

PIC18F6XJXX/8XJXX

Flash Microcontroller Programming Specification

1.0 DEVICE OVERVIEW

This document includes the programming specifications for the following devices:

- PIC18F67J93
- PIC18F67J90
- PIC18F67J50
- PIC18F67J11
- PIC18F67J10
- PIC18F66J93
- PIC18F66J90
- PIC18F66J55
- PIC18F66J50
- PIC18F66J16
- PIC18F66J15
- PIC18F66J11
- PIC18F66J10
- PIC18F65J90
- PIC18F65J50
- PIC18F65J15
- PIC18F65J11
- PIC18F65J10
- PIC18F64J90
- PIC18F64J11
- PIC18F63J90
- PIC18F63J11
- PIC18F87J93
- PIC18F87J90
- PIC18F87J72
- PIC18F87J50
- PIC18F87J11
- PIC18F87J10
- PIC18F86J93
- PIC18F86J90
- PIC18F86J72
- PIC18F86J55
- PIC18F86J50
- PIC18F86J16
- PIC18F86J15
- PIC18F86J11
- PIC18F86J10
- PIC18F85J90
- PIC18F85J50
- PIC18F85J15
- PIC18F85J11
- PIC18F85J10
- PIC18F84J90
- PIC18F84J11
- PIC18F83J90
- PIC18F83J11

2.0 PROGRAMMING OVERVIEW OF THE PIC18F6XJXX/8XJXX

The PIC18F6XJXX/8XJXX devices are programmed using In-Circuit Serial Programming™ (ICSP™). This programming specification applies to PIC18F6XJXX/8XJXX devices in all package types.

2.1 Pin Diagrams

The pin diagrams for the PIC18F6XJXX/8XJXX are shown in Figure 2-1, Figure 2-2 and Figure 2-3. The pins that are required for programming are listed in Table 2-1 and shown in darker lettering in the figures.

PIC18F6XJXX/8XJXX

TABLE 2-1: PIN DESCRIPTIONS (DURING PROGRAMMING): PIC18F6XJXX/8XJXX

Pin Name	During Programming		
	Pin Name	Pin Type	Pin Description
MCLR	MCLR	P	Programming Enable
VDD and AVDD ⁽¹⁾	VDD	P	Power Supply
VSS and AVSS ⁽¹⁾	VSS	P	Ground
ENVREG	ENVREG	P	Internal Voltage Regulator Enable
VDDCORE/VCAP	VDDCORE	P	Regulated Power Supply for Microcontroller Core
	VCAP	I	Filter Capacitor for On-Chip Voltage Regulator
RB6	PGC	I	Serial Clock
RB7	PGD	I/O	Serial Data
VUSB ⁽²⁾	VUSB	P	Internal USB 3.3V Voltage Regulator

Legend: I = Input, O = Output, P = Power

Note 1: All power supply and ground pins must be connected, including analog supplies (AVDD) and ground (AVSS).

2: Valid only for PIC18F6XJ5X/8XJ5X families. This pin should be connected to VDD during programming.

PIC18F6XJXX/8XJXX

FIGURE 2-1: PIC18F6XJXX PIN DIAGRAMS

64-Pin TQFP

The following devices are included in 64-pin TQFP parts:

- | | | |
|---------------|---------------|---------------|
| • PIC18F67J93 | • PIC18F66J55 | • PIC18F67J11 |
| • PIC18F67J90 | • PIC18F67J50 | • PIC18F66J11 |
| • PIC18F66J93 | • PIC18F66J50 | • PIC18F65J11 |
| • PIC18F66J90 | • PIC18F65J50 | • PIC18F64J11 |
| • PIC18F65J90 | • PIC18F66J16 | • PIC18F63J11 |
| • PIC18F64J90 | • PIC18F66F15 | • PIC18F67J10 |
| • PIC18F63J90 | • PIC18F65J15 | • PIC18F66J10 |
| | | • PIC18F65J10 |

Note 1: Valid only for PIC18F6XJ5X/8XJ5X families.

PIC18F6XJXX/8XJXX

FIGURE 2-2: PIC18F8XJXX PIN DIAGRAMS

80-Pin TQFP

The following devices are included in 80-pin TQFP parts:

- PIC18F87J93
- PIC18F87J90
- PIC18F86J93
- PIC18F86J90
- PIC18F85J90
- PIC18F84J90
- PIC18F83J90
- PIC18F86J55
- PIC18F87J50
- PIC18F86J50
- PIC18F85J50
- PIC18F86J16
- PIC18F86F15
- PIC18F85J15
- PIC18F87J11
- PIC18F86J11
- PIC18F85J11
- PIC18F84J11
- PIC18F83J11
- PIC18F87J10
- PIC18F86J10
- PIC18F85J10

Note 1: Valid only for PIC18F6XJ5X/8XJ5X families.

FIGURE 2-3: PIC18F8XJ72 PIN DIAGRAMS

80-Pin TQFP

The following devices are included in 80-pin TQFP parts:

- PIC18F87J72
- PIC18F86J72

Note 1: The CCP2 pin placement depends on the setting of the CCP2MX configuration bit.

Note: Pinouts are subject to change.

PIC18F6XJXX/8XJXX

2.1.1 ON-CHIP VOLTAGE REGULATOR

All of the PIC18F6XJXX/8XJXX devices have dual power requirements. The microcontroller core can be powered from an external source that is separate from VDD, or it can be powered from an on-chip regulator which derives power from VDD. Both sources use the common VDDCORE/VCAP pin.

The regulator is enabled by connecting VDD to the ENVREG pin. In this case, a low ESR capacitor must be connected to the VDDCORE/VCAP pin for proper device operation. If the regulator is disabled by connecting VSS to the ENVREG pin, power to the core must be supplied on VDDCORE/VCAP. Whether or not the regulator is used, it is always good design practice to have sufficient capacitance on all supply pins. Examples are shown in Figure 2-4.

The specifications for core voltage and capacitance are listed in **Section 6.0 “AC/DC Characteristics and Timing Requirements for Program/Verify Test Mode”**.

FIGURE 2-4: CONNECTIONS FOR THE ON-CHIP REGULATOR

2.2 Memory Maps

The PIC18F6XJXX/8XJXX devices offer a total of eight program memory sizes, ranging from 8 Kbytes to 128 Kbytes. The memory sizes for different members of the family are shown in Table 2-2. The overall memory maps for all devices are shown in Figure 2-5, Figure 2-6, Figure 2-7 and Figure 2-8.

For purposes of code protection, the program memory for every device is treated as a single block. Enabling code protection, thus protects the entire code memory and not individual segments.

The Configuration Words for these devices are located at addresses 300000h through 300005h. These are implemented as three pairs of volatile memory registers. 300006h-300007h are reserved for a fourth pair of Configuration registers that are not implemented in PIC18F6XJXX/8XJXX devices. Each register is automatically loaded from a copy stored at the end of program memory. For this reason, the last four words of the code space (also called the Flash Configuration Words) should be written with configuration data and not executable code. The addresses of the Flash Configuration Words are also listed in Table 2-2. Refer to section **Section 5.0 “Configuration Word”** for more information.

Locations, 3FFFFEh and 3FFFFFh, are reserved for the Device ID bits. These bits may be used by the programmer to identify what device type is being programmed and are described in **Section 5.1 “Device ID Word”**. These Device ID bits read out normally, even after code protection.

2.2.1 MEMORY ADDRESS POINTER

Memory in the device address space (000000h to 3FFFFFFh) is addressed via the Table Pointer register, which in turn is comprised of three registers:

- TBLPTRU at RAM address 0FF8h
- TBLPTRH at RAM address 0FF7h
- TBLPTRL at RAM address 0FF6h

TBLPTRU	TBLPTRH	TBLPTRL
Addr<21:16>	Addr<15:8>	Addr<7:0>

The 4-bit command, ‘0000’ (core instruction), is used to load the Table Pointer prior to using many read or write operations.

TABLE 2-2: PROGRAM MEMORY SIZES FOR PIC18F6XJXX/8XJXX DEVICES

2.3 Overview of the Programming Process

Figure 2-9 shows the high-level overview of the programming process. First, a Bulk Erase is performed. Next, the code memory is programmed. Since the only nonvolatile Configuration Words are within the code memory space, they too are programmed as if they were code. Code memory (including the Configuration Words) is then verified to ensure that programming was successful.

Note: In order to maintain the endurance of the cells, each Flash byte should not be programmed more than twice between erase operations. A Bulk Erase of the device is required before attempting to modify the contents a third time.

FIGURE 2-9: HIGH-LEVEL PROGRAMMING FLOW

2.4 Entering and Exiting ICSP Program/Verify Mode

Entry into ICSP modes for PIC18F6XJXX/8XJXX devices is somewhat different than previous PIC18 devices. As shown in Figure 2-10, entering ICSP Program/Verify mode requires three steps:

1. Voltage is briefly applied to the $\overline{\text{MCLR}}$ pin.
2. A 32-bit key sequence is presented on PGD.
3. Voltage is reapplied to $\overline{\text{MCLR}}$.

The programming voltage applied to $\overline{\text{MCLR}}$ is V_{IH} , or usually, V_{DD} . There is no minimum time requirement for holding at V_{IH} . After V_{IH} is removed, an interval of at least P19 must elapse before presenting the key sequence on PGD.

The key sequence is a specific 32-bit pattern, '0100 1101 0100 0011 0100 1000 0101 0000' (more easily remembered as 4D434850h in hexadecimal). The device will enter Program/Verify mode only if the sequence is valid. The Most Significant bit of the most significant nibble must be shifted in first.

Once the key sequence is complete, V_{IH} must be applied to $\overline{\text{MCLR}}$ and held at that level for as long as Program/Verify mode is to be maintained. An interval of at least time, P20 and P12, must elapse before presenting data on PGD. Signals appearing on PGD before P12 has elapsed may not be interpreted as valid.

On successful entry, the program memory can be accessed and programmed in serial fashion. While in the Program/Verify mode, all unused I/Os are placed in the high-impedance state.

Exiting Program/Verify mode is done by removing V_{IH} from $\overline{\text{MCLR}}$, as shown in Figure 2-11. The only requirement for exit is that an interval, P16, should elapse between the last clock and the program signals on PGC and PGD before removing V_{IH} .

When V_{IH} is reapplied to $\overline{\text{MCLR}}$, the device will enter the ordinary operational mode and begin executing the application instructions.

FIGURE 2-10: ENTERING PROGRAM/VERIFY MODE

FIGURE 2-11: EXITING PROGRAM/VERIFY MODE

2.5 Serial Program/Verify Operation

The PGC pin is used as a clock input pin and the PGD pin is used for entering command bits and data input/output during serial operation. Commands and data are transmitted on the rising edge of PGC, latched on the falling edge of PGC and are Least Significant bit (LSb) first.

2.5.1 4-BIT COMMANDS

All instructions are 20 bits, consisting of a leading 4-bit command followed by a 16-bit operand, which depends on the type of command being executed. To input a command, PGC is cycled four times. The commands needed for programming and verification are shown in Table 2-3.

Depending on the 4-bit command, the 16-bit operand represents 16 bits of input data, or 8 bits of input data and 8 bits of output data.

Throughout this specification, commands and data are presented as illustrated in Table 2-4. The 4-bit command is shown, Most Significant bit (MSb) first. The command operand, or "Data Payload", is shown <MSB><LSB>. Figure 2-12 demonstrates how to serially present a 20-bit command/operand to the device.

2.5.2 CORE INSTRUCTION

The core instruction passes a 16-bit instruction to the CPU core for execution. This is needed to set up registers as appropriate for use with other commands.

TABLE 2-3: COMMANDS FOR PROGRAMMING

Description	4-Bit Command
Core Instruction (Shift in 16-bit instruction)	0000
Shift Out TABLAT Register	0010
Table Read	1000
Table Read, Post-Increment	1001
Table Read, Post-Decrement	1010
Table Read, Pre-Increment	1011
Table Write	1100
Table Write, Post-Increment by 2	1101
Table Write, Start Programming, Post-Increment by 2	1110
Table Write, Start Programming	1111

FIGURE 2-12: TABLE WRITE, POST-INCREMENT TIMING (1101)

PIC18F6XJXX/8XJXX

3.0 DEVICE PROGRAMMING

Programming includes the ability to erase or write the memory within the device.

The EECON1 register is used to control Write or Row Erase operations. The WREN bit (EECON1<2>) must be set to enable writes; this must be done prior to initiating a write sequence. It is strongly recommended that the WREN bit only be set immediately prior to a program or erase operation.

Note: The EECON1 register is available only in ICSP Programming mode. In normal operating modes, the corresponding SFR location (FA6h) is unimplemented. Writes to the register during code execution will have no effect; reading the location will return '0's.

3.1 ICSP Erase

3.1.1 ICSP BULK ERASE

The PIC18F6XJXX/8XJXX devices may be Bulk Erased by writing 0180h to the table address, 3C0005h:3C0004h. The basic sequence is shown in Table 3-1 and demonstrated in Figure 3-1.

Since the code-protect Configuration bit is stored in the program code within code memory, a Bulk Erase operation will also clear any code-protect settings for the device.

The actual Bulk Erase function is a self-timed operation. Once the erase has started (falling edge of the 4th PGC after the NOP command), serial execution will cease until the erase completes (parameter, P11). During this time, PGC may continue to toggle but PGD must be held low.

Note: A Bulk Erase is the only way to reprogram the code-protect Configuration bit from an ON state to an OFF state.

TABLE 3-1: BULK ERASE COMMAND SEQUENCE

4-Bit Command	Data Payload	Core Instruction
0000	0E 3C	MOVLW 3Ch
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPTRH
0000	0E 05	MOVLW 05h
0000	6E F6	MOVWF TBLPTRL
1100	01 01	Write 01h to 3C0005h
0000	0E 3C	MOVLW 3Ch
0000	6E F8	MOVWF TBLPTRU
0000	0E 00	MOVLW 00h
0000	6E F7	MOVWF TBLPTRH
0000	0E 04	MOVLW 04h
0000	6E F6	MOVWF TBLPTRL
1100	80 80	Write 80h TO 3C0004h to erase entire device. NOP
0000	00 00	Hold PGD low until erase completes.
0000	00 00	

FIGURE 3-1: BULK ERASE FLOW

FIGURE 3-2: BULK ERASE TIMING

3.1.2 ICSP ROW ERASE

It is possible to erase a single row (1024 bytes of data), provided the block is not code-protected. Rows are located at static boundaries, beginning at program memory address, 000000h, extending to the internal program memory limit (see **Section 2.2 “Memory Maps”**).

The Row Erase duration is internally timed. After the WR bit in EECON1 is set, a NOP is issued, where the 4th PGC is held high for the duration of the Row Erase time, P10.

The code sequence to Row Erase a PIC18F6XJXX/8XJXX device is shown in Table 3-2. The flowchart, shown in Figure 3-3, depicts the logic necessary to completely erase a PIC18F6XJXX/8XJXX device. The timing diagram that details the “Row Erase” operation and parameter, P10, is shown in Figure 3-3.

Note: The TBLPTR register can point at any byte within the row intended for erase.

FIGURE 3-3: ROW ERASE CODE MEMORY FLOW

TABLE 3-2: ERASE CODE MEMORY CODE SEQUENCE

4-Bit Command	Data Payload	Core Instruction
Step 1: Enable memory writes.		
0000	84 A6	BSF EECON1, WREN
Step 2: Point to first row in code memory.		
0000	6A F8	CLRF TBLPTRU
0000	6A F7	CLRF TBLPTRH
0000	6A F6	CLRF TBLPTRL
Step 3: Enable erase and erase single row.		
0000	88 A6	BSF EECON1, FREE
0000	82 A6	BSF EECON1, WR
0000	00 00	NOP – hold PGC high for time P10.
Step 4: Repeat step 3, with Address Pointer incremented by 1024 until all rows are erased.		

PIC18F6XJXX/8XJXX

3.2 Code Memory Programming

Programming code memory is accomplished by first loading data into the write buffer and then initiating a programming sequence. The write buffer for all PIC18F6XJXX/8XJXX devices is 64 bytes. It can be mapped to any integral boundary of 64 bytes, beginning at 000000h. The actual memory write sequence takes the contents of this buffer and programs the 64 bytes of code memory that contains the Table Pointer.

Write buffer locations are not cleared following a write operation. The buffer retains its data after the write is complete. This means that the buffer must be written with 64 bytes on each operation. If there are locations in the code memory that are to remain empty, the corresponding locations in the buffer must be filled with FFFFh. This avoids rewriting old data from the previous cycle.

The programming duration is internally timed. After a Start Programming command is issued (4-bit command, '1111'), a NOP is issued, where the 4th PGC is held high for the duration of the programming time, P9.

The code sequence to program a PIC18F6XJXX/8XJXX device is shown in Table 3-3. The flowchart shown in Figure 3-4 depicts the logic necessary to completely write a PIC18F6XJXX/8XJXX

device. The timing diagram that details the Start Programming command and parameter P9 is shown in Figure 3-5.

Note 1: To maintain the endurance specification of the Flash program memory cells, each 64-byte block of program memory should never be programmed more than once between erase operations. If any byte within a 64-byte block of program memory is written, that entire block must not be written to again until a Bulk Erase on the part, or a Row Erase on the row containing the modified 64-byte block, has been performed. This only applies to the PIC18F87J10, PIC18F85J90 and PIC18F85J11 families. The PIC18F87J50, PIC18F87J11, PIC18F87J90, PIC18F87J93 and PIC18F87J72 families use the 8 MHz FRC oscillator for programming, and therefore, can withstand up to 4 block write operations before needing to be erased.

2: The TBLPTR register must point to the same region when initiating the programming sequence as it did when the write buffers were loaded.

TABLE 3-3: WRITE CODE MEMORY CODE SEQUENCE

4-Bit Command	Data Payload	Core Instruction
Step 1: Enable writes.		
0000	84 A6	BSF EECON1, WREN
Step 2: Load write buffer.		
0000	0E <Addr[21:16]>	MOVLW <Addr[21:16]>
0000	6E F8	MOVWF TBLPTRU
0000	0E <Addr[15:8]>	MOVLW <Addr[15:8]>
0000	6E F7	MOVWF TBLPTRH
0000	0E <Addr[7:0]>	MOVLW <Addr[7:0]>
0000	6E F6	MOVWF TBLPTRL
Step 3: Repeat for all but the last two bytes. Any unused locations should be filled with FFFFh.		
1101	<MSB><LSB>	Write 2 bytes and post-increment address by 2.
Step 4: Load write buffer for last two bytes.		
1111	<MSB><LSB>	Write 2 bytes and start programming.
0000	00 00	NOP - hold PGC high for time P9.
To continue writing data, repeat steps 2 through 4, where the Address Pointer is incremented by 2 at each iteration of the loop.		

FIGURE 3-4: PROGRAM CODE MEMORY FLOW

FIGURE 3-5: TABLE WRITE AND START PROGRAMMING INSTRUCTION TIMING (1111)

PIC18F6XJXX/8XJXX

3.2.1 MODIFYING CODE MEMORY

The previous programming example assumed that the device had been Bulk Erased prior to programming. It may be the case, however, that the user wishes to modify only a section of an already programmed device.

The appropriate number of bytes required for the erase buffer (1,024 bytes) must be read out of code memory (as described in **Section 4.2 “Verify Code Memory and Configuration Word”**) and buffered. Modifications can be made on this buffer. Then, the row of code memory that was read out must be erased and rewritten with the modified data. The code sequence is shown in Table 3-4. The WREN bit must be set if the WR bit in EECON1 is used to initiate a write sequence.

3.2.2 CONFIGURATION WORD PROGRAMMING

Since the Flash Configuration Words are stored in program memory, they are programmed as if they were program data. Refer to **Section 3.2 “Code Memory Programming”** and **Section 3.2.1 “Modifying Code Memory”** for methods and examples on programming or modifying program memory. See also **Section 5.0 “Configuration Word”** for additional information on the Configuration Words.

TABLE 3-4: MODIFYING CODE MEMORY

4-Bit Command	Data Payload	Core Instruction
Step 1: Direct access to code memory.		
0000	0E <Addr[21:16]>	MOVLW <Addr[21:16]>
0000	6E F8	MOVWF TBLPTRU
0000	0E <Addr[8:15]>	MOVLW <Addr[8:15]>
0000	6E F7	MOVWF TBLPTRH
0000	0E <Addr[7:0]>	MOVLW <Addr[7:0]>
0000	6E F6	MOVWF TBLPTRL
Step 2: Read and modify code memory.		
0000	82 A6	BSF EECON1, WREN
0000	88 A6	BSF EECON1, FREE
Step 3: Enable memory writes and set up an erase.		
0000	82 A6	BSF EECON1, WR
0000	00 00	BSF NOP - hold PGC high for time P10.
Step 4: Load write buffer. The correct bytes will be selected based on the Table Pointer.		
0000	0E <Addr[21:16]>	MOVLW <Addr[21:16]>
0000	6E F8	MOVWF TBLPTRU
0000	0E <Addr[8:15]>	MOVLW <Addr[8:15]>
0000	6E F7	MOVWF TBLPTRH
0000	0E <Addr[7:0]>	MOVLW <Addr[7:0]>
0000	6E F6	MOVWF TBLPTRL
1101	<MSB><LSB>	Write 2 bytes and post-increment address by 2.
.	.	
.	.	Repeat as many times as necessary to fill the write buffer.
.	.	
1111	<MSB><LSB>	Write 2 bytes and start programming.
0000	00 00	NOP - hold PGC high for time P9.
To continue modifying data, repeat Step 5, where the Address Pointer is incremented by 1024 bytes at each iteration of the loop.		
Step 5: Disable writes.		
0000	94 A6	BCF EECON1, WREN

4.1 Read Code Memory

The 4-bit command is shifted in LSb first. The read is executed during the next 8 clocks, then shifted out on PGD during the last 8 clocks. LSb to MSb. A delay of

This technique will work to read any memory in the 000000h to 3FFFFFFh address space, so it also applies to reading the Configuration registers.

4-Bit Command	Data Payload	Core Instruction
Step 1: Set Table Pointer.		
0000	0E <Addr[21:16]>	MOVLW Addr[21:16]
0000	6E F8	MOVWF TBLPTRU
0000	0E <Addr[15:8]>	MOVLW <Addr[15:8]>
0000	6E F7	MOVWF TBLPTRH
0000	0E <Addr[7:0]>	MOVLW <Addr[7:0]>
0000	6E F6	MOVWF TBLPTRL
Step 2: Read memory and then shift out on PGD, LSb to MSb.		
1001	00 00	TBLRD *+

The diagram illustrates the timing relationship between the PGC (Program Global Clock) and PGD (Program Global Data) signals during a 16-bit shift operation. The PGC signal is a periodic clock with 16 pulses, numbered 1 through 16. The PGD signal is a data bus that is input during the first 4 clock cycles (PGD = Input), output during the next 12 clock cycles (PGD = Output), and input again during the final 4 clock cycles (PGD = Input). The PGD signal is divided into three sections: a 4-bit input section (bits 1, 0, 0, 1), a 12-bit output section (bits 1 to 16), and a 4-bit input section (bits 1, 2, 3, 4). The output section is further divided into a 6-bit shift data output section (bits 1 to 6) and a 6-bit fetch next 4-bit command section (bits 7 to 12). The PGD signal is labeled with 'LSb' (Least Significant Bit) at the start of the output section and 'MSb' (Most Significant Bit) at the end of the output section. The PGD signal is also labeled with 'P5', 'P6', and 'P5A' indicating specific clock cycles or data bits.

PIC18F6XJXX/8XJXX

4.2 Verify Code Memory and Configuration Word

The verify step involves reading back the code memory space and comparing it against the copy held in the programmer's buffer. Because the Flash Configuration Words are stored at the end of program memory, it is verified with the rest of the code at this time.

The verify process is shown in the flowchart in Figure 4-2. Memory reads occur a single byte at a time, so two bytes must be read to compare against the word in the programmer's buffer. Refer to **Section 4.1 "Read Code Memory"** for implementation details of reading code memory.

Note: Because the Flash Configuration Word contains the device code protection bit, code memory should be verified immediately after writing if code protection is enabled. This is because the device will not be readable or verifiable if a device Reset occurs after the Flash Configuration Words (and the CP0 bit) have been cleared.

FIGURE 4-2: VERIFY CODE MEMORY FLOW

4.3 Blank Check

The term, "Blank Check", means to verify that the device has no programmed memory cells. All memories must be verified: code memory and Configuration bits. The Device ID registers (3FFFFEh:3FFFFFh) should be ignored.

A "blank" or "erased" memory cell will read as '1', so Blank Checking a device merely means to verify that all bytes read as FFh. The overall process flow is shown in Figure 4-3.

Note: Following a device Bulk Erase, the Configuration Words will read as shown in Table 5-2.

Given that Blank Checking is merely code verification with FFh expect data, refer to **Section 4.2 "Verify Code Memory and Configuration Word"** for implementation details.

FIGURE 4-3: BLANK CHECK FLOW

5.0 CONFIGURATION WORD

The Configuration Words of the PIC18F6XJXX/8XJXX devices are implemented as volatile memory registers, as opposed to the programmable nonvolatile memory used in other PIC18 devices. All of the Configuration registers (CONFIG1L, CONFIG1H, CONFIG2L, CONFIG2H, CONFIG3L and CONFIG3H) are automatically loaded following each device Reset.

The data for these registers is taken from the four Flash Configuration Words located at the end of program memory. Configuration data is stored in order, starting with CONFIG1L in the lowest Flash address and ending with CONFIG4H in the last address. The mapping to specific Configuration Words is shown in Table 5-1. While four words are reserved in program memory, only three words (CONFIG1L through CONFIG3H) are used for device configuration. Users should always reserve these locations for Configuration Word data and write their application code accordingly.

The upper four bits of each Flash Configuration Word should always be stored in program memory as '1111'. This is done so these program memory addresses will always be '1111 xxxx xxxx xxxx' and interpreted as a NOP instruction if they were ever to be executed. Because the corresponding bits in the Configuration Words are unimplemented, they will not change the device's configuration.

The Configuration and Device ID registers are summarized in Table 5-2. A listing of the individual Configuration bits and their options is provided in Table 5-3.

TABLE 5-1: MAPPING OF THE FLASH CONFIGURATION WORDS TO THE CONFIGURATION REGISTERS

Configuration Byte	Code Space Address ⁽¹⁾	Configuration Register Address
CONFIG1L	XXXF8h	300000h
CONFIG1H	XXXF9h	300001h
CONFIG2L	XXXFAh	300002h
CONFIG2H	XXXFBh	300003h
CONFIG3L	XXXFCh	300004h
CONFIG3H	XXXFDh	300005h
CONFIG4L ⁽²⁾	XXXFEh	300006h
CONFIG4H ⁽²⁾	XXXFFh	300007h

Note 1: See Table 2-2 for the complete addresses within code space for specific devices and memory sizes.

2: Unimplemented in PIC18F6XJXX/8XJXX devices.

Legend: x = unknown, u = unchanged, — = unimplemented, q = value depends on condition. Shaded cells are unimplemented, read as '0'.

Note 1: Implemented in PIC18F6XJ5X/8XJ5X devices only.

Note 2: The value of these bits in program memory should always be '1'. This ensures that the location is executed as a NOP if it is accidentally executed.

Note 3: This bit should always be maintained as '0'.

Note 4: Implemented in 80-pin devices only. On 64-pin devices, these bits are reserved and should always be maintained as '1'.

Note 5: DEVID registers are read-only and cannot be programmed by the user.

Note 6: Implemented in PIC18F6XJ5X/8XJ5X and PIC18F66J11/66J16/67J11/86J11/86J16/87J11 only.

Note 7: Implemented in PIC18F8XJ5X and PIC18F86J11/86J16/87J11 only.

Note 8: Implemented in PIC18FXXJ10/8XJ15 devices only.

Note 9: Implemented in PIC18FX79X and PIC18FX6J9X.

Note 10: Not implemented in PIC18F8XJ9X.

4: Implemented in PIC18FX6J9X and PIC18FX7J9X.

PIC18F6XJXX/8XJXX

5.1 Device ID Word

The Device ID word for PIC18F6XJXX/8XJXX devices is located at 3FFFEh:3FFFFh. These read-only bits may be used by the programmer to identify what device type is being programmed and read out normally, even after code protection has been enabled. The process for reading the Device IDs is shown in Figure 5-1. A complete list of Device ID values for PIC18F6XJXX/8XJXX devices is presented in Table 5-4.

FIGURE 5-1: READ DEVICE ID WORD FLOW

PIC18F6XJXX/8XJXX

5.2 Checksum Computation

The checksum is calculated by summing the following:

- The contents of all code memory locations
- The Configuration Block (CFGB), appropriately masked
- ID locations

The Least Significant 16 bits of this sum are the checksum.

Table 5-5 (pages 28 through 30) describes how to calculate the checksum for each device.

Note: The checksum calculation differs depending on the code-protect setting. Since the code memory locations read out differently depending on the code-protect setting, the table describes how to manipulate the actual code memory values to simulate the values that would be read from a protected device. When calculating a checksum by reading a device, the entire code memory can simply be read and summed. The Configuration Word and ID locations can always be read.

TABLE 5-5: CHECKSUM EQUATION FOR PIC18F6XJXX/8XJXX

Family	Device	Read Code Protection	Checksum Computation

TABLE 5-5: CHECKSUM EQUATION FOR PIC18F6XJXX/8XJXX (CONTINUED)

Family	Device	Read Code Protection	Checksum Computation
PIC18F87J11	PIC18F65J16	Disabled	CFGB60 + SUM(0000:BFF7h)
		Enabled	0000h
	PIC18F66J11	Disabled	CFGB60 + SUM(0000:FFF7h)
		Enabled	0000h
	PIC18F66J16	Disabled	CFGB60 + SUM(00000:17FF7h)
		Enabled	0000h
	PIC18F67J11	Disabled	CFGB60 + SUM(00000:1FFF7h)
		Enabled	0000h
	PIC18F85J16	Disabled	CFGB80 + SUM(0000:BFF7h)
		Enabled	0000h
	PIC18F86J11	Disabled	CFGB80 + SUM(0000:FFF7h)
		Enabled	0000h
	PIC18F86J16	Disabled	CFGB80 + SUM(00000:17FF7h)
		Enabled	0000h
	PIC18F87J11	Disabled	CFGB80 + SUM(00000:1FFF7h)
		Enabled	0000h
CFGB80 = Byte sum of [(CW1 & 07E1h) + (CW2 & 0FC7h) + (CW3 & 0FF8h)] CFGB60 = Byte sum of [(CW1 & 07E1h) + (CW2 & 0FC7h) + (CW3 & 0900h)]			

Legend: Item Description
 SUM(a:b) = Byte sum of locations a to b inclusive (all 3 bytes of code memory)
 + = Addition
 CW = Configuration Word
 CFGB = Configuration Block (Masked)

Note: CW3 address is the last location – 2 of implemented program memory; CW2 is the last location – 4;
 CW1 is the last location – 6.

CW1 is the last location – 6.

PIC18F6XJXX/8XJXX

6.0 AC/DC CHARACTERISTICS AND TIMING REQUIREMENTS FOR PROGRAM/VERIFY TEST MODE

Standard Operating Conditions Operating Temperature: 25°C is recommended						
Param No.	Symbol	Characteristic	Min	Max	Units	Conditions
	VDDCORE	External Supply Voltage for Microcontroller Core	2.3	2.70	V	(Note 1)
D111	VDD	Supply Voltage During Programming	ENVREG = VSS	VDDCORE	3.60	Normal programming (Note 2)
			ENVREG = VDD	2.65	3.60	
D112	I _{PP}	Programming Current on $\overline{\text{MCLR}}$	—	5	μA	
D113	I _{DDP}	Supply Current During Programming	—	10	mA	
D031	V _{IL}	Input Low Voltage	VSS	0.2 V _{DD}	V	
D041	V _{IH}	Input High Voltage	0.8 V _{DD}	V _{DD}	V	
D080	V _{OL}	Output Low Voltage	—	0.4	V	I _{OL} = 8.5 mA @ 3.3V
D090	V _{OH}	Output High Voltage	2.4	—	V	I _{OH} = -6.0 mA @ 3.3V
D012	C _{IO}	Capacitive Loading on I/O pin (PGD)	—	50	pF	To meet AC specifications
	C _F	Filter Capacitor Value on VCAP	4.7	10	μF	Required for controller core operation when voltage regulator is enabled
P2	T _{PGC}	Serial Clock (PGC) Period	100	—	ns	
P2A	T _{PGCL}	Serial Clock (PGC) Low Time	40	—	ns	
P2B	T _{PGCH}	Serial Clock (PGC) High Time	40	—	ns	
P3	T _{SET1}	Input Data Setup Time to Serial Clock ↓	15	—	ns	
P4	T _{HLD1}	Input Data Hold Time from PGC ↓	15	—	ns	
P5	T _{DLY1}	Delay between 4-Bit Command and Command Operand	40	—	ns	
P5A	T _{DLY1A}	Delay between 4-Bit Command Operand and Next 4-Bit Command	40	—	ns	
P6	T _{DLY2}	Delay between Last PGC ↓ of Command Byte to First PGC ↑ of Read of Data Word	20	—	ns	
P9		Delay to Allow Block Programming to Occur	3.4	—	ms	For PIC18F87J10, PIC18F85J90 and PIC18F85J11 family parts
			1.2	—	ms	For PIC18F87J50, PIC18F87J11, PIC18F87J90, PIC18F87J93 and PIC18F87J72 family parts
P10	T _{DLY6}	Delay to Allow Row Erase to Occur	49	—	ms	
P11	T _{DLY7}	Delay to allow Bulk Erase to Occur	475	—	ms	

- Note 1:** VDDCORE must be supplied to the VDDCORE/VCAP pin if the on-chip voltage regulator is disabled. See **Section 2.1.1 “On-Chip Voltage Regulator”** for more information.
- 2:** VDD must also be supplied to the AVDD pins during programming and to the ENVREG pin if the on-chip voltage regulator is used. AVDD and AVSS should always be within ±0.3V of VDD and VSS, respectively.

6.0 AC/DC CHARACTERISTICS AND TIMING REQUIREMENTS FOR PROGRAM/VERIFY TEST MODE (CONTINUED)

Standard Operating Conditions Operating Temperature: 25°C is recommended						
Param No.	Symbol	Characteristic	Min	Max	Units	Conditions
P12	THLD2	Input Data Hold Time from $\overline{\text{MCLR}} \uparrow$	400	—	μs	
P13	TSET2	$\text{VDD} \uparrow$ Setup Time to $\overline{\text{MCLR}} \uparrow$	100	—	ns	
P14	TVALID	Data Out Valid from PGC $\uparrow$	10	—	ns	
P16	TDLY8	Delay between Last PGC $\downarrow$ and $\overline{\text{MCLR}} \downarrow$	20	—	ns	
P19	TKEY1	Delay from First $\overline{\text{MCLR}} \downarrow$ to First PGC $\uparrow$ for Key Sequence on PGD	1	—	ms	
P20	TKEY2	Delay from Last PGC $\downarrow$ for Key Sequence on PGD to Second $\overline{\text{MCLR}} \uparrow$	40	—	ns	

- Note 1:** VDDCORE must be supplied to the VDDCORE/VCAP pin if the on-chip voltage regulator is disabled. See **Section 2.1.1 “On-Chip Voltage Regulator”** for more information.
- 2:** VDD must also be supplied to the AVDD pins during programming and to the ENVREG pin if the on-chip voltage regulator is used. AVDD and AVSS should always be within $\pm 0.3\text{V}$ of VDD and VSS, respectively.

PIC18F6XJXX/8XJXX

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, dsPIC, KEELOQ, KEELOQ logo, MPLAB, PIC, PICmicro, PICSTART, rPIC and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

FilterLab, Hampshire, HI-TECH C, Linear Active Thermistor, MXDEV, MXLAB, SEEVAL and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, Application Maestro, CodeGuard, dsPICDEM, dsPICDEM.net, dsPICworks, dsSPEAK, ECAN, ECONOMONITOR, FanSense, HI-TIDE, In-Circuit Serial Programming, ICSP, Mindi, MiWi, MPASM, MPLAB Certified logo, MPLIB, MPLINK, mTouch, Octopus, Omniscient Code Generation, PICC, PICC-18, PICDEM, PICDEM.net, PICkit, PICtail, PIC³² logo, REAL ICE, rLAB, Select Mode, Total Endurance, TSHARC, UniWinDriver, WiperLock and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
== ISO/TS 16949:2002 ==

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
