S-8240B Series

BATTERY PROTECTION IC FOR 1-CELL PACK

www.sii-ic.com

Rev.1.0_00

The S-8240B Series is a protection IC for lithium-ion / lithium polymer rechargeable batteries and includes high-accuracy voltage detection circuits and delay circuits.
The S-8240B Series is suitable for protecting 1-cell lithium-ion / lithium polymer rechargeable battery packs from overcharge, overdischarge, and overcurrent.

■ Features

- High-accuracy voltage detection circuit

Overcharge detection voltage	3.5 V to 4.6 V (5 mV step)	Accuracy ±20 mV
Overcharge release voltage	3.1 V to 4.6 V[*1]	Accuracy ±50 mV
Overdischarge detection voltage	2.0 V to 3.4 V (10 mV step)	Accuracy ±50 mV
Overdischarge release voltage	2.0 V to 3.4 V[*2]	Accuracy ±100 mV
Discharge overcurrent detection voltage	0.015 V to 0.100 V (1 mV step)	Accuracy ±3 mV
Load short-circuiting detection voltage	0.065 V to 0.500 V (25 mV step)[*3]	Accuracy ±40 mV
Charge overcurrent detection voltage	–0.100 V to –0.015 V (1 mV step)	Accuracy ±3 mV

- Detection delay times are generated only by an internal circuit (external capacitors are unnecessary).
- 0 V battery charge function is selectable: Available, unavailable
- Power-down function is selectable: Available, unavailable
- Release condition of discharge overcurrent status is selectable: Load disconnection, charger connection
- Release voltage of discharge overcurrent status is selectable: V_{RIOV}, V_{DIOV}
- High-withstand voltage: VM pin and CO pin: Absolute maximum rating 28 V
- Wide operation temperature range: Ta = –40°C to +85°C
- Low current consumption
  - During operation: 1.5 μA typ., 3.0 μA max. (Ta = +25°C)
  - During power-down: 50 nA max. (Ta = +25°C)
  - During overdischarge: 500 nA max. (Ta = +25°C)
- Lead-free (Sn 100%), halogen-free

***1.** Overcharge release voltage = Overcharge detection voltage − Overcharge hysteresis voltage
(Overcharge hysteresis voltage can be selected from a range of 0 V to 0.4 V in 50 mV step.)
***2.** Overdischarge release voltage = Overdischarge detection voltage + Overdischarge hysteresis voltage
(Overdischarge hysteresis voltage can be selected from a range of 0 V to 0.7 V in 100 mV step.)
***3.** Load short-circuiting detection voltage = Discharge overcurrent detection voltage + 0.025 × n
(n can be selected from any integer value greater or equal to 2)

■ Applications

- Lithium-ion rechargeable battery pack
- Lithium polymer rechargeable battery pack

■ Packages

- SNT-6A
- HSNT-6 (1212)

■ Block Diagram

■ Pin Configurations

1. SNT-6A

Top view

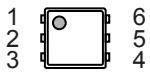

Figure 2

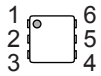
Table 6

Pin No.	Symbol	Description
1	NC*1	No connection
2	CO	Connection pin of charge control FET gate (CMOS output)
3	DO	Connection pin of discharge control FET gate (CMOS output)
4	VSS	Input pin for negative power supply
5	VDD	Input pin for positive power supply
6	VM	Voltage detection pin between VM pin and VSS pin (Overcurrent / charger detection pin)

***1.** The NC pin is electrically open.
The NC pin can be connected to VDD pin or VSS pin.

2. HSNT-6 (1212)

Top view



Bottom view

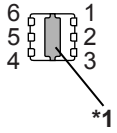


Figure 3

Table 7

Pin No.	Symbol	Description
1	NC*2	No connection
2	CO	Connection pin of charge control FET gate (CMOS output)
3	DO	Connection pin of discharge control FET gate (CMOS output)
4	VSS	Input pin for negative power supply
5	VDD	Input pin for positive power supply
6	VM	Voltage detection pin between VM pin and VSS pin (Overcurrent / charger detection pin)

***1.** Connect the heat sink of backside at shadowed area to the board, and set electric potential open or VDD.
However, do not use it as the function of electrode.

***2.** The NC pin is electrically open.
The NC pin can be connected to VDD pin or VSS pin.

■ Absolute Maximum Ratings

Table 8

(Ta = +25°C unless otherwise specified)

Item		Symbol	Applied Pin	Absolute Maximum Rating	Unit
Input voltage between VDD pin and VSS pin		V_{DS}	VDD	V_{SS} − 0.3 to V_{SS} + 6	V
VM pin input voltage		V_{VM}	VM	V_{DD} − 28 to V_{DD} + 0.3	V
DO pin output voltage		V_{DO}	DO	V_{SS} − 0.3 to V_{DD} + 0.3	V
CO pin output voltage		V_{CO}	CO	V_{VM} − 0.3 to V_{DD} + 0.3	V
Power dissipation	SNT-6A	P_D	−	400[*1]	mW
	HSNT-6 (1212)		−	480[*1]	mW
Operation ambient temperature		T_{opr}	−	−40 to +85	°C
Storage temperature		T_{stg}	−	−55 to +125	°C

***1.** When mounted on board

[Mounted board]

(1) Board size: 114.3 mm × 76.2 mm × t1.6 mm

(2) Board name: JEDEC STANDARD51-7

Caution The absolute maximum ratings are rated values exceeding which the product could suffer physical damage. These values must therefore not be exceeded under any conditions.

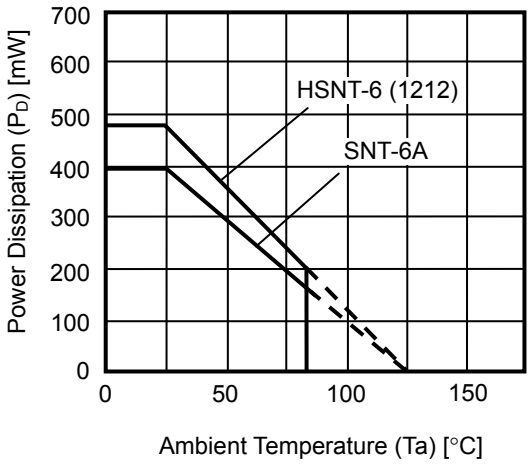

Figure 4 Power Dissipation of Package (When Mounted on Board)

***1.** Since products are not screened at high and low temperature, the specification for this temperature range is guaranteed by design, not tested in production.

■ Test Circuits

Caution Unless otherwise specified, the output voltage levels "H" and "L" at CO pin (V_{CO}) and DO pin (V_{DO}) are judged by the threshold voltage (1.0 V) of the N-channel FET. Judge the CO pin level with respect to V_{VM} and the DO pin level with respect to V_{SS}.

1. Overcharge detection voltage, overcharge release voltage (Test circuit 1)

Overcharge detection voltage (V_{CU}) is defined as the voltage V1 at which V_{CO} goes from "H" to "L" when the voltage V1 is gradually increased from the starting condition of V1 = 3.4 V. Overcharge release voltage (V_{CL}) is defined as the voltage V1 at which V_{CO} goes from "L" to "H" when the voltage V1 is then gradually decreased. Overcharge hysteresis voltage (V_{HC}) is defined as the difference between V_{CU} and V_{CL}.

2. Overdischarge detection voltage, overdischarge release voltage (Test circuit 2)

Overdischarge detection voltage (V_{DL}) is defined as the voltage V1 at which V_{DO} goes from "H" to "L" when the voltage V1 is gradually decreased from the starting conditions of V1 = 3.4 V, V2 = 0 V. Overdischarge release voltage (V_{DU}) is defined as the voltage V1 at which V_{DO} goes from "L" to "H" when setting V2 = 0.01 V and when the voltage V1 is then gradually increased. Overdischarge hysteresis voltage (V_{HD}) is defined as the difference between V_{DU} and V_{DL}.

3. Discharge overcurrent detection voltage, discharge overcurrent release voltage (Test circuit 2)

3. 1 Release voltage of discharge overcurrent status "V_{DIOV}"

Discharge overcurrent detection voltage (V_{DIOV}) is defined as the voltage V2 whose delay time for changing V_{DO} from "H" to "L" is discharge overcurrent detection delay time (t_{DIOV}) when the voltage V2 is increased from the starting conditions of V1 = 3.4 V, V2 = 0 V. V_{DO} goes from "L" to "H" when setting V2 = 3.4 V and when the voltage V2 is then gradually decreased to V_{DIOV} typ. or lower.

3. 2 Release voltage of discharge overcurrent status "V_{RIOV}"

V_{DIOV} is defined as the voltage V2 whose delay time for changing V_{DO} from "H" to "L" is t_{DIOV} when the voltage V2 is increased from the starting conditions of V1 = 3.4 V, V2 = 0 V. Discharge overcurrent release voltage (V_{RIOV}) is defined as the voltage V2 at which V_{DO} goes from "L" to "H" when setting V2 = 3.4 V and when the voltage V2 is then gradually decreased.

4. Load short-circuiting detection voltage (Test circuit 2)

Load short-circuiting detection voltage (V_{SHORT}) is defined as the voltage V2 whose delay time for changing V_{DO} from "H" to "L" is load short-circuiting detection delay time (t_{SHORT}) when the voltage V2 is increased from the starting conditions of V1 = 3.4 V, V2 = 0 V.

5. Charge overcurrent detection voltage (Test circuit 2)

Charge overcurrent detection voltage (V_{CIOV}) is defined as the voltage V2 whose delay time for changing V_{CO} from "H" to "L" is charge overcurrent detection delay time (t_{CIOV}) when the voltage V2 is decreased from the starting conditions of V1 = 3.4 V, V2 = 0 V.

6. Current consumption during operation (Test circuit 3)

The current consumption during operation (I_{OPE}) is the current that flows through the VDD pin (I_{DD}) under the set conditions of V1 = 3.4 V and V2 = 0 V.

7. Current consumption during power-down, current consumption during overdischarge (Test circuit 3)

7. 1 With power-down function

The current consumption during power-down (I_{PDN}) is I_{DD} under the set conditions of V1 = V2 = 1.5 V.

7. 2 Without power-down function

The current consumption during overdischarge (I_{OPED}) is I_{DD} under the set conditions of V1 = V2 = 1.5 V.

8. Resistance between VDD pin and VM pin (Test circuit 3)

R_{VMD} is the resistance between VDD pin and VM pin under the set conditions of V1 = 1.8 V, V2 = 0 V.

9. Resistance between VM pin and VSS pin (Release condition of discharge overcurrent status "load disconnection") (Test circuit 3)

R_{VMS} is the resistance between VM pin and VSS pin under the set conditions of V1 = 3.4 V, V2 = 1.0 V.

10. CO pin resistance "H" (Test circuit 4)

The CO pin resistance "H" (R_{COH}) is the resistance between VDD pin and CO pin under the set conditions of V1 = 3.4 V, V2 = 0 V, V3 = 3.0 V.

11. CO pin resistance "L" (Test circuit 4)

The CO pin resistance "L" (R_{COL}) is the resistance between VM pin and CO pin under the set conditions of V1 = 4.7 V, V2 = 0 V, V3 = 0.4 V.

12. DO pin resistance "H" (Test circuit 4)

The DO pin resistance "H" (R_{DOH}) is the resistance between VDD pin and DO pin under the set conditions of V1 = 3.4 V, V2 = 0 V, V4 = 3.0 V.

13. DO pin resistance "L" (Test circuit 4)

The DO pin resistance "L" (R_{DOL}) is the resistance between VSS pin and DO pin under the set conditions of V1 = 1.8 V, V2 = 0 V, V4 = 0.4 V.

14. Overcharge detection delay time (Test circuit 5)

The overcharge detection delay time (t_{CU}) is the time needed for V_{CO} to go to "L" just after the voltage V1 increases and exceeds V_{CU} under the set conditions of V1 = 3.4 V, V2 = 0 V.

15. Overdischarge detection delay time (Test circuit 5)

The overdischarge detection delay time (t_{DL}) is the time needed for V_{DO} to go to "L" after the voltage V1 decreases and falls below V_{DL} under the set conditions of V1 = 3.4 V, V2 = 0 V.

16. Discharge overcurrent detection delay time (Test circuit 5)

The discharge overcurrent detection delay time (t_{DIOV}) is the time needed for V_{DO} to go to "L" after the voltage V2 increases and exceeds V_{DIOV} under the set conditions of V1 = 3.4 V, V2 = 0 V.

17. Load short-circuiting detection delay time (Test circuit 5)

The load short-circuiting detection delay time (t_{SHORT}) is the time needed for V_{DO} to go to "L" after the voltage V2 increases and exceeds V_{SHORT} under the set conditions of V1 = 3.4 V, V2 = 0 V.

18. Charge overcurrent detection delay time (Test circuit 5)

The charge overcurrent detection delay time (t_{CIOV}) is the time needed for V_{CO} to go to "L" after the voltage V2 decreases and falls below V_{CIOV} under the set conditions of V1 = 3.4 V, V2 = 0 V.

19. 0 V battery charge starting charger voltage (0 V battery charge function "available") (Test circuit 2)

The 0 V battery charge starting charger voltage (V_{0CHA}) is defined as the absolute value of voltage V2 at which V_{CO} goes to "H" ($V_{CO} = V_{DD}$) when the voltage V2 is gradually decreased from the starting condition of V1 = V2 = 0 V.

20. 0 V battery charge inhibition battery voltage (0 V battery charge function "unavailable") (Test circuit 2)

The 0 V battery charge inhibition battery voltage (V_{0INH}) is defined as the voltage V1 at which V_{CO} goes to "L" ($V_{CO} = V_{VM}$) when the voltage V1 is gradually decreased, after setting V1 = 1.9 V, V2 = −4.0 V.

■ Operation

Remark 1. Refer to "**■ Battery Protection IC Connection Example**".
2. Unless otherwise specified, the VM pin voltage is based on V_{SS}.

1. Normal status

The S-8240B Series monitors the voltage of the battery connected between VDD pin and VSS pin, the voltage between VM pin and VSS pin to control charging and discharging. When the battery voltage is in the range from overdischarge detection voltage (V_{DL}) to overcharge detection voltage (V_{CU}), and the VM pin voltage is in the range from charge overcurrent detection voltage (V_{CIOV}) to discharge overcurrent detection voltage (V_{DIOV}), the S-8240B Series turns both the charge and discharge control FETs on. This condition is called the normal status, and in this condition charging and discharging can be carried out freely.
The resistance between VDD pin and VM pin (R_{VMD}), and the resistance between VM pin and VSS pin (R_{VMS}) are not connected in the normal status.

Caution After the battery is connected, discharging may not be carried out. In this case, the S-8240B Series becomes the normal status by connecting a charger.

2. Overcharge status

2. 1 $V_{CL} \neq V_{CU}$ (Product in which overcharge release voltage differs from overcharge detection voltage)

When the battery voltage becomes higher than V_{CU} during charging in the normal status and the condition continues for the overcharge detection delay time (t_{CU}) or longer, the S-8240B Series turns the charge control FET off to stop charging. This condition is called the overcharge status.
The overcharge status is released in the following two cases.

(1) In the case that the VM pin voltage is lower than V_{DIOV}, the S-8240B Series releases the overcharge status when the battery voltage falls below overcharge release voltage (V_{CL}).
(2) In the case that the VM pin voltage is equal to or higher than V_{DIOV}, the S-8240B Series releases the overcharge status when the battery voltage falls below V_{CU}.

When the discharge is started by connecting a load after the overcharge detection, the VM pin voltage rises by the V_f voltage of the parasitic diode than the VSS pin voltage, because the discharge current flows through the parasitic diode in the charge control FET. If this VM pin voltage is equal to or higher than V_{DIOV}, the S-8240B Series releases the overcharge status when the battery voltage is equal to or lower than V_{CU}.

Caution If the battery is charged to a voltage higher than V_{CU} and the battery voltage does not fall below V_{CU} even when a heavy load is connected, discharge overcurrent detection and load short-circuiting detection do not function until the battery voltage falls below V_{CU}. Since an actual battery has an internal impedance of tens of mΩ, the battery voltage drops immediately after a heavy load that causes overcurrent is connected, and discharge overcurrent detection and load short-circuiting detection function.

2. 2 $V_{CL} = V_{CU}$ (Product in which overcharge release voltage is the same as overcharge detection voltage)

When the battery voltage becomes higher than V_{CU} during charging in the normal status and the condition continues for the overcharge detection delay time (t_{CU}) or longer, the S-8240B Series turns the charge control FET off to stop charging. This condition is called the overcharge status.
In the case that the VM pin voltage is equal to or higher than 0 V typ., the S-8240B Series releases the overcharge status when the battery voltage falls below V_{CU}.

Caution 1. If the battery is charged to a voltage higher than V_{CU} and the battery voltage does not fall below V_{CU} even when a heavy load is connected, discharge overcurrent detection and load short-circuiting detection do not function until the battery voltage falls below V_{CU}. Since an actual battery has an internal impedance of tens of mΩ, the battery voltage drops immediately after a heavy load that causes overcurrent is connected, and discharge overcurrent detection and load short-circuiting detection function.
2. When a charger is connected after overcharge detection, the overcharge status is not released even if the battery voltage is below V_{CL}. The overcharge status is released when the VM pin voltage goes over 0 V typ. by removing the charger.

3. Overdischarge status

When the battery voltage falls below V_{DL} during discharging in the normal status and the condition continues for the overdischarge detection delay time (t_{DL}) or longer, the S-8240B Series turns the discharge control FET off to stop discharging. This condition is called the overdischarge status.
Under the overdischarge status, VDD pin and VM pin are shorted by R_{VMD} in the S-8240B Series. The VM pin voltage is pulled up by R_{VMD}.
R_{VMS} is not connected in the overdischarge status.

3. 1 With power-down function

Under the overdischarge status, when voltage difference between VDD pin and VM pin is 0.8 V typ. or lower, the power-down function works and the current consumption is reduced to the current consumption during power-down (I_{PDN}). By connecting a battery charger, the power-down function is released when the VM pin voltage is 0.7 V typ. or lower.

- When a battery is not connected to a charger and the VM pin voltage ≥ 0.7 V typ., the S-8240B Series maintains the overdischarge status even when the battery voltage reaches V_{DU} or higher.
- When a battery is connected to a charger and 0.7 V typ. > the VM pin voltage > 0 V typ., the battery voltage reaches V_{DU} or higher and the S-8240B Series releases the overdischarge status.
- When a battery is connected to a charger and 0 V typ. ≥ the VM pin voltage, the battery voltage reaches V_{DL} or higher and the S-8240B Series releases the overdischarge status.

3. 2 Without power-down function

The power-down function does not work even when voltage difference between VDD pin and VM pin is 0.8 V typ. or lower.

- When a battery is not connected to a charger and the VM pin voltage ≥ 0.7 V typ., the battery voltage reaches V_{DU} or higher and the S-8240B Series releases the overdischarge status.
- When a battery is connected to a charger and 0.7 V typ. > the VM pin voltage > 0 V typ., the battery voltage reaches V_{DU} or higher and the S-8240B Series releases the overdischarge status.
- When a battery is connected to a charger and 0 V typ. ≥ the VM pin voltage, the battery voltage reaches V_{DL} or higher and the S-8240B Series releases the overdischarge status.

4. Discharge overcurrent status (discharge overcurrent, load short-circuiting)

When a battery in the normal status is in the status where the VM pin voltage is equal to or higher than V_{DIOV} because the discharge current is equal to or higher than the specified value and the status lasts for the discharge overcurrent detection delay time (t_{DIOV}) or longer, the discharge control FET is turned off and discharging is stopped. This status is called the discharge overcurrent status.

4. 1 Release condition of discharge overcurrent status "load disconnection" and release voltage of discharge overcurrent status "V_{DIOV}"

Under the discharge overcurrent status, VM pin and VSS pin are shorted by R_{VMS} in the S-8240B Series. However, the VM pin voltage is the VDD pin voltage due to the load as long as the load is connected. When the load is disconnected, VM pin returns to the VSS pin voltage.
When the VM pin voltage returns to V_{DIOV} or lower, the S-8240B Series releases the discharge overcurrent status.
R_{VMD} is not connected in the discharge overcurrent status.

4. 2 Release condition of discharge overcurrent status "load disconnection" and release voltage of discharge overcurrent status "V_{RIOV}"

Under the discharge overcurrent status, VM pin and VSS pin are shorted by R_{VMS} in the S-8240B Series. However, the VM pin voltage is the VDD pin voltage due to the load as long as the load is connected. When the load is disconnected, VM pin returns to the VSS pin voltage.
When the VM pin voltage returns to V_{RIOV} or lower, the S-8240B Series releases the discharge overcurrent status.
R_{VMD} is not connected in the discharge overcurrent status.

4. 3 Release condition of discharge overcurrent status "charger connection"

Under the discharge overcurrent status, VM pin and VDD pin are shorted by R_{VMD} in the S-8240B Series.
When a battery is connected to a charger and the VM pin voltage returns to V_{DIOV} or lower, the S-8240B Series releases the discharge overcurrent status.
R_{VMS} is not connected in the discharge overcurrent status.

5. Charge overcurrent status

When a battery in the normal status is in the status where the VM pin voltage is equal to or lower than V_{CIOV} because the charge current is equal to or higher than the specified value and the status lasts for the charge overcurrent detection delay time (t_{CIOV}) or longer, the charge control FET is turned off and charging is stopped. This status is called the charge overcurrent status.
The S-8240B Series releases the charge overcurrent status when the VM pin voltage returns to 0 V typ. or higher by removing the charger.
The charge overcurrent detection does not function in the overdischarge status.

6. 0 V battery charge function "available"

This function is used to recharge a battery whose voltage is 0 V due to self-discharge. When the 0 V battery charge starting charger voltage (V_{0CHA}) or a higher voltage is applied between the EB+ and EB− pins by connecting a charger, the charge control FET gate is fixed to the VDD pin voltage.
When the voltage between the gate and source of the charge control FET becomes equal to or higher than the threshold voltage due to the charger voltage, the charge control FET is turned on to start charging. At this time, the discharge control FET is off and the charging current flows through the internal parasitic diode in the discharging control FET. When the battery voltage becomes equal to or higher than V_{DL}, the S-8240B Series enters the normal status.

Caution 1. Some battery providers do not recommend charging for a completely self-discharged lithium-ion rechargeable battery. Please ask the battery provider to determine whether to enable or inhibit the 0 V battery charge function.
2. The 0 V battery charge function has higher priority than the charge overcurrent detection function. Consequently, a product in which use of the 0 V battery charge function is enabled charges a battery forcibly and the charge overcurrent cannot be detected when the battery voltage is lower than V_{DL}.

7. 0 V battery charge function "unavailable"

This function inhibits recharging when a battery that is internally short-circuited (0 V battery) is connected. When the battery voltage is the 0 V battery charge inhibition battery voltage (V_{0INH}) or lower, the charge control FET gate is fixed to the EB− pin voltage to inhibit charging. When the battery voltage is V_{0INH} or higher, charging can be performed.

Caution Some battery providers do not recommend charging for a completely self-discharged lithium-ion rechargeable battery. Please ask the battery provider to determine whether to enable or inhibit the 0 V battery charge function.

8. Delay circuit

The detection delay times are determined by dividing a clock of approximately 4 kHz by the counter.

Remark t_{DIOV} and t_{SHORT} start when V_{DIOV} is detected. When V_{SHORT} is detected over t_{SHORT} after V_{DIOV}, the S-8240B Series turns the discharge control FET off within t_{SHORT} from the time of detecting V_{SHORT}.

■ Battery Protection IC Connection Example

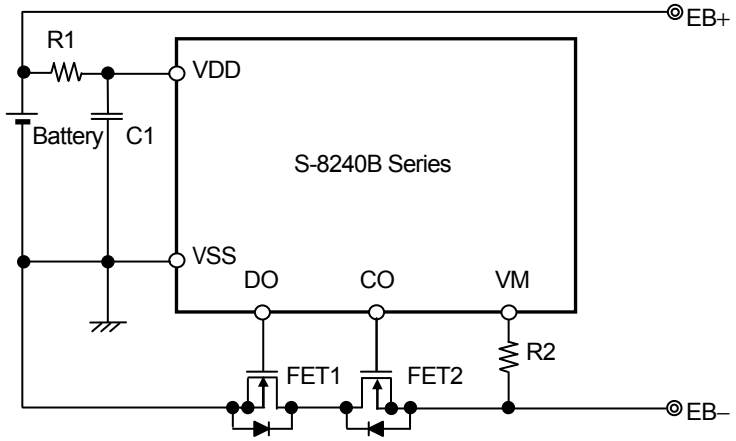

Figure 15

Table 11 Constants for External Components

Symbol	Part	Purpose	Min.	Typ.	Max.	Remark
FET1	N-channel MOS FET	Discharge control	–	–	–	Threshold voltage ≤ Overdischarge detection voltage*1
FET2	N-channel MOS FET	Charge control	–	–	–	Threshold voltage ≤ Overdischarge detection voltage*1
R1	Resistor	ESD protection, For power fluctuation	270 Ω	330 Ω	1 kΩ	–
C1	Capacitor	For power fluctuation	0.068 μF	0.1 μF	1.0 μF	Caution should be exercised when setting $V_{DIOV} \leq 20$ mV, $V_{CIOV} \geq -20$ mV.*2
R2	Resistor	ESD protection, Protection for reverse connection of a charger	300 Ω	470 Ω	4 kΩ	Caution should be exercised when an FET with a large gate capacitance is used.*3

***1.** If an FET with a threshold voltage equal to or higher than the overdischarge detection voltage is used, discharging may be stopped before overdischarge is detected.

***2.** When setting $V_{DIOV} \leq 20$ mV, $V_{CIOV} \geq -20$ mV for power fluctuation protection, the condition of $R1 \times C1 \geq 47\ \mu F \cdot \Omega$ should be met.

***3.** If an FET with a gate capacitance equal to or more than 5 nF is used, charge overcurrent detection voltage may become lower when R2 resistance is large. R2 resistance should be set to a smaller value when an FET with a gate capacitance equal to or more than 5 nF is used.

Caution 1. The above constants may be changed without notice.

2. It has not been confirmed whether the operation is normal or not in circuits other than the above example of connection. In addition, the example of connection shown above and the constant do not guarantee proper operation. Perform thorough evaluation using the actual application to set the constant.

■ Precautions

- The application conditions for the input voltage, output voltage, and load current should not exceed the package power dissipation.
- Do not apply an electrostatic discharge to this IC that exceeds the performance ratings of the built-in electrostatic protection circuit.
- SII Semiconductor Corporation claims no responsibility for any and all disputes arising out of or in connection with any infringement by products including this IC of patents owned by a third party.

※1. ランドパターンの幅に注意してください (0.25 mm min. / 0.30 mm typ.)。
※2. パッケージ中央にランドパターンを広げないでください (1.30 mm ~ 1.40 mm)。

注意 1. パッケージのモールド樹脂下にシルク印刷やハンダ印刷などしないでください。
2. パッケージ下の配線上のソルダーレジストなどの厚みをランドパターン表面から**0.03 mm** 以下にしてください。
3. マスク開口サイズと開口位置はランドパターンと合わせてください。
4. 詳細は〝**SNT**パッケージ活用の手引き〟を参照してください。

※1. Pay attention to the land pattern width (0.25 mm min. / 0.30 mm typ.).
※2. Do not widen the land pattern to the center of the package (1.30 mm ~ 1.40 mm).

Caution 1. Do not do silkscreen printing and solder printing under the mold resin of the package.
2. The thickness of the solder resist on the wire pattern under the package should be 0.03 mm or less from the land pattern surface.
3. Match the mask aperture size and aperture position with the land pattern.
4. Refer to "SNT Package User's Guide" for details.

※1. 请注意焊盘模式的宽度 (0.25 mm min. / 0.30 mm typ.)。
※2. 请勿向封装中间扩展焊盘模式 (1.30 mm ~ 1.40 mm)。

注意 1. 请勿在树脂型封装的下面印刷丝网、焊锡。
2. 在封装下、布线上的阻焊膜厚度 (从焊盘模式表面起) 请控制在 0.03 mm 以下。
3. 钢网的开口尺寸和开口位置请与焊盘模式对齐。
4. 详细内容请参阅 "SNT 封装的应用指南"。

Disclaimers (Handling Precautions)

1. All the information described herein (product data, specifications, figures, tables, programs, algorithms and application circuit examples, etc.) is current as of publishing date of this document and is subject to change without notice.
2. The circuit examples and the usages described herein are for reference only, and do not guarantee the success of any specific mass-production design.
   SII Semiconductor Corporation is not responsible for damages caused by the reasons other than the products or infringement of third-party intellectual property rights and any other rights due to the use of the information described herein.
3. SII Semiconductor Corporation is not responsible for damages caused by the incorrect information described herein.
4. Take care to use the products described herein within their specified ranges. Pay special attention to the absolute maximum ratings, operation voltage range and electrical characteristics, etc.
   SII Semiconductor Corporation is not responsible for damages caused by failures and/or accidents, etc. that occur due to the use of products outside their specified ranges.
5. When using the products described herein, confirm their applications, and the laws and regulations of the region or country where they are used and verify suitability, safety and other factors for the intended use.
6. When exporting the products described herein, comply with the Foreign Exchange and Foreign Trade Act and all other export-related laws, and follow the required procedures.
7. The products described herein must not be used or provided (exported) for the purposes of the development of weapons of mass destruction or military use. SII Semiconductor Corporation is not responsible for any provision (export) to those whose purpose is to develop, manufacture, use or store nuclear, biological or chemical weapons, missiles, or other military use.
8. The products described herein are not designed to be used as part of any device or equipment that may affect the human body, human life, or assets (such as medical equipment, disaster prevention systems, security systems, combustion control systems, infrastructure control systems, vehicle equipment, traffic systems, in-vehicle equipment, aviation equipment, aerospace equipment, and nuclear-related equipment), excluding when specified for in-vehicle use or other uses. Do not use those products without the prior written permission of SII Semiconductor Corporation.
   Especially, the products described herein cannot be used for life support devices, devices implanted in the human body and devices that directly affect human life, etc.
   Prior consultation with our sales office is required when considering the above uses.
   SII Semiconductor Corporation is not responsible for damages caused by unauthorized or unspecified use of our products.
9. Semiconductor products may fail or malfunction with some probability.
   The user of these products should therefore take responsibility to give thorough consideration to safety design including redundancy, fire spread prevention measures, and malfunction prevention to prevent accidents causing injury or death, fires and social damage, etc. that may ensue from the products' failure or malfunction.
   The entire system must be sufficiently evaluated and applied on customer's own responsibility.
10. The products described herein are not designed to be radiation-proof. The necessary radiation measures should be taken in the product design by the customer depending on the intended use.
11. The products described herein do not affect human health under normal use. However, they contain chemical substances and heavy metals and should therefore not be put in the mouth. The fracture surfaces of wafers and chips may be sharp. Take care when handling these with the bare hands to prevent injuries, etc.
12. When disposing of the products described herein, comply with the laws and ordinances of the country or region where they are used.
13. The information described herein contains copyright information and know-how of SII Semiconductor Corporation.
    The information described herein does not convey any license under any intellectual property rights or any other rights belonging to SII Semiconductor Corporation or a third party.
