                                      |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                              |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                           |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
| B3         | PE5      | I/O      | TTL                      | GPIO port E bit 5.                                                                                        |
|            | AIN2     | I        | Analog                   | Analog-to-digital converter input 2.                                                                      |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | I2S0TXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                                  |
| B4         | PE3      | I/O      | TTL                      | GPIO port E bit 3.                                                                                        |
|            | AIN8     | I        | Analog                   | Analog-to-digital converter input 8.                                                                      |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                    |
|            | CCP7     | I/O      | TTL                      | Capture/Compare/PWM 7.                                                                                    |
|            | PhA1     | I        | TTL                      | QEI module 1 phase A.                                                                                     |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                     |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                                                    |
| B5         | PD4      | I/O      | TTL                      | GPIO port D bit 4.                                                                                        |
|            | AIN7     | I        | Analog                   | Analog-to-digital converter input 7.                                                                      |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | I2S0RXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                                                   |
|            | U1RI     | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                                                   |
| B6         | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | PJ1      | I/O      | TTL                      | GPIO port J bit 1.                                                                                        |
|            | PWM1     | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                                      |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |

Table 25-6. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| B7         | PB5       | I/O      | TTL                      | GPIO port B bit 5.                                                                                        |
|            | AIN11     | I        | Analog                   | Analog-to-digital converter input 11.                                                                     |
|            | C0o       | O        | TTL                      | Analog comparator 0 output.                                                                               |
|            | C1-       | I        | Analog                   | Analog comparator 1 negative input.                                                                       |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                    |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
| B8         | PC2       | I/O      | TTL                      | GPIO port C bit 2.                                                                                        |
|            | TDI       | I        | TTL                      | JTAG TDI.                                                                                                 |
| B9         | PC1       | I/O      | TTL                      | GPIO port C bit 1.                                                                                        |
|            | SWDIO     | I/O      | TTL                      | JTAG TMS and SWDIO.                                                                                       |
|            | TMS       | I        | TTL                      | JTAG TMS and SWDIO.                                                                                       |
| B10        | PH4       | I/O      | TTL                      | GPIO port H bit 4.                                                                                        |
|            | SSI1Clk   | I/O      | TTL                      | SSI module 1 clock.                                                                                       |
|            | USB0PFLT  | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| B11        | PE0       | I/O      | TTL                      | GPIO port E bit 0.                                                                                        |
|            | CCP3      | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                      |
|            | SSI1Clk   | I/O      | TTL                      | SSI module 1 clock.                                                                                       |
|            | USB0PFLT  | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| B12        | USB0BIAS  | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                  |
| C1         | NC        | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                              |
| C2         | NC        | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                              |
| C3         | VDDC      | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.        |
| C4         | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                                                  |
| C5         | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                                                  |
| C6         | PD5       | I/O      | TTL                      | GPIO port D bit 5.                                                                                        |
|            | AIN6      | I        | Analog                   | Analog-to-digital converter input 6.                                                                      |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | I2S0RXCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                                                           |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                                |

Table 25-6. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                         |
|------------|----------|----------|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| C7         | VDDA     | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation. |
| C8         | PH1      | I/O      | TTL                      | GPIO port H bit 1.                                                                                                                                                                                                                                                                  |
|            | CCP7     | I/O      | TTL                      | Capture/Compare/PWM 7.                                                                                                                                                                                                                                                              |
|            | PWM3     | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                                                |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                                                                                                                                                                                                |
| C9         | PH0      | I/O      | TTL                      | GPIO port H bit 0.                                                                                                                                                                                                                                                                  |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                                                                                                                                                                                              |
|            | PWM2     | O        | TTL                      | PWM 2. |            | PWM3     | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                                                |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                         |
|            | USB0VBUS | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                                                  |
| E1         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                        |
| E2         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                        |

Table 25-6. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                    |
|------------|-----------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E3         | LDO       | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
| E10        | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |
| E11        | PB3       | I/O      | TTL                      | GPIO port B bit 3.                                                                                                                                                                                                                                                                                             |
|            | Fault0    | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                                                                                   |
|            | Fault3    | I        | TTL                      | PWM Fault 3.                                                                                                                                                                                                                                                                                                   |
|            | I2C0SDA   | I/O      | OD                       | I <sup>2</sup> C module 0 data.                                                                                                                                                                                                                                                                                |
|            | USB0PFLT  | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                                                                      |
| E12        | PB0       | I/O      | TTL                      | GPIO port B bit 0.                                                                                                                                                                                                                                                                                             |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                                                                                                                                                         |
|            | PWM2      | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                                                                           |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                     |
|            | USB0ID    | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side).                                                  |
| F1         | NC        | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                   |
| F2         | NC        | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                   |
| F3         | I2C1SCL   | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                                                                                                                                                                                                                               |
|            | PJ0       | I/O      | TTL                      | GPIO port J bit 0.                                                                                                                                                                                                                                                                                             |
|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                                                                                                                                                                                                                                           |
| F10        | PH5       | I/O      | TTL                      | GPIO port H bit 5.                                                                                                                                                                                                                                                                                             |
|            | Fault2    | I        | TTL                      | PWM Fault 2.                                                                                                                                                                                                                                                                                                   |
|            | SSI1Fss   | I/O      | TTL                      | SSI module 1 frame.                                                                                                                                                                                                                                                                                            |
| F11        | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |
| F12        | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |

|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem output control line.                                         |
| J1         | XTALNPHY   | O        | Analog                   | Ethernet PHY XTALN 25-MHz oscillator crystal output.                                             |
| J2         | XTALPPHY   | I        | Analog                   | Ethernet PHY XTALP 25-MHz oscillator crystal input.                                              |
| J3         | ERBIAS     | O        | Analog                   | 12.4-kΩ resistor (1% precision) used internally for Ethernet PHY.                                |
| J10        | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                         |
| J11        | PF2        | I/O      | TTL                      | GPIO port F bit 2.                                                                               |
|            | LED1       | O        | TTL                      | Ethernet LED 1.                                                                                  |
|            | PWM2       | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                                             |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                             |
|            | SSI1Clk    | I/O      | TTL                      | SSI module 1 clock.                                                                              |
| J12        | PF3        | I/O      | TTL                      | GPIO port F bit 3.                                                                               |
|            | LED0       | O        | TTL                      | Ethernet LED 0.                                                                                  |
|            | PWM3       | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                             |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | SSI1Fss    | I/O      | TTL                      | SSI module 1 frame.                                                                              |
| K1         | PG0        | I/O      | TTL                      | GPIO port G bit 0.                                                                               |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                             |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                             |
|            | U2Rx       | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                       |
|            | USB0EPEN   | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |
| K2         | PG1        | I/O      | TTL                      | GPIO port G bit 1.                                                                               |
|            | I2C1SDA    | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                  |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                             |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | U2Tx       | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
| K3         | PF5        | I/O      | TTL                      | GPIO port F bit 5.                                                                               |
|            | C10        | O        | TTL                      | Analog comparator 1 output.                                                                      |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                           |
|            | SSI1Tx     | O        | TTL                      | SSI module 1 transmit.                                                                           |

Table 25-6. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                    |
|------------|-----------|----------|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| K4         | PF4       | I/O      | TTL                      | GPIO port F bit 4.                                                                                                                                                                                                                             |
|            | C0o       | O        | TTL                      | Analog comparator 0 output.                                                                                                                                                                                                                    |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                                                                                         |
|            | Fault0    | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                   |
|            | SSI1Rx    | I        | TTL                      | SSI module 1 receive.                                                                                                                                                                                                                          |
| K5         | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                       |
| K6         | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                                                                                         |
|            | Fault0    | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                   |
|            | PJ2       | I/O      | TTL                      | GPIO port J bit 2.                                                                                                                                                                                                                             |
| K7         | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                        |
| K8         | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                        |
| K9         | VDD       | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                        |
| K10        | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                       |
| K11        | XOSC0     | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register. |
| K12        | XOSC1     | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                        |
| L1         | PC4       | I/O      | TTL                      | GPIO port C bit 4.                                                                                                                                                                                                                             |

|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                                                                                                             |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                                                                                             |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                                                                                                           |
|            | USB0EPEN  | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                 |
| L7         | RXIN      | I        | Analog                   | RXIN of the Ethernet PHY.                                                                                                                                                        |
| L8         | TXON      | O        | TTL                      | TXON of the Ethernet PHY.                                                                                                                                                        |
| L9         | MDIO      | I/O      | OD                       | MDIO of the Ethernet PHY.                                                                                                                                                        |
| L10        | GND       | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                         |
| L11        | OSC0      | I        | Analog                   | Main oscillator crystal input or an external clock reference input.                                                                                                              |
| L12        | VBAT      | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply. |
| M1         | PC5       | I/O      | TTL                      | GPIO port C bit 5.                                                                                                                                                               |
|            | C0o       | O        | TTL                      | Analog comparator 0 output.                                                                                                                                                      |
|            | C1+       | I        | Analog                   | Analog comparator 1 positive input.                                                                                                                                              |
|            | C1o       | O        | TTL                      | Analog comparator 1 output.                                                                                                                                                      |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                                                                                           |
|            | CCP3      | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                           |
|            | Fault2    | I        | TTL                      | PWM Fault 2.                                                                                                                                                                     |
|            | USB0EPEN  | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                 |
| M2         | PC6       | I/O      | TTL                      | GPIO port C bit 6.                                                                                                                                                               |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                           |
|            | CCP3      | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                           |
|            | PhB0      | I        | TTL                      | QEI module 0 phase B.                                                                                                                                                            |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                       |
|            | USB0PFLT  | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                        |
| M3         | PA1       | I/O      | TTL                      | GPIO port A bit 1.                                                                                                                                                               |
|            | I2C1SDA   | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                                                                                                  |
|            | U0Tx      | O        | TTL                      | UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                      |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                      |

Table 25-6. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| M4         | PA2      | I/O      | TTL                      | GPIO port A bit 2.                                                                                        |
|            | I2S0RXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                                                   |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                      |
|            | SSI0Clk  | I/O      | TTL                      | SSI module 0 clock.                                                                                       |
| M5         | PA5      | I/O      | TTL                      | GPIO port A bit 5.                                                                                        |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                           |
|            | SSI0Tx   | O        | TTL                      | SSI module 0 transmit.                                                                                    |
| M6         | PA7      | I/O      | TTL                      | GPIO port A bit 7.                                                                                        |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | PWM1     | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                                      |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |
|            | U1DCD    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                                              |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| M7         | RXIP     | I        | Analog                   | RXIP of the Ethernet PHY.                                                                                 |
| M8         | TXOP     | O        | TTL                      | TXOP of the Ethernet PHY.                                                                                 |
| M9         | PF0      | I/O      | TTL                      | GPIO port F bit 0.                                                                                        |
|            | CAN1Rx   | I        | TTL                      | CAN module 1 receive.                                                                                     |
|            | I2S0TXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                                  |
|            | PWM0     | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                                      |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                     |
|            | U1DSR    | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                                                   |
| M10        | WAKE     | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                          |
| M11        | OSC1     | O        | Analog                   | Main oscillator crystal output. Leave unconnected when using a single-ended clock source.                 |
| M12        | HIB      | O        | OD                       | An open-drain output that indicates the processor is in Hibernate mode.                                   |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 25-7. Signals by Signal Name

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                          |
|----------|------------|--------------------------|----------|--------------------------|--------------------------------------|
| AIN0     | B1         | PE7                      | I        | Analog                   | Analog-to-digital converter input 0. |
| AIN1     | A1         | PE6                      | I        | Analog                   | Analog-to-digital converter input 1. |
| AIN2     | B3         | PE5                      | I        | Analog                   | Analog-to-digital converter input 2. |
| AIN3     | B2         | PE4                      | I        | Analog                   | Analog-to-digital converter input 3. |
| AIN4     | A2         | PD7                      | I        | Analog                   | Analog-to-digital converter input 4. |
| AIN5     | A3         | PD6                      | I        | Analog                   | Analog-to-digital converter input 5. |

| LD0      | E3                                           | fixed                    | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LD0 pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |

When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                   |
| U2Rx      | G1<br>K1<br>A6<br>C6                              | PD0 (4)<br>PG0 (1)<br>PB4 (4)<br>PD5 (9)                                  | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                    |
| U2Tx      | B2<br>G2<br>K2<br>A3                              | PE4 (5)<br>PD1 (4)<br>PG1 (1)<br>PD6 (9)                                  | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                   |
| USB0DM    | C11                                               | fixed                                                                     | I/O      | Analog                   | Bidirectional differential data pin (D- per USB specification).                                                                                                                                                                                               |
| USB0DP    | C12                                               | fixed                                                                     | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification).                                                                                                                                                                                               |
| USB0EPEN  | K1<br>M1<br>L6<br>A11<br>D10                      | PG0 (7)<br>PC5 (6)<br>PA6 (8)<br>PB2 (8)<br>PH3 (4)                       | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                              |
| USB0ID    | E12                                               | PB0                                                                       | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
| USB0PFLT  | L2<br>M2<br>M6<br>E11<br>B11<br>B10<br>B6         | PC7 (6)<br>PC6 (7)<br>PA7 (8)<br>PB3 (8)<br>PE0 (9)<br>PH4 (4)<br>PJ1 (9) | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
| USB0RBIAS | B12                                               | fixed                                                                     | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                      |
| USB0VBUS  | D12                                               | PB1                                                                       | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |
| VBAT      | L12                                               | fixed                                                                     | -        | Power                    | Power source for the Hibernation module. It is normally connected to the positive terminal of a battery and serves as the battery backup/Hibernation module power-source supply.                                                                              |
| VDD       | K7<br>G12<br>K8<br>K9<br>H10<br>G10<br>E10<br>G11 | fixed                                                                     | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                       |

Table 25-7. Signals by Signal Name (*continued*)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                               |
|----------|------------|--------------------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VDDA     | C7         | fixed                    | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                                       |
| VDDC     | D3<br>C3   | fixed                    | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                                        |
| VREFA    | A7         | PB6                      | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 27-2 on page 1133. |
| WAKE     | M10        | fixed                    | I        | TTL                      | An external input that brings the processor out of Hibernate mode when asserted.                                                                                                                                                                                                                                          |
| XOSC0    | K11        | fixed                    | I        | Analog                   | Hibernation module oscillator crystal input or an external clock reference input. Note that this is either a 4.194304-MHz crystal or a 32.768-kHz oscillator for the Hibernation module RTC. See the CLKSEL bit in the <b>HIBCTL</b> register.                                                                            |
| XOSC1    | K12        | fixed                    | O        | Analog                   | Hibernation module oscillator crystal output. Leave unconnected when using a single-ended clock source.                                                                                                                                                                                                                   |
| XTALNPHY | J1         | fixed                    | O        | Analog                   | Ethernet PHY XTALN 25-MHz oscillator crystal output.                                                                                                                                                                                                                                                                      |
| XTALPPHY | J2         | fixed                    | I        | Analog                   | Ethernet PHY XTALP 25-MHz oscillator crystal input.                                                                                                                                                                                                                                                                       |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 25-8. Signals by Function, Except for GPIO

| Function                | Pin Name | Pin Number                  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                               |
|-------------------------|----------|-----------------------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADC                     | AIN0     | B1                          | I        | Analog                   | Analog-to-digital converter input 0.                                                                                                                                                                                                                                                                                      |

|                         | VREFA    | A7                          | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 27-2 on page 1133. |

Table 25-8. Signals by Function, Except for GPIO (*continued*)

| Function | Pin Name | Pin Number                                        | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                    |
|----------|----------|---------------------------------------------------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power    | GND      | C4<br>C5<br>K5<br>L10<br>K10<br>J10<br>F11<br>F12 | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |
|          | GNDA     | A5                                                | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                              |
|          | LDO      | E3                                                | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
|          | VDD      | K7<br>G12<br>K8<br>K9<br>H10<br>G10<br>E10<br>G11 | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |
|          | VDDA     | C7                                                | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                            |
|          | VDDC     | D3<br>C3                                          | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                             |

|          | USB0EPEN  | K1<br>M1<br>L6<br>A11<br>D10              | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                              |
|          | USB0ID    | E12                                       | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
|          | USB0PFLT  | L2<br>M2<br>M6<br>E11<br>B11<br>B10<br>B6 | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
|          | USB0RBIAS | B12                                       | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                      |
|          | USB0VBUS  | D12                                       | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

a. The digital signals that are shaded gray are the power-on default values for the corresponding GPIO pin.

## 26 Operating Characteristics

**Table 26-1. Temperature Characteristics**

| Characteristic                         | Symbol | Value       | Unit |
|----------------------------------------|--------|-------------|------|
| Industrial operating temperature range | $T_A$  | -40 to +85  | °C   |
| Unpowered storage temperature range    | $T_S$  | -65 to +150 | °C   |

**Table 26-2. Thermal Characteristics**

| Characteristic                                        | Symbol        | Value                               | Unit |
|-------------------------------------------------------|---------------|-------------------------------------|------|
| Thermal resistance (junction to ambient) <sup>a</sup> | $\Theta_{JA}$ | 34                                  | °C/W |
| Average junction temperature <sup>b</sup>             | $T_J$         | $T_A + (P_{AVG} \cdot \Theta_{JA})$ | °C   |

a. Junction to ambient thermal resistance  $\Theta_{JA}$  numbers are determined by a package simulator.

b. Power dissipation is a function of temperature.

**Table 26-3. ESD Absolute Maximum Ratings<sup>a</sup>**

| Parameter Name | Min | Nom | Max | Unit |
|----------------|-----|-----|-----|------|
| $V_{ESDHBM}$   | -   | -   | 2.0 | kV   |
| $V_{ESDCDM}$   | -   | -   | 1.0 | kV   |
| $V_{ESDMM}$    | -   | -   | 100 | V    |

a. All Stellaris parts are ESD tested following the JEDEC standard.

## 27 Electrical Characteristics

### 27.1 DC Characteristics

#### 27.1.1 Maximum Ratings

The maximum ratings are the limits to which the device can be subjected without permanently damaging the device.

**Note:** The device is not guaranteed to operate properly at the maximum ratings.

**Table 27-1. Maximum Ratings**

| Parameter        | Parameter Name <sup>a</sup>                | Value |     | Unit |
|------------------|--------------------------------------------|-------|-----|------|
|                  |                                            | Min   | Max |      |
| V <sub>DD</sub>  | I/O supply voltage (V <sub>DD</sub> )      | 0     | 4   | V    |
| V <sub>DDA</sub> | Analog supply voltage (V <sub>DDA</sub> )  | 0     | 4   | V    |
| V <sub>BAT</sub> | Battery supply voltage (V <sub>BAT</sub> ) | 0     | 4   | V    |
| V <sub>IN</sub>  | Input voltage                              | -0.3  | 5.5 | V    |
| I                | Maximum current per output pins            | -     | 25  | mA   |

a. Voltages are measured with respect to GND.

**Important:** This device contains circuitry to protect the inputs against damage due to high-static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are connected to an appropriate logic voltage level (for example, either GND or V<sub>DD</sub>).

#### 27.1.2 Recommended DC Operating Conditions

For special high-current applications, the GPIO output buffers may be used with the following restrictions. With the GPIO pins configured as 8-mA output drivers, a total of four GPIO outputs may be used to sink current loads up to 18 mA each. At 18-mA sink current loading, the V<sub>OL</sub> value is specified as 1.2 V. The high-current GPIO package pins must be selected such that there are only a maximum of two per side of the physical package or BGA pin group with the total number of high-current GPIO outputs not exceeding four for the entire package.

**Table 27-2. Recommended DC Operating Conditions**

| Parameter                     | Parameter Name            | Min  | Nom | Max  | Unit |
|-------------------------------|---------------------------|------|-----|------|------|
| V <sub>DD</sub>               | I/O supply voltage        | 3.0  | 3.3 | 3.6  | V    |
| V <sub>DDA</sub>              | Analog supply voltage     | 3.0  | 3.3 | 3.6  | V    |
| V <sub>DDC</sub> <sup>a</sup> | Core supply voltage       | 1.08 | 1.2 | 1.32 | V    |
| V <sub>IH</sub>               | High-level input voltage  | 2.0  | -   | 5.0  | V    |
| V <sub>IL</sub>               | Low-level input voltage   | -0.3 | -   | 1.3  | V    |
| V <sub>OH</sub> <sup>b</sup>  | High-level output voltage | 2.4  | -   | -    | V    |
| V <sub>OL</sub> <sup>a</sup>  | Low-level output voltage  | -    | -   | 0.4  | V    |

Table 27-2. Recommended DC Operating Conditions (*continued*)

| Parameter | Parameter Name                            | Min | Nom | Max | Unit |
|-----------|-------------------------------------------|-----|-----|-----|------|
| $I_{OH}$  | High-level source current, $V_{OH}=2.4$ V |     |     |     |      |
|           | 2-mA Drive                                | 2.0 | -   | -   | mA   |
|           | 4-mA Drive                                | 4.0 | -   | -   | mA   |
|           | 8-mA Drive                                | 8.0 | -   | -   | mA   |
| $I_{OL}$  | Low-level sink current, $V_{OL}=0.4$ V    |     |     |     |      |
|           | 2-mA Drive                                | 2.0 | -   | -   | mA   |
|           | 4-mA Drive                                | 4.0 | -   | -   | mA   |
|           | 8-mA Drive                                | 8.0 | -   | -   | mA   |

a.  $V_{DDC}$  is supplied from the output of the LDO.

b.  $V_{OL}$  and  $V_{OH}$  shift to 1.2 V when using high-current GPIOs.

### 27.1.3 On-Chip Low Drop-Out (LDO) Regulator Characteristics

Table 27-3. LDO Regulator Characteristics

| Parameter | Parameter Name                                           | Min  | Nom | Max  | Unit    |
|-----------|----------------------------------------------------------|------|-----|------|---------|
| $C_{LDO}$ | External filter capacitor size for internal power supply | 1.0  | -   | 3.0  | $\mu$ F |
| $V_{LDO}$ | LDO output voltage                                       | 1.08 | 1.2 | 1.32 | V       |

### 27.1.4 Hibernation Module Characteristics

Table 27-4. Hibernation Module DC Characteristics

| Parameter    | Parameter Name             | Min | Nominal | Max | Unit |
|--------------|----------------------------|-----|---------|-----|------|
| $V_{BAT}$    | Battery supply voltage     | 2.4 | 3.0     | 3.6 | V    |
| $V_{LOWBAT}$ | Low battery detect voltage | -   | 2.35    | -   | V    |

### 27.1.5 Flash Memory Characteristics

Table 27-5. Flash Memory Characteristics

| Parameter   | Parameter Name                                                             | Min    | Nom | Max | Unit   |
|-------------|----------------------------------------------------------------------------|--------|-----|-----|--------|
| $PE_{CYC}$  | Number of guaranteed mass program/erase cycles before failure <sup>a</sup> | 15,000 | -   | -   | cycles |
| $T_{RET}$   | Data retention at average operating temperature of 125°C                   | 10     | -   | -   | years  |
| $T_{PROG}$  | Word program time                                                          | -      | -   | 1   | ms     |
| $T_{BPROG}$ | Buffer program time                                                        | -      | -   | 1   | ms     |
| $T_{ERASE}$ | Page erase time                                                            | -      | -   | 12  | ms     |
| $T_{ME}$    | Mass erase time                                                            | -      | -   | 16  | ms     |

a. A program/erase cycle is defined as switching the bits from 1-> 0 -> 1. Caution should be used when performing block erases, as repeated block erases can shorten the number of guaranteed erase cycles, see "Flash Memory Programming" on page 235.

## 27.1.6 GPIO Module Characteristics

**Table 27-6. GPIO Module DC Characteristics**

| Parameter           | Parameter Name                   | Min | Nom | Max | Unit |
|---------------------|----------------------------------|-----|-----|-----|------|
| R <sub>GPIOPU</sub> | GPIO internal pull-up resistor   | 50  | -   | 110 | kΩ   |
| R <sub>GPIOPD</sub> | GPIO internal pull-down resistor | 55  | -   | 180 | kΩ   |

## 27.1.7 USB Module Characteristics

The Stellaris® USB controller DC electrical specifications are compliant with the “Universal Serial Bus Specification Rev. 2.0” (full-speed and low-speed support) and the “On-The-Go Supplement to the USB 2.0 Specification Rev. 1.0”. Some components of the USB system are integrated within the LM3S9L97 microcontroller and specific to the Stellaris® microcontroller design. An external component resistor is needed as specified in Table 27-7.

**Table 27-7. USB Controller DC Characteristics**

| Parameter          | Parameter Name                                       | Value      | Unit |
|--------------------|------------------------------------------------------|------------|------|
| R <sub>UBIAS</sub> | Value of the pull-down resistor on the USB0RBIAS pin | 9.1K ± 1 % | Ω    |

## 27.1.8 Ethernet Controller Characteristics

**Table 27-8. Ethernet Controller DC Characteristics**

| Parameter          | Parameter Name                                    | Value       | Unit |
|--------------------|---------------------------------------------------|-------------|------|
| R <sub>EBIAS</sub> | Value of the pull-down resistor on the ERBIAS pin | 12.4K ± 1 % | Ω    |

## 27.1.9 Current Specifications

This section provides information on typical and maximum power consumption under various conditions.

### 27.1.9.1 Preliminary Current Consumption Specifications

The following table provides preliminary figures for current consumption while ongoing characterization is completed.

**Table 27-9. Preliminary Current Consumption**

| Parameter             | Parameter Name          | Conditions                                                                                                                               | Nom | Max | Unit |
|-----------------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------|-----|-----|------|
| I <sub>DD_RUN</sub>   | Run mode 1 (Flash loop) | V <sub>DD</sub> = 3.3 V<br>Code= while(1){} executed in Flash<br>Peripherals = All ON<br>System Clock = 50 MHz (with PLL)<br>Temp = 25°C | 80  | -   | mA   |
| I <sub>DD_SLEEP</sub> | Sleep mode              | V <sub>DD</sub> = 3.3 V<br>Peripherals = All clock gated<br>System Clock = 50 MHz (with PLL)<br>Temp = 25°C                              | 8   | -   | mA   |

Table 27-9. Preliminary Current Consumption (*continued*)

| Parameter           | Parameter Name                                                              | Conditions                                                                                                                                              | Nom                  | Max | Unit    |
|---------------------|-----------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|-----|---------|
| $I_{DD\_DEEPSLEEP}$ | Deep-sleep mode                                                             | Peripherals = All OFF<br>System Clock = IOS30KHZ/64<br>Temp = 25°C                                                                                      | 550                  | -   | $\mu A$ |

| $I_{HIB\_RTC}$      | Hibernate mode (RTC enabled, I/O not powered <sup>a</sup> )                 | $V_{BAT} = 3.0\text{ V}$<br>$V_{DD} = 0\text{ V}$<br>$V_{DDA} = 0\text{ V}$<br>Peripherals = All OFF<br>System Clock = OFF<br>Hibernate Module = 32 kHz | 18                   | -   | $\mu A$ |
| $I_{HIB\_VDD3ON}$   | Hibernate mode (RTC enabled, I/O powered <sup>b</sup> )                     | $V_{BAT} = 3.0\text{ V}$<br>$V_{DD} = 0\text{ V}$<br>$V_{DDA} = 0\text{ V}$<br>Peripherals = All OFF<br>System Clock = OFF<br>Hibernate Module = 32 kHz | pending <sup>c</sup> | -   | $\mu A$ |

a. The VDD3ON mode must be disabled for the I/O ring to be unpowered.

b. The VDD3ON mode must be enabled for the I/O ring to be powered.

c. Pending product characterization.

## 27.2 AC Characteristics

### 27.2.1 Load Conditions

Unless otherwise specified, the following conditions are true for all timing measurements.

Figure 27-1. Load Conditions

### 27.2.2 Clocks

The following sections provide specifications on the various clock sources and mode.

### 27.2.2.1 PLL Specifications

The following tables provide specifications for using the PLL.

**Table 27-10. Phase Locked Loop (PLL) Characteristics**

| Parameter       | Parameter Name                        | Min                | Nom | Max               | Unit |
|-----------------|---------------------------------------|--------------------|-----|-------------------|------|
| $f_{REF\_XTAL}$ | Crystal reference <sup>a</sup>        | 3.579545           | -   | 16.384            | MHz  |
| $f_{REF\_EXT}$  | External clock reference <sup>a</sup> | 3.579545           | -   | 16.384            | MHz  |
| $f_{PLL}$       | PLL frequency <sup>b</sup>            | -                  | 400 | -                 | MHz  |
| $T_{READY}$     | PLL lock time                         | 0.562 <sup>c</sup> | -   | 1.38 <sup>d</sup> | ms   |

a. The exact value is determined by the crystal value programmed into the XTAL field of the **Run-Mode Clock Configuration (RCC)** register.

b. PLL frequency is automatically calculated by the hardware based on the XTAL field of the **RCC** register.

c. Using a 16.384-MHz crystal

d. Using 3.5795-MHz crystal

Table 27-11 on page 1137 shows the actual frequency of the PLL based on the crystal frequency used (defined by the XTAL field in the **RCC** register).

**Table 27-11. Actual PLL Frequency**

| XTAL | Crystal Frequency (MHz) | PLL Frequency (MHz) | Error   |
|------|-------------------------|---------------------|---------|
| 0x04 | 3.5795                  | 400.904             | 0.0023% |
| 0x05 | 3.6864                  | 398.1312            | 0.0047% |
| 0x06 | 4.0                     | 400                 | -       |
| 0x07 | 4.096                   | 401.408             | 0.0035% |
| 0x08 | 4.9152                  | 398.1312            | 0.0047% |
| 0x09 | 5.0                     | 400                 | -       |
| 0x0A | 5.12                    | 399.36              | 0.0016% |
| 0x0B | 6.0                     | 400                 | -       |
| 0x0C | 6.144                   | 399.36              | 0.0016% |
| 0x0D | 7.3728                  | 398.1312            | 0.0047% |
| 0x0E | 8.0                     | 400                 | 0.0047% |
| 0x0F | 8.192                   | 398.6773333         | 0.0033% |
| 0x10 | 10.0                    | 400                 | -       |
| 0x11 | 12.0                    | 400                 | -       |
| 0x12 | 12.288                  | 401.408             | 0.0035% |
| 0x13 | 13.56                   | 397.76              | 0.0056% |
| 0x14 | 14.318                  | 400.90904           | 0.0023% |
| 0x15 | 16.0                    | 400                 | -       |
| 0x16 | 16.384                  | 404.1386667         | 0.010%  |

### 27.2.2.2 PIOSC Specifications

**Table 27-12. PIOSC Clock Characteristics**

| Parameter     | Parameter Name                                                                       | Min | Nom    | Max | Unit |
|---------------|--------------------------------------------------------------------------------------|-----|--------|-----|------|
| $f_{PIOSC25}$ | Internal 16-MHz precision oscillator frequency variance, factory calibrated at 25 °C | -   | ±0.25% | ±1% | -    |

Table 27-12. PIOSC Clock Characteristics (continued)

| Parameter       | Parameter Name                                                                                                           | Min | Nom    | Max | Unit |
|-----------------|--------------------------------------------------------------------------------------------------------------------------|-----|--------|-----|------|
| $f_{PIOSCT}$    | Internal 16-MHz precision oscillator frequency variance, factory calibrated at 25 °C, across specified temperature range | -   | -      | ±3% | -    |
| $f_{PIOSCUCAL}$ | Internal 16-MHz precision oscillator frequency variance, user calibrated at a chosen temperature                         | -   | ±0.25% | ±1% | -    |

### 27.2.2.3 Internal 30-kHz Oscillator Specifications

Table 27-13. 30-kHz Clock Characteristics

| Parameter       | Parameter Name                       | Min | Nom | Max | Unit |
|-----------------|--------------------------------------|-----|-----|-----|------|
| $f_{IOSC30KHZ}$ | Internal 30-KHz oscillator frequency | 15  | 30  | 45  | KHz  |

### 27.2.2.4 Hibernation Clock Source Specifications

Table 27-14. Hibernation Clock Characteristics

| Parameter            | Parameter Name                                    | Min | Nom      | Max | Unit |
|----------------------|---------------------------------------------------|-----|----------|-----|------|
| $f_{HIBOSC}$         | Hibernation module oscillator frequency           | -   | 4.194304 | -   | MHz  |
| $f_{HIBOSC\_XTAL}$   | Crystal reference for hibernation oscillator      | -   | 4.194304 | -   | MHz  |
| $f_{HIBOSC\_EXT}$    | External clock reference for hibernation module   | -   | 32.768   | -   | KHz  |
| $t_{HIBOSC\_SETTLE}$ | Hibernation oscillator settling time <sup>a</sup> | -   | -        | 10  | ms   |

a. This parameter is highly sensitive to PCB layout and trace lengths, which may make this parameter time longer. Care must be taken in PCB design to minimize trace lengths and RLC (resistance, inductance, capacitance).

Table 27-15. HIB Oscillator Input Characteristics

| Name                               | Value    | Condition |
|------------------------------------|----------|-----------|
| Frequency                          | 4.194304 | MHz       |
| Frequency tolerance                | ±100     | PPM       |
| Oscillation mode                   | parallel | -         |
| Equivalent series resistance (max) | 200      | Ω         |
| Load capacitance                   | 16       | pF        |
| Drive level (typ)                  | 100      | μw        |

### 27.2.2.5 Main Oscillator Specifications

Table 27-16. Main Oscillator Clock Characteristics

| Parameter               | Parameter Name                                                                | Min  | Nom | Max    | Unit |
|-------------------------|-------------------------------------------------------------------------------|------|-----|--------|------|
| $f_{MOSC}$              | Main oscillator frequency                                                     | 1    | -   | 16.384 | MHz  |
| $t_{MOSC\_PER}$         | Main oscillator period                                                        | 61   | -   | 1000   | ns   |
| $t_{MOSC\_SETTLE}$      | Main oscillator settling time                                                 | 17.5 | -   | 20     | ms   |
| $f_{REF\_XTAL\_BYPASS}$ | Crystal reference using the main oscillator (PLL in BYPASS mode) <sup>a</sup> | 1    | -   | 16.384 | MHz  |

**Table 27-16. Main Oscillator Clock Characteristics (continued)**

| Parameter                     | Parameter Name                                             | Min | Nom | Max | Unit |
|-------------------------------|------------------------------------------------------------|-----|-----|-----|------|
| $f_{\text{REF\_EXT\_BYPASS}}$ | External clock reference (PLL in BYPASS mode) <sup>a</sup> | 0   | -   | 80  | MHz  |

a. The ADC must be clocked from the PLL or directly from a 14- to 18-MHz clock source to operate properly.

**Table 27-17. MOSC Oscillator Input Characteristics**

| Name                               | Value    |          |          |          |          |          | Condition |
|------------------------------------|----------|----------|----------|----------|----------|----------|-----------|
| Frequency                          | 16       | 12       | 8        | 6        | 4        | 3.5      | MHz       |
| Frequency tolerance                | ±100     | ±100     | ±100     | ±100     | ±100     | ±100     | PPM       |
| Oscillation mode                   | parallel | parallel | parallel | parallel | parallel | parallel | -         |
| Equivalent series resistance (max) | 70       | 90       | 120      | 160      | 200      | 220      | Ω         |
| Load capacitance                   | 16       | 16       | 16       | 16       | 16       | 16       | pF        |
| Drive level (typ)                  | 100      | 100      | 100      | 100      | 100      | 100      | μw        |

### 27.2.2.6 System Clock Specifications with ADC Operation

**Table 27-18. System Clock Characteristics with ADC Operation**

| Parameter           | Parameter Name                                                                 | Min | Nom | Max | Unit |
|---------------------|--------------------------------------------------------------------------------|-----|-----|-----|------|
| $f_{\text{sysadc}}$ | System clock frequency when the ADC module is operating (when PLL is bypassed) | 16  | -   | -   | MHz  |

### 27.2.3 JTAG and Boundary Scan

**Table 27-19. JTAG Characteristics**

| Parameter No.                | Parameter                          | Parameter Name                    | Min | Nom              | Max | Unit |
|------------------------------|------------------------------------|-----------------------------------|-----|------------------|-----|------|
| J1                           | $f_{\text{TCK}}$                   | TCK operational clock frequency   | 0   | -                | 10  | MHz  |
| J2                           | $t_{\text{TCK}}$                   | TCK operational clock period      | 100 | -                | -   | ns   |
| J3                           | $t_{\text{TCK\_LOW}}$              | TCK clock Low time                | -   | $t_{\text{TCK}}$ | -   | ns   |
| J4                           | $t_{\text{TCK\_HIGH}}$             | TCK clock High time               | -   | $t_{\text{TCK}}$ | -   | ns   |
| J5                           | $t_{\text{TCK\_R}}$                | TCK rise time                     | 0   | -                | 10  | ns   |
| J6                           | $t_{\text{TCK\_F}}$                | TCK fall time                     | 0   | -                | 10  | ns   |
| J7                           | $t_{\text{TMS\_SU}}$               | TMS setup time to TCK rise        | 20  | -                | -   | ns   |
| J8                           | $t_{\text{TMS\_HLD}}$              | TMS hold time from TCK rise       | 20  | -                | -   | ns   |
| J9                           | $t_{\text{TDI\_SU}}$               | TDI setup time to TCK rise        | 25  | -                | -   | ns   |
| J10                          | $t_{\text{TDI\_HLD}}$              | TDI hold time from TCK rise       | 25  | -                | -   | ns   |
| J11<br>$t_{\text{TDO\_ZDV}}$ | TCK fall to Data Valid from High-Z | 2-mA drive                        | -   | 23               | 35  | ns   |
|                              |                                    | 4-mA drive                        |     | 15               | 26  | ns   |
|                              |                                    | 8-mA drive                        |     | 14               | 25  | ns   |
|                              |                                    | 8-mA drive with slew rate control |     | 18               | 29  | ns   |

Table 27-19. JTAG Characteristics (*continued*)

| Parameter No.         | Parameter                              | Parameter Name                    | Min | Nom | Max | Unit |
|-----------------------|----------------------------------------|-----------------------------------|-----|-----|-----|------|
| J12<br>$t_{TDO\_DV}$  | TCK fall to Data Valid from Data Valid | 2-mA drive                        | -   | 21  | 35  | ns   |
|                       |                                        | 4-mA drive                        |     | 14  | 25  | ns   |
|                       |                                        | 8-mA drive                        |     | 13  | 24  | ns   |
|                       |                                        | 8-mA drive with slew rate control |     | 18  | 28  | ns   |
| J13<br>$t_{TDO\_DVZ}$ | TCK fall to High-Z from Data Valid     | 2-mA drive                        | -   | 9   | 11  | ns   |
|                       |                                        | 4-mA drive                        |     | 7   | 9   | ns   |
|                       |                                        | 8-mA drive                        |     | 6   | 8   | ns   |
|                       |                                        | 8-mA drive with slew rate control |     | 7   | 9   | ns   |

## 27.2.4 Reset

Table 27-20. Reset Characteristics

| Parameter No. | Parameter | Parameter Name         | Min  | Nom | Max  | Unit    |
|---------------|-----------|------------------------|------|-----|------|---------|
| R1            | $V_{TH}$  | Reset threshold        | -    | 2.0 | -    | V       |
| R2            | $V_{BTH}$ | Brown-Out threshold    | 2.85 | 2.9 | 2.95 | V       |
| R3            | $T_{POR}$ | Power-On Reset timeout | -    | 10  | -    | ms      |
| R4            | $T_{BOR}$ | Brown-Out timeout      | -    | 500 | -    | $\mu$ s |

Table 27-20. Reset Characteristics (continued)

| Parameter No. | Parameter     | Parameter Name                                               | Min | Nom | Max | Unit          |
|---------------|---------------|--------------------------------------------------------------|-----|-----|-----|---------------|
| R5            | $T_{IRPOR}$   | Internal reset timeout after POR                             | -   | -   | 95  | system clocks |
| R6            | $T_{IRBOR}$   | Internal reset timeout after BOR                             | -   | -   | 7   | system clocks |
| R7            | $T_{IRHWR}$   | Internal reset timeout after hardware reset (RST pin)        | -   | -   | 7   | system clocks |
| R8            | $T_{IRSWR}$   | Internal reset timeout after software-initiated system reset | -   | -   | 16  | system clocks |
| R9            | $T_{IRWDR}$   | Internal reset timeout after watchdog reset                  | -   | -   | 16  | system clocks |
| R10           | $T_{IRMFR}$   | Internal reset timeout after MOSC failure reset              | -   | -   | 32  | system clocks |
| R11           | $T_{VDDRISE}$ | Supply voltage ( $V_{DD}$ ) rise time (0V-3.3V)              | -   | -   | 250 | $\mu$ s       |
| R12           | $T_{MIN}$     | Minimum RST pulse width                                      | 2   | -   | -   | $\mu$ s       |

## 27.2.5 Sleep Modes

Table 27-21. Sleep Modes AC Characteristics<sup>a</sup>

| Parameter No | Parameter          | Parameter Name                                                             | Min | Nom | Max         | Unit          |
|--------------|--------------------|----------------------------------------------------------------------------|-----|-----|-------------|---------------|
| D1           | $t_{WAKE\_S}$      | Time to wake from interrupt in sleep or deep-sleep mode, not using the PLL | -   | -   | 7           | system clocks |
| D2           | $t_{WAKE\_PLL\_S}$ | Time to wake from interrupt in sleep or deep-sleep mode when using the PLL | -   | -   | $T_{READY}$ | ms            |

**Table 27-21. Sleep Modes AC Characteristics (continued)**

| Parameter No | Parameter              | Parameter Name                                   | Min | Nom | Max    | Unit |
|--------------|------------------------|--------------------------------------------------|-----|-----|--------|------|
| D3           | $t_{\text{ENTER\_DS}}$ | Time to enter deep-sleep mode from sleep request | -   | 0   | $16^b$ | ms   |

a. Values in this table assume the IOSC is the clock source during sleep or deep-sleep mode.

b. Nominal specification occurs 99.9995% of the time.

## 27.2.6 Hibernation Module

The Hibernation Module requires special system implementation considerations because it is intended to power down all other sections of its host device, refer to “Hibernation Module” on page 205.

**Table 27-22. Hibernation Module AC Characteristics**

| Parameter No | Parameter                     | Parameter Name                                                                                          | Min | Nom | Max    | Unit          |
|--------------|-------------------------------|---------------------------------------------------------------------------------------------------------|-----|-----|--------|---------------|
| H1           | $t_{\text{HIB\_LOW}}$         | Internal 32.768 KHz clock reference rising edge to HIB asserted                                         | 20  | -   | -      | $\mu\text{s}$ |
| H2           | $t_{\text{HIB\_HIGH}}$        | Internal 32.768 KHz clock reference rising edge to HIB deasserted                                       | -   | 30  | -      | $\mu\text{s}$ |
| H3           | $t_{\text{WAKE\_TO\_HIB}}$    | WAKE assert to HIB desassert (wake up time), internal Hibernation oscillator running during hibernation | 62  | -   | 124    | $\mu\text{s}$ |
| H4           | $t_{\text{WAKE\_TO\_HIB}}$    | WAKE assert to HIB desassert (wake up time), internal Hibernation oscillator stopped during hibernation | -   | -   | 10     | ms            |
| H5           | $t_{\text{WAKE\_CLOCK}}$      | WAKE assertion time, internal Hibernation oscillator running during hibernation                         | 62  | -   | -      | $\mu\text{s}$ |
| H6           | $t_{\text{WAKE\_NOCLOCK}}$    | WAKE assertion time, internal Hibernation oscillator stopped during hibernation <sup>a</sup>            | 10  | -   | -      | ms            |
| H7           | $t_{\text{HIB\_REG\_ACCESS}}$ | Access time to or from a non-volatile register in HIB module to complete                                | 92  | -   | -      | $\mu\text{s}$ |
| H8           | $t_{\text{HIB\_TO\_HIB}}$     | HIB high time between assertions                                                                        | 100 | -   | -      | ms            |
| H9           | $t_{\text{ENTER\_HIB}}$       | Time to enter hibernation mode from hibernation request                                                 | -   | 0   | $50^b$ | ms            |

a. This mode is used when the PINWEN bit is set and the RTCEN bit is clear in the HIBCTL register.

b. Nominal specification occurs 99.998% of the time.

**Figure 27-10. Hibernation Module Timing with Internal Oscillator Running in Hibernation**

Figure 27-11. Hibernation Module Timing with Internal Oscillator Stopped in Hibernation

## 27.2.7 General-Purpose I/O (GPIO)

**Note:** All GPIOs are 5-V tolerant.

Table 27-23. GPIO Characteristics

| Parameter   | Parameter Name                                      | Condition                         | Min | Nom | Max | Unit |
|-------------|-----------------------------------------------------|-----------------------------------|-----|-----|-----|------|
| $t_{GPIOR}$ | GPIO Rise Time<br>(from 20% to 80%<br>of $V_{DD}$ ) | 2-mA drive                        | -   | 14  | 20  | ns   |
|             |                                                     | 4-mA drive                        |     | 7   | 10  | ns   |
|             |                                                     | 8-mA drive                        |     | 4   | 5   | ns   |
|             |                                                     | 8-mA drive with slew rate control |     | 6   | 8   | ns   |
| $t_{GPIOF}$ | GPIO Fall Time<br>(from 80% to 20%<br>of $V_{DD}$ ) | 2-mA drive                        | -   | 14  | 21  | ns   |
|             |                                                     | 4-mA drive                        |     | 7   | 11  | ns   |
|             |                                                     | 8-mA drive                        |     | 4   | 6   | ns   |
|             |                                                     | 8-mA drive with slew rate control |     | 6   | 8   | ns   |

## 27.2.8 Analog-to-Digital Converter

Table 27-24. ADC Characteristics<sup>a</sup>

| Parameter     | Parameter Name                                                                  | Min  | Nom | Max          | Unit          |
|---------------|---------------------------------------------------------------------------------|------|-----|--------------|---------------|
| $V_{ADCIN}$   | Maximum single-ended, full-scale analog input voltage, using internal reference | -    | -   | 3.0          | V             |
|               | Maximum single-ended, full-scale analog input voltage, using external reference | -    | -   | $V_{REFA}$   | V             |
|               | Minimum single-ended, full-scale analog input voltage                           | 0.0  | -   | -            | V             |
|               | Maximum differential, full-scale analog input voltage, using internal reference | -    | -   | 1.5          | V             |
|               | Maximum differential, full-scale analog input voltage, using external reference | -    | -   | $V_{REFA}/2$ | V             |
|               | Minimum differential, full-scale analog input voltage                           | 0.0  | -   | -            | V             |
| N             | Resolution                                                                      | 10   |     |              | bits          |
| $f_{ADC}$     | ADC internal clock frequency <sup>b</sup>                                       | 14   | 16  | 18           | MHz           |
| $t_{ADCCONV}$ | Conversion time <sup>c</sup>                                                    | 1    |     |              | $\mu$ s       |
| $f_{ADCCONV}$ | Conversion rate <sup>c</sup>                                                    | 1000 |     |              | k samples/s   |
| $t_{LT}$      | Latency from trigger to start of conversion                                     | -    | 2   | -            | system clocks |
| $I_L$         | ADC input leakage                                                               | -    | -   | $\pm 1.0$    | $\mu$ A       |
| $R_{ADC}$     | ADC equivalent resistance                                                       | -    | -   | 10           | k $\Omega$    |

**Table 27-24. ADC Characteristics (continued)**

| Parameter | Parameter Name                  | Min | Nom | Max     | Unit |
|-----------|---------------------------------|-----|-----|---------|------|
| $C_{ADC}$ | ADC equivalent capacitance      | 0.9 | 1.0 | 1.1     | pF   |
| $E_L$     | Integral nonlinearity error     | -   | -   | $\pm 1$ | LSB  |
| $E_D$     | Differential nonlinearity error | -   | -   | $\pm 1$ | LSB  |
| $E_O$     | Offset error                    | -   | -   | $\pm 1$ | LSB  |
| $E_G$     | Full-scale gain error           | -   | -   | $\pm 3$ | LSB  |
| $E_{TS}$  | Temperature sensor accuracy     | -   | -   | $\pm 5$ | °C   |

- a. The ADC reference voltage is 3.0 V. This reference voltage is internally generated from the 3.3 V<sub>DDA</sub> supply by a band gap circuit.
- b. The ADC must be clocked from the PLL or directly from an external clock source to operate properly.
- c. The conversion time and rate scale from the specified number if the ADC internal clock frequency is any value other than 16 MHz.

**Figure 27-12. ADC Input Equivalency Diagram****Table 27-25. ADC Module External Reference Characteristics<sup>a</sup>**

| Parameter  | Parameter Name                                  | Min | Nom       | Max      | Unit    |
|------------|-------------------------------------------------|-----|-----------|----------|---------|
| $V_{REFA}$ | External voltage reference for ADC <sup>b</sup> | 2.4 | -         | $V_{DD}$ | V       |
| $I_L$      | External voltage reference leakage current      | -   | $\pm 1.0$ | -        | $\mu A$ |

- a. Care must be taken to supply a reference voltage of acceptable quality.
- b. Ground is always used as the reference level for the minimum conversion value.

**Table 27-26. ADC Module Internal Reference Characteristics**

| Parameter  | Parameter Name                     | Min | Nom | Max       | Unit |
|------------|------------------------------------|-----|-----|-----------|------|
| $V_{REFI}$ | Internal voltage reference for ADC | -   | 3.0 | -         | V    |
| $E_{IR}$   | Internal voltage reference error   | -   | -   | $\pm 2.5$ | %    |

## 27.2.9 Synchronous Serial Interface (SSI)

Table 27-27. SSI Characteristics

| Parameter No. | Parameter       | Parameter Name                    | Min | Nom | Max   | Unit          |
|---------------|-----------------|-----------------------------------|-----|-----|-------|---------------|
| S1            | $t_{CLK\_PER}$  | SSIClk cycle time                 | 2   | -   | 65024 | system clocks |
| S2            | $t_{CLK\_HIGH}$ | SSIClk high time                  | -   | 0.5 | -     | t clk_per     |
| S3            | $t_{CLK\_LOW}$  | SSIClk low time                   | -   | 0.5 | -     | t clk_per     |
| S4            | $t_{CLKRF}$     | SSIClk rise/fall time             | -   | 7.4 | 26    | ns            |
| S5            | $t_{DMD}$       | Data from master valid delay time | 0   | -   | 1     | system clocks |
| S6            | $t_{DMS}$       | Data from master setup time       | 1   | -   | -     | system clocks |
| S7            | $t_{DMH}$       | Data from master hold time        | 2   | -   | -     | system clocks |
| S8            | $t_{DSS}$       | Data from slave setup time        | 1   | -   | -     | system clocks |
| S9            | $t_{DSH}$       | Data from slave hold time         | 2   | -   | -     | system clocks |

# A Boot Loader

## A.1 Boot Loader Overview

The Stellaris® Boot Loader is executed from the ROM when the Flash memory is empty and is used to download code to the Flash memory of a device without the use of a debug interface. At any reset that resets the core, the user has the opportunity to direct the core to execute the ROM Boot Loader or the application in Flash memory by using any GPIO signal in Ports A-H as configured in the **Boot Configuration (BOOTCFG)** register. If the ROM boot loader is not selected, code in the ROM checks address 0x000.0004 to see if the Flash memory has a valid reset vector. If the data at address 0x0000.0004 is 0xFFFF.FFFF, then it is assumed that the Flash memory has not yet been programmed, and the core executes the ROM Boot Loader.

The boot loader uses a simple packet interface to provide synchronous communication with the device. The speed of the boot loader is determined by the internal oscillator (PIOSC) frequency as it does not enable the PLL. The following serial interfaces can be used:

- UART0
- SSIO
- I<sup>2</sup>C0
- Ethernet

For simplicity, both the data format and communication protocol are identical for all serial interfaces.

**Note:** The Flash-memory-resident version of the Boot Loader also supports CAN and USB.

See the *Stellaris® Boot Loader User's Guide* for information on the boot loader software.

## A.2 Serial Interfaces

This section describes how the boot loader operates using a serial interface. The following section describes the Ethernet operation.

### A.2.1 Serial Configuration

Once communication with the boot loader is established via one of the serial interfaces, that interface is used until the boot loader is reset or new code takes over. For example, once you start communicating using the SSI port, communications with the boot loader via the UART are disabled until the device is reset.

#### A.2.1.1 UART

The Universal Asynchronous Receivers/Transmitters (UART) communication uses a fixed serial format of 8 bits of data, no parity, and 1 stop bit. The baud rate used for communication is automatically detected by the boot loader and can be any valid baud rate supported by the host and the device. The auto detection sequence requires that the baud rate should be no more than 1/16 the internal oscillator (PIOSC) frequency of the board that is running the boot loader (which is at least 8.4 MHz, providing support for up to 262,500 baud). The maximum regular speed baud rate for any UART on a Stellaris® device is calculated as follows:

$$\text{Max Baud Rate} = \text{System Clock Frequency} / 16$$

In order to determine the baud rate, the boot loader must determine the relationship between the internal oscillator and the baud rate. With this information, the boot loader can configure the UART to the same baud rate as the host. This automatic baud-rate detection allows the host to use any valid baud rate to communicate with the device.

The method used to perform this automatic synchronization requires the host to send the boot loader two bytes that are both 0x55. With this series of pulses, the boot loader can calculate the ratios needed to program the UART to match the host's baud rate. After the host sends the pattern, it attempts to read back one byte of data from the UART. The boot loader returns the value of 0xCC to indicate successful detection of the baud rate. If this byte is not received after at least twice the time required to transfer the two bytes, the host can resend another pattern of 0x55, 0x55, and wait for the 0xCC byte again until the boot loader acknowledges that it has received a synchronization pattern correctly. For example, the time to wait for data back from the boot loader should be calculated as at least  $2 \times (20(\text{bits}/\text{sync})/\text{baud rate}(\text{bits}/\text{sec}))$ . For a baud rate of 115200, this time is  $2 \times (20/115200)$  or 0.35 ms.

#### A.2.1.2 SSI

The Synchronous Serial Interface (SSI) port also uses a fixed serial format for communications, with the default framing defined as Motorola format with both the SPH and SPO bits set in the **SSICRO** register. See "Frame Formats" on page 598 for more information on formats for this transfer protocol. Like the UART, this interface has hardware requirements that limit the maximum frequency of the SSIClk signal to be at most 1/12 the internal oscillator (PIOSC) frequency of the board running the boot loader (which is at least 8.4 MHz, providing support for up to 700 KHz). Because the host device is the master, the SSI on the boot loader device does not need to determine the clock as it is provided directly by the host.

#### A.2.1.3 I<sup>2</sup>C

The Inter-Integrated Circuit (I<sup>2</sup>C) port operates in slave mode with a slave address of 0x42. The I<sup>2</sup>C port works at both 100-kHz and 400-kHz I2CSCL clock frequency. Because the host device is the master, the I<sup>2</sup>C on the boot loader device does not need to determine the clock as it is provided directly by the host.

### A.2.2 Serial Packet Handling

All communications, with the exception of the UART auto-baud, are done via defined packets that are acknowledged (ACK) or not acknowledged (NAK) by the devices. The packets use the same format for receiving and sending packets, including the method used to acknowledge successful or unsuccessful reception of a packet.

#### A.2.2.1 Packet Format

All packets sent and received from the device use the following byte-packed format.

```
struct
{
    unsigned char ucSize;
    unsigned char ucChecksum;
    unsigned char Data[];
};
```

ucSize                      The first byte received holds the total size of the transfer including the size and checksum bytes.

|            |                                                                                                                                                                                                    |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ucChecksum | This holds a simple checksum of the bytes in the data buffer only. The algorithm is $\text{Data}[0] + \text{Data}[1] + \dots + \text{Data}[\text{ucSize}-3]$ .                                     |
| Data       | This is the raw data intended for the device, which is formatted in some form of command interface. There should be $\text{ucSize}-2$ bytes of data provided in this buffer to or from the device. |

### A.2.2.2 Sending Packets

The actual bytes of the packet can be sent individually or all at once; the only limitation is that commands that cause Flash memory access should limit the download sizes to prevent losing bytes during Flash memory programming. This limitation is discussed further in the section that describes the boot loader command, `COMMAND_SEND_DATA` (see “`COMMAND_SEND_DATA` (0x24)” on page 1157).

Once the packet has been formatted correctly by the host, it should be sent out over the serial interface. Then the host should poll the interface for the first non-zero data returned from the device. The first non-zero byte is either an ACK (0xCC) or a NAK (0x33) byte from the device indicating the packet was received successfully (ACK) or unsuccessfully (NAK). This response does not indicate that the actual contents of the command issued in the data portion of the packet were valid, just that the packet was received correctly.

### A.2.2.3 Receiving Packets

The boot loader sends a packet of data in the same format that it receives a packet. The boot loader may transfer leading zero data before the first actual byte of data is sent out. The first non-zero byte is the size of the packet followed by a checksum byte and finally followed by the data itself. The data is sent without a break after the first non-zero byte is sent from the boot loader. Once the device communicating with the boot loader receives all the bytes, it must either ACK or NAK the packet to indicate that the transmission was successful. The appropriate response after sending a NAK to the boot loader is to resend the command that failed and request the data again. If needed, the host may send leading zeros before sending down the ACK/NAK signal to the boot loader, as the boot loader only accepts the first non-zero data as a valid response. This zero padding is needed by the SSI interface in order to receive data to or from the boot loader.

## A.2.3 Serial Commands

The next section defines the list of commands that can be sent to the boot loader. The first byte of the data should always be one of the defined commands, followed by data or parameters as determined by the command that is sent.

### A.2.3.1 COMMAND\_PING (0X20)

This command simply accepts the command and sets the global status to success. The format of the packet is as follows:

```
Byte[0] = 0x03;
Byte[1] = checksum(Byte[2]);
Byte[2] = COMMAND_PING;
```

The ping command has 3 bytes and the value for `COMMAND_PING` is 0x20 and the checksum of one byte is that same byte, making `Byte[1]` also 0x20. Because the ping command has no real return status, the receipt of an ACK can be interpreted as a successful ping to the boot loader.

### A.2.3.2 COMMAND\_DOWNLOAD (0x21)

This command is sent to the boot loader to indicate where to store data and how many bytes will be sent by the COMMAND\_SEND\_DATA commands that follow. The command consists of two 32-bit values that are both transferred MSB first. The first 32-bit value is the address to start programming data into, while the second is the 32-bit size of the data that will be sent. This command also triggers an erase of the full area to be programmed so this command takes longer than other commands and results in a longer time to receive the ACK/NAK back from the board. This command should be followed by a COMMAND\_GET\_STATUS to ensure that the Program Address and Program size are valid for the device running the boot loader.

The format of the packet to send this command is as follows:

```
Byte[0] = 11
Byte[1] = checksum(Bytes[2:10])
Byte[2] = COMMAND_DOWNLOAD
Byte[3] = Program Address [31:24]
Byte[4] = Program Address [23:16]
Byte[5] = Program Address [15:8]
Byte[6] = Program Address [7:0]
Byte[7] = Program Size [31:24]
Byte[8] = Program Size [23:16]
Byte[9] = Program Size [15:8]
Byte[10] = Program Size [7:0]
```

### A.2.3.3 COMMAND\_RUN (0x22)

This command is used to tell the boot loader to execute from the address passed as the parameter in this command. This command consists of a single 32-bit value that is interpreted as the address to execute. The 32-bit value is transmitted MSB first and the boot loader responds with an ACK signal back to the host device before actually executing the code at the given address. The ACK response tells the host that the command was received successfully, and the code is running.

```
Byte[0] = 7
Byte[1] = checksum(Bytes[2:6])
Byte[2] = COMMAND_RUN
Byte[3] = Execute Address[31:24]
Byte[4] = Execute Address[23:16]
Byte[5] = Execute Address[15:8]
Byte[6] = Execute Address[7:0]
```

### A.2.3.4 COMMAND\_GET\_STATUS (0x23)

This command returns the status of the last command that was issued. Typically, this command should be sent after every command to ensure that the previous command was successful or to properly respond to a failure. The command requires one byte in the data of the packet and should be followed by reading a packet with one byte of data that contains a status code. The last step is to ACK or NAK the received data so the boot loader knows that the data has been read.

```
Byte[0] = 0x03
Byte[1] = checksum(Byte[2])
Byte[2] = COMMAND_GET_STATUS
```

### A.2.3.5 COMMAND\_SEND\_DATA (0x24)

This command should only follow a COMMAND\_DOWNLOAD command or another COMMAND\_SEND\_DATA command if more data is needed. Consecutive send data commands automatically increment address and continue programming from the previous location. For packets which do not contain the final portion of the downloaded data, a multiple of four bytes should always be transferred. The command terminates programming once the number of bytes indicated by the COMMAND\_DOWNLOAD command has been received. Each time this function is called, it should be followed by a COMMAND\_GET\_STATUS to ensure that the data was successfully programmed into the Flash memory. If the boot loader sends a NAK to this command, the boot loader does not increment the current address to allow retransmission of the previous data. The following example shows a COMMAND\_SEND\_DATA packet with 8 bytes of packet data:

```
Byte[0] = 11
Byte[1] = checksum(Bytes[2:10])
Byte[2] = COMMAND_SEND_DATA
Byte[3] = Data[0]
Byte[4] = Data[1]
Byte[5] = Data[2]
Byte[6] = Data[3]
Byte[7] = Data[4]
Byte[8] = Data[5]
Byte[9] = Data[6]
Byte[10] = Data[7]
```

### A.2.3.6 COMMAND\_RESET (0x25)

This command is used to tell the boot loader device to reset. Unlike the COMMAND\_RUN, this command allows the initial stack pointer to be read by the hardware and set up for the new code. COMMAND\_RESET can also be used to reset the boot loader if a critical error occurs, and the host device wants to restart communication with the boot loader.

```
Byte[0] = 3
Byte[1] = checksum(Byte[2])
Byte[2] = COMMAND_RESET
```

The boot loader responds with an ACK signal back to the host device before actually executing the software reset to the device running the boot loader. The ACK tells the host that the command was received successfully and the part will be reset.

## A.3 Ethernet Interface

The Ethernet port uses the bootstrap protocol (BOOTP), which is a predecessor to the DHCP protocol and is used to discover the IP address of the client, the IP address of the server, and the name of the firmware image to use. BOOTP uses UDP/IP packets to communicate between the client and the server; the boot loader acts as the client. First, it sends a BOOTP request using a broadcast message. When the server receives the request, it replies, thereby informing the client of its IP address, the IP address of the server, and the name of the firmware image. Once this reply is received, the BOOTP protocol has completed. At this point, the trivial file transfer protocol (TFTP) is used to transfer the firmware image from the server to the client. TFTP also uses UDP/IP packets to communicate between the client and the server, and the boot loader also acts as the client in this protocol. As each data block is received, it is programmed into Flash memory. Once all data blocks are received and programmed, the device is reset, causing it to start running the new firmware

image. The uIP stack is used to implement the UDP/IP connections. TCP support is not needed and is therefore disabled, greatly reducing the size of the stack.

The following IETF specifications define the protocols used by the Ethernet update mechanism:

- RFC951 (<http://tools.ietf.org/html/rfc951.html>) defines the bootstrap protocol.
- RFC1350 (<http://tools.ietf.org/html/rfc1350.html>) defines the trivial file transfer protocol.

## B ROM DriverLib Functions

### B.1 DriverLib Functions Included in the Integrated ROM

The Stellaris® Peripheral Driver Library (DriverLib) APIs that are available in the integrated ROM of the Stellaris® family of devices are listed below. The detailed description of each function is available in the *Stellaris® ROM User's Guide*.

ROM\_ADCComparatorConfigure

// Configures an ADC digital comparator.

ROM\_ADCComparatorIntClear

// Clears sample sequence comparator interrupt source.

ROM\_ADCComparatorIntDisable

// Disables a sample sequence comparator interrupt.

ROM\_ADCComparatorIntEnable

// Enables a sample sequence comparator interrupt.

ROM\_ADCComparatorIntStatus

// Gets the current comparator interrupt status.

ROM\_ADCComparatorRegionSet

// Defines the ADC digital comparator regions.

ROM\_ADCComparatorReset

// Resets the current ADC digital comparator conditions.

ROM\_ADCHardwareOversampleConfigure

// Configures the hardware oversampling factor of the ADC.

ROM\_ADCIntClear

// Clears sample sequence interrupt source.

ROM\_ADCIntDisable

// Disables a sample sequence interrupt.

ROM\_ADCIntEnable

// Enables a sample sequence interrupt.

ROM\_ADCIntStatus

// Gets the current interrupt status.

ROM\_ADCProcessorTrigger

// Causes a processor trigger for a sample sequence.

ROM\_ADCSequenceConfigure

// Configures the trigger source and priority of a sample sequence.

ROM\_ADCSequenceDataGet

// Gets the captured data for a sample sequence.

ROM\_ADCSequenceDisable  
// Disables a sample sequence.

ROM\_ADCSequenceEnable  
// Enables a sample sequence.

ROM\_ADCSequenceOverflow  
// Determines if a sample sequence overflow occurred.

ROM\_ADCSequenceOverflowClear  
// Clears the overflow condition on a sample sequence.

ROM\_ADCSequenceStepConfigure  
// Configure a step of the sample sequencer.

ROM\_ADCSequenceUnderflow  
// Determines if a sample sequence underflow occurred.

ROM\_ADCSequenceUnderflowClear  
// Clears the underflow condition on a sample sequence.

ROM\_CANBitRateSet  
// This function is used to set the CAN bit timing values to a nominal setting based on a desired bit rate.

ROM\_CANBitTimingGet  
// Reads the current settings for the CAN controller bit timing.

ROM\_CANBitTimingSet  
// Configures the CAN controller bit timing.

ROM\_CANDisable  
// Disables the CAN controller.

ROM\_CANEnable  
// Enables the CAN controller.

ROM\_CANErrCntrGet  
// Reads the CAN controller error counter register.

ROM\_CANInit  
// Initializes the CAN controller after reset.

ROM\_CANIntClear  
// Clears a CAN interrupt source.

ROM\_CANIntDisable  
// Disables individual CAN controller interrupt sources.

ROM\_CANIntEnable  
// Enables individual CAN controller interrupt sources.

ROM\_CANIntStatus  
// Returns the current CAN controller interrupt status.

ROM\_CANMessageClear  
// Clears a message object so that it is no longer used.

ROM\_CANMessageGet  
// Reads a CAN message from one of the message object buffers.

ROM\_CANMessageSet  
// Configures a message object in the CAN controller.

ROM\_CANRetryGet  
// Returns the current setting for automatic retransmission.

ROM\_CANRetrySet  
// Sets the CAN controller automatic retransmission behavior.

ROM\_CANStatusGet  
// Reads one of the controller status registers.

ROM\_ComparatorConfigure  
// Configures a comparator.

ROM\_ComparatorIntClear  
// Clears a comparator interrupt.

ROM\_ComparatorIntDisable  
// Disables the comparator interrupt.

ROM\_ComparatorIntEnable  
// Enables the comparator interrupt.

ROM\_ComparatorIntStatus  
// Gets the current interrupt status.

ROM\_ComparatorRefSet  
// Sets the internal reference voltage.

ROM\_ComparatorValueGet  
// Gets the current comparator output value.

ROM\_Crc16Array  
// Calculates the CRC-16 of an array of words.

ROM\_Crc16Array3  
// Calculates three CRC-16s of an array of words.

ROM\_EPIAddressMapSet  
// Configures the address map for the external interface.

ROM\_EPIConfigGPMModeSet  
// Configures the interface for general-purpose mode operation.

ROM\_EPIConfigHB16Set  
// Configures the interface for Host-bus 16 operation.

ROM\_EPIConfigHB8Set  
// Configures the interface for Host-bus 8 operation.

ROM\_EPIConfigSDRAMSet  
// Configures the SDRAM mode of operation.

ROM\_EPIDividerSet  
// Sets the clock divider for the EPI module.

ROM\_EPIFIFOConfig  
// Configures the read FIFO.

ROM\_EPIIntDisable  
// Disables EPI interrupt sources.

ROM\_EPIIntEnable  
// Enables EPI interrupt sources.

ROM\_EPIIntErrorClear  
// Clears pending EPI error sources.

ROM\_EPIIntErrorStatus  
// Gets the EPI error interrupt status.

ROM\_EPIIntStatus  
// Gets the EPI interrupt status.

ROM\_EPIModeSet  
// Sets the usage mode of the EPI module.

ROM\_EPINonBlockingReadAvail  
// Get the count of items available in the read FIFO.

ROM\_EPINonBlockingReadConfigure  
// Configures a non-blocking read transaction.

ROM\_EPINonBlockingReadCount  
// Get the count remaining for a non-blocking transaction.

ROM\_EPINonBlockingReadGet16  
// Read available data from the read FIFO, as 16-bit data items.

ROM\_EPINonBlockingReadGet32  
// Read available data from the read FIFO, as 32-bit data items.

ROM\_EPINonBlockingReadGet8  
// Read available data from the read FIFO, as 8-bit data items.

ROM\_EPINonBlockingReadStart  
// Starts a non-blocking read transaction.

ROM\_EPINonBlockingReadStop  
// Stops a non-blocking read transaction.

ROM\_EPIWriteFIFOCountGet  
// Reads the number of empty slots in the write transaction FIFO.

ROM\_EthernetConfigGet  
// Gets the current configuration of the Ethernet controller.

ROM\_EthernetConfigSet  
// Sets the configuration of the Ethernet controller.

ROM\_EthernetDisable  
// Disables the Ethernet controller.

ROM\_EthernetEnable  
// Enables the Ethernet controller for normal operation.

ROM\_EthernetInitExpClk  
// Initializes the Ethernet controller for operation.

ROM\_EthernetIntClear  
// Clears Ethernet interrupt sources.

ROM\_EthernetIntDisable  
// Disables individual Ethernet interrupt sources.

ROM\_EthernetIntEnable  
// Enables individual Ethernet interrupt sources.

ROM\_EthernetIntStatus  
// Gets the current Ethernet interrupt status.

ROM\_EthernetMACAddrGet  
// Gets the MAC address of the Ethernet controller.

ROM\_EthernetMACAddrSet  
// Sets the MAC address of the Ethernet controller.

ROM\_EthernetPacketAvail  
// Check for packet available from the Ethernet controller.

ROM\_EthernetPacketGet  
// Waits for a packet from the Ethernet controller.

ROM\_EthernetPacketGetNonBlocking  
// Receives a packet from the Ethernet controller.

ROM\_EthernetPacketPut  
// Waits to send a packet from the Ethernet controller.

ROM\_EthernetPacketPutNonBlocking  
// Sends a packet to the Ethernet controller.

ROM\_EthernetPHYRead  
// Reads from a PHY register.

ROM\_EthernetPHYWrite  
// Writes to the PHY register.

ROM\_EthernetSpaceAvail  
// Checks for packet space available in the Ethernet controller.

ROM\_FlashErase  
// Erases a block of flash.

ROM\_FlashIntClear  
// Clears flash controller interrupt sources.

ROM\_FlashIntDisable  
// Disables individual flash controller interrupt sources.

ROM\_FlashIntEnable  
// Enables individual flash controller interrupt sources.

ROM\_FlashIntGetStatus  
// Gets the current interrupt status.

ROM\_FlashProgram  
// Programs flash.

ROM\_FlashProtectGet  
// Gets the protection setting for a block of flash.

ROM\_FlashProtectSave  
// Saves the flash protection settings.

ROM\_FlashProtectSet  
// Sets the protection setting for a block of flash.

ROM\_FlashUsecGet  
// Gets the number of processor clocks per micro-second.

ROM\_FlashUsecSet  
// Sets the number of processor clocks per micro-second.

ROM\_FlashUserGet  
// Gets the user registers.

ROM\_FlashUserSave  
// Saves the user registers.

ROM\_FlashUserSet  
// Sets the user registers.

ROM\_GPIODirModeGet  
// Gets the direction and mode of a pin.

ROM\_GPIODirModeSet  
// Sets the direction and mode of the specified pin(s).

ROM\_GPIOIntTypeGet  
// Gets the interrupt type for a pin.

ROM\_GPIOIntTypeSet  
// Sets the interrupt type for the specified pin(s).

ROM\_GPIOPadConfigGet  
// Gets the pad configuration for a pin.

ROM\_GPIOPadConfigSet  
// Sets the pad configuration for the specified pin(s).

ROM\_GPIOPinConfigure  
// Configures the alternate function of a GPIO pin.

ROM\_GPIOPinIntClear  
// Clears the interrupt for the specified pin(s).

ROM\_GPIOPinIntDisable  
// Disables interrupts for the specified pin(s).

ROM\_GPIOPinIntEnable  
// Enables interrupts for the specified pin(s).

ROM\_GPIOPinIntStatus  
// Gets interrupt status for the specified GPIO port.

ROM\_GPIOPinRead  
// Reads the values present of the specified pin(s).

ROM\_GPIOPinTypeADC  
// Configures pin(s) for use as analog-to-digital converter inputs.

ROM\_GPIOPinTypeCAN  
// Configures pin(s) for use as a CAN device.

ROM\_GPIOPinTypeComparator  
// Configures pin(s) for use as an analog comparator input.

ROM\_GPIOPinTypeEthernetLED  
// Configures pin(s) for use by the Ethernet peripheral as LED signals.

ROM\_GPIOPinTypeGPIOInput  
// Configures pin(s) for use as GPIO inputs.

ROM\_GPIOPinTypeGPIOOutput  
// Configures pin(s) for use as GPIO outputs.

ROM\_GPIOPinTypeGPIOOutputOD  
// Configures pin(s) for use as GPIO open drain outputs.

ROM\_GPIOPinTypeI2C  
// Configures pin(s) for use by the I2C peripheral.

ROM\_GPIOPinTypeI2S  
    // Configures pin(s) for use by the I2S peripheral.

ROM\_GPIOPinTypePWM  
    // Configures pin(s) for use by the PWM peripheral.

ROM\_GPIOPinTypeQEI  
    // Configures pin(s) for use by the QEI peripheral.

ROM\_GPIOPinTypeSSI  
    // Configures pin(s) for use by the SSI peripheral.

ROM\_GPIOPinTypeTimer  
    // Configures pin(s) for use by the Timer peripheral.

ROM\_GPIOPinTypeUART  
    // Configures pin(s) for use by the UART peripheral.

ROM\_GPIOPinTypeUSBAnalog  
    // Configures pin(s) for use by the USB peripheral.

ROM\_GPIOPinTypeUSBDigital  
    // Configures pin(s) for use by the USB peripheral.

ROM\_GPIOPinWrite  
    // Writes a value to the specified pin(s).

ROM\_HibernateClockSelect  
    // Selects the clock input for the Hibernation module.

ROM\_HibernateDataGet  
    // Reads a set of data from the non-volatile memory of the Hibernation module.

ROM\_HibernateDataSet  
    // Stores data in the non-volatile memory of the Hibernation module.

ROM\_HibernateDisable  
    // Disables the Hibernation module for operation.

ROM\_HibernateEnableExpClk  
    // Enables the Hibernation module for operation.

ROM\_HibernateIntClear  
    // Clears pending interrupts from the Hibernation module.

ROM\_HibernateIntDisable  
    // Disables interrupts for the Hibernation module.

ROM\_HibernateIntEnable  
    // Enables interrupts for the Hibernation module.

ROM\_HibernateIntStatus  
    // Gets the current interrupt status of the Hibernation module.

ROM\_HibernatelsActive  
// Checks to see if the Hibernation module is already powered up.

ROM\_HibernateLowBatGet  
// Gets the currently configured low battery detection behavior.

ROM\_HibernateLowBatSet  
// Configures the low battery detection.

ROM\_HibernateRequest  
// Requests hibernation mode.

ROM\_HibernateRTCDisable  
// Disables the RTC feature of the Hibernation module.

ROM\_HibernateRTCEnable  
// Enables the RTC feature of the Hibernation module.

ROM\_HibernateRTCGet  
// Gets the value of the real time clock (RTC) counter.

ROM\_HibernateRTCMatch0Get  
// Gets the value of the RTC match 0 register.

ROM\_HibernateRTCMatch0Set  
// Sets the value of the RTC match 0 register.

ROM\_HibernateRTCMatch1Get  
// Gets the value of the RTC match 1 register.

ROM\_HibernateRTCMatch1Set  
// Sets the value of the RTC match 1 register.

ROM\_HibernateRTCSet  
// Sets the value of the real time clock (RTC) counter.

ROM\_HibernateRTCTrimGet  
// Gets the value of the RTC predivider trim register.

ROM\_HibernateRTCTrimSet  
// Sets the value of the RTC predivider trim register.

ROM\_HibernateWakeGet  
// Gets the currently configured wake conditions for the Hibernation module.

ROM\_HibernateWakeSet  
// Configures the wake conditions for the Hibernation module.

ROM\_I2CMasterBusBusy  
// Indicates whether or not the I2C bus is busy.

ROM\_I2CMasterBusy  
// Indicates whether or not the I2C Master is busy.

ROM\_I2CMasterControl  
// Controls the state of the I2C Master module.

ROM\_I2CMasterDataGet  
// Receives a byte that has been sent to the I2C Master.

ROM\_I2CMasterDataPut  
// Transmits a byte from the I2C Master.

ROM\_I2CMasterDisable  
// Disables the I2C master block.

ROM\_I2CMasterEnable  
// Enables the I2C Master block.

ROM\_I2CMasterErr  
// Gets the error status of the I2C Master module.

ROM\_I2CMasterInitExpClk  
// Initializes the I2C Master block.

ROM\_I2CMasterIntClear  
// Clears I2C Master interrupt sources.

ROM\_I2CMasterIntDisable  
// Disables the I2C Master interrupt.

ROM\_I2CMasterIntEnable  
// Enables the I2C Master interrupt.

ROM\_I2CMasterIntStatus  
// Gets the current I2C Master interrupt status.

ROM\_I2CMasterSlaveAddrSet  
// Sets the address that the I2C Master will place on the bus.

ROM\_I2CSlaveDataGet  
// Receives a byte that has been sent to the I2C Slave.

ROM\_I2CSlaveDataPut  
// Transmits a byte from the I2C Slave.

ROM\_I2CSlaveDisable  
// Disables the I2C slave block.

ROM\_I2CSlaveEnable  
// Enables the I2C Slave block.

ROM\_I2CSlaveInit  
// Initializes the I2C Slave block.

ROM\_I2CSlaveIntClear  
// Clears I2C Slave interrupt sources.

```
ROM_I2CSlaveIntClearEx
    // Clears I2C Slave interrupt sources.

ROM_I2CSlaveIntDisable
    // Disables the I2C Slave interrupt.

ROM_I2CSlaveIntDisableEx
    // Disables individual I2C Slave interrupt sources.

ROM_I2CSlaveIntEnable
    // Enables the I2C Slave interrupt.

ROM_I2CSlaveIntEnableEx
    // Enables individual I2C Slave interrupt sources.

ROM_I2CSlaveIntStatus
    // Gets the current I2C Slave interrupt status.

ROM_I2CSlaveIntStatusEx
    // Gets the current I2C Slave interrupt status.

ROM_I2CSlaveStatus
    // Gets the I2C Slave module status

ROM_I2SIntClear
    // Clears pending I2S interrupt sources.

ROM_I2SIntDisable
    // Disables I2S interrupt sources.

ROM_I2SIntEnable
    // Enables I2S interrupt sources.

ROM_I2SIntStatus
    // Gets the I2S interrupt status.

ROM_I2SMasterClockSelect
    // Selects the source of the master clock, internal or external.

ROM_I2SRxConfigSet
    // Configures the I2S receive module.

ROM_I2SRxDataGet
    // Reads data samples from the I2S receive FIFO with blocking.

ROM_I2SRxDataGetNonBlocking
    // Reads data samples from the I2S receive FIFO without blocking.

ROM_I2SRxDisable
    // Disables the I2S receive module for operation.

ROM_I2SRxEnable
    // Enables the I2S receive module for operation.
```

ROM\_I2SRxFIFOLevelGet  
// Gets the number of samples in the receive FIFO.

ROM\_I2SRxFIFOLimitGet  
// Gets the current setting of the FIFO service request level.

ROM\_I2SRxFIFOLimitSet  
// Sets the FIFO level at which a service request is generated.

ROM\_I2STxConfigSet  
// Configures the I2S transmit module.

ROM\_I2STxDataPut  
// Writes data samples to the I2S transmit FIFO with blocking.

ROM\_I2STxDataPutNonBlocking  
// Writes data samples to the I2S transmit FIFO without blocking.

ROM\_I2STxDisable  
// Disables the I2S transmit module for operation.

ROM\_I2STxEnable  
// Enables the I2S transmit module for operation.

ROM\_I2STxFIFOLevelGet  
// Gets the number of samples in the transmit FIFO.

ROM\_I2STxFIFOLimitGet  
// Gets the current setting of the FIFO service request level.

ROM\_I2STxFIFOLimitSet  
// Sets the FIFO level at which a service request is generated.

ROM\_I2STxRxConfigSet  
// Configures the I2S transmit and receive modules.

ROM\_I2STxRxDisable  
// Disables the I2S transmit and receive modules.

ROM\_I2STxRxEnable  
// Enables the I2S transmit and receive modules for operation.

ROM\_IntDisable  
// Disables an interrupt.

ROM\_IntEnable  
// Enables an interrupt.

ROM\_IntMasterDisable  
// Disables the processor interrupt.

ROM\_IntMasterEnable  
// Enables the processor interrupt.

ROM\_IntPendClear  
// Unpends an interrupt.

ROM\_IntPendSet  
// Pends an interrupt.

ROM\_IntPriorityGet  
// Gets the priority of an interrupt.

ROM\_IntPriorityGroupingGet  
// Gets the priority grouping of the interrupt controller.

ROM\_IntPriorityGroupingSet  
// Sets the priority grouping of the interrupt controller.

ROM\_IntPrioritySet  
// Sets the priority of an interrupt.

ROM\_MPUDisable  
// Disables the MPU for use.

ROM\_MPUEnable  
// Enables and configures the MPU for use.

ROM\_MPURegionCountGet  
// Gets the count of regions supported by the MPU.

ROM\_MPURegionDisable  
// Disables a specific region.

ROM\_MPURegionEnable  
// Enables a specific region.

ROM\_MPURegionGet  
// Gets the current settings for a specific region.

ROM\_MPURegionSet  
// Sets up the access rules for a specific region.

ROM\_pvAESTable  
// AES forward, reverse, S-box, and reverse S-box tables.

ROM\_PWMDeadBandDisable  
// Disables the PWM dead band output.

ROM\_PWMDeadBandEnable  
// Enables the PWM dead band output, and sets the dead band delays.

ROM\_PWMFaultIntClear  
// Clears the fault interrupt for a PWM module.

ROM\_PWMFaultIntClearExt  
// Clears the fault interrupt for a PWM module.

ROM\_PWMGenConfigure  
// Configures a PWM generator.

ROM\_PWMGenDisable  
// Disables the timer/counter for a PWM generator block.

ROM\_PWMGenEnable  
// Enables the timer/counter for a PWM generator block.

ROM\_PWMGenFaultClear  
// Clears one or more latched fault triggers for a given PWM generator.

ROM\_PWMGenFaultConfigure  
// Configures the minimum fault period and fault pin senses for a given PWM generator.

ROM\_PWMGenFaultStatus  
// Returns the current state of the fault triggers for a given PWM generator.

ROM\_PWMGenFaultTriggerGet  
// Returns the set of fault triggers currently configured for a given PWM generator.

ROM\_PWMGenFaultTriggerSet  
// Configures the set of fault triggers for a given PWM generator.

ROM\_PWMGenIntClear  
// Clears the specified interrupt(s) for the specified PWM generator block.

ROM\_PWMGenIntStatus  
// Gets interrupt status for the specified PWM generator block.

ROM\_PWMGenIntTrigDisable  
// Disables interrupts for the specified PWM generator block.

ROM\_PWMGenIntTrigEnable  
// Enables interrupts and triggers for the specified PWM generator block.

ROM\_PWMGenPeriodGet  
// Gets the period of a PWM generator block.

ROM\_PWMGenPeriodSet  
// Set the period of a PWM generator.

ROM\_PWMIntDisable  
// Disables generator and fault interrupts for a PWM module.

ROM\_PWMIntEnable  
// Enables generator and fault interrupts for a PWM module.

ROM\_PWMIntStatus  
// Gets the interrupt status for a PWM module.

ROM\_PWMOutputFault  
// Specifies the state of PWM outputs in response to a fault condition.

ROM\_PWMOutputFaultLevel  
// Specifies the level of PWM outputs suppressed in response to a fault condition.

ROM\_PWMOutputInvert  
// Selects the inversion mode for PWM outputs.

ROM\_PWMOutputState  
// Enables or disables PWM outputs.

ROM\_PWMPulseWidthGet  
// Gets the pulse width of a PWM output.

ROM\_PWMPulseWidthSet  
// Sets the pulse width for the specified PWM output.

ROM\_PWMSyncTimeBase  
// Synchronizes the counters in one or multiple PWM generator blocks.

ROM\_PWMSyncUpdate  
// Synchronizes all pending updates.

ROM\_QEIConfigure  
// Configures the quadrature encoder.

ROM\_QEIDirectionGet  
// Gets the current direction of rotation.

ROM\_QEIDisable  
// Disables the quadrature encoder.

ROM\_QEIEnable  
// Enables the quadrature encoder.

ROM\_QEIErrorGet  
// Gets the encoder error indicator.

ROM\_QEIIntClear  
// Clears quadrature encoder interrupt sources.

ROM\_QEIIntDisable  
// Disables individual quadrature encoder interrupt sources.

ROM\_QEIIntEnable  
// Enables individual quadrature encoder interrupt sources.

ROM\_QEIIntStatus  
// Gets the current interrupt status.

ROM\_QEIPositionGet  
// Gets the current encoder position.

ROM\_QEIPositionSet  
// Sets the current encoder position.

ROM\_QEIVelocityConfigure  
// Configures the velocity capture.

ROM\_QEIVelocityDisable  
// Disables the velocity capture.

ROM\_QEIVelocityEnable  
// Enables the velocity capture.

ROM\_QEIVelocityGet  
// Gets the current encoder speed.

ROM\_SSIBusy  
// Determines whether the SSI transmitter is busy or not.

ROM\_SSIConfigSetExpClk  
// Configures the synchronous serial interface.

ROM\_SSIDataGet  
// Gets a data element from the SSI receive FIFO.

ROM\_SSIDataGetNonBlocking  
// Gets a data element from the SSI receive FIFO.

ROM\_SSIDataPut  
// Puts a data element into the SSI transmit FIFO.

ROM\_SSIDataPutNonBlocking  
// Puts a data element into the SSI transmit FIFO.

ROM\_SSIDisable  
// Disables the synchronous serial interface.

ROM\_SSIDMADisable  
// Disable SSI DMA operation.

ROM\_SSIDMAEnable  
// Enable SSI DMA operation.

ROM\_SSIEnable  
// Enables the synchronous serial interface.

ROM\_SSIIntClear  
// Clears SSI interrupt sources.

ROM\_SSIIntDisable  
// Disables individual SSI interrupt sources.

ROM\_SSIIntEnable  
// Enables individual SSI interrupt sources.

ROM\_SSIIntStatus  
// Gets the current interrupt status.

ROM\_SysCtlADCSpeedGet  
// Gets the sample rate of the ADC.

ROM\_SysCtlADCSpeedSet  
// Sets the sample rate of the ADC.

ROM\_SysCtlClockGet  
// Gets the processor clock rate.

ROM\_SysCtlClockSet  
// Sets the clocking of the device.

ROM\_SysCtlDeepSleep  
// Puts the processor into deep-sleep mode.

ROM\_SysCtlDelay  
// Provides a small delay.

ROM\_SysCtlFlashSizeGet  
// Gets the size of the flash.

ROM\_SysCtlGPIOAHBDisable  
// Disables a GPIO peripheral for access from the AHB.

ROM\_SysCtlGPIOAHBEnable  
// Enables a GPIO peripheral for access from the AHB.

ROM\_SysCtlI2SMClkSet  
// Sets the MCLK frequency provided to the I2S module.

ROM\_SysCtlIntClear  
// Clears system control interrupt sources.

ROM\_SysCtlIntDisable  
// Disables individual system control interrupt sources.

ROM\_SysCtlIntEnable  
// Enables individual system control interrupt sources.

ROM\_SysCtlIntStatus  
// Gets the current interrupt status.

ROM\_SysCtlLDOGet  
// Gets the output voltage of the LDO.

ROM\_SysCtlLDOSet  
// Sets the output voltage of the LDO.

ROM\_SysCtlPeripheralClockGating  
// Controls peripheral clock gating in sleep and deep-sleep mode.

ROM\_SysCtlPeripheralDeepSleepDisable  
// Disables a peripheral in deep-sleep mode.

ROM\_SysCtlPeripheralDeepSleepEnable  
// Enables a peripheral in deep-sleep mode.

ROM\_SysCtlPeripheralDisable  
// Disables a peripheral.

ROM\_SysCtlPeripheralEnable  
// Enables a peripheral.

ROM\_SysCtlPeripheralPresent  
// Determines if a peripheral is present.

ROM\_SysCtlPeripheralReset  
// Performs a software reset of a peripheral.

ROM\_SysCtlPeripheralSleepDisable  
// Disables a peripheral in sleep mode.

ROM\_SysCtlPeripheralSleepEnable  
// Enables a peripheral in sleep mode.

ROM\_SysCtlPinPresent  
// Determines if a pin is present.

ROM\_SysCtlPWMClockGet  
// Gets the current PWM clock configuration.

ROM\_SysCtlPWMClockSet  
// Sets the PWM clock configuration.

ROM\_SysCtlReset  
// Resets the device.

ROM\_SysCtlResetCauseClear  
// Clears reset reasons.

ROM\_SysCtlResetCauseGet  
// Gets the reason for a reset.

ROM\_SysCtlSleep  
// Puts the processor into sleep mode.

ROM\_SysCtlSRAMSizeGet  
// Gets the size of the SRAM.

ROM\_SysCtlUSBPLLDisable  
// Powers down the USB PLL.

ROM\_SysCtlUSBPLLEnable  
// Powers up the USB PLL.

ROM\_SysTickDisable  
// Disables the SysTick counter.

ROM\_SysTickEnable  
// Enables the SysTick counter.

ROM\_SysTickIntDisable  
// Disables the SysTick interrupt.

ROM\_SysTickIntEnable  
// Enables the SysTick interrupt.

ROM\_SysTickPeriodGet  
// Gets the period of the SysTick counter.

ROM\_SysTickPeriodSet  
// Sets the period of the SysTick counter.

ROM\_SysTickValueGet  
// Gets the current value of the SysTick counter.

ROM\_TimerConfigure  
// Configures the timer(s).

ROM\_TimerControlEvent  
// Controls the event type.

ROM\_TimerControlLevel  
// Controls the output level.

ROM\_TimerControlStall  
// Controls the stall handling.

ROM\_TimerControlTrigger  
// Enables or disables the trigger output.

ROM\_TimerDisable  
// Disables the timer(s).

ROM\_TimerEnable  
// Enables the timer(s).

ROM\_TimerIntClear  
// Clears timer interrupt sources.

ROM\_TimerIntDisable  
// Disables individual timer interrupt sources.

ROM\_TimerIntEnable  
// Enables individual timer interrupt sources.

ROM\_TimerIntStatus  
// Gets the current interrupt status.

ROM\_TimerLoadGet  
// Gets the timer load value.

ROM\_TimerLoadSet  
// Sets the timer load value.

ROM\_TimerMatchGet  
// Gets the timer match value.

ROM\_TimerMatchSet  
// Sets the timer match value.

ROM\_TimerPrescaleGet  
// Get the timer prescale value.

ROM\_TimerPrescaleSet  
// Set the timer prescale value.

ROM\_TimerRTCDisable  
// Disable RTC counting.

ROM\_TimerRTCEnable  
// Enable RTC counting.

ROM\_TimerValueGet  
// Gets the current timer value.

ROM\_UARTBreakCtl  
// Causes a BREAK to be sent.

ROM\_UARTBusy  
// Determines whether the UART transmitter is busy or not.

ROM\_UARTCharGet  
// Waits for a character from the specified port.

ROM\_UARTCharGetNonBlocking  
// Receives a character from the specified port.

ROM\_UARTCharPut  
// Waits to send a character from the specified port.

ROM\_UARTCharPutNonBlocking  
// Sends a character to the specified port.

ROM\_UARTCharsAvail  
// Determines if there are any characters in the receive FIFO.

ROM\_UARTConfigGetExpClk  
// Gets the current configuration of a UART.

ROM\_UARTConfigSetExpClk  
// Sets the configuration of a UART.

ROM\_UARTDisable  
// Disables transmitting and receiving.

ROM\_UARTDisableSIR  
// Disables SIR (IrDA) mode on the specified UART.

ROM\_UARTDMADisable  
// Disable UART DMA operation.

ROM\_UARTDMAEnable  
// Enable UART DMA operation.

ROM\_UARTEnable  
// Enables transmitting and receiving.

ROM\_UARTEnableSIR  
// Enables SIR (IrDA) mode on the specified UART.

ROM\_UARTFIFODisable  
// Disables the transmit and receive FIFOs.

ROM\_UARTFIFOEnable  
// Enables the transmit and receive FIFOs.

ROM\_UARTFIFOLevelGet  
// Gets the FIFO level at which interrupts are generated.

ROM\_UARTFIFOLevelSet  
// Sets the FIFO level at which interrupts are generated.

ROM\_UARTIntClear  
// Clears UART interrupt sources.

ROM\_UARTIntDisable  
// Disables individual UART interrupt sources.

ROM\_UARTIntEnable  
// Enables individual UART interrupt sources.

ROM\_UARTIntStatus  
// Gets the current interrupt status.

ROM\_UARTParityModeGet  
// Gets the type of parity currently being used.

ROM\_UARTParityModeSet  
// Sets the type of parity.

ROM\_UARTRxErrorClear  
// Clears all reported receiver errors.

ROM\_UARTRxErrorGet  
// Gets current receiver errors.

ROM\_UARTSpaceAvail  
// Determines if there is any space in the transmit FIFO.

ROM\_UARTTxIntModeGet  
// Returns the current operating mode for the UART transmit interrupt.

ROM\_UARTTxIntModeSet  
// Sets the operating mode for the UART transmit interrupt.

ROM\_uDMAChannelAttributeDisable  
// Disables attributes of a uDMA channel.

ROM\_uDMAChannelAttributeEnable  
// Enables attributes of a uDMA channel.

ROM\_uDMAChannelAttributeGet  
// Gets the enabled attributes of a uDMA channel.

ROM\_uDMAChannelControlSet  
// Sets the control parameters for a uDMA channel.

ROM\_uDMAChannelDisable  
// Disables a uDMA channel for operation.

ROM\_uDMAChannelEnable  
// Enables a uDMA channel for operation.

ROM\_uDMAChannelIsEnabled  
// Checks if a uDMA channel is enabled for operation.

ROM\_uDMAChannelModeGet  
// Gets the transfer mode for a uDMA channel.

ROM\_uDMAChannelRequest  
// Requests a uDMA channel to start a transfer.

ROM\_uDMAChannelSelectDefault  
// Selects the default peripheral for a set of uDMA channels.

ROM\_uDMAChannelSelectSecondary  
// Selects the secondary peripheral for a set of uDMA channels.

ROM\_uDMAChannelSizeGet  
// Gets the current transfer size for a uDMA channel.

ROM\_uDMAChannelTransferSet  
// Sets the transfer parameters for a uDMA channel.

ROM\_uDMAControlBaseGet  
// Gets the base address for the channel control table.

ROM\_uDMAControlBaseSet  
// Sets the base address for the channel control table.

ROM\_uDMADisable  
// Disables the uDMA controller for use.

ROM\_uDMAEnable  
// Enables the uDMA controller for use.

ROM\_uDMAErrorStatusClear  
// Clears the uDMA error interrupt.

ROM\_uDMAErrorStatusGet  
// Gets the uDMA error status.

ROM\_UpdateEthernet  
// Starts an update over the Ethernet interface.

ROM\_UpdateI2C  
// Starts an update over the I2C0 interface.

ROM\_UpdateSSI  
// Starts an update over the SSI0 interface.

ROM\_UpdateUART  
// Starts an update over the UART0 interface.

ROM\_USBDevAddrGet  
// Returns the current device address in device mode.

ROM\_USBDevAddrSet  
// Sets the address in device mode.

ROM\_USBDevConnect  
// Connects the USB controller to the bus in device mode.

ROM\_USBDevDisconnect  
// Removes the USB controller from the bus in device mode.

ROM\_USBDevEndpointConfigGet  
// Gets the current configuration for an endpoint.

ROM\_USBDevEndpointConfigSet  
// Sets the configuration for an endpoint.

ROM\_USBDevEndpointDataAck  
// Acknowledge that data was read from the given endpoint's FIFO in device mode.

ROM\_USBDevEndpointStall  
// Stalls the specified endpoint in device mode.

ROM\_USBDevEndpointStallClear  
// Clears the stall condition on the specified endpoint in device mode.

ROM\_USBDevEndpointStatusClear  
// Clears the status bits in this endpoint in device mode.

ROM\_USBEndpointDataAvail  
// Determine the number of bytes of data available in a given endpoint's FIFO.

ROM\_USBEndpointDataGet  
// Retrieves data from the given endpoint's FIFO.

ROM\_USBEndpointDataPut  
// Puts data into the given endpoint's FIFO.

ROM\_USBEndpointDataSend  
// Starts the transfer of data from an endpoint's FIFO.

ROM\_USBEndpointDataToggleClear  
// Sets the Data toggle on an endpoint to zero.

ROM\_USBEndpointDMAChannel  
// Sets the DMA channel to use for a given endpoint.

ROM\_USBEndpointDMADisable  
// Disable DMA on a given endpoint.

ROM\_USBEndpointDMAEnable  
// Enable DMA on a given endpoint.

ROM\_USBEndpointStatus  
// Returns the current status of an endpoint.

ROM\_USBFIFOAddrGet  
// Returns the absolute FIFO address for a given endpoint.

ROM\_USBFIFOConfigGet  
// Returns the FIFO configuration for an endpoint.

ROM\_USBFIFOConfigSet  
// Sets the FIFO configuration for an endpoint.

ROM\_USBFIFOFlush  
// Forces a flush of an endpoint's FIFO.

ROM\_USBFrameNumberGet  
// Get the current frame number.

ROM\_USBHostAddrGet  
// Gets the current functional device address for an endpoint.

ROM\_USBHostAddrSet  
// Sets the functional address for the device that is connected to an endpoint in host mode.

ROM\_USBHostEndpointConfig  
// Sets the base configuration for a host endpoint.

ROM\_USBHostEndpointDataAck  
// Acknowledge that data was read from the given endpoint's FIFO in host mode.

ROM\_USBHostEndpointDataToggle  
// Sets the value data toggle on an endpoint in host mode.

ROM\_USBHostEndpointStatusClear  
// Clears the status bits in this endpoint in host mode.

ROM\_USBHostHubAddrGet  
// Get the current device hub address for this endpoint.

ROM\_USBHostHubAddrSet  
// Set the hub address for the device that is connected to an endpoint.

ROM\_USBHostMode  
// Change the mode of the USB controller to host.

ROM\_USBHostPwrDisable  
// Disables the external power pin.

ROM\_USBHostPwrEnable  
// Enables the external power pin.

ROM\_USBHostPwrFaultConfig  
// Sets the configuration for USB power fault.

ROM\_USBHostPwrFaultDisable  
// Disables power fault detection.

ROM\_USBHostPwrFaultEnable  
// Enables power fault detection.

ROM\_USBHostRequestIN  
// Schedules a request for an IN transaction on an endpoint in host mode.

ROM\_USBHostRequestStatus  
// Issues a request for a status IN transaction on endpoint zero.

ROM\_USBHostReset  
// Handles the USB bus reset condition.

ROM\_USBHostResume  
// Handles the USB bus resume condition.

ROM\_USBHostSpeedGet  
// Returns the current speed of the USB device connected.

ROM\_USBHostSuspend  
// Puts the USB bus in a suspended state.

ROM\_USBIntDisable  
// Disables the sources for USB interrupts.

ROM\_USBIntDisableControl  
// Disable control interrupts on a given USB controller.

ROM\_USBIntDisableEndpoint  
// Disable endpoint interrupts on a given USB controller.

ROM\_USBIntEnable  
// Enables the sources for USB interrupts.

ROM\_USBIntEnableControl  
// Enable control interrupts on a given USB controller.

ROM\_USBIntEnableEndpoint  
// Enable endpoint interrupts on a given USB controller.

ROM\_USBIntStatus  
// Returns the status of the USB interrupts.

ROM\_USBIntStatusControl  
// Returns the control interrupt status on a given USB controller.

ROM\_USBIntStatusEndpoint  
// Returns the endpoint interrupt status on a given USB controller.

ROM\_USBModeGet  
// Returns the current operating mode of the controller.

ROM\_USBOTGHostRequest  
// This function will enable host negotiation protocol when in device mode.

ROM\_WatchdogEnable  
// Enables the watchdog timer.

ROM\_WatchdogIntClear  
// Clears the watchdog timer interrupt.

ROM\_WatchdogIntEnable  
// Enables the watchdog timer interrupt.

ROM\_WatchdogIntStatus  
// Gets the current watchdog timer interrupt status.

ROM\_WatchdogLock  
// Enables the watchdog timer lock mechanism.

ROM\_WatchdogLockState  
// Gets the state of the watchdog timer lock mechanism.

ROM\_WatchdogReloadGet  
// Gets the watchdog timer reload value.

ROM\_WatchdogReloadSet  
// Sets the watchdog timer reload value.

ROM\_WatchdogResetDisable  
// Disables the watchdog timer reset.

ROM\_WatchdogResetEnable  
// Enables the watchdog timer reset.

ROM\_WatchdogRunning  
// Determines if the watchdog timer is enabled.

ROM\_WatchdogStallDisable  
// Disables stalling of the watchdog timer during debug events.

ROM\_WatchdogStallEnable  
// Enables stalling of the watchdog timer during debug events.

ROM\_WatchdogUnlock  
// Disables the watchdog timer lock mechanism.

ROM\_WatchdogValueGet  
// Gets the current watchdog timer value.

ROM\_ADCComparatorConfigure  
// Configures an ADC digital comparator.

ROM\_ADCComparatorIntClear  
// Clears sample sequence comparator interrupt source.

ROM\_ADCComparatorIntDisable  
// Disables a sample sequence comparator interrupt.

ROM\_ADCComparatorIntEnable  
// Enables a sample sequence comparator interrupt.

ROM\_ADCComparatorIntStatus  
// Gets the current comparator interrupt status.

ROM\_ADCComparatorRegionSet  
// Defines the ADC digital comparator regions.

ROM\_ADCComparatorReset  
// Resets the current ADC digital comparator conditions.

ROM\_ADCHardwareOversampleConfigure  
// Configures the hardware oversampling factor of the ADC.

ROM\_ADCIntClear  
// Clears sample sequence interrupt source.

ROM\_ADCIntDisable  
// Disables a sample sequence interrupt.

ROM\_ADCIntEnable  
// Enables a sample sequence interrupt.

ROM\_ADCIntStatus  
// Gets the current interrupt status.

ROM\_ADCProcessorTrigger  
// Causes a processor trigger for a sample sequence.

ROM\_ADCSequenceConfigure  
// Configures the trigger source and priority of a sample sequence.

ROM\_ADCSequenceDataGet  
// Gets the captured data for a sample sequence.

ROM\_ADCSequenceDisable  
// Disables a sample sequence.

ROM\_ADCSequenceEnable  
// Enables a sample sequence.

ROM\_ADCSequenceOverflow  
// Determines if a sample sequence overflow occurred.

ROM\_ADCSequenceOverflowClear  
// Clears the overflow condition on a sample sequence.

ROM\_ADCSequenceStepConfigure  
// Configure a step of the sample sequencer.

ROM\_ADCSequenceUnderflow  
// Determines if a sample sequence underflow occurred.

ROM\_ADCSequenceUnderflowClear  
// Clears the underflow condition on a sample sequence.

ROM\_CANBitRateSet  
// This function is used to set the CAN bit timing values to a nominal setting based on a desired bit rate.

ROM\_CANBitTimingGet  
// Reads the current settings for the CAN controller bit timing.

ROM\_CANBitTimingSet  
// Configures the CAN controller bit timing.

ROM\_CANDisable  
// Disables the CAN controller.

ROM\_CANEnable  
// Enables the CAN controller.

ROM\_CANErrCntGet  
// Reads the CAN controller error counter register.

ROM\_CANInit  
// Initializes the CAN controller after reset.

ROM\_CANIntClear  
// Clears a CAN interrupt source.

ROM\_CANIntDisable  
// Disables individual CAN controller interrupt sources.

ROM\_CANIntEnable  
// Enables individual CAN controller interrupt sources.

ROM\_CANIntStatus  
// Returns the current CAN controller interrupt status.

ROM\_CANMessageClear  
// Clears a message object so that it is no longer used.

ROM\_CANMessageGet  
// Reads a CAN message from one of the message object buffers.

ROM\_CANMessageSet  
// Configures a message object in the CAN controller.

ROM\_CANRetryGet  
// Returns the current setting for automatic retransmission.

ROM\_CANRetrySet  
// Sets the CAN controller automatic retransmission behavior.

ROM\_CANStatusGet  
// Reads one of the controller status registers.

ROM\_ComparatorConfigure  
// Configures a comparator.

ROM\_ComparatorIntClear  
// Clears a comparator interrupt.

ROM\_ComparatorIntDisable  
// Disables the comparator interrupt.

ROM\_ComparatorIntEnable  
// Enables the comparator interrupt.

ROM\_ComparatorIntStatus  
// Gets the current interrupt status.

ROM\_ComparatorRefSet  
// Sets the internal reference voltage.

ROM\_ComparatorValueGet  
// Gets the current comparator output value.

ROM\_Crc16Array  
// Calculates the CRC-16 of an array of words.

ROM\_Crc16Array3  
// Calculates three CRC-16s of an array of words.

ROM\_EPIAddressMapSet  
// Configures the address map for the external interface.

ROM\_EPIConfigGPMoDeSet  
// Configures the interface for general-purpose mode operation.

ROM\_EPIConfigHB16Set  
// Configures the interface for Host-bus 16 operation.

ROM\_EPIConfigHB8Set  
// Configures the interface for Host-bus 8 operation.

ROM\_EPIConfigSDRAMSet  
// Configures the SDRAM mode of operation.

ROM\_EPIDividerSet  
// Sets the clock divider for the EPI module.

ROM\_EPIFIFOConfig  
// Configures the read FIFO.

ROM\_EPIIntDisable  
// Disables EPI interrupt sources.

ROM\_EPIIntEnable  
// Enables EPI interrupt sources.

ROM\_EPIIntErrorClear  
// Clears pending EPI error sources.

ROM\_EPIIntErrorStatus  
// Gets the EPI error interrupt status.

ROM\_EPIIntStatus  
// Gets the EPI interrupt status.

ROM\_EPIModeSet  
// Sets the usage mode of the EPI module.

ROM\_EPINonBlockingReadAvail  
// Get the count of items available in the read FIFO.

ROM\_EPINonBlockingReadConfigure  
// Configures a non-blocking read transaction.

ROM\_EPINonBlockingReadCount  
// Get the count remaining for a non-blocking transaction.

ROM\_EPINonBlockingReadGet16  
// Read available data from the read FIFO, as 16-bit data items.

ROM\_EPINonBlockingReadGet32  
// Read available data from the read FIFO, as 32-bit data items.

ROM\_EPINonBlockingReadGet8  
// Read available data from the read FIFO, as 8-bit data items.

ROM\_EPINonBlockingReadStart  
// Starts a non-blocking read transaction.

ROM\_EPINonBlockingReadStop  
// Stops a non-blocking read transaction.

ROM\_EPIWriteFIFOCountGet  
// Reads the number of empty slots in the write transaction FIFO.

ROM\_EthernetConfigGet  
// Gets the current configuration of the Ethernet controller.

ROM\_EthernetConfigSet  
// Sets the configuration of the Ethernet controller.

ROM\_EthernetDisable  
// Disables the Ethernet controller.

ROM\_EthernetEnable  
// Enables the Ethernet controller for normal operation.

ROM\_EthernetInitExpClk  
// Initializes the Ethernet controller for operation.

ROM\_EthernetIntClear  
// Clears Ethernet interrupt sources.

ROM\_EthernetIntDisable  
// Disables individual Ethernet interrupt sources.

ROM\_EthernetIntEnable  
// Enables individual Ethernet interrupt sources.

ROM\_EthernetIntStatus  
// Gets the current Ethernet interrupt status.

ROM\_EthernetMACAddrGet  
// Gets the MAC address of the Ethernet controller.

ROM\_EthernetMACAddrSet  
// Sets the MAC address of the Ethernet controller.

ROM\_EthernetPacketAvail  
// Check for packet available from the Ethernet controller.

ROM\_EthernetPacketGet  
// Waits for a packet from the Ethernet controller.

ROM\_EthernetPacketGetNonBlocking  
// Receives a packet from the Ethernet controller.

ROM\_EthernetPacketPut  
// Waits to send a packet from the Ethernet controller.

ROM\_EthernetPacketPutNonBlocking  
// Sends a packet to the Ethernet controller.

ROM\_EthernetPHYRead  
// Reads from a PHY register.

ROM\_EthernetPHYWrite  
// Writes to the PHY register.

ROM\_EthernetSpaceAvail  
// Checks for packet space available in the Ethernet controller.

ROM\_FlashErase  
// Erases a block of flash.

ROM\_FlashIntClear  
// Clears flash controller interrupt sources.

ROM\_FlashIntDisable  
// Disables individual flash controller interrupt sources.

ROM\_FlashIntEnable  
// Enables individual flash controller interrupt sources.

ROM\_FlashIntGetStatus  
// Gets the current interrupt status.

ROM\_FlashProgram  
// Programs flash.

ROM\_FlashProtectGet  
// Gets the protection setting for a block of flash.

ROM\_FlashProtectSave  
// Saves the flash protection settings.

ROM\_FlashProtectSet  
// Sets the protection setting for a block of flash.

ROM\_FlashUsecGet  
// Gets the number of processor clocks per micro-second.

ROM\_FlashUsecSet  
// Sets the number of processor clocks per micro-second.

ROM\_FlashUserGet  
// Gets the user registers.

ROM\_FlashUserSave  
// Saves the user registers.

ROM\_FlashUserSet  
// Sets the user registers.

ROM\_GPIODirModeGet  
// Gets the direction and mode of a pin.

ROM\_GPIODirModeSet  
// Sets the direction and mode of the specified pin(s).

ROM\_GPIOIntTypeGet  
// Gets the interrupt type for a pin.

ROM\_GPIOIntTypeSet  
// Sets the interrupt type for the specified pin(s).

ROM\_GPIOPadConfigGet  
// Gets the pad configuration for a pin.

ROM\_GPIOPadConfigSet  
// Sets the pad configuration for the specified pin(s).

ROM\_GPIOPinConfigure  
// Configures the alternate function of a GPIO pin.

ROM\_GPIOPinIntClear  
// Clears the interrupt for the specified pin(s).

ROM\_GPIOPinIntDisable  
// Disables interrupts for the specified pin(s).

ROM\_GPIOPinIntEnable  
// Enables interrupts for the specified pin(s).

ROM\_GPIOPinIntStatus  
// Gets interrupt status for the specified GPIO port.

ROM\_GPIOPinRead  
// Reads the values present of the specified pin(s).

ROM\_GPIOPinTypeADC  
// Configures pin(s) for use as analog-to-digital converter inputs.

ROM\_GPIOPinTypeCAN  
// Configures pin(s) for use as a CAN device.

ROM\_GPIOPinTypeComparator  
// Configures pin(s) for use as an analog comparator input.

ROM\_GPIOPinTypeEthernetLED  
// Configures pin(s) for use by the Ethernet peripheral as LED signals.

ROM\_GPIOPinTypeGPIOInput  
// Configures pin(s) for use as GPIO inputs.

ROM\_GPIOPinTypeGPIOOutput  
// Configures pin(s) for use as GPIO outputs.

ROM\_GPIOPinTypeGPIOOutputOD  
// Configures pin(s) for use as GPIO open drain outputs.

ROM\_GPIOPinTypeI2C  
// Configures pin(s) for use by the I2C peripheral.

ROM\_GPIOPinTypeI2S  
// Configures pin(s) for use by the I2S peripheral.

ROM\_GPIOPinTypePWM  
// Configures pin(s) for use by the PWM peripheral.

ROM\_GPIOPinTypeQEI  
// Configures pin(s) for use by the QEI peripheral.

ROM\_GPIOPinTypeSSI  
// Configures pin(s) for use by the SSI peripheral.

ROM\_GPIOPinTypeTimer  
// Configures pin(s) for use by the Timer peripheral.

ROM\_GPIOPinTypeUART  
// Configures pin(s) for use by the UART peripheral.

ROM\_GPIOPinTypeUSBAnalog  
// Configures pin(s) for use by the USB peripheral.

ROM\_GPIOPinTypeUSBDigital  
// Configures pin(s) for use by the USB peripheral.

ROM\_GPIOPinWrite  
// Writes a value to the specified pin(s).

ROM\_HibernateClockSelect  
// Selects the clock input for the Hibernation module.

ROM\_HibernateDataGet  
// Reads a set of data from the non-volatile memory of the Hibernation module.

ROM\_HibernateDataSet  
// Stores data in the non-volatile memory of the Hibernation module.

ROM\_HibernateDisable  
// Disables the Hibernation module for operation.

ROM\_HibernateEnableExpClk  
// Enables the Hibernation module for operation.

ROM\_HibernateIntClear  
// Clears pending interrupts from the Hibernation module.

ROM\_HibernateIntDisable  
// Disables interrupts for the Hibernation module.

ROM\_HibernateIntEnable  
// Enables interrupts for the Hibernation module.

ROM\_HibernateIntStatus  
// Gets the current interrupt status of the Hibernation module.

ROM\_HibernatelsActive  
// Checks to see if the Hibernation module is already powered up.

ROM\_HibernateLowBatGet  
// Gets the currently configured low battery detection behavior.

ROM\_HibernateLowBatSet  
// Configures the low battery detection.

ROM\_HibernateRequest  
// Requests hibernation mode.

ROM\_HibernateRTCDisable  
// Disables the RTC feature of the Hibernation module.

ROM\_HibernateRTCEnable  
// Enables the RTC feature of the Hibernation module.

ROM\_HibernateRTCGet  
// Gets the value of the real time clock (RTC) counter.

ROM\_HibernateRTCMatch0Get  
// Gets the value of the RTC match 0 register.

ROM\_HibernateRTCMatch0Set  
// Sets the value of the RTC match 0 register.

ROM\_HibernateRTCMatch1Get  
// Gets the value of the RTC match 1 register.

ROM\_HibernateRTCMatch1Set  
// Sets the value of the RTC match 1 register.

ROM\_HibernateRTCSet  
// Sets the value of the real time clock (RTC) counter.

ROM\_HibernateRTCTrimGet  
// Gets the value of the RTC predivider trim register.

ROM\_HibernateRTCTrimSet  
// Sets the value of the RTC predivider trim register.

ROM\_HibernateWakeGet  
// Gets the currently configured wake conditions for the Hibernation module.

ROM\_HibernateWakeSet  
// Configures the wake conditions for the Hibernation module.

ROM\_I2CMasterBusBusy  
// Indicates whether or not the I2C bus is busy.

ROM\_I2CMasterBusy  
// Indicates whether or not the I2C Master is busy.

ROM\_I2CMasterControl  
// Controls the state of the I2C Master module.

ROM\_I2CMasterDataGet  
// Receives a byte that has been sent to the I2C Master.

ROM\_I2CMasterDataPut  
// Transmits a byte from the I2C Master.

ROM\_I2CMasterDisable  
// Disables the I2C master block.

ROM\_I2CMasterEnable  
// Enables the I2C Master block.

ROM\_I2CMasterErr  
// Gets the error status of the I2C Master module.

ROM\_I2CMasterInitExpClk  
// Initializes the I2C Master block.

ROM\_I2CMasterIntClear  
// Clears I2C Master interrupt sources.

ROM\_I2CMasterIntDisable  
// Disables the I2C Master interrupt.

ROM\_I2CMasterIntEnable  
// Enables the I2C Master interrupt.

ROM\_I2CMasterIntStatus  
// Gets the current I2C Master interrupt status.

ROM\_I2CMasterSlaveAddrSet  
// Sets the address that the I2C Master will place on the bus.

ROM\_I2CSlaveDataGet  
// Receives a byte that has been sent to the I2C Slave.

ROM\_I2CSlaveDataPut  
// Transmits a byte from the I2C Slave.

ROM\_I2CSlaveDisable  
// Disables the I2C slave block.

ROM\_I2CSlaveEnable  
// Enables the I2C Slave block.

ROM\_I2CSlaveInit  
// Initializes the I2C Slave block.

ROM\_I2CSlaveIntClear  
// Clears I2C Slave interrupt sources.

ROM\_I2CSlaveIntClearEx  
// Clears I2C Slave interrupt sources.

ROM\_I2CSlaveIntDisable  
// Disables the I2C Slave interrupt.

ROM\_I2CSlaveIntDisableEx  
// Disables individual I2C Slave interrupt sources.

ROM\_I2CSlaveIntEnable  
// Enables the I2C Slave interrupt.

ROM\_I2CSlaveIntEnableEx  
// Enables individual I2C Slave interrupt sources.

ROM\_I2CSlaveIntStatus  
// Gets the current I2C Slave interrupt status.

ROM\_I2CSlaveIntStatusEx  
// Gets the current I2C Slave interrupt status.

ROM\_I2CSlaveStatus  
// Gets the I2C Slave module status

ROM\_I2SIntClear  
// Clears pending I2S interrupt sources.

ROM\_I2SIntDisable  
// Disables I2S interrupt sources.

ROM\_I2SIntEnable  
// Enables I2S interrupt sources.

ROM\_I2SIntStatus  
// Gets the I2S interrupt status.

ROM\_I2SMasterClockSelect  
// Selects the source of the master clock, internal or external.

ROM\_I2SRxConfigSet  
// Configures the I2S receive module.

ROM\_I2SRxDataGet  
// Reads data samples from the I2S receive FIFO with blocking.

ROM\_I2SRxDataGetNonBlocking  
// Reads data samples from the I2S receive FIFO without blocking.

ROM\_I2SRxDisable  
// Disables the I2S receive module for operation.

ROM\_I2SRxEnable  
// Enables the I2S receive module for operation.

ROM\_I2SRxFIFOLevelGet  
// Gets the number of samples in the receive FIFO.

ROM\_I2SRxFIFOLimitGet  
// Gets the current setting of the FIFO service request level.

ROM\_I2SRxFIFOLimitSet  
// Sets the FIFO level at which a service request is generated.

ROM\_I2STxConfigSet  
// Configures the I2S transmit module.

ROM\_I2STxDataPut  
// Writes data samples to the I2S transmit FIFO with blocking.

ROM\_I2STxDataPutNonBlocking  
// Writes data samples to the I2S transmit FIFO without blocking.

ROM\_I2STxDisable  
// Disables the I2S transmit module for operation.

ROM\_I2STxEnable  
// Enables the I2S transmit module for operation.

ROM\_I2STxFIFOLevelGet  
// Gets the number of samples in the transmit FIFO.

ROM\_I2STxFIFOLimitGet  
// Gets the current setting of the FIFO service request level.

ROM\_I2STxFIFOLimitSet  
// Sets the FIFO level at which a service request is generated.

ROM\_I2STxRxConfigSet  
// Configures the I2S transmit and receive modules.

ROM\_I2STxRxDisable  
// Disables the I2S transmit and receive modules.

ROM\_I2STxRxEnable  
// Enables the I2S transmit and receive modules for operation.

ROM\_IntDisable  
// Disables an interrupt.

ROM\_IntEnable  
// Enables an interrupt.

ROM\_IntMasterDisable  
// Disables the processor interrupt.

ROM\_IntMasterEnable  
// Enables the processor interrupt.

ROM\_IntPendClear  
// Unpends an interrupt.

ROM\_IntPendSet  
// Pends an interrupt.

ROM\_IntPriorityGet  
// Gets the priority of an interrupt.

ROM\_IntPriorityGroupingGet  
// Gets the priority grouping of the interrupt controller.

ROM\_IntPriorityGroupingSet  
// Sets the priority grouping of the interrupt controller.

ROM\_IntPrioritySet  
// Sets the priority of an interrupt.

ROM\_MPUDisable  
// Disables the MPU for use.

ROM\_MPUEnable  
// Enables and configures the MPU for use.

ROM\_MPURegionCountGet  
// Gets the count of regions supported by the MPU.

ROM\_MPURegionDisable  
// Disables a specific region.

ROM\_MPURegionEnable  
// Enables a specific region.

ROM\_MPURegionGet  
// Gets the current settings for a specific region.

ROM\_MPURegionSet  
// Sets up the access rules for a specific region.

ROM\_pvAESTable  
// AES forward, reverse, S-box, and reverse S-box tables.

ROM\_PWMDeadBandDisable  
// Disables the PWM dead band output.

ROM\_PWMDeadBandEnable  
// Enables the PWM dead band output, and sets the dead band delays.

ROM\_PWMFaultIntClear  
// Clears the fault interrupt for a PWM module.

ROM\_PWMFaultIntClearExt  
// Clears the fault interrupt for a PWM module.

ROM\_PWMGenConfigure  
// Configures a PWM generator.

ROM\_PWMGenDisable  
// Disables the timer/counter for a PWM generator block.

ROM\_PWMGenEnable  
// Enables the timer/counter for a PWM generator block.

ROM\_PWMGenFaultClear  
// Clears one or more latched fault triggers for a given PWM generator.

ROM\_PWMGenFaultConfigure  
// Configures the minimum fault period and fault pin senses for a given PWM generator.

ROM\_PWMGenFaultStatus  
// Returns the current state of the fault triggers for a given PWM generator.

ROM\_PWMGenFaultTriggerGet  
// Returns the set of fault triggers currently configured for a given PWM generator.

ROM\_PWMGenFaultTriggerSet  
// Configures the set of fault triggers for a given PWM generator.

ROM\_PWMGenIntClear  
// Clears the specified interrupt(s) for the specified PWM generator block.

ROM\_PWMGenIntStatus  
// Gets interrupt status for the specified PWM generator block.

ROM\_PWMGenIntTrigDisable  
// Disables interrupts for the specified PWM generator block.

ROM\_PWMGenIntTrigEnable  
// Enables interrupts and triggers for the specified PWM generator block.

ROM\_PWMGenPeriodGet  
// Gets the period of a PWM generator block.

ROM\_PWMGenPeriodSet  
// Set the period of a PWM generator.

ROM\_PWMIntDisable  
// Disables generator and fault interrupts for a PWM module.

ROM\_PWMIntEnable  
// Enables generator and fault interrupts for a PWM module.

ROM\_PWMIntStatus  
// Gets the interrupt status for a PWM module.

ROM\_PWMOutputFault  
// Specifies the state of PWM outputs in response to a fault condition.

ROM\_PWMOutputFaultLevel  
// Specifies the level of PWM outputs suppressed in response to a fault condition.

ROM\_PWMOutputInvert  
// Selects the inversion mode for PWM outputs.

ROM\_PWMOutputState  
// Enables or disables PWM outputs.

ROM\_PWMPulseWidthGet  
// Gets the pulse width of a PWM output.

ROM\_PWMPulseWidthSet  
// Sets the pulse width for the specified PWM output.

ROM\_PWMSyncTimeBase  
// Synchronizes the counters in one or multiple PWM generator blocks.

ROM\_PWMSyncUpdate  
// Synchronizes all pending updates.

ROM\_QEIConfigure  
// Configures the quadrature encoder.

ROM\_QEIDirectionGet  
// Gets the current direction of rotation.

ROM\_QEIDisable  
// Disables the quadrature encoder.

ROM\_QEIEnable  
// Enables the quadrature encoder.

ROM\_QEIErrGet  
// Gets the encoder error indicator.

ROM\_QEIIntClear  
// Clears quadrature encoder interrupt sources.

ROM\_QEIIntDisable  
// Disables individual quadrature encoder interrupt sources.

ROM\_QEIIntEnable  
// Enables individual quadrature encoder interrupt sources.

ROM\_QEIIntStatus  
// Gets the current interrupt status.

ROM\_QEIPositionGet  
// Gets the current encoder position.

ROM\_QEIPositionSet  
// Sets the current encoder position.

ROM\_QEIVelocityConfigure  
// Configures the velocity capture.

ROM\_QEIVelocityDisable  
// Disables the velocity capture.

ROM\_QEIVelocityEnable  
// Enables the velocity capture.

ROM\_QEIVelocityGet  
// Gets the current encoder speed.

ROM\_SSIBusy  
// Determines whether the SSI transmitter is busy or not.

ROM\_SSIConfigSetExpClk  
// Configures the synchronous serial interface.

ROM\_SSIDataGet  
// Gets a data element from the SSI receive FIFO.

ROM\_SSIDataGetNonBlocking  
// Gets a data element from the SSI receive FIFO.

ROM\_SSIDataPut  
// Puts a data element into the SSI transmit FIFO.

ROM\_SSIDataPutNonBlocking  
// Puts a data element into the SSI transmit FIFO.

ROM\_SSIDisable  
// Disables the synchronous serial interface.

ROM\_SSIDMADisable  
// Disable SSI DMA operation.

ROM\_SSIDMAEnable  
// Enable SSI DMA operation.

ROM\_SSIEnable  
// Enables the synchronous serial interface.

ROM\_SSIIntClear  
// Clears SSI interrupt sources.

ROM\_SSIIntDisable  
// Disables individual SSI interrupt sources.

ROM\_SSIIntEnable  
// Enables individual SSI interrupt sources.

ROM\_SSIIntStatus  
// Gets the current interrupt status.

ROM\_SysCtlADCSpeedGet  
// Gets the sample rate of the ADC.

ROM\_SysCtlADCSpeedSet  
// Sets the sample rate of the ADC.

ROM\_SysCtlClockGet  
// Gets the processor clock rate.

ROM\_SysCtlClockSet  
// Sets the clocking of the device.

ROM\_SysCtlDeepSleep  
// Puts the processor into deep-sleep mode.

ROM\_SysCtlDelay  
// Provides a small delay.

ROM\_SysCtlFlashSizeGet  
// Gets the size of the flash.

ROM\_SysCtlGPIOAHBDisable  
// Disables a GPIO peripheral for access from the AHB.

ROM\_SysCtlGPIOAHBEnable  
// Enables a GPIO peripheral for access from the AHB.

ROM\_SysCtlI2SMClkSet  
// Sets the MCLK frequency provided to the I2S module.

ROM\_SysCtlIntClear  
// Clears system control interrupt sources.

ROM\_SysCtlIntDisable  
// Disables individual system control interrupt sources.

ROM\_SysCtlIntEnable  
// Enables individual system control interrupt sources.

ROM\_SysCtlIntStatus  
// Gets the current interrupt status.

ROM\_SysCtlLDOGet  
// Gets the output voltage of the LDO.

ROM\_SysCtlLDOSet  
// Sets the output voltage of the LDO.

ROM\_SysCtlPeripheralClockGating  
// Controls peripheral clock gating in sleep and deep-sleep mode.

ROM\_SysCtlPeripheralDeepSleepDisable  
// Disables a peripheral in deep-sleep mode.

ROM\_SysCtlPeripheralDeepSleepEnable  
// Enables a peripheral in deep-sleep mode.

ROM\_SysCtlPeripheralDisable  
// Disables a peripheral.

ROM\_SysCtlPeripheralEnable  
// Enables a peripheral.

ROM\_SysCtlPeripheralPresent  
// Determines if a peripheral is present.

ROM\_SysCtlPeripheralReset  
// Performs a software reset of a peripheral.

ROM\_SysCtlPeripheralSleepDisable  
// Disables a peripheral in sleep mode.

ROM\_SysCtlPeripheralSleepEnable  
// Enables a peripheral in sleep mode.

ROM\_SysCtlPinPresent  
// Determines if a pin is present.

ROM\_SysCtlPWMClockGet  
// Gets the current PWM clock configuration.

ROM\_SysCtlPWMClockSet  
// Sets the PWM clock configuration.

ROM\_SysCtlReset  
// Resets the device.

ROM\_SysCtlResetCauseClear  
// Clears reset reasons.

ROM\_SysCtlResetCauseGet  
// Gets the reason for a reset.

ROM\_SysCtlSleep  
// Puts the processor into sleep mode.

ROM\_SysCtlSRAMSizeGet  
// Gets the size of the SRAM.

ROM\_SysCtlUSBPLLDisable  
// Powers down the USB PLL.

ROM\_SysCtlUSBPLLEnable  
// Powers up the USB PLL.

ROM\_SysTickDisable  
// Disables the SysTick counter.

ROM\_SysTickEnable  
// Enables the SysTick counter.

ROM\_SysTickIntDisable  
// Disables the SysTick interrupt.

ROM\_SysTickIntEnable  
// Enables the SysTick interrupt.

ROM\_SysTickPeriodGet  
// Gets the period of the SysTick counter.

ROM\_SysTickPeriodSet  
// Sets the period of the SysTick counter.

ROM\_SysTickValueGet  
// Gets the current value of the SysTick counter.

ROM\_TimerConfigure  
// Configures the timer(s).

ROM\_TimerControlEvent  
// Controls the event type.

ROM\_TimerControlLevel  
// Controls the output level.

ROM\_TimerControlStall  
// Controls the stall handling.

ROM\_TimerControlTrigger  
// Enables or disables the trigger output.

ROM\_TimerDisable  
// Disables the timer(s).

ROM\_TimerEnable  
// Enables the timer(s).

ROM\_TimerIntClear  
// Clears timer interrupt sources.

ROM\_TimerIntDisable  
// Disables individual timer interrupt sources.

ROM\_TimerIntEnable  
// Enables individual timer interrupt sources.

ROM\_TimerIntStatus  
// Gets the current interrupt status.

ROM\_TimerLoadGet  
// Gets the timer load value.

ROM\_TimerLoadSet  
// Sets the timer load value.

ROM\_TimerMatchGet  
// Gets the timer match value.

ROM\_TimerMatchSet  
// Sets the timer match value.

ROM\_TimerPrescaleGet  
// Get the timer prescale value.

ROM\_TimerPrescaleSet  
// Set the timer prescale value.

ROM\_TimerRTCDisable  
// Disable RTC counting.

ROM\_TimerRTCEnable  
// Enable RTC counting.

ROM\_TimerValueGet  
// Gets the current timer value.

ROM\_UARTBreakCtl  
// Causes a BREAK to be sent.

ROM\_UARTBusy  
// Determines whether the UART transmitter is busy or not.

ROM\_UARTCharGet  
// Waits for a character from the specified port.

ROM\_UARTCharGetNonBlocking  
// Receives a character from the specified port.

ROM\_UARTCharPut  
// Waits to send a character from the specified port.

ROM\_UARTCharPutNonBlocking  
// Sends a character to the specified port.

ROM\_UARTCharsAvail  
// Determines if there are any characters in the receive FIFO.

ROM\_UARTConfigGetExpClk  
// Gets the current configuration of a UART.

ROM\_UARTConfigSetExpClk  
// Sets the configuration of a UART.

ROM\_UARTDisable  
// Disables transmitting and receiving.

ROM\_UARTDisableSIR  
// Disables SIR (IrDA) mode on the specified UART.

ROM\_UARTDMADisable  
// Disable UART DMA operation.

ROM\_UARTDMAEnable  
// Enable UART DMA operation.

ROM\_UARTEnable  
// Enables transmitting and receiving.

ROM\_UARTEnableSIR  
// Enables SIR (IrDA) mode on the specified UART.

ROM\_UARTFIFODisable  
// Disables the transmit and receive FIFOs.

ROM\_UARTFIFOEnable  
// Enables the transmit and receive FIFOs.

ROM\_UARTFIFOLevelGet  
// Gets the FIFO level at which interrupts are generated.

ROM\_UARTFIFOLevelSet  
// Sets the FIFO level at which interrupts are generated.

ROM\_UARTIntClear  
// Clears UART interrupt sources.

ROM\_UARTIntDisable  
// Disables individual UART interrupt sources.

ROM\_UARTIntEnable  
// Enables individual UART interrupt sources.

ROM\_UARTIntStatus  
// Gets the current interrupt status.

ROM\_UARTParityModeGet  
// Gets the type of parity currently being used.

ROM\_UARTParityModeSet  
// Sets the type of parity.

ROM\_UARTRxErrorClear  
// Clears all reported receiver errors.

ROM\_UARTRxErrorGet  
// Gets current receiver errors.

ROM\_UARTSpaceAvail  
// Determines if there is any space in the transmit FIFO.

ROM\_UARTTxIntModeGet  
// Returns the current operating mode for the UART transmit interrupt.

ROM\_UARTTxIntModeSet  
// Sets the operating mode for the UART transmit interrupt.

ROM\_uDMAChannelAttributeDisable  
// Disables attributes of a uDMA channel.

ROM\_uDMAChannelAttributeEnable  
// Enables attributes of a uDMA channel.

ROM\_uDMAChannelAttributeGet  
// Gets the enabled attributes of a uDMA channel.

ROM\_uDMAChannelControlSet  
// Sets the control parameters for a uDMA channel.

ROM\_uDMAChannelDisable  
// Disables a uDMA channel for operation.

ROM\_uDMAChannelEnable  
// Enables a uDMA channel for operation.

ROM\_uDMAChannelsEnabled  
// Checks if a uDMA channel is enabled for operation.

ROM\_uDMAChannelModeGet  
// Gets the transfer mode for a uDMA channel.

ROM\_uDMAChannelRequest  
// Requests a uDMA channel to start a transfer.

ROM\_uDMAChannelSelectDefault  
// Selects the default peripheral for a set of uDMA channels.

ROM\_uDMAChannelSelectSecondary  
// Selects the secondary peripheral for a set of uDMA channels.

ROM\_uDMAChannelSizeGet  
// Gets the current transfer size for a uDMA channel.

ROM\_uDMAChannelTransferSet  
// Sets the transfer parameters for a uDMA channel.

ROM\_uDMAControlBaseGet  
// Gets the base address for the channel control table.

ROM\_uDMAControlBaseSet  
// Sets the base address for the channel control table.

ROM\_uDMADisable  
// Disables the uDMA controller for use.

ROM\_uDMAEnable  
// Enables the uDMA controller for use.

ROM\_uDMAErrorStatusClear  
// Clears the uDMA error interrupt.

ROM\_uDMAErrorStatusGet  
// Gets the uDMA error status.

ROM\_UpdateEthernet  
// Starts an update over the Ethernet interface.

ROM\_UpdateI2C  
// Starts an update over the I2C0 interface.

ROM\_UpdateSSI  
// Starts an update over the SSI0 interface.

ROM\_UpdateUART  
// Starts an update over the UART0 interface.

ROM\_USBDevAddrGet  
// Returns the current device address in device mode.

ROM\_USBDevAddrSet  
// Sets the address in device mode.

ROM\_USBDevConnect  
// Connects the USB controller to the bus in device mode.

ROM\_USBDevDisconnect  
// Removes the USB controller from the bus in device mode.

ROM\_USBDevEndpointConfigGet  
// Gets the current configuration for an endpoint.

ROM\_USBDevEndpointConfigSet  
// Sets the configuration for an endpoint.

ROM\_USBDevEndpointDataAck  
// Acknowledge that data was read from the given endpoint's FIFO in device mode.

ROM\_USBDevEndpointStall  
// Stalls the specified endpoint in device mode.

ROM\_USBDevEndpointStallClear  
// Clears the stall condition on the specified endpoint in device mode.

ROM\_USBDevEndpointStatusClear  
// Clears the status bits in this endpoint in device mode.

ROM\_USBEndpointDataAvail  
// Determine the number of bytes of data available in a given endpoint's FIFO.

ROM\_USBEndpointDataGet  
// Retrieves data from the given endpoint's FIFO.

ROM\_USBEndpointDataPut  
// Puts data into the given endpoint's FIFO.

ROM\_USBEndpointDataSend  
// Starts the transfer of data from an endpoint's FIFO.

ROM\_USBEndpointDataToggleClear  
// Sets the Data toggle on an endpoint to zero.

ROM\_USBEndpointDMAChannel  
// Sets the DMA channel to use for a given endpoint.

ROM\_USBEndpointDMADisable  
// Disable DMA on a given endpoint.

ROM\_USBEndpointDMAEnable  
// Enable DMA on a given endpoint.

ROM\_USBEndpointStatus  
// Returns the current status of an endpoint.

ROM\_USBFIFOAddrGet  
// Returns the absolute FIFO address for a given endpoint.

ROM\_USBFIFOConfigGet  
// Returns the FIFO configuration for an endpoint.

ROM\_USBFIFOConfigSet  
// Sets the FIFO configuration for an endpoint.

ROM\_USBFIFOFlush  
// Forces a flush of an endpoint's FIFO.

ROM\_USBFrameNumberGet  
// Get the current frame number.

ROM\_USBHostAddrGet  
// Gets the current functional device address for an endpoint.

ROM\_USBHostAddrSet  
// Sets the functional address for the device that is connected to an endpoint in host mode.

ROM\_USBHostEndpointConfig  
// Sets the base configuration for a host endpoint.

ROM\_USBHostEndpointDataAck  
// Acknowledge that data was read from the given endpoint's FIFO in host mode.

ROM\_USBHostEndpointDataToggle  
// Sets the value data toggle on an endpoint in host mode.

ROM\_USBHostEndpointStatusClear  
// Clears the status bits in this endpoint in host mode.

ROM\_USBHostHubAddrGet  
// Get the current device hub address for this endpoint.

ROM\_USBHostHubAddrSet  
// Set the hub address for the device that is connected to an endpoint.

ROM\_USBHostMode  
// Change the mode of the USB controller to host.

ROM\_USBHostPwrDisable  
// Disables the external power pin.

ROM\_USBHostPwrEnable  
// Enables the external power pin.

ROM\_USBHostPwrFaultConfig  
// Sets the configuration for USB power fault.

ROM\_USBHostPwrFaultDisable  
// Disables power fault detection.

ROM\_USBHostPwrFaultEnable  
// Enables power fault detection.

ROM\_USBHostRequestIN  
// Schedules a request for an IN transaction on an endpoint in host mode.

ROM\_USBHostRequestStatus  
// Issues a request for a status IN transaction on endpoint zero.

ROM\_USBHostReset  
// Handles the USB bus reset condition.

ROM\_USBHostResume  
// Handles the USB bus resume condition.

ROM\_USBHostSpeedGet  
// Returns the current speed of the USB device connected.

ROM\_USBHostSuspend  
// Puts the USB bus in a suspended state.

ROM\_USBIntDisable  
// Disables the sources for USB interrupts.

ROM\_USBIntDisableControl  
// Disable control interrupts on a given USB controller.

ROM\_USBIntDisableEndpoint  
// Disable endpoint interrupts on a given USB controller.

ROM\_USBIntEnable  
// Enables the sources for USB interrupts.

ROM\_USBIntEnableControl  
// Enable control interrupts on a given USB controller.

ROM\_USBIntEnableEndpoint  
// Enable endpoint interrupts on a given USB controller.

ROM\_USBIntStatus  
// Returns the status of the USB interrupts.

ROM\_USBIntStatusControl  
// Returns the control interrupt status on a given USB controller.

ROM\_USBIntStatusEndpoint  
// Returns the endpoint interrupt status on a given USB controller.

ROM\_USBModeGet  
// Returns the current operating mode of the controller.

ROM\_USBOTGHostRequest  
// This function will enable host negotiation protocol when in device mode.

ROM\_WatchdogEnable  
// Enables the watchdog timer.

ROM\_WatchdogIntClear  
// Clears the watchdog timer interrupt.

ROM\_WatchdogIntEnable  
// Enables the watchdog timer interrupt.

ROM\_WatchdogIntStatus  
// Gets the current watchdog timer interrupt status.

ROM\_WatchdogLock  
// Enables the watchdog timer lock mechanism.

ROM\_WatchdogLockState  
// Gets the state of the watchdog timer lock mechanism.

ROM\_WatchdogReloadGet  
// Gets the watchdog timer reload value.

ROM\_WatchdogReloadSet  
// Sets the watchdog timer reload value.

ROM\_WatchdogResetDisable  
// Disables the watchdog timer reset.

ROM\_WatchdogResetEnable  
// Enables the watchdog timer reset.

ROM\_WatchdogRunning  
// Determines if the watchdog timer is enabled.

ROM\_WatchdogStallDisable  
// Disables stalling of the watchdog timer during debug events.

ROM\_WatchdogStallEnable  
// Enables stalling of the watchdog timer during debug events.

ROM\_WatchdogUnlock  
// Disables the watchdog timer lock mechanism.

ROM\_WatchdogValueGet  
// Gets the current watchdog timer value.

## **C Advance Encryption Standard and Cyclic Redundancy Check Software in ROM**

AES and CRC software is available in the integrated ROM of the LM3S9L97 microcontroller. For more information on this software, see *Stellaris® ROM User's Guide*.

### **C.1 Advanced Encryption Standard Software**

The Advanced Encryption Standard (AES) is a publicly defined encryption standard used by the U.S. Government. It is a strong encryption method with reasonable performance and size. AES is fast in both hardware and software, is fairly easy to implement, and requires little memory. AES is ideal for applications that can use pre-arranged keys, such as setup during manufacturing or configuration.

### **C.2 Cyclic Redundancy Check Software**

CRC (Cyclic Redundancy Check) is a technique to validate a span of data has the same contents as when previously checked. This technique can be used to validate correct receipt of messages (nothing lost or modified in transit), to validate data after decompression, to validate that Flash memory contents have not been changed, and for other cases where the data needs to be validated. A CRC is preferred over a simple checksum (e.g. XOR all bits) because it catches changes more readily.

## D Register Quick Reference

## E Ordering and Contact Information

### E.1 Ordering Information

**Table E-1. Part Ordering Information**

| Orderable Part Number | Description                                                                           |
|-----------------------|---------------------------------------------------------------------------------------|
| LM3S9L97-IQC80-C1     | Stellaris® LM3S9L97 Microcontroller Industrial Temperature 100-pin LQFP               |
| LM3S9L97-IBZ80-C1     | Stellaris® LM3S9L97 Microcontroller Industrial Temperature 108-ball BGA               |
| LM3S9L97-IQC80-C1T    | Stellaris® LM3S9L97 Microcontroller Industrial Temperature 100-pin LQFP Tape-and-reel |
| LM3S9L97-IBZ80-C1T    | Stellaris® LM3S9L97 Microcontroller Industrial Temperature 108-ball BGA Tape-and-reel |

### E.2 Part Markings

The Stellaris® microcontrollers are marked with an identifying number. This code contains the following information:

- The first line indicates the part number. In the example figure below, this is the LM3S6965.
- The first seven characters in the second line indicate the temperature, package, speed, and revision. In the example figure below, this is an Industrial temperature (I), 100-pin LQFP package (QC), 50-MHz (50), revision A2 (A2) device.
- The remaining characters contain internal tracking numbers.

## E.3 Kits

The Stellaris<sup>®</sup> Family provides the hardware and software tools that engineers need to begin development quickly.

- Reference Design Kits accelerate product development by providing ready-to-run hardware and comprehensive documentation including hardware design files
- Evaluation Kits provide a low-cost and effective means of evaluating Stellaris<sup>®</sup> microcontrollers before purchase
- Development Kits provide you with all the tools you need to develop and prototype embedded applications right out of the box

See the website at [www.ti.com/stellaris](http://www.ti.com/stellaris) for the latest tools available, or ask your distributor.

## E.4 Support Information

For support on Stellaris<sup>®</sup> products, contact the TI Worldwide Product Information Center nearest you: <http://www-k.ext.ti.com/sc/technical-support/product-information-centers.htm>.

## F Package Information

Figure F-1. 100-Pin LQFP Package

**Note:** The following notes apply to the package drawing.

1. All dimensions shown in mm.
2. Dimensions shown are nominal with tolerances indicated.
3. Foot length 'L' is measured at gage plane 0.25 mm above seating plane.

| Body +2.00 mm Footprint, 1.4 mm package thickness |             |                     |

### Figure F-2. 108-Ball BGA Package

**Note:** The following notes apply to the package drawing.

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. 'e' REPRESENTS THE BASIC SOLDER BALL GRID PITCH.
3. 'M' REPRESENTS THE BASIC SOLDER BALL MATRIX SIZE.  
AND SYMBOL 'N' IS THE NUMBER OF BALLS AFTER DEPOPULATING.
4. 'b' IS MEASURABLE AT THE MAXIMUM SOLDER BALL DIAMETER AFTER REFLOW  
PARALLEL TO PRIMARY DATUM [C].
5. DIMENSION 'ccc' IS MEASURED PARALLEL TO PRIMARY DATUM [C].
6. PRIMARY DATUM [C] AND SEATING PLANE ARE DEFINED BY THE SPHERICAL  
CROWNS OF THE SOLDER BALLS.
7. PACKAGE SURFACE SHALL BE MATTE FINISH CHARMILLES 24 TO 27.
8. SUBSTRATE MATERIAL BASE IS BT RESIN.
9. THE OVERALL PACKAGE THICKNESS "A" ALREADY CONSIDERS COLLAPSE BALLS
10. DIMENSIONING AND TOLERANCING PER ASME Y14.5M 1994.
11. EXCEPT DIMENSION b.

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## PZ (S-PQFP-G100)

## PLASTIC QUAD FLATPACK

- NOTES: A. All linear dimensions are in millimeters.  
 B. This drawing is subject to change without notice.  
 C. Falls within JEDEC MS-026

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
