

PIC16C774 Rev. B Silicon Errata Sheet

The PIC16C774 (Rev. B) parts you have received conform functionally to the Device Data Sheet (DS30275A), except for the anomalies described below.

All of the problems listed here will be addressed in future revisions of the PIC16C774 silicon.

1. Module: VREF

If the VRH high voltage reference is enabled and also used as a reference source for the A/D converter, the VRHOEN bit (REFCON<5>) must be set. Since setting the VRHOEN bit connects the VRH reference to the RA3 pin, the TRISA<3> bit must be maintained set and the pin cannot be used for general purpose I/O.

The VRL low voltage reference does not function properly on parts with date codes earlier than 0012NNN, where the first two digits are the year and the second two are the work week. Laser marked parts are made after this date and have a functional VRL. In parts without functional VRL, the VRLEN (REFCON<6>) and VRLOEN (REFCON<4>) bits should be maintained cleared.

Work around

None.

2. Module: PORTE

The minimum V_{IH} specification for PORTE (parameter D040) is 2.2 volts. The maximum V_{IL} specification for PORTE (parameter D030A) is 0.6 volts.

Work around

None.

3. Module: BOR

The Brown-out Reset module's selection ranges have changed. Table 1 shows the new specifications.

Work around

None.

5. Module: Timer1

When Timer1 is running in Asynchronous mode and then disabled, data in the Timer1 register (TMR1) may become corrupted. Corruption occurs when the timer enable is turned off at the same instant that a ripple carry occurs in the timer module.

This issue only occurs in asynchronous operation. In synchronous operation, the relevant signals are latched with the CPU clock and the problem condition does not arise.

Work around

When Timer1 is configured to operate as an asynchronous counter, care must be taken that there is no incoming pulse while the module is being turned off. If an incoming pulse arrives while Timer1 is being turned off, the value of register TMR1 may become corrupted.

If an application requires that Timer1 be turned off, and if it is possible that Timer1 may receive an incoming pulse while being turned off, synchronize the external clock first by clearing the T1SYNC bit of register T1CON (T1CON<2>). Please note, however, that this may cause Timer1 to miss up to one count.

6. Module: A/D Converter

Exceptions have been observed in the differential linearity error specification (parameter A04), as listed in Table 15-9 of the Data Sheet.

No missing codes have been observed when using up to, and including, 11-bits of resolution. At 12-bits of resolution, up to four missing codes may occur. The missing codes will never be adjacent.

Work around

None.

Clarifications/Corrections to the Data Sheet:

In the Device Data Sheet (DS30275A), the following clarifications and corrections should be noted.

1. Table 15-1 in the Device Data Sheet (DS30275A) should be omitted. Figure 15-1 and Figure 15-2 below should be used to determine the operating voltages and frequencies for the devices.

FIGURE 15-1: PIC16C773/774 VOLTAGE-FREQUENCY GRAPH, $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$

FIGURE 15-2: PIC16LC773/774 VOLTAGE-FREQUENCY GRAPH, $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$

$$F_{\text{MAX}} = (12.0 \text{ MHz/V}) (V_{\text{DDAPP MIN}} - 2.5\text{V}) + 4 \text{ MHz}$$

- Note 1:** VDDAPPMIN is the minimum voltage of the PICmicro® device in the application.
- 2:** FMAX has a maximum frequency of 10 MHz.
- 3:** The shaded region indicates the permissible combinations of voltage and frequency.

8. The A/D clock source bits (ADCS1:ADCS0) have had their operation modified. See Register 1 for a new definition of the ADCS1 and ADCS0 bits.

Figure 1 shows how the TAD time is determined based upon the selection of the ADCS<1:0> bits and the source of VREF+ and VREF-. When VREF+ or VREF- comes from the internal voltage reference (VRH or VRL), then the required TAD time is increased by a factor of eight (see electrical specification parameter #130A).

The clock source selected by the ADCS<1:0> bits is divided by eight when an internally generated reference voltage is used as reference to the A/D module. This automatically addresses the requirement for the TAD time, when the internal voltage reference is used as the A/D voltage reference.

Note: Electrical specification parameter #130A is currently specified in the clarifications and corrections section of the Device Errata Sheet.

Note 1: The A/D RC source has a typical TAD time of 4 μs for VDD > 3.0V, but can vary between 2 μs and 6 μs . Note 2: The A/D RC source has a typical TAD time of 32 μs for VDD > 3.0V, but can vary between 16 μs and 48 μs . Note 3: When the device frequency is greater than 1 MHz, the A/D RC clock source is only recommended if the conversion will be performed during SLEEP.			

9. The 12-bit A/D module requires some new timing specifications for the A/D clock period (minimum TAD time). These new specifications are for when the reference voltage for the A/D is selected as either the VRH or VRL reference voltage. The new specifications are shown in **bold** in Table 8.
