

STK11C88-3

32K x 8 nvSRAM

3.3V QuantumTrap™ CMOS

Nonvolatile Static RAM

Obsolete - Not Recommend for new Deisgns

FEATURES

- 35, 45ns and 55ns Access Times
- **STORE** to Nonvolatile Elements Initiated by Software
- **RECALL** to SRAM Initiated by Software or Power Restore
- 10 mA Typical Icc at 200 nsec Cycle Time
- Unlimited READ, WRITE and **RECALL** Cycles
- 1,000,000 **STORE** Cycles to Nonvolatile Elements
- 100-Year Data Retention in Nonvolatile Elements
- Single 3.3V $\pm$ 0.3V Operation
- Commercial and Industrial Temperatures
- 28-Pin DIP and SOIC Packages

DESCRIPTION

The Simtek STK11C88-3 is a fast static RAM with a nonvolatile element incorporated in each static memory cell. The SRAM can be read and written an unlimited number of times, while independent non-volatile data resides in Nonvolatile Elements. Data transfers from the SRAM to the Nonvolatile Elements (the **STORE** operation), or from Nonvolatile Elements to SRAM (the **RECALL** operation) are initiated using a software sequence. Data transfers from the Nonvolatile Elements to the SRAM (the **RECALL** operation) also occur upon restoration of power.

BLOCK DIAGRAM

PIN CONFIGURATIONS

PIN NAMES

A ₀ - A ₁₄	Address Inputs
$\overline{W}$	Write Enable
DQ ₀ - DQ ₇	Data In/Out
$\overline{E}$	Chip Enable
$\overline{G}$	Output Enable
V _{CC}	Power (+ 3.3V)
V _{SS}	Ground

ABSOLUTE MAXIMUM RATINGS^a

Voltage on Input Relative to Ground -0.5V to 4.5V
Voltage on Input Relative to V_{SS} -0.6V to (V_{CC} + 0.5V)
Voltage on DQ₀₋₇ -0.5V to (V_{CC} + 0.5V)
Temperature under Bias -55°C to 125°C
Storage Temperature -65°C to 150°C
Power Dissipation 1W
DC Output Current (1 output at a time, 1s duration) 15mA

Note a: Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

DC CHARACTERISTICS

(V_{CC} = 3.0V-3.6V)

SYMBOL	PARAMETER	COMMERCIAL		INDUSTRIAL		UNITS	NOTES
		MIN	MAX	MIN	MAX		
I _{CC1} ^b	Average V _{CC} Current		50		52	mA	t _{AVAV} = 35ns t _{AVAV} = 45ns t _{AVAV} = 55ns
			42		44		
			37		39		
I _{CC2} ^c	Average V _{CC} Current During <i>STORE</i>		3		3	mA	All Inputs Don't Care, V _{CC} = max
I _{CC3} ^b	Average V _{CC} Current at t _{AVAV} = 200ns 3.3V, 25°C, Typical		9		9	mA	$\overline{W} \geq (V_{CC} - 0.2V)$ All Others Cycling, CMOS Levels
I _{SB1} ^d	Average V _{CC} Current (Standby, Cycling TTL Input Levels)		18		19	mA	t _{AVAV} = 35ns, $\overline{E} \geq V_{IH}$ t _{AVAV} = 45ns, $\overline{E} \geq V_{IH}$ t _{AVAV} = 55ns, $\overline{E} \geq V_{IH}$
			16		17		
			15		16		
I _{SB2} ^d	V _{CC} Standby Current (Standby, Stable CMOS Input Levels)		750		750	µA	$\overline{E} \geq (V_{CC} - 0.2V)$ All Others V _{IN} ≤ 0.2V or ≥ (V _{CC} - 0.2V)
I _{ILK}	Input Leakage Current		±1		±1	µA	V _{CC} = max V _{IN} = V _{SS} to V _{CC}
I _{OLK}	Off-State Output Leakage Current		±1		±1	µA	V _{CC} = max V _{IN} = V _{SS} to V _{CC} , $\overline{E}$ or $\overline{G} \geq V_{IH}$
V _{IH}	Input Logic “1” Voltage	2.2	V _{CC} + .5	2.2	V _{CC} + .5	V	All Inputs
V _{IL}	Input Logic “0” Voltage	V _{SS} - .5	0.8	V _{SS} - .5	0.8	V	All Inputs
V _{OH}	Output Logic “1” Voltage	2.4		2.4		V	I _{OUT} = -4mA
V _{OL}	Output Logic “0” Voltage		0.4		0.4	V	I _{OUT} = 8mA
T _A	Operating Temperature	0	70	-40	85	°C	

Note b: I_{CC1} and I_{CC3} are dependent on output loading and cycle rate. The specified values are obtained with outputs unloaded.

Note c: I_{CC2} is the average current required for the duration of the *STORE* cycle (t_{STORE}).

Note d: $\overline{E} \geq V_{IH}$ will not produce standby current levels until any nonvolatile cycle in progress has timed out.

AC TEST CONDITIONS

Input Pulse Levels	0V to 3.0V
Input Rise and Fall Times	≤ 5ns
Input and Output Timing Reference Levels	1.5V
Output Load	See Figure 1

CAPACITANCE^e (T_A = 25°C, f = 1.0MHz)

SYMBOL	PARAMETER	MAX	UNITS	CONDITIONS
C _{IN}	Input Capacitance	5	pF	ΔV = 0 to 3V
C _{OUT}	Output Capacitance	7	pF	ΔV = 0 to 3V

Note e: These parameters are guaranteed but not tested.

STORE INHIBIT/POWER-UP RECALL

($V_{CC} = 3.0V-3.6V$)

NO.	SYMBOLS	PARAMETER	STK11C88-3		UNITS	NOTES
	Standard		MIN	MAX		
22	$t_{RESTORE}$	Power-up <i>RECALL</i> Duration		550	μs	k
23	t_{STORE}	<i>STORE</i> Cycle Duration		10	ms	g
24	V_{SWITCH}	Low Voltage Trigger Level	2.7	2.95	V	
25	V_{RESET}	Low Voltage Reset Level		2.4	V	

Note k: $t_{RESTORE}$ starts from the time V_{CC} rises above V_{SWITCH} .

STORE INHIBIT/POWER-UP RECALL

SOFTWARE STORE/RECALL MODE SELECTION

$\overline{E}$	$\overline{W}$	A ₁₃ - A ₀ (hex)	MODE	I/O	NOTES
L	H	0E38	Read SRAM	Output Data	l, m
		31C7	Read SRAM	Output Data	
		03E0	Read SRAM	Output Data	
		3C1F	Read SRAM	Output Data	
		303F	Read SRAM	Output Data	
		0FC0	Nonvolatile STORE	Output High Z	
L	H	0E38	Read SRAM	Output Data	l, m
		31C7	Read SRAM	Output Data	
		03E0	Read SRAM	Output Data	
		3C1F	Read SRAM	Output Data	
		303F	Read SRAM	Output Data	
		0C63	Nonvolatile RECALL	Output High Z	

Note l: The six consecutive addresses must be in order listed. $\overline{W}$ must be high during all six consecutive cycles to enable a nonvolatile cycle.
Note m: While there are 15 addresses on the STK11C88-3, only the lower 14 are used to control software modes.

SOFTWARE STORE/RECALL CYCLE^{n, o} (V_{CC} = 3.0V-3.6V)

NO.	SYMBOLS	PARAMETER	STK11C88-3-35		STK11C88-3-45		STK11C88-3-55		UNITS
			MIN	MAX	MIN	MAX	MIN	MAX	
26	t _{AVAV}	STORE/RECALL Initiation Cycle Time	35		45		55		ns
27	t _{AVEL} ⁿ	Address Set-up Time	0		0		0		ns

29	t _{ELAX} ⁿ	Address Hold Time	20		20		20		ns
30	t _{RECALL} ⁿ	RECALL Duration		20		20		20	μs

Note n: The software sequence is clocked with $\overline{E}$ controlled READs.
Note o: The six consecutive addresses must be in the order listed in the Software STORE/RECALL Mode Selection Table: (0E38, 31C7, 03E0, 3C1F, 303F, 0FC0) for a STORE cycle or (0E38, 31C7, 03E0, 3C1F, 303F, 0C63) for a RECALL cycle. $\overline{W}$ must be high during all six consecutive cycles.

SOFTWARE STORE/RECALL CYCLE: $\overline{E}$ Controlled^o

DEVICE OPERATION

The STK11C88-3 is a versatile 3.3V V_{CC} memory chip that provides several modes of operation. The STK11C88-3 can operate as a standard 32K x 8 SRAM. It has a 32K x 8 Nonvolatile Elements shadow to which the SRAM information can be copied or from which the SRAM can be updated in non-volatile mode.

NOISE CONSIDERATIONS

Note that the STK11C88-3 is a high-speed memory and so must have a high frequency bypass capacitor of approximately 0.1 μ F connected between V_{CC} and V_{SS} , using leads and traces that are as short as possible. As with all high-speed CMOS ICs, normal careful routing of power, ground and signals will help prevent noise problems.

SRAM READ

The STK11C88-3 performs a READ cycle whenever $\overline{E}$ and $\overline{G}$ are low and $\overline{W}$ is high. The address specified on pins A_{0-14} determines which of the 32,768 data bytes will be accessed. When the READ is initiated by an address transition, the outputs will be valid after a delay of t_{AVQV} (READ cycle #1). If the READ is initiated by $\overline{E}$ or $\overline{G}$, the outputs will be valid at t_{ELQV} or at t_{GLQV} , whichever is later (READ cycle #2). The data outputs will repeatedly respond to address changes within the t_{AVQV} access time without the need for transitions on any control input pins, and will remain valid until another address change or until $\overline{E}$ or $\overline{G}$ is brought high.

SRAM WRITE

A WRITE cycle is performed whenever $\overline{E}$ and $\overline{W}$ are low. The address inputs must be stable prior to entering the WRITE cycle and must remain stable until either $\overline{E}$ or $\overline{W}$ goes high at the end of the cycle. The data on the common I/O pins DQ_{0-7} will be written into the memory if it is valid t_{DVWH} before the end of a $\overline{W}$ controlled WRITE or t_{DVEH} before the end of an $\overline{E}$ controlled WRITE.

It is recommended that $\overline{G}$ be kept high during the entire WRITE cycle to avoid data bus contention on the common I/O lines. If $\overline{G}$ is left low, internal circuitry will turn off the output buffers t_{WLQZ} after $\overline{W}$ goes low.

SOFTWARE NONVOLATILE STORE

The STK11C88-3 software STORE cycle is initiated by executing sequential READ cycles from six specific address locations. During the STORE cycle an erase of the previous nonvolatile data is first performed, followed by a program of the nonvolatile elements. The program operation copies the SRAM data into nonvolatile memory. Once a STORE cycle is initiated, further input and output are disabled until the cycle is completed.

Because a sequence of reads from specific addresses is used for STORE initiation, it is important that no other READ or WRITE accesses intervene in the sequence, or the sequence will be aborted and no STORE or RECALL will take place.

To initiate the software STORE cycle, the following READ sequence must be performed:

1.	Read address	0E38 (hex)	Valid READ
2.	Read address	31C7 (hex)	Valid READ
3.	Read address	03E0 (hex)	Valid READ
4.	Read address	3C1F (hex)	Valid READ
5.	Read address	303F (hex)	Valid READ
6.	Read address	0FC0 (hex)	Initiate STORE cycle

The software sequence is clocked with $\overline{E}$ controlled READS.

Once the sixth address in the sequence has been entered, the STORE cycle will commence and the chip will be disabled. It is important that READ cycles and not WRITE cycles be used in the sequence, although it is not necessary that $\overline{G}$ be low for the sequence to be valid. After the t_{STORE} cycle time has been fulfilled, the SRAM will again be activated for READ and WRITE operation.

SOFTWARE NONVOLATILE RECALL

A software RECALL cycle is initiated with a sequence of READ operations in a manner similar to the software STORE initiation. To initiate the RECALL cycle, the following sequence of READ operations must be performed:

1.	Read address	0E38 (hex)	Valid READ
2.	Read address	31C7 (hex)	Valid READ
3.	Read address	03E0 (hex)	Valid READ
4.	Read address	3C1F (hex)	Valid READ
5.	Read address	303F (hex)	Valid READ
6.	Read address	0C63 (hex)	Initiate RECALL cycle

Internally, *RECALL* is a two-step procedure. First, the SRAM data is cleared, and second, the nonvolatile information is transferred into the SRAM cells. After the t_{RECALL} cycle time the SRAM will once again be ready for READ and WRITE operations. The *RECALL* operation in no way alters the data in the Nonvolatile Elements. The nonvolatile data can be recalled an unlimited number of times.

POWER-UP RECALL

During power up, or after any low-power condition ($V_{\text{CC}} < V_{\text{RESET}}$), an internal *RECALL* request will be latched. When V_{CC} once again exceeds the sense voltage of V_{SWITCH} , a *RECALL* cycle will automatically be initiated and will take t_{RESTORE} to complete.

If the STK11C88-3 is in a WRITE state at the end of power-up *RECALL*, the SRAM data will be corrupted. To help avoid this situation, a 10K Ohm resistor should be connected either between $\overline{W}$ and system V_{CC} or between $\overline{E}$ and system V_{CC} .

HARDWARE PROTECT

The STK11C88-3 offers hardware protection against inadvertent *STORE* operation during low-voltage conditions. When $V_{\text{CC}} < V_{\text{SWITCH}}$, all software *STORE* operations are inhibited.

LOW AVERAGE ACTIVE POWER

The STK11C88-3 draws significantly less current when it is cycled at times longer than 55ns. Figure 2 shows the relationship between I_{CC} and READ cycle time. Worst-case current consumption is shown for both CMOS and TTL input levels (commercial temperature range, $V_{\text{CC}} = 3.6\text{V}$, 100% duty cycle on chip enable). Figure 3 shows the same relationship for WRITE cycles. If the chip enable duty cycle is less than 100%, only standby current is drawn when the chip is disabled. The overall average current drawn by the STK11C88-3 depends on the following items: 1) CMOS vs. TTL input levels; 2) the duty cycle of chip enable; 3) the overall cycle rate for accesses; 4) the ratio of READS to WRITES; 5) the operating temperature; 6) the V_{CC} level; and 7) I/O loading.
