

### FEATURES

**Low Input Offset Voltage:** 75  $\mu\text{V}$  Max  
**Low Offset Voltage Drift, Over  $-55^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ :**  
 0.5  $\mu\text{V}/^{\circ}\text{C}$  Max  
**Low Supply Current (Per Amplifier):** 725  $\mu\text{A}$  Max  
**High Open-Loop Gain:** 5000 V/mV Min  
**Low Input Bias Current:** 2 nA Max  
**Low Noise Voltage Density:** 11 nV/ $\sqrt{\text{Hz}}$  at 1 kHz  
**Stable with Large Capacitive Loads:** 10 nF Typ  
**Pin Compatible to OP221, MC1458, and LT1013 with  
 Improved Performance**  
**Available in Die Form**

### GENERAL DESCRIPTION

The OP200 is the first monolithic dual operational amplifier to offer OP77 type precision performance. Available in the industry-standard 8-lead pinout, the OP200 combines precision performance with the space and cost savings offered by a dual amplifier.

The OP200 features an extremely low input offset voltage of less than 75  $\mu\text{V}$  with a drift below 0.5  $\mu\text{V}/^{\circ}\text{C}$ , guaranteed over the full military temperature range. Open-loop gain of the OP200 exceeds 5,000,000 into a 10 k $\Omega$  load; input bias current is under 2 nA; CMR is over 120 dB and PSRR below 1.8  $\mu\text{V}/\text{V}$ . On-chip Zener zap trimming is used to achieve the extremely low input offset voltage of the OP200 and eliminates the need for offset pulling.

Power consumption of the OP200 is very low, with each amplifier drawing less than 725  $\mu\text{A}$  of supply current. The total current drawn by the dual OP200 is less than one-half that of a single OP07, yet the OP200 offers significant improvements over this industry-standard op amp. The voltage noise density of the OP200, 11 nV/ $\sqrt{\text{Hz}}$  at 1 kHz, is half that of most competitive devices.

### PIN CONNECTIONS

#### 16-Lead SOIC (S-Suffix)

#### 8-Lead PDIP (P-Suffix)

#### 8-Lead CERDIP (Z-Suffix)

The OP200 is pin compatible with the OP221, LM158, MC1458/1558, and LT1013.

The OP200 is an ideal choice for applications requiring multiple precision op amps and where low power consumption is critical.

For a quad precision op amp, see the OP400.

Figure 1. Simplified Schematic (One of two amplifiers is shown.)

### NOTES

<sup>1</sup>Absolute maximum ratings apply to both DICE and packaged parts, unless otherwise noted.

<sup>2</sup> $\theta_{JA}$  is specified for worst-case mounting conditions, i.e.,  $\theta_{JA}$  is specified for device in socket for Cerdip and PDIP packages;  $\theta_{JA}$  is specified for device soldered to printed circuit board for SOIC package.

### CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the OP200 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## APPLICATIONS INFORMATION

The OP200 is inherently stable at all gains and is capable of driving large capacitive loads without oscillating. Nonetheless, good supply decoupling is highly recommended. Proper supply decoupling reduces problems caused by supply line noise and improves the capacitive load driving capability of the OP200.

## APPLICATIONS

### Dual Low-Power Instrumentation Amplifier

A dual instrumentation amplifier that consumes less than 33 mW of power per channel is shown in Figure 4. The linearity of the instrumentation amplifier exceeds 16 bits in gains of 5 to 200 and is better than 14 bits in gains from 200 to 1000. CMRR is above 115 dB (gain = 1000). Offset voltage drift is typically  $0.2 \mu\text{V}/^\circ\text{C}$  over the military temperature range, which is comparable to the best monolithic instrumentation amplifiers. The bandwidth of the low power instrumentation amplifier is a function of gain and is shown below:

| Gain | Bandwidth |
|------|-----------|
| 5    | 150 kHz   |
| 10   | 67 kHz    |
| 100  | 7.5 kHz   |
| 1000 | 500 Hz    |

Figure 4. Dual Low Power Instrumentation Amplifier

The output signal is specified with respect to the reference input, which is normally connected to analog ground. The reference input can be used to offset the output from  $-10 \text{ V}$  to  $+10 \text{ V}$  if required.

## Precision Absolute Value Amplifier

The circuit in Figure 5 is a precision absolute value amplifier with an input impedance of 10 M $\Omega$ . The high gain and low TCV<sub>OS</sub> of the OP200 ensure accurate operation with microvolt input signals. In this circuit, the input always appears as a common-mode signal to the op amps. The CMR of the OP200 exceeds 120 dB, yielding an error of less than 2 ppm.

Figure 5. Precision Absolute Value Amplifier

## Precision Current Pump

Maximum output current of the precision current pump shown in Figure 6 is  $\pm 10$  mA. Voltage compliance is  $\pm 10$  V with  $\pm 15$  V supplies. Output impedance of the current transmitter exceeds 3 M $\Omega$  with linearity better than 16 bits.

Figure 6. Precision Current Pump

## Dual 12-Bit Voltage Output DAC

The dual output DAC shown in Figure 7 is capable of providing untrimmed 12-bit accurate operation over the entire military temperature range. Offset voltage, bias current, and gain errors of the OP200 contribute less than 1/10 of an LSB error at 12 bits over the military temperature range.

Figure 7. Dual 12-Bit Voltage Output DAC

# OP200

## Dual Precision Voltage Reference

A dual OP200 and a REF43, a 2.5 V reference, can be used to build a  $\pm 2.5$  V precision voltage reference. Maximum output current from each reference is  $\pm 10$  mA with load regulation under  $25 \mu\text{V}/\text{mA}$ . Line regulation is better than  $15 \mu\text{V}/\text{V}$  and output voltage drift is under  $20 \mu\text{V}/^\circ\text{C}$ . Output voltage noise from 0.1 Hz to 10 Hz is typically  $75 \mu\text{V}$  p-p. R1 and D1 ensure correct start-up.

## Programmable High Resolution Window Comparator

The programmable window comparator shown in Figure 9 is easily capable of 12-bit accuracy over the full military temperature range. A dual CMOS 12-bit DAC, the DAC8212, is used in the voltage switching mode to set the upper and lower thresholds (DAC A and DAC B, respectively).
