Note:

1. At peak load, the output can last for 8 seconds without shout down.
2. At factory, in 60% rated load condition, the output is checked to be within voltage accuracy.
3. Line regulation is defined by changing ±10% of input voltage from nominal line at rated load.
4. Load regulation is defined by changing ±40% of measured output load from 60% rated load at another output set to 60% rated load.
5. Ripple & noise is measured by using 15MHz bandwidth limited oscilloscope and terminated each output with a 0.47uF capacitor at rated load and nominal line.
6. Hold up time is measured from the end of the last charging pulse to the time which the main output drops down to low limit of main output at rated load and nominal line.
7. Efficiency is measured at rated load and nominal line.
8. EMI filter (Delta 15GEE G3E-R) has to be used for the requirement of EMI.
9. Installations (A) and (B) can achieve 100% rated load, installation (C) can achieve 85% rated load.
