

# Dual Precision Instrumentation Switched Capacitor Building Block

## FEATURES

- Instrumentation Front End with 120dB CMRR
- Precise, Charge-Balanced Switching
- Operates from 3V to 18V
- Internal or External Clock
- Operates up to 5MHz Clock Rate
- Low Power
- Two Independent Sections with One Clock

## APPLICATIONS

- Precision Instrumentation Amplifiers
- Ultra Precision Voltage Inverters, Multipliers and Dividers
- V-F and F-V Converters
- Sample-and-Hold
- Switched Capacitor Filters

## DESCRIPTION

The LTC<sup>®</sup>1043 is a monolithic, charge-balanced, dual switched capacitor instrumentation building block. A pair of switches alternately connects an external capacitor to an input voltage and then connects the charged capacitor across an output port. The internal switches have a break-before-make action. An internal clock is provided and its frequency can be adjusted with an external capacitor. The LTC1043 can also be driven with an external CMOS clock.

The LTC1043, when used with low clock frequencies, provides ultra precision DC functions without requiring precise external components. Such functions are differential voltage to single-ended conversion, voltage inversion, voltage multiplication and division by 2, 3, 4, 5, etc. The LTC1043 can also be used for precise V-F and F-V circuits without trimming, and it is also a building block for switched capacitor filters, oscillators and modulators.

The LTC1043 is manufactured using Linear Technology's enhanced LTCMOS<sup>™</sup> silicon gate process.

**LT**, LTC and LT are registered trademarks of Linear Technology Corporation.  
 LTCMOS is a trademark of Linear Technology Corporation.

## BLOCK DIAGRAM

THE SWITCHES ARE TIMED AS SHOWN WITH PIN 16 HIGH

THE CHARGE BALANCING CIRCUITRY SAMPLES THE VOLTAGE AT S3 WITH RESPECT TO S4 (PIN 16 HIGH) AND INJECTS A SMALL CHARGE AT THE  $C^+$  PIN (PIN 16 LOW). THIS BOOSTS THE CMRR WHEN THE LTC1043 IS USED AS AN INSTRUMENTATION AMPLIFIER FRONT END. FOR MINIMUM CHARGE INJECTION IN OTHER TYPES OF APPLICATIONS, S3A AND S3B SHOULD BE GROUND

## APPLICATIONS INFORMATION

### Common Mode Rejection Ratio (CMRR)

The LTC1043, when used as a differential to single-ended converter rejects common mode signals and preserves differential voltages (Figure 1). Unlike other techniques, the LTC1043's CMRR does not degrade with increasing common mode voltage frequency. During the sampling mode, the impedance of Pins 2, 3 (and 11, 12) should be reasonably balanced, otherwise, common mode signals will appear differentially. The value of the CMRR depends on the value of the sampling and holding capacitors ( $C_S$ ,  $C_H$ ) and on the sampling frequency. Since the common mode voltages are not sampled, the common mode signal frequency can well exceed the sampling frequency without experiencing aliasing phenomena. The CMRR of Figure 1 is measured by

Figure 1. Differential to Single-Ended Converter

## APPLICATIONS INFORMATION

shorting Pins 7 and 13 and by observing, with a precision DVM, the change of the voltage across  $C_H$  with respect to an input CM voltage variation. During the sampling and holding mode, charges are being transferred and minute voltage transients will appear across the holding capacitor. Although the  $R_{ON}$  on the switches is low enough to allow fast settling, as the sampling frequency increases, the rate of charge transfer increases and the average voltage measured with a DVM across it will increase proportionally; this causes the CMRR of the sampled data system, as seen by a “continuous” instrument (DVM), to decrease (Figure 2).

### Switch Charge Injection

Figure 3 shows one out of the eight switches of the LTC1043, configured as a basic sample-and-hold circuit. When the switch opens, a “hold step” is observed and its magnitude depends on the value of the input voltage. Figure 4 shows charge injected into the hold capacitor. For instance, a 2pC of charge injected into a 0.01 $\mu$ F capacitor causes a 200 $\mu$ V hold step. As shown in Figure 4, there is a predictable and repeatable charge injection cancellation when the input voltage is close to half the supply voltage of the LTC1043. This is a unique feature of this product, containing charge-balanced switches fabricated with a self-aligning gate CMOS process. Any switch of the LTC1043, when powered with symmetrical dual supplies, will sample-and-hold small signals around ground without any significant error.

Figure 2. CMRR vs Sampling Frequency

### Shielding the Sampling Capacitor for Very High CMRR

Internal or external parasitic capacitors from the  $C^+$  pin(s) to ground affect the CMRR of the LTC1043 (Figure 1). The common mode error due to the internal junction capacitances of the  $C^+$  Pin(s) 2 and 11 is cancelled through internal circuitry. The  $C^+$  pin, therefore, should be used as the top plate of the sampling capacitor. The interpin capacitance between pin 2 and dummy Pin 1 (11 and 10) appears in parallel with the sampling capacitor so it does not degrade the CMRR. A shield placed underneath the sampling capacitor and connected to either Pin 1 or 3 helps to boost the CMRR in excess of 120dB (Figure 5).

Excessive external parasitic capacitance between the  $C^-$  pins and ground indirectly degrades CMRR; this becomes visible especially when the LTC1043 is used with clock frequencies above 2kHz. Because of this, if a shield is used, the parasitic capacitance between the shield and circuit ground should be minimized.

It is recommended that the outer plate of the sampling capacitor be connected to the  $C^-$  pin(s).

### Input Pins, SCR Sensitivity

An internal 60 $\Omega$  resistor is connected in series with the input of the switches (Pins 5, 6, 7, 8, 13, 14, 15, 18) and it is included in the  $R_{ON}$  specification. When the input voltage exceeds the power supply by a diode drop, current will flow into the input pin(s). The LTC1043 will not latch until the input current reaches 2mA–3mA. The device will

Figure 3

## APPLICATIONS INFORMATION

recover from the latch mode when the input drops 3V to 4V below the voltage value which caused the latch. For instance, if an external resistor of  $200\Omega$  is connected in series with an input pin, the input can be taken 1.3V above the supply without latching the IC. The same applies for the  $C^+$  and  $C^-$  pins.

### $C_{OSC}$ Pin (16), Figure 6

The  $C_{OSC}$  pin can be used with an external capacitor,  $C_{OSC}$ , connected from Pin 16 to Pin 17, to modify the internal oscillator frequency. If Pin 16 is floating, the internal 24pF capacitor, plus any external interpin capacitance, set the oscillator frequency around 190kHz with  $\pm 5V$  supply. The typical performance characteristics curves provide the necessary information to set the oscillator frequency for various power supply ranges. Pin 16 can also be driven

with an external clock to override the internal oscillator. Although standard 7400 series CMOS gates do not guarantee CMOS levels with the current source and sink requirements of Pin 16, they will in reality drive the  $C_{OSC}$  pin. CMOS gates conforming to standard B series output drive have the appropriate voltage levels and more than enough output current to simultaneously drive several LTC1043  $C_{OSC}$  pins. The typical trip levels of the Schmitt trigger (Figure 6) are given below.

| SUPPLY                | TRIP LEVELS             |
|-----------------------|-------------------------|
| $V^+ = 5V, V^- = 0V$  | $V_H = 3.4VV_L = 1.35V$ |
| $V^+ = 10V, V^- = 0V$ | $V_H = 6.5VV_L = 2.8V$  |
| $V^+ = 15V, V^- = 0V$ | $V_H = 9.5VV_L = 4.1V$  |

The schematic diagram illustrates a precision sine wave generator circuit. It features an amplitude-stable sine wave source (LT1013) and a 1.5kHz oscillator (LTC1043). The circuit includes a 1.5kHz sine wave generator (LTC1043), a 1.5kHz sine wave generator (LTC1043), and a 1.5kHz sine wave generator (LTC1043). The output is a 1.5kHz sine wave with an amplitude of 0V to ±2.5V, which can be trimmed from 0mV to 2.50mV. The circuit is powered by a 5V supply and a -5V supply. Key components include resistors (30k, 10k, 4.7k, 1.2k, 7.5k, 100k, 1k, 200k), capacitors (0.005μF, 10μF, 0.01μF, 1μF), and diodes (1N914, LT1004). The LVDT is a Schaeffert E-100.

SHUNT CAN BE IN POSITIVE OR NEGATIVE SUPPLY LEAD

## PACKAGE DESCRIPTION

**D Package**  
**18-Lead Side Brazed (Hermetic)**  
 (Reference LTC DWG # 05-08-1210)

## OBSOLETE PACKAGE

**N Package**  
**18-Lead PDIP (Narrow .300 Inch)**  
 (Reference LTC DWG # 05-08-1510)

NOTE:  
 1. DIMENSIONS ARE IN INCHES  
 MILLIMETERS

\*THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS.  
 MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED .010 INCH (0.254mm)

**SW Package**  
**18-Lead Plastic Small Outline (Wide .300 Inch)**  
 (Reference LTC DWG # 05-08-1620)

NOTE:  
 1. DIMENSIONS IN INCHES  
 (MILLIMETERS)  
 2. DRAWING NOT TO SCALE  
 3. PIN 1 IDENT, NOTCH ON TOP AND CAVITIES  
 ON THE BOTTOM OF PACKAGES ARE THE  
 MANUFACTURING OPTIONS.  
 THE PART MAY BE SUPPLIED WITH OR  
 WITHOUT ANY OF THE OPTIONS  
 4. THESE DIMENSIONS DO NOT INCLUDE  
 MOLD FLASH OR PROTRUSIONS.  
 MOLD FLASH OR PROTRUSIONS SHALL NOT  
 EXCEED .006" (0.15mm)
