

PIC24FJXXXGA2/GB2 FAMILIES

PIC24FJXXXGA2/GB2 Families Flash Programming Specification

1.0 DEVICE OVERVIEW

This document defines the programming specification for the PIC24FJXXXGA2/GB2 families of microcontroller devices. This programming specification is required only for those developing programming support for the PIC24FJXXXGA2/GB2 devices. Customers using only one of these devices should use development tools that already provide support for device programming.

This programming specification is specific to the following devices:

- PIC24FJ128GA204
- PIC24FJ128GA202
- PIC24FJ128GB204
- PIC24FJ128GB202
- PIC24FJ64GA204
- PIC24FJ64GA202
- PIC24FJ64GB204
- PIC24FJ64GB202

2.0 PROGRAMMING OVERVIEW OF PIC24FJXXXGA2/GB2 DEVICES

There are two methods of programming the PIC24FJXXXGA2/GB2 devices discussed in this programming specification. They are:

- In-Circuit Serial Programming™ (ICSP™)
- Enhanced In-Circuit Serial Programming (Enhanced ICSP)

The ICSP programming method is the most direct method to program the device; however, it is also the slower of the two methods. It provides native, low-level programming capability to erase, program and verify the chip.

The Enhanced In-Circuit Serial Programming (Enhanced ICSP) protocol uses a faster method that takes advantage of the Programming Executive (PE), as illustrated in [Figure 2-1](#). The Programming Executive provides all the necessary functionality to erase, program and verify the chip through a small command set. The command set allows the programmer to program the PIC24FJXXXGA2/GB2 MCUs without having to deal with the low-level programming protocols of the chip.

This specification is divided into major sections that describe the programming methods independently. [Section 3.0 “Device Programming – ICSP”](#) describes the In-Circuit Serial Programming method. [Section 4.0 “Device Programming – Enhanced ICSP”](#) describes the Enhanced In-Circuit Serial Programming method.

Note: The address of the Special Function Register, TBLPAG, has moved from 32h to 54h in the devices covered in this specification.

In those cases where legacy programming specification code from other device families is used as a basis to implement the programming specification for the PIC24FJXXXGA2/GB2 devices, special care must be taken to ensure all references to TBLPAG and NVMCON, in any existing code, are updated with the correct opcode hex data for the mnemonic and operands.

PIC24FJXXXGA2/GB2 Devices:

Command (Binary)	Data (Hex)	Description
0000	8802A0	MOV W0, TBLPAG

Previous PIC24F Families:

Command (Binary)	Data (Hex)	Description
0000	880190	MOV W0, TBLPAG

PIC24FJXXXGA2/GB2 FAMILIES

FIGURE 2-1: PROGRAMMING SYSTEM OVERVIEW FOR ENHANCED ICSP™

2.1 Power Requirements

All PIC24FJXXXGA2/GB2 devices power their core digital logic at a nominal 1.8V. To simplify system design, all devices in the PIC24FJXXXGA2/GB2 families incorporate an on-chip regulator that allows the device to run its core logic from VDD. The regulator provides power to the core from the other VDD pins. A low-ESR capacitor (such as ceramic or tantalum) must be connected to the VCAP pin (see [Table 2-1](#) and [Figure 2-2](#)). This helps to maintain the stability of the regulator. The specifications for core voltage and capacitance are listed in [Section 7.0 “AC/DC Characteristics and Timing Requirements”](#).

Devices in the PIC24FJ128GA204/GB204 families also incorporate a secondary voltage source pin (VBAT) that allows the device to resume operation after VDD has been removed. It is recommended that the VBAT pin always be supplied with voltage from either VDD or a backup battery source during programming.

FIGURE 2-2: CONNECTIONS FOR THE VCAP AND VBAT PINS

2.2 Program Memory Write/Erase Requirements

The Flash program memory on PIC24FJXXXGA2/GB2 devices has a specific write/erase requirement that must be adhered to for proper device operation. The rule is that any given word in memory must not be written more than twice before erasing the page in which it is located. Thus, the easiest way to conform to this rule is to write all of the data in a programming block, within one write cycle. The programming methods specified in this specification comply with this requirement.

Note: Writing to a location multiple times without erasing is not recommended.

TABLE 2-1: PIN DESCRIPTIONS (DURING PROGRAMMING)

Pin Name	During Programming		
	Pin Name	Pin Type	Pin Description
MCLR	MCLR	P	Programming Enable
VDD, AVDD ⁽¹⁾	VDD	P	Power Supply
VSS, AVSS ⁽¹⁾	VSS	P	Ground
VBAT ⁽²⁾	VBAT	P	VBAT Mode Power Supply
VCAP	VCAP	P	On-Chip Voltage Regulator Output to the Core
PGECx	PGECx	I	Programming Pin Pairs 1, 2 and 3: Serial Clock
PGEDx	PGEDx	I/O	Programming Pin Pairs 1, 2 and 3: Serial Data
VUSB3V3 ⁽³⁾	VUSB3V3	P	USB Transceiver Power Input Voltage (3.3V nominal)

Legend: I = Input, O = Output, P = Power

- 1: All power supply and ground pins must be connected, including analog supplies and ground (AVDD/AVSS are implemented).
- 2: It is recommended to connect the VBAT pin to the battery or VDD during programming.
- 3: This pin is available only in the PIC24FJXXXGB2XX family devices.

PIC24FJXXXGA2/GB2 FAMILIES

2.3 Pin Diagrams

Figure 2-3 through Figure 2-6 provide the pin diagrams for the PIC24FJXXXGA2/GB2 devices. The pins that are required for programming are listed in Table 2-1 and are shown in bold type in the figures. Refer to the specific device data sheet for complete pin descriptions.

2.3.1 PGECx AND PGEDx PIN PAIRS

All of the PIC24FJXXXGA2/GB2 devices have three separate pairs of programming pins, labeled as PGEC1/PGED1, PGEC2/PGED2 and PGEC3/PGED3. Any one of these pin pairs may be used for device programming by either the ICSP or Enhanced ICSP method. Unlike voltage supply and ground pins, it is not necessary to connect all three pin pairs to program the device. However, the programming method must use both pins of the same pair.

2.4 Memory Map

The program memory map extends from 000000h to FFFFFFFh. Code storage is located at the base of the memory map and supports up to 87K instruction words (about 256 Kbytes). [Table 2-2](#) shows the program memory sizes, and the number of erase and program blocks present in each device variant. Each erase block or page contains 512 instructions and each program block or row contains 64 instructions.

Locations, 800000h through 8007FEh, are reserved for executive code memory. This region stores the Programming Executive and the Debugging Executive. The Programming Executive is used for device programming and the Debugging Executive is used for in-circuit debugging. This region of memory cannot be used to store user code.

The last four implemented program memory locations are reserved for the Flash Configuration Words. The reserved addresses are provided in [Table 2-2](#).

Locations, FF0000h and FF0002h, are reserved for the Device ID registers. These bits can be used by the programmer to identify what device type is being programmed. They are described in [Section 6.1 “Device ID”](#). The Device ID registers read out normally, even after code protection is applied.

[Figure 2-7](#) displays the memory map for the PIC24FJXXXGA2/GB2 devices.

TABLE 2-2: CODE MEMORY SIZE AND FLASH CONFIGURATION WORD LOCATIONS FOR PIC24FJXXXGA2/GB2 DEVICES

Device	User Memory Address Limit (Instruction Words)	Write Blocks	Erase Blocks	Configuration Word Addresses			
				1	2	3	4
PIC24FJ64GA2XX	00ABFEh (22K)	344	43	00ABFEh	00ABFCh	00ABFAh	00ABF8h
PIC24FJ64GB2XX							
PIC24FJ128GA2XX	0157FEh (44K)	688	86	0157FEh	0157FCh	0157FAh	0157F8h

PIC24FJXXXGA2/GB2 FAMILIES

3.0 DEVICE PROGRAMMING – ICSP

ICSP mode is a special programming protocol that allows you to read and write to the memory of PIC24FJXXXGA2/GB2 devices. The ICSP mode is the most direct method used to program the device; note however, that Enhanced ICSP is faster. ICSP mode also has the ability to read the contents of executive memory to determine if the Programming Executive is present. This capability is accomplished by applying control codes and instructions, serially to the device, using pins, PGECx and PGEDx.

In ICSP mode, the system clock is taken from the PGECx pin, regardless of the device's Oscillator Configuration bits. All instructions are shifted serially into an internal buffer, then loaded into the Instruction Register (IR) and executed. No program fetching occurs from internal memory. Instructions are fed in, 24 bits at a time. PGEDx is used to shift data in, and PGECx is used as both the serial shift clock and the CPU execution clock.

Note: During ICSP operation, the operating frequency of PGECx must not exceed 10 MHz.

3.1 Overview of the Programming Process

Figure 3-1 shows the high-level overview of the programming process. After entering ICSP mode, the first action is to Chip Erase the device. Next, the code memory is programmed, followed by the device Configuration registers. Code memory (including the Configuration registers) is then verified to ensure that programming was successful. Then, the code-protect Configuration bits are programmed, if required.

FIGURE 3-1: HIGH-LEVEL ICSP™ PROGRAMMING FLOW

3.2 ICSP Operation

Upon entry into ICSP mode, the CPU is Idle. Execution of the CPU is governed by an internal state machine. A 4-bit control code is clocked in using PGECx and PGEDx, and this control code is used to command the CPU (see Table 3-1).

The SIX control code is used to send instructions to the CPU for execution and the REGOUT control code is used to read data out of the device via the VISI register.

TABLE 3-1: CPU CONTROL CODES IN ICSP™ MODE

4-Bit Control Code	Mnemonic	Description
0000	SIX	Shift in 24-bit instruction and execute.
0001	REGOUT	Shift out the VISI (0784h) register.
0010–1111	N/A	Reserved.

PIC24FJXXXGA2/GB2 FAMILIES

3.2.1 SIX SERIAL INSTRUCTION EXECUTION

The **SIX** control code allows execution of PIC24F assembly instructions. When the **SIX** code is received, the CPU is suspended for 24 clock cycles, as the instruction is then clocked into the internal buffer. Once the instruction is shifted in, the state machine allows it to be executed over the next four **PGE**Cx clock cycles. While the received instruction is executed, the state machine simultaneously shifts in the next 4-bit command (see Figure 3-2).

Coming out of Reset, the first 4-bit control code is always forced to **SIX** and a forced **NOP** instruction is executed by the CPU. Five additional **PGE**Cx clocks are needed on start-up, resulting in a 9-bit **SIX** command instead of the normal 4-bit **SIX** command.

After the forced **SIX** is clocked in, ICSP operation resumes as normal. That is, the next 24 clock cycles load the first instruction word to the CPU.

Note: To account for this forced **NOP**, all example code in this specification begins with a **NOP** to ensure that no data is lost.

FIGURE 3-2: SIX SERIAL EXECUTION

3.2.1.1 Differences Between Execution of **SIX** and Normal Instructions

There are some differences between executing instructions normally and using the **SIX** ICSP command. As a result, the code examples in this specification may not match those for performing the same functions during normal device operation.

During **SIX** ICSP operation:

- Two-word instructions require two **SIX** operations to clock in all of the necessary data. Examples of two-word instructions are **GOTO** and **CALL**.
- Two-cycle instructions require two **SIX** operations. The first **SIX** operation shifts in the instruction and begins to execute it. The second **SIX** operation, which should shift in a **NOP** to avoid losing data, provides the CPU clocks required to finish executing the instruction. Examples of two-cycle instructions are Table Read and Table Write instructions.
- The CPU does not automatically stall to account for pipeline changes. A CPU Stall occurs when an instruction modifies a register that is used for Indirect Addressing by the following instruction.

During normal device operation:

- The CPU will automatically force a **NOP** while the new data is read. When using ICSP, there is no automatic stall, so any indirect references to a recently modified register should be preceded by a **NOP**.

For example, the instructions, **MOV #0x0, W0** and **MOV [W0], W1**, must have a **NOP** inserted between them.

If a two-cycle instruction modifies a register that is used indirectly, it will require two **NOPs**: one to execute the second half of the instruction and the other to stall the CPU to correct the pipeline.

Instructions, such as **TBLWTL [W0++], [W1]**, should be followed by two **NOPs**.

- The device Program Counter (PC) continues to automatically increment during ICSP instruction execution, even though the Flash memory is not being used.

As a result, the PC may be incremented to point to invalid memory locations. Invalid memory spaces include unimplemented Flash addresses and the vector space (locations: 0x0 to 0x1FF).

If the PC points to these locations, the device will reset, possibly interrupting the ICSP operation. To prevent this, instructions should be periodically executed to reset the PC to a safe space. The optimal method to accomplish this is to perform a **GOTO 0x200**.

PIC24FJXXXGA2/GB2 FAMILIES

3.2.2 REGOUT SERIAL INSTRUCTION EXECUTION

The **REGOUT** control code allows for data to be extracted from the device in ICSP mode. It is used to clock the contents of the VISI register, out of the device, over the PGEDx pin. After the **REGOUT** control code is received, the CPU is held Idle for 8 cycles. After these 8 cycles, an additional 16 cycles are required to clock the data out (see [Figure 3-3](#)).

The **REGOUT** code is unique because the PGEDx pin is an input when the control code is transmitted to the device. However, after the control code is processed, the PGEDx pin becomes an output as the VISI register is shifted out.

Note 1: After the contents of VISI are shifted out, PIC24FJXXXGA2/GB2 devices maintain PGEDx as an output until the first rising edge of the next clock is received.

2: Data changes on the falling edge and latches on the rising edge of PGECx. For all data transmissions, the Least Significant bit (LSb) is transmitted first.

FIGURE 3-3: REGOUT SERIAL EXECUTION

PIC24FJXXXGA2/GB2 FAMILIES

3.3 Entering ICSP Mode

As shown in Figure 3-4, entering ICSP Program/Verify mode requires three steps:

1. $\overline{\text{MCLR}}$ is briefly driven high, then low.
2. A 32-bit key sequence is clocked into PGEDx.
3. $\overline{\text{MCLR}}$ is then driven high within a specified period and held.

The programming voltage applied to $\overline{\text{MCLR}}$ is V_{IH} , which is essentially V_{DD} in the case of PIC24FJXXXGA2/GB2 devices. There is no minimum time requirement for holding at V_{IH} . After V_{IH} is removed, an interval of at least P18 must elapse before presenting the key sequence on PGEDx.

The key sequence is a specific 32-bit pattern: '0100 1101 0100 0011 0100 1000 0101 0001' (more easily remembered as 4D434851h in hexadecimal). The device will enter Program/Verify mode only if the sequence is valid. The Most Significant bit (MSb) of the most significant nibble must be shifted in first.

Once the key sequence is complete, V_{IH} must be applied to $\overline{\text{MCLR}}$ and held at that level for as long as Program/Verify mode is to be maintained. An interval of at least time, P19 and P7, must elapse before presenting data on PGEDx. Signals appearing on PGECx before P7 has elapsed will not be interpreted as valid.

On successful entry, the program memory can be accessed and programmed in serial fashion. While in ICSP mode, all unused I/Os are placed in the high-impedance state.

FIGURE 3-4: ENTERING ICSP™ MODE

PIC24FJXXXGA2/GB2 FAMILIES

3.4 Flash Memory Programming in ICSP Mode

3.4.1 PROGRAMMING OPERATIONS

Flash memory write and erase operations are controlled by the NVMCON register. Programming is performed by setting NVMCON to select the type of erase operation (see [Table 3-2](#)) or write operation (see [Table 3-3](#)) and initiating the programming by setting the WR control bit (NVMCON<15>).

In ICSP mode, all programming operations are self-timed. There is an internal delay between the user setting the WR control bit and the automatic clearing of the WR control bit when the programming operation is complete. For information about the delays associated with various programming operations, refer to [Section 7.0 “AC/DC Characteristics and Timing Requirements”](#).

TABLE 3-2: NVMCON ERASE OPERATIONS

NVMCON Value	Erase Operation
404Fh	Erase all code memory, executive memory and Configuration registers (does not erase Device ID registers).
4042h	Erase a page of code memory or executive memory.

TABLE 3-3: NVMCON WRITE OPERATIONS

NVMCON Value	Write Operation
4003h	Write a single code memory word, Configuration Word or executive memory word.
4001h	Program 1 row (64 instruction words) of code memory or executive memory.

3.4.2 STARTING AND STOPPING A PROGRAMMING CYCLE

The WR bit (NVMCON<15>) is used to start an erase or write cycle. Setting the WR bit initiates the programming cycle.

All erase and write cycles are self-timed. The WR bit should be polled to determine if the erase or write cycle has been completed. Starting a programming cycle is performed as follows:

```
BSET    NVMCON, #WR
```

3.5 Erasing Program Memory

The procedure for erasing program memory (all of the code memory, data memory, executive memory and code-protect bits) consists of setting NVMCON to 404Fh and executing the programming cycle.

A Chip Erase can erase all of the user memory or both the user and configuration memory. A Table Write instruction should be executed, prior to performing the Chip Erase, to select which sections are erased.

The Table Write instruction is executed:

- If the TBLPAG register points to user space (is less than 80h), the Chip Erase will erase only user memory and Flash Configuration Words.
- If the TBLPAG register points to configuration space (is greater than or equal to 80h), the Chip Erase is not allowed. The configuration space can be erased, one page at a time.

Note: The Chip Erase is not allowed when the TBLPAG points to the configuration space to avoid the diagnostic and calibration words from getting erased.

[Figure 3-5](#) displays the ICSP programming process for performing a Chip Erase. This process includes the ICSP command code, which must be transmitted (for each instruction), LSb first, using the PGECx and PGEDx pins (see [Figure 3-2](#)).

Note: Program memory must be erased before writing any data to program memory.

FIGURE 3-5: CHIP ERASE FLOW

PIC24FJXXXGA2/GB2 FAMILIES

TABLE 3-4: SERIAL INSTRUCTION EXECUTION FOR CHIP ERASE

Command (Binary)	Data (Hex)	Description
Step 1: Exit the Reset vector.		
0000	000000	NOP
0000	040200	GOTO 0x200
0000	000000	NOP
Step 2: Set the NVMCON register to erase all program memory.		
0000	2404FA	MOV #0x404F, W10
0000	883B0A	MOV W10, NVMCON
Step 3: Set the TBLPAG register and perform a dummy Table Write to select what portions of memory are erased.		
0000	2xxxx0	MOV #<PAGEVAL>, W0
0000	8802A0	MOV W0, TBLPAG
0000	200000	MOV #0x0000, W0
0000	BB0800	TBLWTL W0, [W0]
0000	000000	NOP
0000	000000	NOP
Step 4: Initiate the erase cycle.		
0000	A8E761	BSET NVMCON, #WR
0000	000000	NOP
0000	000000	NOP
Step 5: Repeat this step to poll the WR bit (bit 15 of NVMCON) until it is cleared by the hardware.		
0000	040200	GOTO 0x200
0000	000000	NOP
0000	803B02	MOV NVMCON, W2
0000	883C22	MOV W2, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of the VISI register
0000	000000	NOP

PIC24FJXXXGA2/GB2 FAMILIES

3.6 Writing Code Memory

The procedure for writing code memory is the same as the procedure for writing the Configuration registers, except that 64 instruction words are programmed at a time. To facilitate this operation, Working registers, W0:W5, are used as temporary holding registers for the data to be programmed.

Table 3-5 provides the ICSP programming details, including the serial pattern with the ICSP command code which must be transmitted, LSb first, using the PGECx and PGEDx pins (see Figure 3-2).

In Step 1, the Reset vector is exited. In Step 2, the NVMCON register is initialized for programming a full row of code memory. In Step 3, the 24-bit starting destination address for programming is loaded into the TBLPAG register and W7 register. (The upper byte of the starting destination address is stored in TBLPAG and the lower 16 bits of the destination address are stored in W7.)

To minimize the programming time, a packed instruction format is used (see Figure 3-6).

In Step 4, four packed instruction words are stored in Working registers, W0:W5, using the MOV instruction. The Read Pointer, W6, is initialized. The contents of W0:W5 (holding the packed instruction word data) are shown in Figure 3-6.

In Step 5, eight TBLWT instructions are used to copy the data from W0:W5 to the write latches of code memory. Since code memory is programmed, 64 instruction words at a time, Steps 4 and 5 are repeated, 16 times, to load all the write latches (Step 6).

After the write latches are loaded, programming is initiated by writing to the NVMCON register in Steps 7 and 8. In Step 9, the internal PC is reset to 200h. This is a precautionary measure to prevent the PC from incrementing into unimplemented memory when large devices are being programmed. Lastly, in Step 10, Steps 3-9 are repeated until all of the code memory is programmed.

FIGURE 3-6: PACKED INSTRUCTION WORDS IN W0:W5

TABLE 3-5: SERIAL INSTRUCTION EXECUTION FOR WRITING CODE MEMORY

Command (Binary)	Data (Hex)	Description
Step 1: Exit the Reset vector.		
0000	000000	NOP
0000	040200	GOTO 0x200
0000	000000	NOP
Step 2: Set the NVMCON register to program 64 instruction words.		
0000	24001A	MOV #0x4001, W10
0000	883B0A	MOV W10, NVMCON
Step 3: Initialize the Write Pointer (W7) for the TBLWT instruction.		
0000	200xx0	MOV #<DestinationAddress23:16>, W0
0000	8802A0	MOV W0, TBLPAG
0000	2xxxx7	MOV #<DestinationAddress15:0>, W7
Step 4: Load W0:W5 with the next 4 instruction words to program.		
0000	2xxxx0	MOV #<LSW0>, W0
0000	2xxxx1	MOV #<MSB1:MSB0>, W1
0000	2xxxx2	MOV #<LSW1>, W2
0000	2xxxx3	MOV #<LSW2>, W3
0000	2xxxx4	MOV #<MSB3:MSB2>, W4
0000	2xxxx5	MOV #<LSW3>, W5

0000	000000	NOP
0000	000000	NOP
0000	BB1BB6	TBLWTL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
Step 6: Repeat Steps 4 and 5, 16 times, to load the write latches for 64 instructions.		
Step 7: Initiate the write cycle.		
0000	A8E761	BSET NVMCON, #WR
0000	000000	NOP
0000	000000	NOP
Step 8: Repeat this step to poll the WR bit (bit 15 of NVMCON) until it is cleared by the hardware.		
0000	040200	GOTO 0x200
0000	000000	NOP
0000	803B02	MOV NVMCON, W2
0000	883C22	MOV W2, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of the VISI register.
0000	000000	NOP
Step 9: Reset the device's internal PC.		
0000	040200	GOTO 0x200
0000	000000	NOP
Step 10: Repeat Steps 3 through 9 until all code memory is programmed.		

PIC24FJXXXGA2/GB2 FAMILIES

FIGURE 3-7: PROGRAM CODE MEMORY FLOW

PIC24FJXXXGA2/GB2 FAMILIES

3.7 Writing Configuration Words

Device configuration for PIC24FJXXXGA2/GB2 devices is stored in the Flash Configuration Words at the end of the user space program memory and in multiple Configuration Word registers located in the test space. These registers reflect values read at any Reset from program memory locations. The values for the Configuration Words for the default device configurations are listed in [Table 3-6](#).

TABLE 3-6: DEFAULT CONFIGURATION REGISTER VALUES

Address	Name	Default Value
Last Word	CW1	7FFFh
Last Word – 2	CW2	BFFFh ⁽¹⁾
Last Word – 4	CW3	FFFFh
Last Word – 6	CW4	FFFFh

Note 1: For the PIC24FJXXXGB2 family, the default value is BFFFh. For the PIC24FJXXXGA2 family, the default value is B7FFh.

The values can be changed only by programming the content of the corresponding Flash Configuration Word and resetting the device. The Reset forces an automatic reload of the Flash stored configuration values by sequencing through the dedicated Flash Configuration Words and transferring the data into the Configuration registers.

For the PIC24FJXXXGA2/GB2 devices, certain reserved Configuration bits have default states that must always be maintained to ensure device functionality, regardless of the settings of other Configuration bits. These bits and their values are listed in [Table 3-7](#).

To change the values of the Flash Configuration Word once it has been programmed, the device must be Chip Erased, as described in [Section 3.5 “Erasing Program Memory”](#), and reprogrammed to the desired value. It is not possible to program a ‘0’ to a ‘1’; a ‘1’ to a ‘0’ may be programmed to enable code protection.

[Table 3-8](#) provides the ICSP programming details for programming the Configuration Word locations. This includes the serial pattern with the ICSP command code which must be transmitted, LSB first, using the PGECx and PGEDx pins (see [Figure 3-2](#)).

In Step 1, the Reset vector is exited. In Step 2, the lower 16 bits of the source address are stored in W7. In Step 3, the NVMCON register is initialized for programming of code memory. In Step 4, the upper byte of the 24-bit starting source address for writing is loaded into the TBLPAG register.

The TBLPAG register must be loaded with 00h for 64 Kbytes, and 01h for 128-Kbyte and 256-Kbyte devices.

To verify the data by reading the Configuration Words after performing the write in order, the code protection bits should initially be programmed to a ‘1’ to ensure that the verification can be performed properly. After verification is finished, the code protection bit can be programmed to a ‘0’ by using a word write to the appropriate Configuration Word.

TABLE 3-7: RESERVED CONFIGURATION BIT LOCATIONS

Family	Register/Bits	Value	Comments
All Devices	CW1<15>	0	Always program as ‘0’; required to maintain device functionality.
	CW2<2>	1	Always program as ‘1’.
	CW2<14>	0	Always program as ‘0’.
	CW3<7>	1	Always program as ‘1’.
	CW4<9>	1	Always program as ‘1’.
PIC24FJXXGA2XX	CW2<11>	0	Always program as ‘0’.

TABLE 3-8: SERIAL INSTRUCTION EXECUTION FOR WRITING CONFIGURATION REGISTERS

Command (Binary)	Data (Hex)	Description
Step 1: Exit the Reset vector.		
0000	000000	NOP
0000	040200	GOTO 0x200
0000	000000	NOP
Step 2: Initialize the Write Pointer (W7) for the TBLWT instruction.		
0000	2xxxx7	MOV #<CW1Address15:0>, W7
Step 3: Set the NVMCON register to program CW1.		
0000	24003A	MOV #0x4003, W10
0000	883B0A	MOV W10, NVMCON
Step 4: Initialize the TBLPAG register.		
0000	200xx0	MOV #<CW1Address23:16>, W0
0000	8802A0	MOV W0, TBLPAG
Step 5: Load the Configuration register data to W6.		
0000	2xxxx6	MOV #<CW1_VALUE>, W6
Step 6: Write the Configuration register data to the write latch and decrement the Write Pointer.		
0000	200008	MOV #0x0000, W8
0000	000000	NOP
0000	BBCB88	TBLWTH.B W8, [W7]
0000	000000	NOP
0000	000000	NOP
0000	BB1386	TBLWTL.W W6, [W7--]
0000	000000	NOP
0000	000000	NOP
Step 7: Initiate the write cycle.		
0000	A8E761	BSET NVMCON, #WR
0000	000000	NOP
0000	000000	NOP
Step 8: Repeat this step to poll the WR bit (bit 15 of NVMCON) until it is cleared by the hardware.		
0000	040200	GOTO 0x200
0000	000000	NOP
0000	803B02	MOV NVMCON, W2
0000	883C22	MOV W2, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of the VISI register.
0000	000000	NOP
Step 9: Reset the device's internal PC.		
0000	040200	GOTO 0x200
0000	000000	NOP
Step 10: Repeat Steps 5 through 9 to write Configuration Word 2 to Configuration Word 4.		

PIC24FJXXXGA2/GB2 FAMILIES

3.8 Reading Code Memory

Reading from code memory is performed by executing a series of `TBLRD` instructions and clocking out the data using the `REGOUT` command.

Table 3-9 provides the ICSP programming details for reading code memory. In Step 1, the Reset vector is exited. In Step 2, the Write Pointer, `W7`, is initialized. In Step 3, the 24-bit starting source address for reading is loaded into the `TBLPAG` and `W6` registers. The upper byte of the starting source address is stored in `TBLPAG` and the lower 16 bits of the source address are stored in `W6`.

To minimize the reading time, the packed instruction word format that was utilized for writing is also used for reading (see Figure 3-6). In Step 4, two instruction words are read from code memory and clocked out of the device, through the `VISI` register, using the `REGOUT` command. Step 4 is repeated until the desired amount of code memory is read.

TABLE 3-9: SERIAL INSTRUCTION EXECUTION FOR READING CODE MEMORY

Command (Binary)	Data (Hex)	Description
Step 1: Exit the Reset vector.		
0000	000000	NOP
0000	040200	GOTO 0x200
0000	000000	NOP
Step 2: Initialize the Write Pointer (<code>W7</code>) to point to the <code>VISI</code> register.		
0000	207847	MOV # <code>VISI</code> , <code>W7</code>
0000	000000	NOP
Step 3: Initialize the <code>TBLPAG</code> register and the Read Pointer (<code>W6</code>) for the <code>TBLRD</code> instruction.		
0000	200xx0	MOV #<SourceAddress23:16>, <code>W0</code>
0000	8802A0	MOV <code>W0</code> , <code>TBLPAG</code>
0000	2xxxx6	MOV #<SourceAddress15:0>, <code>W6</code>
Step 4: Read and clock out the contents of the next two locations of code memory, through the <code>VISI</code> register, using the <code>REGOUT</code> command.		
0000	BA0B96	TBLRDL [<code>W6</code>], [<code>W7</code>]
0000	000000	NOP
0000	000000	NOP
0001	< <code>VISI</code> >	Clock out contents of the <code>VISI</code> register
0000	000000	NOP
0000	BADBB6	TBLRDH.B [<code>W6++</code>], [<code>W7++</code>]
0000	000000	NOP
0000	000000	NOP
0000	BAD3D6	TBLRDH.B [<code>++W6</code>], [<code>W7--</code>]
0000	000000	NOP
0000	000000	NOP
0001	< <code>VISI</code> >	Clock out contents of the <code>VISI</code> register
0000	000000	NOP
0000	BA0BB6	TBLRDL [<code>W6++</code>], [<code>W7</code>]
0000	000000	NOP
0000	000000	NOP
0001	< <code>VISI</code> >	Clock out contents of the <code>VISI</code> register
0000	000000	NOP
Step 5: Reset the device's internal PC.		
0000	040200	GOTO 0x200
0000	000000	NOP
Step 6: Repeat Steps 3 through 5 until all desired code memory is read (note that "Reset the device's internal PC" will be Step 5).		

PIC24FJXXXGA2/GB2 FAMILIES

3.9 Reading Configuration Words

The procedure for reading configuration memory is similar to the procedure for reading code memory, except that 16-bit data words are read instead of 24-bit words. Configuration Words are read, one register at a time.

Table 3-10 provides the ICSP programming details for reading the Configuration Words. Note that the TBLPAG register must be loaded with 00h for 64 Kbytes, and 01h for 128-Kbyte and 256-Kbyte devices. W6 is initialized to the lower 16 bits of the Configuration Word location.

TABLE 3-10: SERIAL INSTRUCTION EXECUTION FOR READING ALL CONFIGURATION MEMORY

Command (Binary)	Data (Hex)	Description
Step 1: Exit the Reset vector.		
0000	000000	NOP
0000	040200	GOTO 0x200
0000	000000	NOP
Step 2: Initialize the TBLPAG register, the Read Pointer (W6) and the Write Pointer (W7) for the TBLRD instruction.		
0000	200xx0	MOV #<CW1Address23:16>, W0
0000	8802A0	MOV W0, TBLPAG
0000	2xxxx6	MOV #<CW1Address15:0>, W6
0000	207847	MOV #VISI, W7
0000	000000	NOP
Step 3: Read the Configuration register and write it to the VISI register (located at 784h), and clock out the VISI register using the REGOUT command.		
0000	BA0BA6	TBLRDL [W6--], [W7]
0000	000000	NOP
0000	000000	NOP
0001	<VISI>	Clock out contents of the VISI register
0000	000000	NOP
Step 4: Repeat Step 3 to read Configuration Word 2 to Configuration Word 4.		
Step 5: Reset the device's internal PC.		
0000	040200	GOTO 0x200
0000	000000	NOP

PIC24FJXXXGA2/GB2 FAMILIES

3.10 Verify Code Memory and Configuration Word

The verify step involves reading back the code memory space and comparing it with the copy held in the programmer's buffer. The Configuration registers are verified with the rest of the code.

The verify process is shown in the flowchart in [Figure 3-8](#). Memory reads occur, a single byte at a time, so two bytes must be read to compare against the word in the programmer's buffer. Refer to [Section 3.8 "Reading Code Memory"](#) for implementation details of reading code memory.

Note: Because the Configuration registers include the device code protection bit, code memory should be verified immediately after writing if code protection is enabled. This is because the device will not be readable or verifiable if a device Reset occurs after the code-protect bit in CW1 has been cleared.

FIGURE 3-8: VERIFY CODE MEMORY FLOW

3.11 Reading the Application ID Word

The Application ID Word is stored at address, 8007F0h, in executive code memory. To read this memory location, you must use the `SIX` control code to move this program memory location to the VISI register. Then, the `REGOUT` control code must be used to clock the contents of the VISI register out of the device. [Table 3-11](#) provides the corresponding control and instruction codes that must be serially transmitted to the device to perform this operation.

After the programmer has clocked out the Application ID Word, it must be inspected. If the Application ID has the value, CEh, the Programming Executive is resident in memory and the device can be programmed using the mechanism described in [Section 4.0 "Device Programming – Enhanced ICSP"](#). However, if the Application ID has any other value, the Programming Executive is not resident in memory; it must be loaded to memory before the device can be programmed. The procedure for loading the Programming Executive to memory is described in [Section 5.4 "Programming the Programming Executive to Memory"](#).

3.12 Exiting ICSP Mode

Exiting Program/Verify mode is done by removing V_{IH} from MCLR, as shown in [Figure 3-9](#). The only requirement for exit is that an interval, P16, should elapse between the last clock, and program signals on PGECx and PGEDx, before removing V_{IH} .

FIGURE 3-9: EXITING ICSP™ MODE

TABLE 3-11: SERIAL INSTRUCTION EXECUTION FOR READING THE APPLICATION ID WORD

Command (Binary)	Data (Hex)	Description
Step 1: Exit the Reset vector.		
0000	000000	NOP
0000	040200	GOTO 0x200
0000	000000	NOP
Step 2: Initialize the TBLPAG register and the Read Pointer (W0) for the TBLRD instruction.		
0000	200800	MOV #0x80, W0
0000	8802A0	MOV W0, TBLPAG
0000	207F00	MOV #0x07F0, W0
0000	207841	MOV #VISI, W1
0000	000000	NOP
0000	BA0890	TBLRDL [W0], [W1]
0000	000000	NOP
0000	000000	NOP
Step 3: Output the VISI register using the REGOUT command.		
0001	<VISI>	Clock out contents of the VISI register
0000	000000	NOP

PIC24FJXXXGA2/GB2 FAMILIES

4.0 DEVICE PROGRAMMING – ENHANCED ICSP

This section discusses programming the device through Enhanced ICSP and the Programming Executive. The Programming Executive resides in executive memory (separate from code memory) and is executed when Enhanced ICSP Programming mode is entered. The Programming Executive provides the mechanism for the programmer (host device) to program and verify the PIC24FJXXXGA2/GB2 devices, using a simple command set and communication protocol. There are several basic functions provided by the Programming Executive:

- Read Memory
- Erase Memory
- Program Memory
- Blank Check
- Read Executive Firmware Revision

The Programming Executive performs the low-level tasks required for erasing, programming and verifying a device. This allows the programmer to program the device by issuing the appropriate commands and data. [Table 4-1](#) summarizes the commands. A detailed description for each command is provided in [Section 5.2 “Programming Executive Commands”](#).

TABLE 4-1: COMMAND SET SUMMARY

Command	Description
SCHECK	Sanity Check
READC	Read Device ID Registers
READP	Read Code Memory
PROGP	Program One Row of Code Memory and Verify
PROGW	Program One Word of Code Memory and Verify
QBLANK	Query if the Code Memory is Blank
QVER	Query the Software Version

The Programming Executive uses the device’s data RAM for variable storage and program execution. After the Programming Executive has run, no assumptions should be made about the contents of data RAM.

4.1 Overview of the Programming Process

[Figure 4-1](#) shows the high-level overview of the programming process. After entering Enhanced ICSP mode, the Programming Executive is verified. Next, the device is erased. Then, the code memory is programmed, followed by the configuration locations. Code memory (including the Configuration registers) is then verified to ensure that programming was successful.

After the Programming Executive has been verified in memory (or loaded if not present), the PIC24FJXXXGA2/GB2 devices can be programmed using the command set provided in [Table 4-1](#).

FIGURE 4-1: HIGH-LEVEL ENHANCED ICSP™ PROGRAMMING FLOW

4.2 Confirming the Presence of the Programming Executive

Before programming can begin, the programmer must confirm that the Programming Executive is stored in executive memory. The procedure for this task is shown in [Figure 4-2](#).

First, ICSP mode is entered. Then, the unique Application ID Word stored in executive memory is read. If the Programming Executive is resident, the Application ID Word is CEh, which means programming can resume as normal. However, if the Application ID Word is not CEh, the Programming Executive must be programmed to executive code memory using the method described in [Section 5.4 “Programming the Programming Executive to Memory”](#).

[Section 3.0 “Device Programming – ICSP”](#) describes the ICSP programming method. [Section 3.11 “Reading the Application ID Word”](#) describes the procedure for reading the Application ID Word in ICSP mode.

PIC24FJXXXGA2/GB2 FAMILIES

FIGURE 4-2: CONFIRMING PRESENCE OF PROGRAMMING EXECUTIVE

4.3 Entering Enhanced ICSP Mode

As shown in Figure 4-3, entering Enhanced ICSP Program/Verify mode requires three steps:

1. The $\overline{\text{MCLR}}$ pin is briefly driven high, then low.
2. A 32-bit key sequence is clocked into PGEDx.
3. $\overline{\text{MCLR}}$ is then driven high within a specified period and held.

The programming voltage applied to $\overline{\text{MCLR}}$ is V_{IH} , which is essentially V_{DD} in the case of PIC24FJXXXGA2/GB2 devices. There is no minimum time requirement for holding at V_{IH} . After V_{IH} is removed, an interval of at least P18 must elapse before presenting the key sequence on PGEDx.

The key sequence is a specific 32-bit pattern: '0100 1101 0100 0011 0100 1000 0101 0000' (more easily remembered as 4D434850h in hexadecimal format). The device will enter Program/Verify mode only if the key sequence is valid. The MSb of the most significant nibble must be shifted in first.

Once the key sequence is complete, V_{IH} must be applied to $\overline{\text{MCLR}}$ and held at that level for as long as Program/Verify mode is to be maintained. An interval of at least time, P19 and P7, must elapse before presenting data on PGEDx. Signals appearing on PGEDx, before P7 has elapsed, will not be interpreted as valid.

On successful entry, the program memory can be accessed and programmed in serial fashion. While in the Program/Verify mode, all unused I/Os are placed in the high-impedance state.

FIGURE 4-3: ENTERING ENHANCED ICSP™ MODE

PIC24FJXXXGA2/GB2 FAMILIES

4.4 Blank Check

The term, “Blank Check”, implies verifying that the device has been successfully erased and has no programmed memory locations. A blank or erased memory location is always read as ‘1’.

The Device ID registers (FF0002h:FF0000h) can be ignored by the Blank Check since this region stores device information that cannot be erased. The device Configuration registers are also ignored by the Blank Check. Additionally, all unimplemented memory space should be ignored by the Blank Check.

The `QBLANK` command is used for the Blank Check. It determines if the code memory is erased by testing these memory regions. A ‘BLANK’ or ‘NOT BLANK’ response is returned. If it is determined that the device is not blank, it must be erased before attempting to program the chip.

4.5 Code Memory Programming

4.5.1 PROGRAMMING METHODOLOGY

Code memory is programmed with the `PROGP` command. `PROGP` programs one row of code memory, starting from the memory address specified in the command. The number of `PROGP` commands required to program a device depends on the number of write blocks that must be programmed in the device.

A flowchart for programming the code memory of the PIC24FJXXXGA2/GB2 devices is shown in Figure 4-4. In this example, all 87K instruction words of a 256-Kbyte device are programmed. First, the number of commands to send (called ‘RemainingCmds’) in the flowchart) is set to 1368 and the destination address (called ‘BaseAddress’) is set to ‘0’. Next, one write block in the device is programmed with a `PROGP` command. Each `PROGP` command contains data for one row of code memory of the device. After the first command is processed successfully, ‘RemainingCmds’ is decremented by 1 and compared with 0. Since there are more `PROGP` commands to send, ‘BaseAddress’ is incremented by 80h to point to the next row of memory.

On the second `PROGP` command, the second row is programmed. This process is repeated until the entire device is programmed. No special handling must be performed when a panel boundary is crossed.

FIGURE 4-4: FLOWCHART FOR PROGRAMMING CODE MEMORY

4.5.2 PROGRAMMING VERIFICATION

After code memory is programmed, the contents of memory can be verified to ensure that programming was successful. Verification requires code memory to be read back and compared with the copy held in the programmer’s buffer.

The `READP` command can be used to read back all of the programmed code memory.

Alternatively, you can have the programmer perform the verification, after the entire device is programmed, using a checksum computation.

PIC24FJXXXGA2/GB2 FAMILIES

4.6 Configuration Bits Programming

4.6.1 OVERVIEW

The PIC24FJXXXGA2/GB2 devices have Configuration bits stored in the last four locations of implemented program memory (see [Table 2-2](#) for locations). These bits can be set or cleared to select various device configurations.

There are two types of Configuration bits: system operation bits and code-protect bits. The system operation bits determine the power-on settings for system-level components, such as the oscillator and Watchdog Timer. The code-protect bits prevent program memory from being read and written.

The descriptions for the Configuration bits for the PIC24FJXXXGA2/GB2 device families are shown in [Table 4-2](#).

Note: Although not implemented with a specific function, some Configuration bit positions have default states that must always be maintained to ensure device functionality, regardless of the settings of other Configuration bits. Refer to [Table 3-7](#) for a list of these bit positions and their default states.

TABLE 4-2: PIC24FJXXXGA2/GB2 CONFIGURATION BIT DESCRIPTIONS

Bit Field	Register ⁽¹⁾	Description
ALTCMPI	CW2<12>	Alternate Comparator Input bit 1 = C1INC is on RB13, C2INC is on RB9 and C3INC is on RA0 0 = C1INC, C2INC and C3INC are on RB9
ALTRB6 ^(2,3)	CW2<11>	Alternate RB6 Pin Functions Location Enable bit 1 = Appends the RP6/ASCL1/PMD6 functions of RB6 to RA1 pin functions 0 = Retains the RP6/ASCL1/PMD6 functions to RB6
BOREN	CW3<12>	Brown-out Reset Enable bit 1 = BOR is enabled in hardware (outside of Deep Sleep) 0 = BOR is disabled
DEBUG	CW1<11>	Background Debugger Enable bit 1 = Device resets into Operational mode 0 = Device resets into Debug mode
DSSWEN	CW4<8>	Deep Sleep Software Control bit 1 = Deep Sleep operation is enabled and controlled by the DSEN bit 0 = Deep Sleep operation is always disabled
DSWDTEN	CW4<7>	Deep Sleep Watchdog Timer (DSWDT) Enable bit 1 = DSWDT is enabled in Deep Sleep 0 = DSWDT is disabled
DSBOREN	CW4<6>	Deep Sleep BOR Enable bit 1 = BOR is enabled in Deep Sleep 0 = BOR is disabled in Deep Sleep (does not affect Sleep mode)
DSWDTOSC	CW4<5>	DSWDT Reference Clock Select bit 1 = DSWDT uses LPRC as the reference clock 0 = DSWDT uses SOSC as the reference clock

Note 1: Bits<23:16> should be programmed to a value of 00h to ensure that accidental program execution of any of the Configuration Words would be interpreted as a NOP opcode.

2: This bit must be '1' whenever VBUS functionality is used.

3: This bit is reserved in PIC24FJXXXGA20X devices; the default value is '0'.

4: The JTAGEN bit can be modified only using In-Circuit Serial Programming™ (ICSP™).

5: Irrespective of the WPCFG status, if WPEND = 1 or if the WPPF<6:0> bits correspond to the Configuration Words page, the Configuration Words page will be protected.

6: Reserved; do not use for the PIC24FJXXXGA20X family.

PIC24FJXXXGA2/GB2 FAMILIES

PIC24FJXXXGA2/GB2 FAMILIES

4.6.2 PROGRAMMING METHODOLOGY

Configuration bits may be programmed, a single word at a time, using the `PROGW` command. This command specifies the configuration data and Configuration register address. When Configuration bits are programmed, any unimplemented or reserved bits must be programmed with a '1'.

Four `PROGW` commands are required to program the Configuration bits. A flowchart for Configuration bit programming is shown in [Figure 4-5](#).

Note: If the General Segment Code-Protect bit (GCP) is programmed to '0', code memory is code-protected and cannot be read. Code memory must be verified before enabling read protection. See [Section 4.6.4 "Code-Protect Configuration Bits"](#) for more information about code-protected Configuration bits.

4.6.3 PROGRAMMING VERIFICATION

After the Configuration bits are programmed, the contents of memory should be verified to ensure that the programming was successful. Verification requires the Configuration bits to be read back and compared with the copy held in the programmer's buffer. The `READP` command reads back the programmed Configuration bits and verifies that the programming was successful.

FIGURE 4-5: CONFIGURATION BIT PROGRAMMING FLOW

PIC24FJXXXGA2/GB2 FAMILIES

4.6.4 CODE-PROTECT CONFIGURATION BITS

PIC24FJXXXGA2/GB2 devices provide two complementary methods to protect application code from overwrites and erasures. These methods also help to protect the device from inadvertent configuration changes during run time. Additional information is available in the product data sheet.

4.6.4.1 GENERAL SEGMENT PROTECTION

For the PIC24FJXXXGA2/GB2 devices, the on-chip program memory space is treated as a single block, known as the General Segment (GS). Code protection for this block is controlled by one Configuration bit, GCP. This bit inhibits external reads and writes to the program memory space; it has no direct effect in normal execution mode.

Write protection is controlled by the GWRP bit in the Configuration Word. When GWRP is programmed to '0', internal write and erase operations to the program memory are blocked.

4.6.4.2 CODE SEGMENT PROTECTION

In addition to global General Segment protection, a separate subrange of the program memory space can be individually protected against writes and erases. This area can be used for many purposes, where a separate block of write and erase-protected code is needed, such as bootloader applications. Unlike common boot block implementations, the specially protected segment in PIC24FJXXXGA2/GB2 devices can be located by the user anywhere in the program space and configured in a wide range of sizes.

Code segment protection provides an added level of protection to a designated area of program memory by disabling the NVM safety interlock whenever a write or erase address falls within a specified range. It does not override General Segment protection controlled by the GCP or GWRP bits. For example, if GCP and GWRP are enabled, enabling segmented code protection for the bottom half of program memory does not undo General Segment protection for the top half.

Note: Chip Erasing in ICSP mode is the only way to reprogram code-protect bits from an ON state ('0') to an OFF state ('1').

4.7 Exiting Enhanced ICSP Mode

Exiting Program/Verify mode is done by removing V_{IH} from MCLR, as shown in Figure 4-6. The only requirement for exit is that an interval, P16, should elapse between the last clock, and program signals on PGECx and PGEDx, before removing V_{IH} .

FIGURE 4-6: EXITING ENHANCED ICSP™ MODE

PIC24FJXXXGA2/GB2 FAMILIES

5.0 THE PROGRAMMING EXECUTIVE

Note: The Programming Executive (PE) can be obtained from each device page on the Microchip web site, www.microchip.com.

5.1 Programming Executive Communication

The programmer and Programming Executive have a master-slave relationship, where the programmer is the master programming device and the Programming Executive is the slave.

All communication is initiated by the programmer in the form of a command. Only one command at a time can be sent to the Programming Executive. In turn, the Programming Executive only sends one response to the programmer after receiving and processing a command. The Programming Executive command set is described in [Section 5.2 “Programming Executive Commands”](#). The response set is described in [Section 5.3 “Programming Executive Responses”](#).

5.1.1 COMMUNICATION INTERFACE AND PROTOCOL

The Enhanced ICSP interface is a 2-wire SPI, implemented using the PGECx and PGEDx pins. The PGECx pin is used as a clock input pin and the clock source must be provided by the programmer. The PGEDx pin is used for sending command data to, and receiving response data from, the Programming Executive.

Data transmits to the device must change on the rising edge and hold on the falling edge. Data receives from the device must change on the falling edge and hold on the rising edge.

All data transmissions are sent, MSb first, using 16-bit mode (see [Figure 5-1](#)).

FIGURE 5-1: PROGRAMMING EXECUTIVE SERIAL TIMING FOR DATA RECEIVED FROM DEVICE

FIGURE 5-2: PROGRAMMING EXECUTIVE SERIAL TIMING FOR DATA TRANSMITTED TO DEVICE

Since a 2-wire SPI is used, and data transmissions are half-duplex, a simple protocol is used to control the direction of PGEDx. When the programmer completes a command transmission, it releases the PGEDx line and allows the Programming Executive to drive this line high. The Programming Executive keeps the PGEDx line high to indicate that it is processing the command.

After the Programming Executive has processed the command, it brings PGEDx low for 15 μ s to indicate to the programmer that the response is available to be clocked out. The programmer can begin to clock out the response, 23 μ s after PGEDx is brought low, and it must provide the necessary amount of clock pulses to receive the entire response from the Programming Executive.

After the entire response is clocked out, the programmer should terminate the clock on PGECx until it is time to send another command to the Programming Executive. This protocol is shown in [Figure 5-3](#).

5.1.2 SPI RATE

In Enhanced ICSP mode, the PIC24FJXXXGA2/GB2 devices operate from the Internal Fast RC Oscillator (FRCDIV), which has a nominal frequency of 8 MHz. This oscillator frequency yields an effective system clock frequency of 4 MHz. To ensure that the programmer does not clock too fast, it is recommended that a 4 MHz clock be provided by the programmer.

PIC24FJXXXGA2/GB2 FAMILIES

5.1.3 TIME-OUTS

The Programming Executive uses no Watchdog Timer or time-out for transmitting responses to the programmer. If the programmer does not follow the flow control mechanism using PGECx, as described in [Section 5.1.1 “Communication Interface and Protocol”](#), it is possible that the Programming Executive will behave unexpectedly while trying to send a response to the

programmer. Since the Programming Executive has no time-out, it is imperative that the programmer correctly follow the described communication protocol.

As a safety measure, the programmer should use the command time-outs identified and provided in [Table 5-1](#). If the command time-out expires, the programmer should reset the Programming Executive and start programming the device again.

FIGURE 5-3: PROGRAMMING EXECUTIVE – PROGRAMMER COMMUNICATION PROTOCOL

5.2 Programming Executive Commands

The Programming Executive command set is shown in [Table 5-1](#). This table contains the opcode, mnemonic, length, time-out and description for each command. Functional details on each command are provided in [Section 5.2.4 “Command Descriptions”](#).

5.2.1 COMMAND FORMAT

All Programming Executive commands have a general format, consisting of a 16-bit header and any required data for the command (see [Figure 5-4](#)). The 16-bit header consists of a 4-bit opcode field, which is used to identify the command, followed by a 12-bit command length field.

FIGURE 5-4: COMMAND FORMAT

The command opcode must match one of those in the command set. Any command that is received, which does not match the list in [Table 5-1](#), will return a “NACK” response (see [Section 5.3.1.1 “Opcode Field”](#)).

The command length is represented in 16-bit words since the SPI operates in 16-bit mode. The Programming Executive uses the command length field to determine the number of words to read from the SPI port. If the value of this field is incorrect, the command will not be properly received by the Programming Executive.

PIC24FJXXXGA2/GB2 FAMILIES

5.2.2 PACKED DATA FORMAT

When 24-bit instruction words are transferred across the 16-bit SPI interface, they are packed to conserve space using the format shown in [Figure 5-5](#). This format minimizes traffic over the SPI and provides the Programming Executive with data that is properly aligned for performing Table Write operations.

FIGURE 5-5: PACKED INSTRUCTION WORD FORMAT

Note: When the number of instruction words transferred is odd, MSB2 is zero and LSW2 cannot be transmitted.

5.2.3 PROGRAMMING EXECUTIVE ERROR HANDLING

The Programming Executive will “NACK” all unsupported commands. Additionally, due to the memory constraints of the Programming Executive, no checking is performed on the data contained in the programmer command. It is the responsibility of the programmer to command the Programming Executive with valid command arguments or the programming operation may fail. Additional information on error handling is provided in [Section 5.3.1.3 “QE_Code Field”](#).

TABLE 5-1: PROGRAMMING EXECUTIVE COMMAND SET

Opcode	Mnemonic	Length (16-bit words)	Time-out	Description
0h	SCHECK	1	1 ms	Sanity check.
1h	READC	3	1 ms	Read an 8-bit word from the specified Device ID register.
2h	READP	4	1 ms/row	Read N 24-bit instruction words of code memory, starting from the specified address.
3h	RESERVED	N/A	N/A	This command is reserved; it will return a NACK.
4h	PROGC	4	5 ms	Write an 8-bit word to the specified Device ID registers.
5h	PROGP	99	5 ms	Program one row of code memory at the specified address, then verify. ⁽¹⁾
6h	RESERVED	5	5 ms	This command is reserved; it will return a NACK.
7h	RESERVED	N/A	N/A	This command is reserved; it will return a NACK.
8h	RESERVED	N/A	N/A	This command is reserved; it will return a NACK.
9h	RESERVED	N/A	N/A	This command is reserved; it will return a NACK.
Ah	RESERVED	N/A	N/A	This command is reserved.
Bh	QVER	1	1 ms	Query the Programming Executive software version.
Ch	RESERVED	N/A	N/A	This command is reserved; it will return a NACK.
Dh	PROGW	4	5 ms	Program one instruction word of code memory at the specified address and then verify.
Eh	QBLANK	3	30 ms/Kbyte	Query if the code memory is blank.

Note 1: One row of code memory consists of (64) 24-bit words. Refer to [Table 2-2](#) for device-specific information.

PIC24FJXXXGA2/GB2 FAMILIES

5.2.4 COMMAND DESCRIPTIONS

All commands supported by the Programming Executive are described in [Section 5.2.5 “SCHECK Command”](#) through [Section 5.2.12 “QVER Command”](#).

5.2.5 SCHECK COMMAND

15	12	11	0
Opcode	Length		

Field	Description
Opcode	0h
Length	1h

The `SCHECK` command instructs the Programming Executive to do nothing but generate a response. This command is used as a “Sanity Check” to verify that the Programming Executive is operational.

Expected Response (2 Words):

1000h
0002h

Note: This instruction is not required for programming; it is provided for development purposes only.

5.2.6 READC COMMAND

15	12	11	8	7	0
Opcode		Length			
N			Addr_MSB		
Addr_LS					

Field	Description
Opcode	1h
Length	3h
N	Number of 8-bit Device ID registers to read (max. of 256)
Addr_MSB	MSB of 24-bit source address
Addr_LS	Least Significant 16 bits of 24-bit source address

The `READC` command instructs the Programming Executive to read N or Device ID registers, starting from the 24-bit address specified by `Addr_MSB` and `Addr_LS`. This command can only be used to read 8-bit or 16-bit data.

When this command is used to read Device ID registers, the upper byte in every data word returned by the Programming Executive is 00h and the lower byte contains the Device ID register value.

Expected Response (4 + 3 * (N – 1)/2 Words for N Odd):

1100h
2 + N
Device ID Register 1
...
Device ID Register N

Note: Reading unimplemented memory will cause the Programming Executive to reset. Ensure that only memory locations present on a particular device are accessed.

PIC24FJXXXGA2/GB2 FAMILIES

5.2.7 READP COMMAND

15	12	11	8	7	0
Opcode		Length			
N					
Reserved			Addr_MSB		
Addr_LS					

Field	Description
Opcode	2h
Length	4h
N	Number of 24-bit instructions to read (max. of 32768)
Reserved	0h
Addr_MSB	MSB of 24-bit source address
Addr_LS	Least Significant 16 bits of 24-bit source address

The **READP** command instructs the Programming Executive to read N 24-bit words of code memory, including Configuration Words, starting from the 24-bit address specified by Addr_MSB and Addr_LS. This command can only be used to read 24-bit data. All data returned in response to this command uses the packed data format described in [Section 5.2.2 “Packed Data Format”](#).

Expected Response (2 + 3 * N/2 Words for N Even):

1200h
 2 + 3 * N/2
 Least Significant Program Memory Word 1
 ...
 Least Significant Data Word N

Expected Response (4 + 3 * (N – 1)/2 Words for N Odd):

1200h
 4 + 3 * (N – 1)/2
 Least Significant Program Memory Word 1
 ...
 MSB of Program Memory Word N (zero-padded)

Note: Reading unimplemented memory will cause the Programming Executive to reset. Ensure that only memory locations present on a particular device are accessed.

5.2.8 PROGC COMMAND

15	12	11	8	7	0
Opcode		Length			
Reserved			Addr_MSB		
Addr_LS					
Data					

Field	Description
Opcode	4h
Length	4h
Reserved	0h
Addr_MSB	MSB of the 24-bit destination address
Addr_LS	Least Significant 16 bits of the 24-bit destination address
Data	8-bit data word

The **PROGC** command instructs the Programming Executive to program a single Device ID register located at the specified memory address.

After the specified data word has been programmed to code memory, the Programming Executive verifies the programmed data against the data in the command.

Expected Response (2 Words):

1400h
 0002h

PIC24FJXXXGA2/GB2 FAMILIES

5.2.9 PROGP COMMAND

15	12	11	8	7	0
Opcode		Length			
Reserved			Addr_MSB		
Addr_LS					
D_1					
D_2					
...					
D_96					

Field	Description
Opcode	5h
Length	63h
Reserved	0h
Addr_MSB	MSB of the 24-bit destination address
Addr_LS	Least Significant 16 bits of the 24-bit destination address
D_1	16-bit Data Word 1
D_2	16-bit Data Word 2
...	16-bit Data Word 3 through 95
D_96	16-bit Data Word 96

The **PROGP** command instructs the Programming Executive to program one row of code memory, including Configuration Words (64 instruction words), to the specified memory address. Programming begins with the row address specified in the command. The destination address should be a multiple of 80h.

The data to program to memory, located in command words, D_1 through D_96, must be arranged using the packed instruction word format shown in [Figure 5-5](#).

After all data has been programmed to code memory, the Programming Executive verifies the programmed data against the data in the command.

Expected Response (2 Words):

1500h
0002h

Note: Refer to [Table 2-2](#) for code memory size information.

5.2.10 PROGW COMMAND

15	12	11	8	7	0
Opcode		Length			
Data_MSB			Addr_MSB		
Addr_LS					
Data_LS					

Field	Description
Opcode	Dh
Length	4h
Reserved	0h
Addr_MSB	MSB of the 24-bit destination address
Addr_LS	Least Significant 16 bits of the 24-bit destination address
Data_MSB	MSB of 24-bit data
Data_LS	Least Significant 16 bits of the 24-bit data

The **PROGW** command instructs the Programming Executive to program one word of code memory (3 bytes) to the specific memory address.

After the word has been programmed to code memory, the Programming Executive verifies the programmed data against the data in the command.

Expected Response (2 Words):

1600h
0002h

PIC24FJXXXGA2/GB2 FAMILIES

5.2.11 QBLANK COMMAND

15	12	11	0
Opcode	Length		
PSize_MSW			
PSize_LSW			

Field	Description
Opcode	Ah
Length	3h
PSize	Length of program memory to check in 24-bit words plus one (max. of 49152)

The **QBLANK** command queries the Programming Executive to determine if the contents of code memory and code-protect Configuration bits (GCP and GWRP) are blank (contain all '1's). The size of code memory to check must be specified in the command.

The Blank Check for code memory begins at 0h and advances toward larger addresses for the specified number of instruction words.

QBLANK returns a QE_Code of F0h if the specified code memory and code-protect bits are blank; otherwise, **QBLANK** returns a QE_Code of 0Fh.

Expected Response (2 Words for Blank Device):

1AF0h
0002h

Expected Response (2 Words for Non-Blank Device):

1A0Fh
0002h

Note: **QBLANK** does not check the system operation Configuration bits, since these bits are not set to '1' when a Chip Erase is performed.

5.2.12 QVER COMMAND

15	12	11	0
Opcode	Length		

Field	Description
Opcode	Bh
Length	1h

The **QVER** command queries the version of the Programming Executive software stored in test memory. The "version.revision" information is returned in the response's QE_Code, using a single byte with the following format: main version in upper nibble and revision in the lower nibble (i.e., 23h means Version 2.3 of Programming Executive software).

Expected Response (2 Words):

1BMNh (where "MN" stands for Version M.N)
0002h

PIC24FJXXXGA2/GB2 FAMILIES

5.3 Programming Executive Responses

The Programming Executive sends a response to the programmer for each command that it receives. The response indicates if the command was processed correctly. It includes any required response data or error data.

The Programming Executive response set is shown in [Table 5-2](#). This table contains the opcode, mnemonic and description for each response. The response format is described in [Section 5.3.1 “Response Format”](#).

TABLE 5-2: PROGRAMMING EXECUTIVE RESPONSE OPCODES

Opcode	Mnemonic	Description
1h	PASS	Command is successfully processed
2h	FAIL	Command is unsuccessfully processed
3h	NACK	Command is not known

5.3.1 RESPONSE FORMAT

All Programming Executive responses have a general format, consisting of a two-word header and any required data for the command.

Field	Description
Opcode	Response opcode
Last_Cmd	Programmer command that generated the response
QE_Code	Query code or error code
Length	Response length in 16-bit words (includes 2 header words)
D_1	First 16-bit data word (if applicable)
D_N	Last 16-bit data word (if applicable)

5.3.1.1 Opcode Field

The opcode is a 4-bit field in the first word of the response. The opcode indicates how the command was processed (see [Table 5-2](#)). If the command was processed successfully, the response opcode is PASS. If there was an error in processing the command, the response opcode is FAIL and the QE_Code indicates the reason for the failure. If the command sent to the Programming Executive is not identified, the Programming Executive returns a NACK response.

5.3.1.2 Last_Cmd Field

The Last_Cmd is a 4-bit field in the first word of the response and indicates the command that the Programming Executive processed. Since the Programming Executive can only process one command at a time, this field is technically not required. However, it can be used to verify that the Programming Executive correctly received the command that the programmer transmitted.

PIC24FJXXXGA2/GB2 FAMILIES

5.3.1.3 QE_Code Field

The QE_Code is a byte in the first word of the response. This byte is used to return data for query commands and error codes for all other commands.

When the Programming Executive processes one of the two query commands (`QBLANK` or `QVER`), the returned opcode is always PASS and the QE_Code holds the query response data. The format of the QE_Code for both queries is provided in [Table 5-3](#).

TABLE 5-3: QE_Code FOR QUERIES

Query	QE_Code
QBLANK	0Fh = Code memory is NOT blank F0h = Code memory is blank
QVER	0xMN, where Programming Executive Software Version = M.N (i.e., 32h means Software Version 3.2)

When the Programming Executive processes any command other than a query, the QE_Code represents an error code. Supported error codes are shown in [Table 5-4](#). If a command is successfully processed, the returned QE_Code is set to 0h, which indicates that there was no error in the command processing. If the verification of the programming for the `PROGP` or `PROGC` command fails, the QE_Code is set to 1h. For all other Programming Executive errors, the QE_Code is 2h.

TABLE 5-4: QE_Code FOR NON-QUERY COMMANDS

QE_Code	Description
0h	No error
1h	Verify failed
2h	Other error

5.3.1.4 Response Length

The response length indicates the length of the Programming Executive's response in 16-bit words. This field includes the 2 words of the response header.

With the exception of the response for the `READP` command, the length of each response is only 2 words.

The response to the `READP` command uses the packed instruction word format, described in [Section 5.2.2 "Packed Data Format"](#). When reading an odd number of program memory words (N odd), the response to the `READP` command is $(3 * (N + 1)/2 + 2)$ words. When reading an even number of program memory words (N even), the response to the `READP` command is $(3 * N/2 + 2)$ words.

PIC24FJXXXGA2/GB2 FAMILIES

5.4 Programming the Programming Executive to Memory

5.4.1 OVERVIEW

If it is determined that the Programming Executive is not present in executive memory (as described in [Section 4.2 “Confirming the Presence of the Programming Executive”](#)), it must be programmed into executive memory using ICSP, as described in [Section 3.0 “Device Programming – ICSP”](#).

Storing the Programming Executive to executive memory is similar to normal programming of code memory. Namely, the executive memory must be erased and then the Programming Executive must be programmed, 64 words at a time. [Table 5-5](#) provides this control flow.

Note: The Programming Executive must always be erased before it is programmed, as described in [Table 5-5](#).

TABLE 5-5: PROGRAMMING THE EXECUTIVE

Command (Binary)	Data (Hex)	Description
Step 1: Exit the Reset vector and erase the executive memory.		
0000	000000	NOP
0000	040200	GOTO 0x200
0000	000000	NOP
Step 2: Initialize the NVMCON register to erase the executive memory.		
0000	240420	MOV #0x4042, W0
0000	883B00	MOV W0, NVMCON
Step 3: Initialize the Erase Pointers to the first page of the executive and then initiate the erase cycle.		
0000	200800	MOV #0x80, W0
0000	8802A0	MOV W0, TBLPAG
0000	200001	MOV #0x0, W1
0000	000000	NOP
0000	BB0881	TBLWTL W1, [W1]
0000	000000	NOP
0000	000000	NOP
0000	A8E761	BSET NVMCON, #15
0000	000000	NOP
0000	000000	NOP
Step 4: Repeat this step to poll the WR bit (bit 15 of NVMCON) until it is cleared by the hardware.		
0000	040200	GOTO 0x200
0000	000000	NOP
0000	803B02	MOV NVMCON, W2
0000	883C22	MOV W2, VISI
0001	000000	NOP
<VISI>		Clock out contents of the VISI register.
0000	000000	NOP
Step 5: Repeat Steps 3 and 4 to erase the second page of executive memory. The W1 Pointer should be incremented by 400h to point to the second page.		
Step 6: Initialize the NVMCON register to program 64 instruction words.		
0000	240010	MOV #0x4001, W0
0000	883B00	MOV W0, NVMCON
Step 7: Initialize the TBLPAG register and the Write Pointer (W7).		
0000	200800	MOV #0x80, W0
0000	8802A0	MOV W0, TBLPAG
0000	EB0380	CLR W7
0000	000000	NOP

PIC24FJXXXGA2/GB2 FAMILIES

TABLE 5-5: PROGRAMMING THE EXECUTIVE (CONTINUED)

Command (Binary)	Data (Hex)	Description
Step 8: Load W0:W5 with the next four words of packed Programming Executive code and initialize W6 for programming. Programming starts from the base of executive memory (800000h) using W6 as a Read Pointer and W7 as a Write Pointer.		
0000	2<LSW0>0	MOV #<LSW0>, W0
0000	2<MSB1:MSB0>1	MOV #<MSB1:MSB0>, W1
0000	2<LSW1>2	MOV #<LSW1>, W2
0000	2<LSW2>3	MOV #<LSW2>, W3
0000	2<MSB3:MSB2>4	MOV #<MSB3:MSB2>, W4
0000	2<LSW3>5	MOV #<LSW3>, W5
Step 9: Set the Read Pointer (W6) and load the (next four write) latches.		
0000	EB0300	CLR W6
0000	000000	NOP
0000	BB0BB6	TBLWTL [W6++], [W7]
0000	000000	NOP
0000	000000	NOP
0000	BBDBB6	TBLWTH.B [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BBEBB6	TBLWTH.B [W6++], [++W7]
0000	000000	NOP
0000	000000	NOP
0000	BB1BB6	TBLWTL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BB0BB6	TBLWTL [W6++], [W7]
0000	000000	NOP
0000	000000	NOP
0000	BBDBB6	TBLWTH.B [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BBEBB6	TBLWTH.B [W6++], [++W7]
0000	000000	NOP
0000	000000	NOP
0000	BB1BB6	TBLWTL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
Step 10: Repeat Steps 8 and 9, 16 times, to load the write latches for the 64 instructions.		
Step 11: Initiate the programming cycle.		
0000	A8E761	BSET NVMCON, #15
0000	000000	NOP
0000	000000	NOP
Step 12: Repeat this step to poll the WR bit (bit 15 of NVMCON) until it is cleared by the hardware.		
0000	040200	GOTO 0x200
0000	000000	NOP
0000	803B02	MOV NVMCON, W2
0000	883C22	MOV W2, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of the VISI register.
0000	000000	NOP
Step 13: Reset the device's internal PC.		
0000	040200	GOTO 0x200
0000	000000	NOP
Step 14: Repeat Steps 8 through 13 until all 16 rows of executive memory have been programmed.		

PIC24FJXXXGA2/GB2 FAMILIES

5.4.2 PROGRAMMING VERIFICATION

After the Programming Executive has been programmed to executive memory using ICSP, it must be verified. Verification is performed by reading out the contents of executive memory and comparing it with the image of the Programming Executive stored in the programmer.

Reading the contents of executive memory can be performed using the same technique described in [Section 3.8 “Reading Code Memory”](#). A procedure for reading executive memory is provided in [Table 5-6](#). Note that in Step 2, the TBLPAG register is set to 80h, such that executive memory may be read. The last eight words of executive memory should be verified with stored values of the diagnostic and calibration words to ensure accuracy.

TABLE 5-6: READING EXECUTIVE MEMORY

Command (Binary)	Data (Hex)	Description
Step 1: Exit the Reset vector.		
0000	000000	NOP
0000	040200	GOTO 0x200
0000	000000	NOP
Step 2: Initialize the TBLPAG register and the Read Pointer (W6) for the TBLRD instruction.		
0000	200800	MOV #0x80, W0
0000	8802A0	MOV W0, TBLPAG
0000	EB0300	CLR W6
Step 3: Initialize the Write Pointer (W7) to point to the VISI register.		
0000	207847	MOV #VISI, W7
0000	000000	NOP
Step 4: Read and clock out the contents of the next two locations of executive memory, through the VISI register, using the REGOUT command.		
0000	BA0B96	TBLRDL [W6], [W7]
0000	000000	NOP
0000	000000	NOP
0001	<VISI>	Clock out contents of the VISI register
0000	000000	NOP
0000	BADBB6	TBLRDH.B [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BAD3D6	TBLRDH.B [++W6], [W7--]
0000	000000	NOP
0000	000000	NOP
0001	<VISI>	Clock out contents of the VISI register
0000	000000	NOP
0000	BA0BB6	TBLRDL [W6++], [W7]
0000	000000	NOP
0000	000000	NOP
0001	<VISI>	Clock out contents of the VISI register
0000	000000	NOP
Step 5: Reset the device's internal PC.		
0000	040200	GOTO 0x200
0000	000000	NOP
Step 6: Repeat Steps 4 and 5 until all 1024 instruction words of executive memory are read.		

PIC24FJXXXGA2/GB2 FAMILIES

6.0 DEVICE DETAILS

6.1 Device ID

The Device ID region of memory can be used to determine mask, variant and manufacturing information about the chip. The Device ID region is 2 x 16 bits and it can be read using the `READC` command. This region of memory is read-only and can also be read when code protection is enabled.

Table 6-1 shows the Device ID for each device, Table 6-2 shows the Device ID registers and Table 6-3 describes the bit field of each register.

TABLE 6-1: DEVICE IDs

Device	DEVID
PIC24FJ128GB204	4C5B
PIC24FJ128GB202	4C5A
PIC24FJ64GB204	4C59
PIC24FJ64GB202	4C58
PIC24FJ128GA204	4C53
PIC24FJ128GA202	4C52
PIC24FJ64GA204	4C51
PIC24FJ64GA202	4C50

TABLE 6-2: PIC24FJXXXGA2/GB2 DEVICE ID REGISTERS

Address	Name	Bit															
		15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FF0000h	DEVID	FAMID<7:0>								DEV<7:0>							
FF0002h	DEVREV	—												REV<3:0>			

TABLE 6-3: DEVICE ID BIT DESCRIPTIONS

Bit Field	Register	Description
FAMID<7:0>	DEVID	Encodes the ID of the device family
DEV<7:0>	DEVID	Encodes the individual ID of the device
REV<3:0>	DEVREV	Encodes the sequential (numerical) revision identifier of the device

PIC24FJXXXGA2/GB2 FAMILIES

6.2 Checksum Computation

Checksums for the PIC24FJXXXGA2/GB2 devices are 16 bits in size. The checksum is calculated by summing the following:

- Contents of code memory locations
- Contents of Configuration registers

Table 6-4 describes how to calculate the checksum for each device. All memory locations are summed, one byte at a time, using only their native data size. More specifically, Configuration registers are summed by adding the lower two bytes of these locations (the upper byte is ignored), while code memory is summed by adding all three bytes of code memory.

TABLE 6-4: CHECKSUM COMPUTATION

Device	Read Code Protection	Checksum Computation	Erased Checksum Value	Checksum with 0xAAAAAA at 0x0 and Last Code Address
PIC24FJ128GA204	Disabled	CFGB + SUM(0:157F7)	F73C	F53E
	Enabled	0	0000h	0000h
PIC24FJ128GA202	Disabled	CFGB + SUM(0:157F7)	F73C	F53E
	Enabled	0	0000h	0000h
PIC24FJ128GB204	Disabled	CFGB + SUM(0:157F7)	F744h	F546h
	Enabled	0	0000h	0000h
PIC24FJ128GB202	Disabled	CFGB + SUM(0:157F7)	F744h	F546h
	Enabled	0	0000h	0000h
PIC24FJ64GA204	Disabled	CFGB + SUM(0:0ABF7)	F93C	F73E
	Enabled	0	0000h	0000h
PIC24FJ64GA202	Disabled	CFGB + SUM(0:0ABF7)	F93C	F73E
	Enabled	043	0000h	0000h
PIC24FJ64GB204	Disabled	CFGB + SUM(0:0ABF7)	F944h	F746h
	Enabled	0	0000h	0000h
PIC24FJ64GB202	Disabled	CFGB + SUM(0:0ABF7)	F944h	F746h
	Enabled	0	0000h	0000h

Legend:

Item	Description
SUM[a:b]	Byte sum of locations, a to b inclusive (all 3 bytes of code memory)
CFGB	Configuration Block (masked) byte sum of ((CW1 & 0x7FFF) + (CW2 & 0xFFFF) + (CW3 & 0xFFFF) + (CW4 & 0xFFFF))

Note: CW1 address is the last location of implemented program memory; CW2 is (last location – 2); CW3 is (last location – 4); CW4 is (last location – 6).

PIC24FJXXXGA2/GB2 FAMILIES

7.0 AC/DC CHARACTERISTICS AND TIMING REQUIREMENTS

Standard Operating Conditions

Operating Temperature: 0°C to +70°C. Programming at +25°C is recommended.

Param No.	Symbol	Characteristic	Min	Max	Units	Conditions
D111	VDD	Supply Voltage During Programming	2.20	3.60	V	Normal programming ⁽¹⁾
D112	I _{PP}	Programming Current on $\overline{\text{MCLR}}$	—	5	μA	
D113	I _{DDP}	Supply Current During Programming	—	16	mA	
D031	V _{IL}	Input Low Voltage	V _{SS}	0.2 V _{DD}	V	
D041	V _{IH}	Input High Voltage	0.8 V _{DD}	V _{DD}	V	
D080	V _{OL}	Output Low Voltage	—	0.4	V	I _{OL} = 8.5 mA @ 3.6V
D090	V _{OH}	Output High Voltage	3.0	—	V	I _{OH} = -3.0 mA @ 3.6V
D012	C _{IO}	Capacitive Loading on I/O Pin (PGEDx)	—	50	pF	To meet AC specifications
D013	C _F	Filter Capacitor Value on VCAP	4.7	10	μF	Required for controller core
P1	TPGEC	Serial Clock (PGECx) Period	100	—	ns	ICSP™ mode
			250	—	ns	Enhanced ICSP mode
P1A	TPGECL	Serial Clock (PGECx) Low Time	40	—	ns	ICSP mode
			100	—	ns	Enhanced ICSP mode
P1B	TPGECH	Serial Clock (PGECx) High Time	40	—	ns	ICSP mode
			100	—	ns	Enhanced ICSP mode
P2	TSET1	Input Data Setup Time to Serial Clock ↑	15	—	ns	
P3	THLD1	Input Data Hold Time from PGECx ↑	15	—	ns	
P4	TDLY1	Delay Between 4-Bit Command and Command Operand	40	—	ns	
P4A	TDLY1A	Delay Between 4-Bit Command Operand and Next 4-Bit Command	40	—	ns	
P5	TDLY2	Delay Between Last PGECx ↓ of Command Byte to First PGECx ↑ of Read of Data Word	20	—	ns	
P6	TSET2	VDD ↑ Setup Time to $\overline{\text{MCLR}}$ ↑	100	—	ns	
P7	THLD2	Input Data Hold Time from $\overline{\text{MCLR}}$ ↑	25	—	ms	
P8	TDLY3	Delay Between Last PGECx ↓ of Command Byte to PGEDx ↑ by Programming Executive	12	—	μs	
P9	TDLY4	Programming Executive Command Processing Time	40	—	μs	
P10	TDLY6	PGECx Low Time After Programming	400	—	ns	
P11	TDLY7	Chip Erase Time	20	40	ms	
P12	TDLY8	Page Erase Time	20	40	ms	
P13	TDLY9	Row Programming Time	1.5	—	ms	
P14	T _R	$\overline{\text{MCLR}}$ Rise Time to Enter ICSP mode	—	1.0	μs	
P15	T _{VALID}	Data Out Valid from PGECx ↑	10	—	ns	
P16	TDLY10	Delay Between Last PGECx ↓ and $\overline{\text{MCLR}}$ ↓	0	—	s	
P17	THLD3	$\overline{\text{MCLR}}$ ↓ to VDD ↓	100	—	ns	
P18	T _{KEY1}	Delay from First $\overline{\text{MCLR}}$ ↓ to First PGECx ↑ for Key Sequence on PGEDx	10	—	ms	

Note 1: VDD must also be supplied to the AVDD pins during programming. AVDD and AVSS should always be within ±0.3V of VDD and VSS, respectively. When the internal voltage regulator is enabled (i.e., ENVREG = VDD), the nominal VCAP is 1.8V.

PIC24FJXXXGA2/GB2 FAMILIES

7.0 AC/DC CHARACTERISTICS AND TIMING REQUIREMENTS (CONTINUED)

Standard Operating Conditions

Operating Temperature: 0°C to +70°C. Programming at +25°C is recommended.

Param No.	Symbol	Characteristic	Min	Max	Units	Conditions
P19	TKEY2	Delay from Last PGECx ↓ for Key Sequence on PGEDx to Second MCLR ↑	1	—	ms	
P20	TDLY11	Delay Between PGEDx ↓ by Programming Executive to PGEDx Driven by Host	23	—	μs	
P21	TDLY12	Delay Between Programming Executive Command Response Words	8	—	ns	

Note 1: VDD must also be supplied to the AVDD pins during programming. AVDD and AVSS should always be within ±0.3V of VDD and VSS, respectively. When the internal voltage regulator is enabled (i.e., ENVREG = VDD), the nominal VCAP is 1.8V.

APPENDIX A: REVISION HISTORY

Revision A (March 2012)

Initial revision of this document, released for PIC24FJ128GB204 family devices.

Revision B (August 2012)

Adds the PIC24FJ128GA204 device family to the specification:

Changes opcode in Table 3-4, Table 3-5, Table 3-8, Table 5-5 and [Section 2.0 “Programming Overview of PIC24FJXXXGA2/GB2 Devices”](#).

Revision C (January 2013)

Redistributes pin diagrams for clarity and adds [Figure 2-6](#).

Updates [Table 2-2](#) to include new devices.

Updates [Table 6-1](#) to update all Device IDs.

Corrects notes on specification, P18 (TKEY1), and removes alternate value; key specification value of 10 ms is unchanged.

Updates the history description for Revision B (previously did not mention the addition of the PIC24FJ128GA204 device family).

Revision D (February 2014)

This revision incorporates the following updates:

- Figures:
 - Updated [Figure 2-3](#), [Figure 2-4](#), [Figure 2-5](#), [Figure 2-6](#)
- Tables:
 - Updated [Table 3-7](#), [Table 4-2](#), [Table 5-5](#)

Revision E (May 2014)

This revision incorporates the following updates:

- Tables:
 - Updates [Table 3-6](#), [Table 3-7](#), [Table 4-2](#), [Table 6-4](#)

Revision F (May 2015)

This revision incorporates the following updates:

- Tables:
 - Updates [Table 3-6](#), [Table 3-7](#), [Table 4-2](#) and [Table 6-4](#)

PIC24FJXXXGA2/GB2 FAMILIES

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, dsPIC, FlashFlex, flexPWR, JukeBlox, KEELOQ, KEELOQ logo, Klear, LANCheck, MediaLB, MOST, MOST logo, MPLAB, OptoLyzer, PIC, PICSTART, PIC³² logo, RightTouch, SpyNIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
== ISO/TS 16949 ==

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
