RF Design Tools

ADI supports its broad product portfolio with a comprehensive suite of design tools. These tools reduce design risk and time to market by making the overall RF-to-digital design process simpler, faster, more accurate, and more robust.

ADIsimRF

ADIsimRF™ provides calculations for the most important parameters within the RF signal chain, including cascaded gain, noise figure, IP3, P1dB, and total power consumption.

ADIsimPLL

ADIsimPLL™ enables the rapid and reliable evaluation of ADI's high performance PLL synthesizers. It is the most comprehensive PLL design tool available today. It performs simulations of all key nonlinear effects that impact PLL performance and removes iterations from the design process, thereby speeding design times.

ADIsimFrequencyPlanner

ADIsimFrequencyPlanner enables fast, accurate simulation and elimination of integer boundary spurs from Analog Devices PLL synthesizers. The tool analyzes the user's output requirements, and then optimizes the PFD frequency for each output step to give the best integer boundary spur performance. The optimum PFD frequency is selected by changing the output divider of the clock generation chip and changing the reference input divider of the PLL/VCO.

ADIsimCLK

Developed specifically for ADI's range of ultralow jitter clock distribution and clock generation products, ADIsimCLK™ allows users to rapidly develop, evaluate, and optimize designs. It enables direct modification of parameters, such as loop bandwidth, divide ratios, phase offsets, and output frequencies, and shows the performance effects of the changes in real time.

Virtual Eval

Virtual Eval™ accurately models the typical performance characteristics of many of ADI's high speed converters. It reproduces the errors associated with both static and dynamic features such as ac linearity, clock jitter, and many other product specific anomalies.
