Layout and application information

Recommend connecting Pad 1 and Pad 2 together to permit the design to accept both Enable/Disable input pad versions to be used (See PE37T for E/D on pad 1)

For Optimum Jitter Performance, Pletronics recommends:

- a ground plane under the device
- no large transient signals (both current and voltage) should be routed under the device
- do not layout near a large magnetic field such as a high frequency switching power supply
- do not place near piezoelectric buzzers or mechanical fans.

- The package is not hermetically sealed.
- The sides are intentionally left open to permit cleaning material to freely flow in the package, thus minimizing the accumulation of contaminants during cleaning processes.
- The internal part of the package must be thoroughly dry before operating.

Pad	Function	Note
1	No connect	There is no internal connection to this pad
2	Output Enable/Disable	When this pad is not connected the oscillator shall operate. When this pad is <0.60 volts, the output will be in a fixed state Recommend connecting this pad to V _{CC} if the oscillator is to be always on.
3	Ground (GND)	
4	Output	Logic high when disabled
5	Output*	Logic low when disabled
6	Supply Voltage (V _{CC})	Recommend connecting appropriate power supply bypass capacitors as close as possible.

Reflow Cycle (typical for lead free processing)

The part may be reflowed 2 times without degradation.

Tape and Reel: available for quantities of 250 to 1000 per reel, cut tape for < 250
