|      |      |      |      |      |      |      |      |      |      |      | rs       |      |      |      |      |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **RETRAMEN**: RETRAM peripheral clocks enable

Set by software.

When set, this bit indicates that the RETRAM is allocated by the MPU. It causes the system to maintain the access to this memory also according to the MPU operation modes.

0: Writing '0' has no effect, reading '0' means that the memory is not allocated by the MPU

1: Writing '1' allocates the memory to the MPU, reading '1' means that the memory is allocated to the MPU.

Bits 3:0 Reserved, must be kept at reset value.

### 10.7.164 RCC MLAHB Periph. Enable For MPU Clear Register (RCC\_MP\_MLAHBENCLRR)

Address offset: 0xA3C

Reset value: 0x0000 0010

This register is used to clear the peripheral clock enable bit of the corresponding peripheral. It shall be used to deallocate a peripheral from MPU. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '0'.

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **RETRAMEN**: RETRAM peripheral clocks enable

Cleared by software.

When set, this bit indicates that the RETRAM is allocated by the MPU. It causes the system to maintain the access to this memory also according to the MPU operation modes.

0: Writing '0' has no effect, reading '0' means that the memory is not allocated by the MPU

1: Writing '1' deallocates the memory to the MPU, reading '1' means that the memory is allocated to the MPU.

Bits 3:0 Reserved, must be kept at reset value.

### 10.7.165 RCC APB1 Sleep Clock Ena. For MPU Set Register (RCC\_MP\_APB1LPENSETR)

Address offset: 0xB00

Reset value: 0xADEF DBFF

This register is used by the MPU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

| 31         | 30         | 29        | 28       | 27       | 26        | 25         | 24        | 23        | 22        | 21       | 20       | 19        | 18        | 17        | 16        |

Bit 31 **MDIOSLPEN**: MDIOS peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 30 Reserved, must be kept at reset value.

Bit 29 **DAC12LPEN**: DAC1&2 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 28 Reserved, must be kept at reset value.

Bit 27 **CECLPEN**: HDMI-CEC peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 26 **SPDIFLPEN**: SPDIFRX peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 25 Reserved, must be kept at reset value.
- Bit 24 **I2C5LPEN**: I2C5 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 23 **I2C3LPEN**: I2C3 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 22 **I2C2LPEN**: I2C2 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 21 **I2C1LPEN**: I2C1 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 20 Reserved, must be kept at reset value.
- Bit 19 **UART8LPEN**: UART8 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 18 **UART7LPEN**: UART7 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 17 **UART5LPEN**: UART5 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 16 **UART4LPEN**: UART4 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 15 **USART3LPEN**: USART3 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 14 **USART2LPEN**: USART2 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 13 Reserved, must be kept at reset value.
- Bit 12 **SPI3LPEN**: SPI3 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 11 **SPI2LPEN**: SPI2 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 10 Reserved, must be kept at reset value.
- Bit 9 **LPTIM1LPEN**: LPTIM1 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 8 **TIM14LPEN**: TIM14 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 7 **TIM13LPEN**: TIM13 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 6 **TIM12LPEN**: TIM12 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 5 **TIM7LPEN**: TIM7 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 4 **TIM6LPEN**: TIM6 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 3 **TIM5LPEN**: TIM5 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 2 **TIM4LPEN**: TIM4 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 1 **TIM3LPEN**: TIM3 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 0 **TIM2LPEN**: TIM2 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.166 RCC APB1 Sleep Clock Ena. For MCU Set Register (RCC\_MC\_APB1LPENSETR)

Address offset: 0xB80

Reset value: 0xBDEF DBFF

This register is used by the MCU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bit 31 **MDIOSLPEN**: MDIOS peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 30 Reserved, must be kept at reset value.

Bit 29 **DAC12LPEN**: DAC1&2 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 28 **WWDG1LPEN**: WWDG1 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 27 **CECLPEN**: HDMI-CEC peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 26 **SPDIFLPEN**: SPDIFRX peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 25 Reserved, must be kept at reset value.
- Bit 24 **I2C5LPEN**: I2C5 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 23 **I2C3LPEN**: I2C3 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 22 **I2C2LPEN**: I2C2 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 21 **I2C1LPEN**: I2C1 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 20 Reserved, must be kept at reset value.
- Bit 19 **UART8LPEN**: UART8 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 18 **UART7LPEN**: UART7 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 17 **UART5LPEN**: UART5 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 16 **UART4LPEN**: UART4 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 15 **USART3LPEN**: USART3 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 14 **USART2LPEN**: USART2 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 13 Reserved, must be kept at reset value.
- Bit 12 **SPI3LPEN**: SPI3 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 11 **SPI2LPEN**: SPI2 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 10 Reserved, must be kept at reset value.
- Bit 9 **LPTIM1LPEN**: LPTIM1 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 8 **TIM14LPEN**: TIM14 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 7 **TIM13LPEN**: TIM13 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 6 **TIM12LPEN**: TIM12 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 5 **TIM7LPEN**: TIM7 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 4 **TIM6LPEN**: TIM6 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 3 **TIM5LPEN**: TIM5 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 2 **TIM4LPEN**: TIM4 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 1 **TIM3LPEN**: TIM3 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 0 **TIM2LPEN**: TIM2 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.167 RCC APB1 Sleep Clock Ena. MPU Clear Register (RCC\_MP\_APB1LPENCLRR)

Address offset: 0xB04

Reset value: 0xADEF DBFF

This register is used by the MPU in order to clear the PERxLPEN bits of the corresponding peripherals located into the APB1 bus. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '0'.

Bit 31 **MDIOSLPEN**: MDIOS peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 30 Reserved, must be kept at reset value.

Bit 29 **DAC12LPEN**: DAC1&2 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 28 Reserved, must be kept at reset value.

Bit 27 **CECLPEN**: HDMI-CEC peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 26 **SPDIFLPEN**: SPDIFRX peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 25 Reserved, must be kept at reset value.
- Bit 24 **I2C5LPEN**: I2C5 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 23 **I2C3LPEN**: I2C3 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 22 **I2C2LPEN**: I2C2 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 21 **I2C1LPEN**: I2C1 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 20 Reserved, must be kept at reset value.
- Bit 19 **UART8LPEN**: UART8 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 18 **UART7LPEN**: UART7 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 17 **UART5LPEN**: UART5 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 16 **UART4LPEN**: UART4 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 15 **USART3LPEN**: USART3 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 14 **USART2LPEN**: USART2 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 13 Reserved, must be kept at reset value.
- Bit 12 **SPI3LPEN**: SPI3 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 11 **SPI2LPEN**: SPI2 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 10 Reserved, must be kept at reset value.
- Bit 9 **LPTIM1LPEN**: LPTIM1 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 8 **TIM14LPEN**: TIM14 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 7 **TIM13LPEN**: TIM13 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 6 **TIM12LPEN**: TIM12 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 5 **TIM7LPEN**: TIM7 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 4 **TIM6LPEN**: TIM6 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 3 **TIM5LPEN**: TIM5 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 2 **TIM4LPEN**: TIM4 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 1 **TIM3LPEN**: TIM3 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 0 **TIM2LPEN**: TIM2 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.168 RCC APB1 Sleep Clock Ena. MCU Clear Register (RCC\_MC\_APB1LPENCLRR)

Address offset: 0xB84

Reset value: 0xBDEF DBFF

This register is used by the MCU in order to clear the PERxLPEN bits of the corresponding peripherals located into the APB1 bus. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '0'.

Bit 31 **MDIOSLPEN**: MDIOS peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 30 Reserved, must be kept at reset value.

Bit 29 **DAC12LPEN**: DAC1&2 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 28 **WWDG1LPEN**: WWDG1 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 27 **CECLPEN**: HDMI-CEC peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 26 **SPDIFLPEN**: SPDIFRX peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 25 Reserved, must be kept at reset value.
- Bit 24 **I2C5LPEN**: I2C5 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 23 **I2C3LPEN**: I2C3 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 22 **I2C2LPEN**: I2C2 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 21 **I2C1LPEN**: I2C1 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 20 Reserved, must be kept at reset value.
- Bit 19 **UART8LPEN**: UART8 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 18 **UART7LPEN**: UART7 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 17 **UART5LPEN**: UART5 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 16 **UART4LPEN**: UART4 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 15 **USART3LPEN**: USART3 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 14 **USART2LPEN**: USART2 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 13 Reserved, must be kept at reset value.
- Bit 12 **SPI3LPEN**: SPI3 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 11 **SPI2LPEN**: SPI2 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 10 Reserved, must be kept at reset value.
- Bit 9 **LPTIM1LPEN**: LPTIM1 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 8 **TIM14LPEN**: TIM14 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 7 **TIM13LPEN**: TIM13 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 6 **TIM12LPEN**: TIM12 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 5 **TIM7LPEN**: TIM7 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 4 **TIM6LPEN**: TIM6 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 3 **TIM5LPEN**: TIM5 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 2 **TIM4LPEN**: TIM4 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 1 **TIM3LPEN**: TIM3 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 0 **TIM2LPEN**: TIM2 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.169 RCC APB2 Sleep Clock Ena. For MPU Set Register (RCC\_MP\_APB2LPENSETR)

Address offset: 0xB08

Reset value: 0x0137 271F

This register is used by the MPU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **FDCANLPEN**: FDCAN and CANRAM peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **ADFSDMLPEN**: Audio DFSDM peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 20 **DFSDMLPEN**: DFSDM peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 19 Reserved, must be kept at reset value.

- Bit 18 **SAI3LPEN**: SAI3 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 17 **SAI2LPEN**: SAI2 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 16 **SAI1LPEN**: SAI1 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bits 15:14 Reserved, must be kept at reset value.
- Bit 13 **USART6LPEN**: USART6 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bits 12:11 Reserved, must be kept at reset value.
- Bit 10 **SPI5LPEN**: SPI5 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 9 **SPI4LPEN**: SPI4 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 8 **SPI1LPEN**: SPI/I2S1 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bits 7:5 Reserved, must be kept at reset value.

- Bit 4 **TIM17LPEN**: TIM17 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 3 **TIM16LPEN**: TIM16 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 2 **TIM15LPEN**: TIM15 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 1 **TIM8LPEN**: TIM8 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 0 **TIM1LPEN**: TIM1 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.170 RCC APB2 Sleep Clock Ena. For MCU Set Register (RCC\_MC\_APB2LPENSETR)

Address offset: 0xB88

Reset value: 0x0137 271F

This register is used by the MCU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **FDCANLPEN**: FDCAN and CANRAM peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **ADFSDMLPEN**: Audio DFSDM peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 20 **DFSDMLPEN**: DFSDM peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 19 Reserved, must be kept at reset value.

- Bit 18 **SAI3LPEN**: SAI3 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 17 **SAI2LPEN**: SAI2 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 16 **SAI1LPEN**: SAI1 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bits 15:14 Reserved, must be kept at reset value.
- Bit 13 **USART6LPEN**: USART6 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bits 12:11 Reserved, must be kept at reset value.
- Bit 10 **SPI5LPEN**: SPI5 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 9 **SPI4LPEN**: SPI4 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 8 **SPI1LPEN**: SPI/I2S1 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **TIM17LPEN**: TIM17 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 3 **TIM16LPEN**: TIM16 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 2 **TIM15LPEN**: TIM15 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 1 **TIM8LPEN**: TIM8 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 0 **TIM1LPEN**: TIM1 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.171 RCC APB2 Sleep Clock Ena. For MPU Clear Register (RCC\_MP\_APB2LPENCLRR)

Address offset: 0xB0C

Reset value: 0x0137 271F

This register is used by the MPU in order to clear the PERxLPEN bit of the corresponding peripheral. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **FDCANLPEN**: FDCAN and CANRAM peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **ADFSDMLPEN**: Audio DFSDM peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 20 **DFSDMLPEN**: DFSDM peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 19 Reserved, must be kept at reset value.

- Bit 18 **SAI3LPEN**: SAI3 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 17 **SAI2LPEN**: SAI2 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 16 **SAI1LPEN**: SAI1 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bits 15:14 Reserved, must be kept at reset value.
- Bit 13 **USART6LPEN**: USART6 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bits 12:11 Reserved, must be kept at reset value.
- Bit 10 **SPI5LPEN**: SPI5 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 9 **SPI4LPEN**: SPI4 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 8 **SPI1LPEN**: SPI/I2S1 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bits 7:5 Reserved, must be kept at reset value.

- Bit 4 **TIM17LPEN**: TIM17 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 3 **TIM16LPEN**: TIM16 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 2 **TIM15LPEN**: TIM15 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 1 **TIM8LPEN**: TIM8 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 0 **TIM1LPEN**: TIM1 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.172 RCC APB2 Sleep Clock Ena. For MCU Clear Register (RCC\_MC\_APB2LPENCLRR)

Address offset: 0xB8C

Reset value: 0x0137 271F

This register is used by the MCU in order to clear the PERxLPEN bit of the corresponding peripheral. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **FDCANLPEN**: FDCAN and CANRAM peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **ADFSDMLPEN**: Audio DFSDM peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 20 **DFSDMLPEN**: DFSDM peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 19 Reserved, must be kept at reset value.

- Bit 18 **SAI3LPEN**: SAI3 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 17 **SAI2LPEN**: SAI2 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 16 **SAI1LPEN**: SAI1 peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.173 RCC APB3 Sleep Clock Ena. For MPU Set Register (RCC\_MP\_APB3LPENSETR)

Address offset: 0xB10

Reset value: 0x0003 290F

This register is used by the MPU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **DTSLPEN**: DTS peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **VREFLPEN**: VREF peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 12 Reserved, must be kept at reset value.

Bit 11 **SYSCFGLPEN**: SYSCFG peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 10:9 Reserved, must be kept at reset value.

Bit 8 **SAI4LPEN**: SAI4 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **LPTIM5LPEN**: LPTIM5 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 2 **LPTIM4LPEN**: LPTIM4 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 1 **LPTIM3LPEN**: LPTIM3 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 0 **LPTIM2LPEN**: LPTIM2 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.174 RCC APB3 Sleep Clock Ena. For MCU Set Register (RCC\_MC\_APB3LPENSETR)

Address offset: 0xB90

Reset value: 0x0003 290F

This register is used by the MCU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **DTSLPEN**: DTS peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **VREFLPEN**: VREF peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 12 Reserved, must be kept at reset value.

Bit 11 **SYSCFGLPEN**: SYSCFG peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 10:9 Reserved, must be kept at reset value.

Bit 8 **SAI4LPEN**: SAI4 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **LPTIM5LPEN**: LPTIM5 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 2 **LPTIM4LPEN**: LPTIM4 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 1 **LPTIM3LPEN**: LPTIM3 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 0 **LPTIM2LPEN**: LPTIM2 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.175 RCC APB3 Sleep Clock Ena. For MPU Clear Register (RCC\_MP\_APB3LPENCLRR)

Address offset: 0xB14

Reset value: 0x0003 290F

This register is used by the MPU in order to clear the PERxLPEN bit of the corresponding peripheral. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **DTSLPEN**: DTS peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **VREFLPEN**: VREF peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 12 Reserved, must be kept at reset value.

Bit 11 **SYSCFGLPEN**: SYSCFG peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 10:9 Reserved, must be kept at reset value.

Bit 8 **SAI4LPEN**: SAI4 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **LPTIM5LPEN**: LPTIM5 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 2 **LPTIM4LPEN**: LPTIM4 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 1 **LPTIM3LPEN**: LPTIM3 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 0 **LPTIM2LPEN**: LPTIM2 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.177 RCC APB4 Sleep Clock Ena. For MCU Set Register (RCC\_MC\_APB4LPENSETR)

Address offset: 0x380

Reset value: 0x0011 0111

This register is used by the MCU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **STGENROSTPEN**: STGEN Read-Only Interface, clock enable during CStop mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CStop

1: Writing '1' enables the peripheral clocks in CStop, reading '1' means that the peripheral clocks are enabled in CStop

Bit 20 **STGENROLPEN**: STGEN Read-Only Interface peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **USBPHYPEN**: USBPHYC peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **DDRPERFMLPEN**: DDRPERFM APB clock enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the APB clock is disabled in CSleep

1: Writing '1' enables the APB clock in CSleep, reading '1' means that the APB clock is enabled in CSleep

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **DSILPEN**: DSI peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **LTDCLPEN**: LTDC peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.178 RCC APB4 Sleep Clock Ena. For MPU Set Register (RCC\_MP\_APB4LPENSETR)

Address offset: 0x300

Reset value: 0x0011 8111

This register is used by the MPU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **STGENROSTPEN**: STGEN Read-Only Interface, clock enable during CStop mode

Set by software.

- 0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CStop
- 1: Writing '1' enables the peripheral clocks in CStop, reading '1' means that the peripheral clocks are enabled in CStop

Bit 20 **STGENROLPEN**: STGEN Read-Only Interface peripheral clocks enable during CSleep mode

Set by software.

- 0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep
- 1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **USBPHYPEN**: USBPHYC peripheral clocks enable during CSleep mode

Set by software.

- 0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep
- 1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 15 **IWDG2APBLPEN**: IWDG2 APB clock enable during CSleep mode

Set by software.

- 0: Writing '0' has no effect, reading '0' means that the APB clock is disabled in CSleep
- 1: Writing '1' enables the APB clock in CSleep, reading '1' means that the APB clock is enabled in CSleep

Bits 14:9 Reserved, must be kept at reset value.

Bit 8 **DDRPERFMLPEN**: DDRPERFM APB clock enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the APB clock is disabled in CSleep

1: Writing '1' enables the APB clock in CSleep, reading '1' means that the APB clock is enabled in CSleep

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **DSILPEN**: DSI peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **LTDCLPEN**: LTDC peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.179 RCC APB4 Sleep Clock Ena. For MCU Clear Register (RCC\_MC\_APB4LPENCLRR)

Address offset: 0x384

Reset value: 0x0011 0111

This register is used by the MCU in order to clear the PERxLPEN bit of the corresponding peripheral. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **STGENSTPEN**: STGEN Controller part, peripheral clocks enable during CStop mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CStop  
1: Writing '1' enables the peripheral clocks in CStop, reading '1' means that the peripheral clocks are enabled in CStop

Bit 20 **STGENLPEN**: STGEN Controller part, peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **BSECLPEN**: BSEC peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **TZPCLPEN**: TZPC peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 12 **TZC2LPEN**: TZC AXI port 2 peripheral clocks enable during CSleep mode  
Set by software. See Section 1.4.8.17: TZC clocks for details.  
0: Writing '0' has no effect, reading '0' means that the clocks are disabled for AXI port 2 in CSleep  
1: Writing '1' enables the pclk5 and aclk\_tzc2 clocks in CSleep, reading '1' means that the clocks are enabled for AXI port 2 in CSleep
- Bit 11 **TZC1LPEN**: TZC AXI port 1 peripheral clocks enable during CSleep mode  
Set by software. See Section 1.4.8.17: TZC clocks for details.  
0: Writing '0' has no effect, reading '0' means that the clocks are disabled for AXI port 1 in CSleep  
1: Writing '1' enables the pclk5 and aclk\_tzc1 clocks in CSleep, reading '1' means that the clocks are enabled for AXI port 1 in CSleep
- Bits 10:9 Reserved, must be kept at reset value.
- Bit 8 **RTCAPBLPEN**: RTC APB clock enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bits 7:5 Reserved, must be kept at reset value.
- Bit 4 **USART1LPEN**: USART1 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 3 **I2C6LPEN**: I2C6 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 2 **I2C4LPEN**: I2C4 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 1 Reserved, must be kept at reset value.
- Bit 0 **SPI6LPEN**: SPI6 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.182 RCC APB5 Sleep Clock Ena. For MPU Set Register (RCC\_MP\_APB5LPENSETR)

Address offset: 0x308

Reset value: 0x0011 B91D

This register is used by the MPU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'. If TZEN = '1', this register can only be modified in secure mode.

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **STGENSTPEN**: STGEN Controller part, peripheral clocks enable during CStop mode

Set by software.

- 0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CStop
- 1: Writing '1' enables the peripheral clocks in CStop, reading '1' means that the peripheral clocks are enabled in CStop

Bit 20 **STGENLPEN**: STGEN Controller part, peripheral clocks enable during CSleep mode

Set by software.

- 0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep
- 1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **BSECLPEN**: BSEC peripheral clocks enable during CSleep mode

Set by software.

- 0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep
- 1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 15 **IWDG1APBLPEN**: IWDG1 APB clock enable during CSleep mode

Set by software.

- 0: Writing '0' has no effect, reading '0' means that the APB clock is disabled in CSleep
- 1: Writing '1' enables the APB clock in CSleep, reading '1' means that the APB clock is enabled in CSleep

- Bit 14 Reserved, must be kept at reset value.
- Bit 13 **TZPCLPEN**: TZPC peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 12 **TZC2LPEN**: TZC AXI port 2 peripheral clocks enable during CSleep mode  
Set by software. See Section 1.4.8.17: TZC clocks for details.  
0: Writing '0' has no effect, reading '0' means that the clocks are disabled for AXI port 2 in CSleep  
1: Writing '1' enables the pclk5 and aclk\_tzc2 clocks in CSleep, reading '1' means that the clocks are enabled for AXI port 2 in CSleep
- Bit 11 **TZC1LPEN**: TZC AXI port 1 peripheral clocks enable during CSleep mode  
Set by software. See Section 1.4.8.17: TZC clocks for details.  
0: Writing '0' has no effect, reading '0' means that the clocks are disabled for AXI port 1 in CSleep  
1: Writing '1' enables the pclk5 and aclk\_tzc1 clocks in CSleep, reading '1' means that the clocks are enabled for AXI port 1 in CSleep
- Bits 10:9 Reserved, must be kept at reset value.
- Bit 8 **RTCAPBLPEN**: RTC APB clock enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bits 7:5 Reserved, must be kept at reset value.
- Bit 4 **USART1LPEN**: USART1 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 3 **I2C6LPEN**: I2C6 peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 2 **I2C4LPEN**: I2C4 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 1 Reserved, must be kept at reset value.

Bit 0 **SPI6LPEN**: SPI6 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.183 RCC APB5 Sleep Clock Ena. For MCU Clear Register (RCC\_MC\_APB5LPENCLRR)

Address offset: 0x38C

Reset value: 0x0011 391D

This register is used by the MCU in order to clear the PERxLPEN bit of the corresponding peripheral. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 1 Reserved, must be kept at reset value.

Bit 0 **SPI6LPEN**: SPI6 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.185 RCC AHB5 Periph. Enable For MPU Set Register (RCC\_MP\_AHB5LPENSETR)

Address offset: 0x310

Reset value: 0x0000 0171

This register is used by the MPU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'. If TZEN = '1', this register can only be modified in secure mode.

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **BKPSRAMLPEN**: BKPSRAM clock enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the clock is disabled in CSleep

1: Writing '1' enables the peripheral clock in CSleep, reading '1' means that the clock is enabled in CSleep

Bit 7 Reserved, must be kept at reset value.

Bit 6 **RNG1LPEN**: RNG1 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 5 **HASH1LPEN**: HASH1 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 4 **CRYP1LPEN**: CRYP1 (3DES/AES1) peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **GPIOLPEN**: GPIOZ Secure peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.186 RCC AHB5 Periph. Enable For MCU Set Register (RCC\_MC\_AHB5LPENSETR)

Address offset: 0x390

Reset value: 0x0000 0171

This register is used by the MCU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **BKPSRAMLPEN**: BKPSRAM clock enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the clock is disabled in CSleep

1: Writing '1' enables the peripheral clock in CSleep, reading '1' means that the clock is enabled in CSleep

Bit 7 Reserved, must be kept at reset value.

Bit 6 **RNG1LPEN**: RNG1 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 5 **HASH1LPEN**: HASH1 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 4 **CRYP1LPEN**: CRYP1 (3DES/AES1) peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **GPIOLPEN**: GPIOZ Secure peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.187 RCC AHB5 Sleep Clock Ena. For MPU Clear Register (RCC\_MP\_AHB5LPENCLRR)

Address offset: 0x314

Reset value: 0x0000 0171

This register is used by the MPU in order to clear the PERxLPEN bit of the corresponding peripheral. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'. If TZEN = '1', this register can only be modified in secure mode.

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **USBHLPEN**: USBH peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **CRC1LPEN**: CRC1 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **SDMMC2LPEN**: SDMMC2 and SDMMC2 delay (DLYBSD2) block peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 16 **SDMMC1LPEN**: SDMMC1 and SDMMC1 delay (DLYBSD1) block peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 15 Reserved, must be kept at reset value.
- Bit 14 **QSPILPEN**: QUADSPI peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 13 Reserved, must be kept at reset value.
- Bit 12 **FMCLPEN**: FMC peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 11 **ETHSTPEN**: ETH peripheral clock enable during CStop mode  
Allows the ETH block to receive the clock coming from pads ETH\_TX\_CLK and ETH\_RX\_CLK during CStop.  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the ETH RX and TX kernel clocks are gated in CStop  
1: Writing '1' enables the ETH RX and TX kernel clocks in CStop, reading '1' means that the ETH RX and TX kernel clocks are enabled in CStop
- Bit 10 **ETHMACLPEN**: Enable of the bus interface clocks for ETH block during CSleep mode  
The bus interface clocks for ETH are hclk6 and aclk.  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the bus interface clocks are disabled in CSleep  
1: Writing '1' enables the bus interface clocks in CSleep, reading '1' means that the bus interface clocks are enabled in CSleep
- Bit 9 **ETHRXLPEN**: Enable of the Ethernet Reception Clock during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the reception clock is disabled in CSleep  
1: Writing '1' enables the reception clock in CSleep, reading '1' means that the reception clock is enabled in CSleep
- Bit 8 **ETHTXLPEN**: Enable of the Ethernet Transmission Clock during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the transmission clock is disabled in CSleep  
1: Writing '1' enables the transmission clock in CSleep, reading '1' means that the transmission clock is enabled in CSleep

Bit 7 **ETHCKLPEN**: Enable of the Ethernet clock generated by the RCC (eth\_ker\_ck) during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that eth\_ker\_ck clock is disabled in CSleep

1: Writing '1' enables the eth\_ker\_ck clock in CSleep, reading '1' means that the eth\_ker\_ck clock is enabled in CSleep

Bit 6 Reserved, must be kept at reset value.

Bit 5 **GPULPEN**: GPU peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 4:1 Reserved, must be kept at reset value.

Bit 0 **MDMALPEN**: MDMA peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.190 RCC AHB6 Sleep Clock Ena. For MCU Set Register (RCC\_MC\_AHB6LPENSETR)

Address offset: 0x398

Reset value: 0x0113 57A1

This register is used by the MCU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **USBHLPEN**: USBH peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **CRC1LPEN**: CRC1 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **SDMMC2LPEN**: SDMMC2 and SDMMC2 delay (DLYBSD2) block peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 16 **SDMMC1LPEN**: SDMMC1 and SDMMC1 delay (DLYBSD1) block peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 15 Reserved, must be kept at reset value.
- Bit 14 **QSPILPEN**: QUADSPI peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 13 Reserved, must be kept at reset value.
- Bit 12 **FMCLPEN**: FMC peripheral clocks enable during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 11 **ETHSTPEN**: ETH peripheral clock enable during CStop mode  
Allows the ETH block to receive the clock coming from pads ETH\_TX\_CLK and ETH\_RX\_CLK during CStop.  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the ETH RX and TX kernel clocks are gated in CStop  
1: Writing '1' enables the ETH RX and TX kernel clocks in CStop, reading '1' means that the ETH RX and TX kernel clocks are enabled in CStop
- Bit 10 **ETHMACLPEN**: Enable of the bus interface clocks for ETH block during CSleep mode  
The bus interface clocks for ETH are hclk6 and aclk.  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the bus interface clocks are disabled in CSleep  
1: Writing '1' enables the bus interface clocks in CSleep, reading '1' means that the bus interface clocks are enabled in CSleep
- Bit 9 **ETHRXLPEN**: Enable of the Ethernet Reception Clock during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the reception clock is disabled in CSleep  
1: Writing '1' enables the reception clock in CSleep, reading '1' means that the reception clock is enabled in CSleep
- Bit 8 **ETHTXLPEN**: Enable of the Ethernet Transmission Clock during CSleep mode  
Set by software.  
0: Writing '0' has no effect, reading '0' means that the transmission clock is disabled in CSleep  
1: Writing '1' enables the transmission clock in CSleep, reading '1' means that the transmission clock is enabled in CSleep

Bit 7 **ETHCKLPEN**: Enable of the Ethernet clock generated by the RCC (eth\_ker\_ck) during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that eth\_ker\_ck clock is disabled in CSleep

1: Writing '1' enables the eth\_ker\_ck clock in CSleep, reading '1' means that the eth\_ker\_ck clock is enabled in CSleep

Bit 6 Reserved, must be kept at reset value.

Bit 5 **GPULPEN**: GPU peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 4:1 Reserved, must be kept at reset value.

Bit 0 **MDMALPEN**: MDMA peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.191 RCC AHB6 Sleep Clock Ena. For MPU Clear Register (RCC\_MP\_AHB6LPENCLRR)

Address offset: 0x31C

Reset value: 0x0113 57A1

This register is used by the MPU in order to clear the PERxLPEN bit of the corresponding peripheral. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **USBHLPEN**: USBH peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **CRC1LPEN**: CRC1 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **SDMMC2LPEN**: SDMMC2 and SDMMC2 delay (DLYBSD2) block peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

- Bit 16 **SDMMC1LPEN**: SDMMC1 and SDMMC1 delay (DLYBSD1) block peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 15 Reserved, must be kept at reset value.
- Bit 14 **QSPI LPEN**: QUADSPI peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 13 Reserved, must be kept at reset value.
- Bit 12 **FMCLPEN**: FMC peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep
- Bit 11 **ETHSTPEN**: ETH peripheral clock enable during CStop mode  
Allows the ETH block to receive the clock coming from pads ETH\_TX\_CLK and ETH\_RX\_CLK during CStop.  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the ETH RX and TX kernel clocks are gated in CStop  
1: Writing '1' disabled the ETH RX and TX kernel clocks in CStop, reading '1' means that the ETH RX and TX kernel clocks are enabled in CStop
- Bit 10 **ETHMACLPEN**: Disable of the bus interface clocks for ETH block during CSleep mode  
The bus interface clocks for ETH are hclk6 and aclk.  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the bus interface clocks are disabled in CSleep  
1: Writing '1' disables the bus interface clocks in CSleep, reading '1' means that the bus interface clocks are enabled in CSleep
- Bit 9 **ETHRXLPEN**: Disable of the Ethernet Reception Clock during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the reception clock is disabled in CSleep  
1: Writing '1' disables the reception clock in CSleep, reading '1' means that the reception clock is enabled in CSleep
- Bit 8 **ETHTXLPEN**: Disable of the Ethernet Transmission Clock during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the transmission clock is disabled in CSleep  
1: Writing '1' disables the transmission clock in CSleep, reading '1' means that the transmission clock is enabled in CSleep

Bit 7 **ETHCKLPEN**: Disable of the Ethernet clock generated by the RCC (eth\_ker\_ck) during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that eth\_ker\_ck clock is disabled in CSleep

1: Writing '1' disables the eth\_ker\_ck clock in CSleep, reading '1' means that the eth\_ker\_ck clock is enabled in CSleep

Bit 6 Reserved, must be kept at reset value.

Bit 5 **GPULPEN**: GPU peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 4:1 Reserved, must be kept at reset value.

Bit 0 **MDMALPEN**: MDMA peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.192 RCC AHB6 Sleep Clock Ena. For MCU Clear Register (RCC\_MC\_AHB6LPENCLRR)

Address offset: 0x39C

Reset value: 0x0113 57A1

This register is used by the MCU in order to clear the PERxLPEN bit of the corresponding peripheral. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the transmission clock is disabled in CSleep  
1: Writing '1' disables the transmission clock in CSleep, reading '1' means that the transmission clock is enabled in CSleep

Bit 7 **ETHCKLPEN**: Disable of the Ethernet clock generated by the RCC (eth\_ker\_ck) during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that eth\_ker\_ck clock is disabled in CSleep

1: Writing '1' disables the eth\_ker\_ck clock in CSleep, reading '1' means that the eth\_ker\_ck clock is enabled in CSleep

Bit 6 Reserved, must be kept at reset value.

Bit 5 **GPULPEN**: GPU peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 4:1 Reserved, must be kept at reset value.

Bit 0 **MDMALPEN**: MDMA peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.193 RCC AHB6 Secure Sleep Clock Ena. For MPU Set Register (RCC\_MP\_TZAHB6LPENSETR)

Address offset: 0x320

Reset value: 0x0000 0001

This register is used by the MPU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'. If TZEN = '1', this register can only be modified in secure mode.

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **SDMMC3LPEN**: SDMMC3 and SDMMC3 delay (DLYBSD3) block peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **USBOLPEN**: USB0 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **ADC12LPEN**: ADC1&2 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **DMAMUXLPEN**: DMAMUX peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 1 **DMA2LPEN**: DMA2 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 0 **DMA1LPEN**: DMA1 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.196 RCC AHB2 Sleep Clock Ena. For MCU Set Register (RCC\_MC\_AHB2LPENSETR)

Address offset: 0xB98

Reset value: 0x0001 0127

This register is used by the MCU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **SDMMC3LPEN**: SDMMC3 and SDMMC3 delay (DLYBSD3) block peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **USBOLPEN**: USB0 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **ADC12LPEN**: ADC1&2 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **DMAMUXLPEN**: DMAMUX peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 1 **DMA2LPEN**: DMA2 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 0 **DMA1LPEN**: DMA1 peripheral clocks enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' enables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.197 RCC AHB2 Sleep Clock Ena. For MPU Clear Register (RCC\_MP\_AHB2LPENCLRR)

Address offset: 0xB1C

Reset value: 0x0001 0127

This register is used by the MPU in order to clear the PERxLPEN bit of the corresponding peripheral. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **IPCCLPEN**: IPCC peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 11 **HSEMLPEN**: HSEM peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 10:8 Reserved, must be kept at reset value.

Bit 7 **CRC2LPEN**: CRC2 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 6 **RNG2LPEN**: RNG2 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 5 **HASH2LPEN**: HASH2 peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bit 4 **CRYP2LPEN**: CRYP2 (3DES/AES2) peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **DCMILPEN**: DCMI peripheral clocks enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep

1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.202 RCC AHB3 Sleep Clock Ena. For MCU Clear Register (RCC\_MC\_AHB3LPENCLRR)

Address offset: 0xBA4

Reset value: 0x0000 18F1

This register is used by the MCU in order to clear the PERxLPEN bit of the corresponding peripheral. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

- Bit 0 **GPIOALPEN**: GPIOA peripheral clocks enable during CSleep mode  
Cleared by software.  
0: Writing '0' has no effect, reading '0' means that the peripheral clocks are disabled in CSleep  
1: Writing '1' disables the peripheral clocks in CSleep, reading '1' means that the peripheral clocks are enabled in CSleep

### 10.7.206 RCC AHB4 Sleep Clock Ena. For MCU Clear Register (RCC\_MC\_AHB4LPENCLRR)

Address offset: 0xBAC

Reset value: 0x0000 07FF

This register is used by the MCU in order to clear the PERxLPEN bit of the corresponding peripheral. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **RETRAML PEN**: RETRAM interface clock enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the memory interface clock is disabled in CSleep

1: Writing '1' enables the memory interface clock in CSleep, reading '1' means that the memory interface is enabled in CSleep

Bit 3 Reserved, must be kept at reset value.

Bit 2 **SRAM34LPEN**: SRAM3 and SRAM4 interface clock enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the memory interface clock is disabled in CSleep

1: Writing '1' enables the memory interface clock in CSleep, reading '1' means that the memory interface is enabled in CSleep

Bit 1 **SRAM2LPEN**: SRAM2 interface clock enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the memory interface clock is disabled in CSleep

1: Writing '1' enables the memory interface clock in CSleep, reading '1' means that the memory interface is enabled in CSleep.

Bit 0 **SRAM1LPEN**: SRAM1 interface clock enable during CSleep mode

Set by software.

0: Writing '0' has no effect, reading '0' means that the memory interface clock is disabled in CSleep

1: Writing '1' enables the memory interface clock in CSleep, reading '1' means that the memory interface is enabled in CSleep

### 10.7.212 RCC MLAHB Sleep Clock Ena. For MCU Set Register (RCC\_MC\_MLAHBLPENSETR)

Address offset: 0xBB8

Reset value: 0x0000 0017

This register is used by the MCU in order to set the PERxLPEN bit of the corresponding peripheral to '1'. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

|      |      |      |      |      |      |      |      |      |      |      |             |      |            |           |           |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **RETRAML PEN**: RETRAM interface clock enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the memory interface clock is disabled in CSleep

1: Writing '1' disables the memory interface clock in CSleep, reading '1' means that the memory interface is enabled in CSleep

Bit 3 Reserved, must be kept at reset value.

Bit 2 **SRAM34LPEN**: SRAM3 and SRAM4 interface clock enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the memory interface clock is disabled in CSleep

1: Writing '1' disables the memory interface clock in CSleep, reading '1' means that the memory interface is enabled in CSleep

Bit 1 **SRAM2LPEN**: SRAM2 interface clock enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the memory interface clock is disabled in CSleep

1: Writing '1' disables the memory interface clock in CSleep, reading '1' means that the memory interface is enabled in CSleep

Bit 0 **SRAM1LPEN**: SRAM1 interface clock enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the memory interface clock is disabled in CSleep

1: Writing '1' disables the memory interface clock in CSleep, reading '1' means that the memory interface is enabled in CSleep

### 10.7.214 RCC MLAHB Sleep Clock Ena. For MCU Clear Register (RCC\_MC\_MLAHBLPENCLRR)

Address offset: 0xBBB

Reset value: 0x0000 0017

This register is used by the MCU in order to clear the PERxLPEN bit of the corresponding peripheral. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

|      |      |      |      |      |      |      |      |      |      |      |             |      |            |           |           |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **RETRAML PEN**: RETRAM interface clock enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the memory interface clock is disabled in CSleep

1: Writing '1' disables the memory interface clock in CSleep, reading '1' means that the memory interface is enabled in CSleep

Bit 3 Reserved, must be kept at reset value.

Bit 2 **SRAM34LPEN**: SRAM3 and SRAM4 interface clock enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the memory interface clock is disabled in CSleep

1: Writing '1' disables the memory interface clock in CSleep, reading '1' means that the memory interface is enabled in CSleep

Bit 1 **SRAM2LPEN**: SRAM2 interface clock enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the memory interface clock is disabled in CSleep

1: Writing '1' disables the memory interface clock in CSleep, reading '1' means that the memory interface is enabled in CSleep

Bit 0 **SRAM1LPEN**: SRAM1 interface clock enable during CSleep mode

Cleared by software.

0: Writing '0' has no effect, reading '0' means that the memory interface clock is disabled in CSleep

1: Writing '1' disables the memory interface clock in CSleep, reading '1' means that the memory interface is enabled in CSleep

### 10.7.215 RCC BOOTROM Reset Status Clear Register (RCC\_BR\_RSTSCLR)

Address offset: 0x400

Reset value: 0x0000 0015

This register is used by the BOOTROM to check the reset source. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' clears the corresponding bit to '0'. In order to identify the reset source, the MPU application must use [RCC MPU Reset Status Clear Register \(RCC\\_MP\\_RSTSCLR\)](#), and the MCU application must use the [RCC MCU Reset Status Clear Register \(RCC\\_MC\\_RSTSCLR\)](#). Refer to [Section 10.3.13: Reset source identification](#) for details.

This register except MPUP[1:0]RSTF flags is located into V<sub>DD</sub> domain, and is reset by por\_rst reset. The MPUP[1:0]RSTF flags are located into V<sub>DDCORE</sub> and are reset by nreset. If TZEN = '1', this register can only be modified in secure mode.

|      |           |           |      |      |      |           |           |           |           |      |           |          |         |         |         |
|------|-----------|-----------|------|------|------|-----------|-----------|-----------|-----------|------|-----------|----------|---------|---------|---------|

|      |           |           |      |      |      |           |           |           |           |      |           |          |         |         |         |
| 15   | 14        | 13        | 12   | 11   | 10   | 9         | 8         | 7         | 6         | 5    | 4         | 3        | 2       | 1       | 0       |
| Res. | MPUP1RSTF | MPUP0RSTF | Res. | Res. | Res. | IWDG2RSTF | IWDG1RSTF | MCSYSRSTF | MPSYSRSTF | Res. | VCORERSTF | HCSSRSTF | PADRSTF | BORRSTF | PORRSTF |
|      | rc_w1     | rc_w1     |      |      |      | rc_w1     | rc_w1     | rc_w1     | rc_w1     |      | rc_w1     | rc_w1    | rc_w1   | rc_w1   | rc_w1   |

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **MPUP1RSTF**: MPU processor 1 reset flag

Cleared by software, set by hardware when a MPU processor 1 reset occurred.

0: Writing '0' has no effect, reading '0' means that no MPU processor 1 reset occurred (default after nreset reset)

1: Writing '1' clears the MPUP1RSTF flag, reading '1' means that MPU processor 1 reset occurred

Bit 13 **MPUP0RSTF**: MPU processor 0 reset flag

Cleared by software, set by hardware when a MPU processor 0 reset occurred.

0: Writing '0' has no effect, reading '0' means that no MPU processor 0 reset occurred (default after nreset reset)

1: Writing '1' clears the MPUP0RSTF flag, reading '1' means that MPU processor 0 reset occurred

Bits 12:10 Reserved, must be kept at reset value.

Bit 9 **IWDG2RSTF**: IWDG2 reset flag

Cleared by software, set by hardware when a IWDG2 reset occurred.

0: Writing '0' has no effect, reading '0' means that no IWDG2 reset occurred (default after por\_rst reset)

1: Writing '1' clears the IWDG2RSTF flag, reading '1' means that a IWDG2 reset occurred

- Bit 8 **IWDG1RSTF**: IWDG1 reset flag  
 Cleared by software, set by hardware when a IWDG1 reset occurred.  
 0: Writing '0' has no effect, reading '0' means that no IWDG1 reset occurred (default after por\_rst reset)  
 1: Writing '1' clears the IWDG1RSTF flag, reading '1' means that a IWDG1 reset occurred
- Bit 7 **MCSYSRSTF**: MCU System reset flag  
 Cleared by software, set by hardware when a MCU system reset occurred.  
 Note that for the RCC\_BR\_RSTSCLR register, this bit is forced to '0' when the option byte OTP\_MCU\_SYSRST\_EN does not allow the MCU to perform a system reset.  
 0: Writing '0' has no effect, reading '0' means that no system reset generated by the MCU occurred (default after por\_rst reset)  
 1: Writing '1' clears the MCURSTF flag, reading '1' means that a system reset generated by the MCU occurred
- Bit 6 **MPSYSRSTF**: MPU System reset flag  
 Cleared by software, set by hardware when a MPU system reset occurred.  
 0: Writing '0' has no effect, reading '0' means that no system reset generated by the MPU occurred (default after por\_rst reset)  
 1: Writing '1' clears the MCURSTF flag, reading '1' means that a system reset generated by the MPU occurred
- Bit 5 Reserved, must be kept at reset value.
- Bit 4 **VCORERSTF**: V<sub>DDCORE</sub> reset flag  
 Cleared by software, set by hardware when a reset occurred because V<sub>DDCORE</sub> is lower than the expected value.  
 0: Writing '0' has no effect, reading '0' means that V<sub>DDCORE</sub> is not the origin of the reset  
 1: Writing '1' clears the VCORERSTF flag, reading '1' means that V<sub>DDCORE</sub> is the origin of the reset (default after por\_rst reset)
- Bit 3 **HCSSRSTF**: HSE CSS reset flag  
 Cleared by software, set by hardware when a failure is detected on HSE.  
 0: Writing '0' has no effect, reading '0' means that no HSE CSS reset occurred (default after por\_rst reset)  
 1: Writing '1' clears the HCSSRSTF flag, reading '1' means that a HSE CSS reset occurred
- Bit 2 **PADRSTF**: NRST reset flag  
 Cleared by software, set by hardware when a PAD reset occurred.  
 0: Writing '0' has no effect, reading '0' means that no PAD reset occurred (default after por\_rst reset)  
 1: Writing '1' clears the PADRSTF flag, reading '1' means that a PAD reset occurred
- Bit 1 **BORRSTF**: BOR reset flag  
 Cleared by software, set by hardware when a BOR reset occurred.  
 0: Writing '0' has no effect, reading '0' means that no BOR reset occurred (default after por\_rst reset)  
 1: Writing '1' clears the BORRSTF flag, reading '1' means that a BOR reset occurred
- Bit 0 **PORRSTF**: POR/PDR reset flag  
 Cleared by software, set by hardware when a POR/PDR reset occurred.  
 0: Writing '0' has no effect, reading '0' means that no POR/PDR reset occurred  
 1: Writing '1' clears the PORRSTF flag, reading '1' means that a POR/PDR reset occurred (default after por\_rst reset)

### 10.7.216 RCC MCU Reset Status Clear Register (RCC\_MC\_RSTSCLRR)

Address offset: 0xC00

Reset value: 0x0000 0015

This register is used by the MCU to check the reset source. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' clears the corresponding bit to '0'. Refer to [Section 1.3.12: Reset Source Identification](#) for details. This register is located into  $V_{DD}$  domain, and is reset by por\_rst reset.

|      |      |      |      |      |           |           |           |           |           |         |           |          |         |         |         |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **WWDG1RSTF**: WWDG1 reset flag

Cleared by software, set by hardware when a WWDG1 reset occurred.

0: Writing '0' has no effect, reading '0' means that no WWDG1 reset occurred (default after por\_rst reset)

1: Writing '1' clears the WWDG1RSTF flag, reading '1' means that a WWDG1 reset occurred

Bit 9 **IWDG2RSTF**: IWDG2 reset flag

Cleared by software, set by hardware when a IWDG2 reset occurred.

0: Writing '0' has no effect, reading '0' means that no IWDG2 reset occurred (default after por\_rst reset)

1: Writing '1' clears the IWDG2RSTF flag, reading '1' means that a IWDG2 reset occurred

Bit 8 **IWDG1RSTF**: IWDG1 reset flag

Cleared by software, set by hardware when a IWDG1 reset occurred.

0: Writing '0' has no effect, reading '0' means that no IWDG1 reset occurred (default after por\_rst reset)

1: Writing '1' clears the IWDG1RSTF flag, reading '1' means that a IWDG1 reset occurred

Bit 7 **MCSYSRSTF**: MCU System reset flag

Cleared by software, set by hardware when a MCU system reset occurred.

Note that for the RCC\_BR\_RSTSCLRR register, this bit is forced to '0' when the option byte OTP\_MCU\_SYSRST\_EN does not allow the MCU to perform a system reset.

0: Writing '0' has no effect, reading '0' means that no system reset generated by the MCU occurred (default after por\_rst reset)

1: Writing '1' clears the MCURSTF flag, reading '1' means that a system reset generated by the MCU occurred

**Bit 6 MPSYSRSTF:** MPU System reset flag

Cleared by software, set by hardware when a MPU system reset occurred.

0: Writing '0' has no effect, reading '0' means that no system reset generated by the MPU occurred (default after por\_rst reset)

1: Writing '1' clears the MCURSTF flag, reading '1' means that a system reset generated by the MPU occurred

**Bit 5 MCURSTF:** MCU reset flag

Cleared by software, set by hardware when a MCU reset occurred.

0: Writing '0' has no effect, reading '0' means that no MCU reset occurred (default after por\_rst reset)

1: Writing '1' clears the MCURSTF flag, reading '1' means that a MCU reset occurred

**Bit 4 VCORERSTF:** V<sub>DDCORE</sub> reset flag

Cleared by software, set by hardware when a reset occurred because V<sub>DDCORE</sub> is lower than the expected value.

0: Writing '0' has no effect, reading '0' means that V<sub>DDCORE</sub> is not the origin of the reset

1: Writing '1' clears the VCORERSTF flag, reading '1' means that V<sub>DDCORE</sub> is the origin of the reset (default after por\_rst reset)

**Bit 3 HCSSRSTF:** HSE CSS reset flag

Cleared by software, set by hardware when a failure is detected on HSE.

0: Writing '0' has no effect, reading '0' means that no HSE CSS reset occurred (default after por\_rst reset)

1: Writing '1' clears the HCSSRSTF flag, reading '1' means that a HSE CSS reset occurred

**Bit 2 PADRSTF:** NRST reset flag

Cleared by software, set by hardware when a PAD reset occurred.

0: Writing '0' has no effect, reading '0' means that no PAD reset occurred (default after por\_rst reset)

1: Writing '1' clears the PADRSTF flag, reading '1' means that a PAD reset occurred

**Bit 1 BORRSTF:** BOR reset flag

Cleared by software, set by hardware when a BOR reset occurred.

0: Writing '0' has no effect, reading '0' means that no BOR reset occurred (default after por\_rst reset)

1: Writing '1' clears the BORRSTF flag, reading '1' means that a BOR reset occurred

**Bit 0 PORRSTF:** POR/PDR reset flag

Cleared by software, set by hardware when a POR/PDR reset occurred.

0: Writing '0' has no effect, reading '0' means that no POR/PDR reset occurred

1: Writing '1' clears the PORRSTF flag, reading '1' means that a POR/PDR reset occurred (default after por\_rst reset)

**10.7.217 RCC MPU Reset Status Clear Register (RCC\_MP\_RSTSCLRR)**

Address offset: 0x408

Reset value: 0x0000 0000

This register is used by the MPU to check the reset source. This register is updated by the BOOTROM code, after a power-on reset (por\_rst), a system reset (nreset), or an exit from Standby or CStandby.

Writing '0' has no effect, reading will return the effective values of the corresponding bits.

Writing a '1' clears the corresponding bit to '0'.

Refer to [Section 10.3.13: Reset source identification](#) for details.

The register is located in V<sub>DDCORE</sub>.

If TZEN = '1', this register can only be modified in secure mode.

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **SPARE**: Spare bits

Set and reset by software. Reserved for future use.

Bit 14 **MPUP1RSTF**: MPU processor 1 reset flag

Cleared by software, set by the BOOTROM code when a MPU processor 1 reset occurred.

0: No MPU processor 1 reset occurred (default after nreset reset)

1: MPU processor 1 reset occurred

Bit 13 **MPUP0RSTF**: MPU processor 0 reset flag

Cleared by software, set by the BOOTROM code when a MPU processor 0 reset occurred.

0: No MPU processor 0 reset occurred (default after nreset reset)

1: MPU processor 0 reset occurred

Bit 12 **CSTDBYRSTF**: MPU CStandby reset flag

Cleared by software, set by the BOOTROM code when the MPU exits from CStandby.

0: MPU has not been in CStandby mode

1: MPU has been in CStandby mode

Bit 11 **STDBYRSTF**: System Standby reset flag

Cleared by software, set by the BOOTROM code when exiting from system Standby.

0: System has not been in Standby mode

1: System has been in Standby mode

Bit 10 Reserved, must be kept at reset value.

Bit 9 **IWDG2RSTF**: IWDG2 reset flag

Cleared by software, set by the BOOTROM code when a IWDG2 reset occurred.

0: No IWDG2 reset occurred

1: An IWDG2 reset occurred

Bit 8 **IWDG1RSTF**: IWDG1 reset flag

Cleared by software, set by the BOOTROM code when a IWDG1 reset occurred.

0: No IWDG1 reset occurred

1: An IWDG1 reset occurred

Bit 7 **MCSYSRSTF**: MCU System reset flag

Cleared by software, set by the BOOTROM code when a MCU system reset occurred.

0: No system reset generated by the MCU occurred

1: A system reset generated by the MCU occurred

- Bit 6 **MPSYSRSTF**: MPU System reset flag  
Cleared by software, set by the BOOTROM code when a MPU system reset occurred.  
0: No system reset generated by the MPU occurred  
1: A system reset generated by the MPU occurred
- Bit 5 Reserved, must be kept at reset value.
- Bit 4 **VCORERSTF**: V<sub>DDCORE</sub> reset flag  
Cleared by software, set by the BOOTROM code when a reset occurred because V<sub>DDCORE</sub> is lower than the expected value.  
0: V<sub>DDCORE</sub> is not the origin of the reset  
1: V<sub>DDCORE</sub> is the origin of the reset
- Bit 3 **HCSSRSTF**: HSE CSS reset flag  
Cleared by software, set by the BOOTROM code when a failure is detected on HSE.  
0: No HSE CSS reset occurred  
1: A HSE CSS reset occurred
- Bit 2 **PADRSTF**: NRST reset flag  
Cleared by software, set by the BOOTROM code when a PAD reset occurred.  
0: No PAD reset occurred  
1: A PAD reset occurred
- Bit 1 **BORRSTF**: BOR reset flag  
Cleared by software, set by the BOOTROM code when a BOR reset occurred.  
0: No BOR reset occurred  
1: A BOR reset occurred
- Bit 0 **PORRSTF**: POR/PDR reset flag  
Cleared by software, set by the BOOTROM code when a POR/PDR reset occurred.  
0: No POR/PDR reset occurred  
1: A POR/PDR reset occurred

### 10.7.218 RCC MPU Reset Status Set Register (RCC\_MP\_RSTSSETR)

Address offset: 0x420

Reset value: 0x0000 0000

This register is dedicated to the BOOTROM code in order to update the reset source. This register is updated by the BOOTROM code, after a power-on reset (por\_rst), a system reset (nreset), or an exit from Standby or CStandby. The application software shall not use this register. In order to identify the reset source, the MPU application must use [RCC MPU Reset Status Clear Register \(RCC\\_MP\\_RSTSCLR\)](#), and the MCU application must use the [RCC MCU Reset Status Clear Register \(RCC\\_MC\\_RSTSCLR\)](#).

Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'.

Refer to [Section 10.3.13: Reset source identification](#) for details.

The register is located in V<sub>DDCORE</sub>.

If TZEN = '1', this register can only be modified in secure mode.

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **SPARE**: Spare bits

Set and reset by software. Reserved for future use.

Bit 14 **MPUP1RSTF**: MPU processor 1 reset flag

Set by the BOOTROM code when a MPU processor 1 reset occurred.

0: No MPU processor 1 reset occurred (default after nreset reset)

1: MPU processor 1 reset occurred

Bit 13 **MPUP0RSTF**: MPU processor 0 reset flag

Set by the BOOTROM code when a MPU processor 0 reset occurred.

0: No MPU processor 0 reset occurred (default after nreset reset)

1: MPU processor 0 reset occurred

Bit 12 **CSTDBYRSTF**: MPU CStandby reset flag

Set by the BOOTROM code when the MPU exits from CStandby.

0: MPU has not been in CStandby mode

1: MPU has been in CStandby mode

Bit 11 **STDBYRSTF**: System Standby reset flag

Set by the BOOTROM code when exiting from system Standby.

0: System has not been in Standby mode

1: System has been in Standby mode

- Bit 10 Reserved, must be kept at reset value.
- Bit 9 **IWDG2RSTF**: IWDG2 reset flag  
Set by the BOOTROM code when a IWDG2 reset occurred.  
0: No IWDG2 reset occurred  
1: An IWDG2 reset occurred
- Bit 8 **IWDG1RSTF**: IWDG1 reset flag  
Set by the BOOTROM code when a IWDG1 reset occurred.  
0: No IWDG1 reset occurred  
1: An IWDG1 reset occurred
- Bit 7 **MCSYSRSTF**: MCU System reset flag  
Set by the BOOTROM code when a MCU system reset occurred.  
0: No system reset generated by the MCU occurred  
1: A system reset generated by the MCU occurred
- Bit 6 **MPSYSRSTF**: MPU System reset flag  
Set by the BOOTROM code when a MPU system reset occurred.  
0: No system reset generated by the MPU occurred  
1: A system reset generated by the MPU occurred
- Bit 5 Reserved, must be kept at reset value.
- Bit 4 **VCORERSTF**: V<sub>DDCORE</sub> reset flag  
Set by the BOOTROM code when a reset occurred because V<sub>DDCORE</sub> is lower than the expected value.  
0: V<sub>DDCORE</sub> is not the origin of the reset  
1: V<sub>DDCORE</sub> is the origin of the reset
- Bit 3 **HCSSRSTF**: HSE CSS reset flag  
Set by the BOOTROM code when a failure is detected on HSE.  
0: No HSE CSS reset occurred  
1: A HSE CSS reset occurred
- Bit 2 **PADRSTF**: NRST reset flag  
Set by the BOOTROM code when a PAD reset occurred.  
0: No PAD reset occurred  
1: A PAD reset occurred
- Bit 1 **BORRSTF**: BOR reset flag  
Set by the BOOTROM code when a BOR reset occurred.  
0: No BOR reset occurred  
1: A BOR reset occurred
- Bit 0 **PORRSTF**: POR/PDR reset flag  
Set by the BOOTROM code when a POR/PDR reset occurred.  
0: No POR/PDR reset occurred  
1: A POR/PDR reset occurred

### 10.7.219 RCC IWDG Clock Freeze Set Register (RCC\_MP\_IWDGFZSETR)

Address offset: 0x40C

Reset value: 0x0000 0000

This register is used by the BOOTROM in order to freeze the IWDGs clocks. After a system reset or Standby reset (nreset), or a CStandby reset (cstby\_rst) the MPU is allowed to write it once. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' sets the corresponding bit to '1'. The MCU cannot modify this register. If TZEN = '1', this register can only be modified in secure mode.

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |          |          |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FZ\_IWDG2**: Freeze the IWDG2 clock

Set once by the BOOTROM software after a system reset or Standby reset, or a CStandby reset, in order to freeze the IWDG2.

0: Writing '0' has no effect, reading '0' means that the IWDG2 clock is not frozen (default after reset)

1: Writing '1' freeze the IWDG2 clock, reading '1' means that the IWDG2 clock is frozen

Bit 0 **FZ\_IWDG1**: Freeze the IWDG1 clock

Set once by the BOOTROM software after a system reset or Standby reset, or a CStandby reset, in order to freeze the IWDG1.

0: Writing '0' has no effect, reading '0' means that the IWDG1 clock is not frozen (default after reset)

1: Writing '1' freeze the IWDG1 clock, reading '1' means that the IWDG1 clock is frozen

### 10.7.220 RCC IWDG Clock Freeze Clear Register (RCC\_MP\_IWDGFZCLRR)

Address offset: 0x410

Reset value: 0x0000 0000

This register is used by the BOOTROM in order to unfreeze the IWDGs clocks. Writing '0' has no effect, reading will return the effective values of the corresponding bits. Writing a '1' clears the corresponding bit to '0'. The MCU cannot modify this register. If TZEN = '1', this register can only be modified in secure mode.

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FZ\_IWDG2**: Unfreeze the IWDG2 clock

Cleared by the BOOTROM software, in order to unfreeze the IWDG2.

0: Writing '0' has no effect, reading '0' means that the IWDG2 clock is not frozen (default after reset)

1: Writing '1' unfreeze the IWDG2 clock, reading '1' means that the IWDG2 clock is frozen

Bit 0 **FZ\_IWDG1**: Unfreeze the IWDG1 clock

Cleared by the BOOTROM software, in order to unfreeze the IWDG1.

0: Writing '0' has no effect, reading '0' means that the IWDG1 clock is not frozen (default after reset)

1: Writing '1' unfreeze the IWDG1 clock, reading '1' means that the IWDG1 clock is frozen

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 11 Hardware semaphore (HSEM)

### 11.1 Hardware semaphore introduction

The hardware semaphore block provides 32 (32-bit) register based semaphores.

The semaphores can be used to ensure synchronization between different processes running between different cores. The HSEM provides a non blocking mechanism to lock semaphores in an atomic way. The following functions are provided:

- Locking a semaphore can be done in two ways:
  - 2-step lock: by writing COREID and PROCID to the semaphore, followed by a read check
  - 1-step lock: by reading the COREID from the semaphore
- Interrupt generation when a semaphore is freed
  - Each semaphore may generate an interrupt on one of the interrupt lines
- Semaphore clear protection
  - A semaphore is only cleared when COREID and PROCID match
- Global semaphore clear per COREID

### 11.2 Hardware semaphore main features

The HSEM includes the following features:

- 32 (32-bit) semaphores
- 8-bit PROCID
- 4-bit COREID
- 2 interrupt lines
- Lock indication

## 11.3 HSEM functional description

### 11.3.1 HSEM block diagram

As shown in [Figure 109](#), the HSEM is based on three sub-blocks:

- The semaphore block containing the semaphore status and IDs
- The semaphore interface block providing AHB access to the semaphore via the HSEM\_Rx and HSEM\_RLRx registers
- The interrupt interface block providing control for the interrupts via the HSEM\_CnISR, HSEM\_CnIER, HSEM\_CnMISR, and HSEM\_CnICR registers

**Figure 109. HSEM block diagram**

### 11.3.2 HSEM internal signals

**Table 76. HSEM internal input/output signals**

| Signal name  | Signal type    | Description      |
|--------------|----------------|------------------|
| hsem_hclk    | Digital input  | AHB clock        |
| hsem_int1_it | Digital output | Interrupt 1 line |
| hsem_int2_it | Digital output | Interrupt 2 line |

### 11.3.3 HSEM lock procedures

There are two lock procedures:

- 2-step (write) lock
- 1-step (read) lock

The semaphore is free when its LOCK bit is 0. In this case, the COREID and PROCID are also 0. When the LOCK bit is 1, the semaphore is locked and the COREID indicates which AHB bus master locked it. The PROCID indicates which process of that AHB bus master locked the semaphore.

When write locking a semaphore, the COREID is taken from the master ID and the PROCID is taken from the write data. When read locking the semaphore, the COREID is taken from the AHB bus master ID, and the PROCID is zero. There is no PROCID available with the 1-step (read) lock.

The COREID is taken from the AHB bus master ID. The PROCID is written by the software of that AHB bus master. Each AHB bus master process must have a unique PROCID. PROCID is only available in the 2-step lock procedure.

The two procedures (1-step and 2-step) can be used concurrently.

**Figure 110. Procedure state diagram**

#### 2-step (write) lock procedure

The 2-step lock procedure consists in a write to lock the semaphore, followed by a read to check if the lock has been successful, carried out from the HSEM\_Rx register

- Write semaphore with PROCID and COREID, and LOCK = 1  
Lock is put in place when semaphore is free at write time.
- Read-back the semaphore  
The software checks the lock status, if PROCID and COREID match, then the lock is confirmed.
- Else retry (the semaphore has been locked by another AHB bus master or process)

A semaphore can only be locked when it is free.

A semaphore can be locked when the PROCID = 0.

Consecutive write attempts with LOCK = 1 to a locked semaphore, are ignored.

### 1-step (read) lock procedure

The 1-step procedure consists in a read to lock and check the semaphore in a single step from the HSEM\_RLRx register.

- Read Lock semaphore with COREID.
- If read COREID matches and PROCID = 0, then the lock is put in place. If COREID matches and PROCID is not 0, this means that another process from the same COREID locked the semaphore with a 2-step (write) procedure.
- Else retry (the semaphore has been locked by another AHB bus master or process)

A semaphore can only be locked when it is free. When read locking a free semaphore, PROCID is 0. Read locking a locked semaphore returns the COREID and PROCID that locked it. All read locks, including the first one that locks the semaphore, return the COREID that locks or locked the semaphore.

If multiple processes of the same AHB bus master use the 1-step procedure, all processes using the same semaphore read the same status. When only one process locks the semaphore, each process of that AHB bus master reads the semaphore as locked by itself with the COREID.

### 11.3.4 HSEM write/read/readlock register address

For each semaphore, two AHB register addresses are provided, separated in two banks of 0x80.

In the first register address bank the semaphore can be written (locked/cleared) and read through the HSEM\_Rx registers.

In the second register address bank the semaphore can be read (locked) through the HSEM\_RLRx registers.

### 11.3.5 HSEM clear procedures

Clearing a semaphore is a protected process, to prevent accidental clearing by a AHB bus master or by a process that does not have the semaphore lock right. The semaphore clear procedure consists in writing to the semaphore with the corresponding COREID and PROCID and LOCK = 0. When cleared, the semaphore LOCK, the COREID, and the PROCID are all 0.

When cleared, an interrupt may be generated to signal the event. To this end, the semaphore interrupt must be enabled.

The clear procedure consists in a write to the semaphore HSEM\_Rx registers:

- Write semaphore with PROCID and COREID, LOCK = 0.
- If PROCID and COREID match, semaphore is freed, and an interrupt may be generated when enabled.
- Else write is ignored, semaphore remains locked and no interrupts are generated (the semaphore is locked by another AHB bus master or process).

If multiple processes of the same AHB bus master use the 1-step lock procedure (PROCID = 0), all processes using the same semaphore clear the semaphore also for the other processes of that AHB bus master.

### 11.3.6 HSEM COREID semaphore clear

All semaphores locked by a AHB bus master can be cleared all at once by using the HSEM\_CR register.

The procedure to clear all semaphores locked by a AHB bus master is the following:

- Write COREID and correct KEY value. All locked semaphore with a matching COREID are cleared (set to free), and may generate an interrupt when enabled.

This procedure may be used in case of an incorrect functioning AHB bus master, where another AHB bus master can free the locked semaphores by writing the incorrect functioning COREID into the HSEM\_CR register with the correct KEY value. This clears all locked semaphores with a matching COREID.

An interrupt may be generated for the semaphore(s) that become free. To this end, the semaphore interrupt must be enabled in the HSEM\_CnIER registers.

### 11.3.7 HSEM interrupts

There are two interrupt lines, hsem\_int1\_it (for interrupt 1) and hsem\_int2\_it (for interrupt 2), allowing each of the semaphores to generate an interrupt.

Each of these two interrupt lines provides the following features:

- Interrupt enable per semaphore
- Interrupt clear per semaphore
- Interrupt status per semaphore
- Masked interrupt status per semaphore

With the interrupt enable (HSEM\_CnIER), the semaphores affecting the interrupt line can be enabled. Disabled (masked) semaphore interrupts do not set the masked interrupt status for that semaphore, and do not generate an interrupt on the interrupt line.

The interrupt clear (HSEM\_CnICR) clears the interrupt status and masked interrupt status of the associated semaphore for the interrupt line.

The interrupt status (HSEM\_CnISR) mirrors the semaphore interrupt status of the interrupt line before the enable.

The masked interrupt status (HSEM\_CnMISR) only mirrors the semaphore interrupt status of the enabled semaphore interrupts on the interrupt line. All masked interrupt status of the enabled semaphore must be cleared in order to clear the interrupt line.

Figure 111. Interrupt state diagram

The procedure to get an interrupt when a semaphore becomes free is described hereafter.

### Try to lock the semaphore x

- If the semaphore lock is obtained, no interrupt is needed.
- If the semaphore lock fails:

Clear pending semaphore x interrupt status for the interrupt line hsem\_intn\_it in HSEM\_CnICR.

Re-try to lock the semaphore x again:

- If the semaphore lock is obtained, no interrupt is needed (semaphore has been freed between first try to lock it and clear semaphore interrupt status).
- If the semaphore lock fails, enable the semaphore x interrupt for the interrupt line hsem\_intn\_it in HSEM\_CnIER.

**On the semaphore x free interrupt, try to lock the semaphore x**

- If the semaphore lock is obtained:  
Disable the semaphore x interrupt for the interrupt line hsem\_intn\_it in HSEM\_CnIER.  
Clear pending semaphore x interrupt status for the interrupt line hsem\_intn\_it in HSEM\_CnICR.
- If the semaphore x lock fails:  
Clear pending semaphore x Interrupt status for the interrupt line hsem\_intn\_it in HSEM\_CnICR.  
Try again to lock the semaphore x:
  - If the semaphore lock is obtained (semaphore has been freed between first try to lock and semaphore Interrupt status clear), Disable the semaphore interrupt for the interrupt line hsem\_intn\_it in HSEM\_CnIER.
  - If the semaphore lock failed, wait for semaphore free interrupt.

*Note:* An interrupt does not lock the semaphore. After an interrupt, either the AHB bus master or the process must still perform the lock procedure to lock the semaphore.

It is possible to have multiple AHB bus masters informed by the semaphore free interrupts. Each AHB bus master gets its interrupt, and the first one to react locks the semaphore.

**11.3.8 AHB bus master ID verification**

The HSEM allows only authorized AHB bus master IDs to lock and unlock semaphores.

- The AHB bus master 2-step lock write access to the semaphore HSEM\_Rx register is checked against the valid bus master IDs.
  - Accesses from unauthorized AHB bus master IDs are discarded and do not lock the semaphore.
- The AHB bus master 1-step lock read access from the semaphore HSEM\_RLRx register is checked against the valid bus master IDs.
  - An unauthorized AHB bus master ID read from HSEM\_RLRx returns the following Read data depending on the semaphore status:
    - when the semaphore is free, it returns all 0.
    - when the semaphore has been locked before, it returns the HSEM\_RLRx data.
- The COREID semaphore clear write access to the HSEM\_CR register is checked against the valid bus master IDs. Only the valid bus master IDs can write to the HSEM\_CR register and clear any of the COREID semaphores.
  - Accesses from unauthorized AHB bus master IDs are discarded and do not clear the COREID semaphore.

*Table 77* details the relation between bus master/CPU and COREID.

**Table 77. Authorized AHB bus master IDs**

| Bus master 0 (CPU1) | Bus master 1 (CPU2) |
|---------------------|---------------------|
| COREID = 1          | COREID = 2          |

*Note:* Accesses from unauthorized AHB bus master IDs to other registers are granted.

## 11.4 HSEM registers

Registers must be accessed using word format. Byte and half-word accesses are ignored and have no effect on the semaphores. Byte and half-word read accesses always return 0. Byte and half-word accesses do not generate a bus error.

### 11.4.1 HSEM register semaphore x (HSEM\_Rx)

Address offset:  $0x000 + 0x4 * x$  ( $x = 0$  to  $31$ )

Reset value:  $0x0000\ 0000$

The HSEM\_Rx must be used to perform a 2-step write lock and read back. Only write accesses with authorized AHB bus master IDs are granted. Write accesses with unauthorized AHB bus master IDs are discarded.

|      |      |      |      |             |      |      |      |             |      |      |      |      |      |      |      |

| 15   | 14   | 13   | 12   | 11          | 10   | 9    | 8    | 7           | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | COREID[3:0] |      |      |      | PROCID[7:0] |      |      |      |      |      |      |      |
|      |      |      |      | rw          | rw   | rw   | rw   | rw          | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bit 31 **LOCK**: Lock indication

This bit can be written and read by software.

0: On write free semaphore (only when COREID and PROCID match), on read semaphore is free.

1: On write try to lock semaphore, on read semaphore is locked.

Bits 30:12 Reserved, must be kept at reset value.

Bits 11:8 **COREID[3:0]**: Semaphore COREID

Written by software, when the semaphore is free and the LOCK bit is at the same time written to 1, the COREID is written only when the bus ID of the AHB bus master writing the semaphore matches.

When the semaphore is cleared (LOCK bit written to 0 and AHB bus master ID matched COREID), the COREID is cleared to 0.

When the semaphore is cleared (LOCK bit written to 0 and AHB bus master ID does not match COREID), the COREID is not be affected.

Write when LOCK bit is already 1 (semaphore locked), the COREID is not affected.

A read returns the stored COREID value.

Bits 7:0 **PROCID[7:0]**: Semaphore PROCID

Written by software, when the semaphore is free and the lock bit is written to 1, the PROCID is set to the written data.

When the semaphore is cleared, (LOCK bit written to 0), the PROCID is cleared to 0.

Write when LOCK bit is already 1 (semaphore locked), the PROCID is not affected.

A read returns the programmed PROCID value.

### 11.4.2 HSEM read lock register semaphore x (HSEM\_RLRx)

Address offset:  $0x080 + 0x004 * x$  ( $x = 0$  to  $31$ )

Reset value:  $0x0000\ 0000$

Accesses the same physical bits as HSEM\_Rx. The HSEM\_RLRx must be used to perform a 1-step read lock. Only read accesses with authorized AHB bus master IDs are granted. Read accesses with unauthorized AHB bus master IDs are discarded.

Bit 31 **LOCK**: Lock indication

This bit is read only by software at this address. A read with a valid bus master ID always returns 1.

When the semaphore is free and the software performs a read, the hardware sets the semaphore to locked.

When the semaphore is locked and the software performs a read, the LOCK bit is not effected.

0: Semaphore free

1: Semaphore locked

Bits 30:12 Reserved, must be kept at reset value.

Bits 11:8 **COREID[3:0]**: Semaphore COREID

This field is read only by software at this address.

On a read, when the semaphore is free, the hardware sets the COREID to the AHB bus master ID reading the semaphore. The COREID of the AHB bus master locking the semaphore, is read.

On a read when the semaphore is locked, this field returns the COREID of the AHB bus master that has locked the semaphore.

Bits 7:0 **PROCID[7:0]**: Semaphore processor ID

This field is read only by software at this address.

On a read when the semaphore is free, this field returns 0.

On a read when the semaphore is locked, this field returns the processor ID of the process that locked the semaphore.

### 11.4.3 HSEM interrupt enable register (HSEM\_CnIER) (n=1 to 2)

Address offset: Block 1: 0x100

Address offset: Block 2: 0x110

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ISE[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| ISE[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **ISE[31:0]**: Interrupt semaphore x enable bit

This bit is read and written by software.

0: Interrupt generation for semaphore x disabled (masked)

1: Interrupt generation for semaphore x enabled (not masked)

### 11.4.4 HSEM interrupt clear register (HSEM\_CnICR) (n=1 to 2)

Address offset: Block 1: 0x104

Address offset: Block 2: 0x114

Reset value: 0x0000 0000

|            |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |

| ISC[15:0]  |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |
| rc_w1      | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 |

Bits 31:0 **ISC[31:0]**: Interrupt semaphore x clear bit

This bit is read and written by software, and is always read 0.

0: Interrupt semaphore x status and masked status not affected

1: Interrupt semaphore x status and masked status cleared

### 11.4.5 HSEM interrupt status register (HSEM\_CnISR) (n=1 to 2)

Address offset: Block 1: 0x108

Address offset: Block 2: 0x118

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ISF[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ISF[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **ISF[31:0]**: Interrupt semaphore x status bit before enable (mask)

This bit is set by hardware, and reset only by software. This bit is cleared by software writing the corresponding HSEM\_CnICR bit.

0: Interrupt semaphore x status, no interrupt pending

1: Interrupt semaphore x status, interrupt pending

### 11.4.6 HSEM interrupt status register (HSEM\_CnMISR) (n=1 to 2)

Address offset: Block 1: 0x10C

Address offset: Block 2: 0x11C

Reset value: 0x0000 0000

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| MISF[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r           | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| MISF[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r           | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **MISF[31:0]**: Masked interrupt semaphore x status bit after enable (mask)

This bit is set by hardware and read only by software. This bit is cleared by software writing the corresponding HSEM\_CnICR bit.

0: Interrupt semaphore x status after masking not pending

1: Interrupt semaphore x status after masking pending

### 11.4.7 HSEM clear register (HSEM\_CR)

Address offset: 0x140

Reset value: 0x0000 0000

Only write accesses with authorized AHB bus master IDs are granted. Write accesses with unauthorized AHB bus master IDs are discarded.

|           |      |      |      |             |    |    |    |      |      |      |      |      |      |      |      |
|-----------|------|------|------|-------------|----|----|----|------|------|------|------|------|------|------|------|
| 31        | 30   | 29   | 28   | 27          | 26 | 25 | 24 | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| KEY[15:0] |      |      |      |             |    |    |    |      |      |      |      |      |      |      |      |
| w         | w    | w    | w    | w           | w  | w  | w  | w    | w    | w    | w    | w    | w    | w    | w    |
| 15        | 14   | 13   | 12   | 11          | 10 | 9  | 8  | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res.      | Res. | Res. | Res. | COREID[3:0] |    |    |    | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|           |      |      |      | w           | w  | w  | w  |      |      |      |      |      |      |      |      |

Bits 31:16 **KEY[15:0]**: Semaphore clear key

This field can be written by software and is always read 0.

If this key value does not match HSEM\_KEYR.KEY, semaphores are not effected.

If this key value matches HSEM\_KEYR.KEY, all semaphores matching the COREID are cleared to the free state.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **COREID[3:0]**: COREID of semaphores to be cleared

This field can be written by software and is always read 0.

This field indicates the COREID for which the semaphores are cleared when writing the HSEM\_CR.

Bits 7:0 Reserved, must be kept at reset value.

### 11.4.8 HSEM interrupt clear register (HSEM\_KEYR)

Address offset: 0x144

Reset value: 0x0000 0000

|           |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|-----------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31        | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| KEY[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| rw        | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |
| 15        | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |

Bits 31:16 **KEY[15:0]**: Semaphore clear key

This field can be written and read by software.

Key value to match when clearing semaphores.

Bits 15:0 Reserved, must be kept at reset value.

### 11.4.9 HSEM hardware configuration register 2 (HSEM\_HWCFGR2)

Address offset: 0x3EC

Reset value: 0x0000 0021

|                |      |      |      |                |      |      |      |                |      |      |      |                |      |      |      |
|----------------|------|------|------|----------------|------|------|------|----------------|------|------|------|----------------|------|------|------|

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 12 Inter-processor communication controller (IPCC)

### 12.1 IPCC introduction

The inter-processor communication controller (IPCC) is used for communicating data between two processors.

The IPCC block provides a non blocking signaling mechanism to post and retrieve communication data in an atomic way. It provides the signaling for twelve channels:

- six channels in the direction from processor 1 to processor 2
- six channels in the opposite direction

It is then possible to have two different communication types in each direction.

The IPCC communication data must be located in a common memory, which is not part of the IPCC block.

### 12.2 IPCC main features

- Status signaling for the twelve channels
  - Channel occupied/free flag, also used as lock
- Two interrupt lines per processor
  - One for RX channel occupied (communication data posted by sending processor)
  - One for TX channel free (communication data retrieved by receiving processor)
- Interrupt masking per channel
  - Channel occupied mask
  - Channel free mask
- Two channel operation modes
  - Simplex (each channel has its own communication data memory location)
  - Half duplex (a single channel associated to a bidirectional communication data information memory location)

### 12.3 IPCC functional description

The IPCC communication data is located in a common memory, which is not part of the IPCC block. The address location of the communication data must be known or located in a known common area that, as already stated, is not part of the IPCC block.

For each communication, the IPCC block provides a channel status flag CHnF.

- When 0, the channel status flag CHnF indicates that the associated IPCC channel is free (communication data has been retrieved by the receiving processor), and can be accessed by the sending processor.
- When 1, the channel status flag CHnF indicates that the associated IPCC channel is occupied (communication data has been posted by the sending processor) and can be accessed by the receiving processor.

The channel operation mode must be known to both processors. A common parameter can be used to indicate the channel transfer mode and must also be located in a known common area. This parameter is not available from the IPCC.

### 12.3.1 IPCC block diagram

The IPCC (see [Figure 112](#)) consists of the following sub-blocks:

- Status block, containing the channel status
- IPCC interface block, providing AHB access to the channel status registers
- Interrupt interface block, providing control for the interrupts

Figure 112. IPCC block diagram

### 12.3.2 IPCC Simplex channel mode

In Simplex channel mode, a dedicated memory location (used to transfer data in a single direction) is assigned to the communication data. The associated channel N control bits (see [Table 79](#)) are used to manage the transfer from the sending to the receiving processor.

Table 79. Bits used for the communication

| Processor                   | A                                                                           | B                                                     |
|-----------------------------|-----------------------------------------------------------------------------|-------------------------------------------------------|
| SEND A = 1<br>RECEIVE B = 2 | IPCC_C1CR.TXFIE<br>IPCC_C1MR.CHnFM<br>IPCC_C1SCR.CHnS<br>IPCC_C1TOC2SR.CHnF | IPCC_C2CR.RXOIE<br>IPCC_C2MR.CHnOM<br>IPCC_C2SCR.CHnC |
| SEND A = 2<br>RECEIVE B = 1 | IPCC_C2CR.TXFIE<br>IPCC_C2MR.CHnFM<br>IPCC_C2SCR.CHnS<br>IPCC_C2TOC1SR.CHnF | IPCC_C1CR.RXOIE<br>IPCC_C1MR.CHnOM<br>IPCC_C1SCR.CHnC |

Once the sending processor has posted the communication data in the memory, it sets the channel status flag CHnF to occupied with CHnS.

Once the receiving processor has retrieved the communication data from the memory, it clears the channel status flag CHnF back to free with CHnC.

**Figure 113. IPCC Simplex channel mode transfer timing**

**Figure 114. IPCC Simplex - Send procedure state diagram**

To send communication data:

- The sending processor checks the channel status flag CHnF:
  - When CHnF = 0, the channel is free (last communication data retrieved by receiving processor) and the new communication data can be written.
  - When CHnF = 1, the channel is occupied (last communication data not retrieved by receiving processor) and the sending processor unmask the channel free interrupt (CHnFM = 0).
  - On a TX free interrupt, the sending processor checks which channel became free and masks the channel free interrupt (CHnFM = 1). Then the new communication can take place.
- Once the complete communication data is posted, the channel status is set to occupied with CHnS. This gives memory access to the receiving processor and generates the RX occupied interrupt.

**Figure 115. IPCC Simplex - Receive procedure state diagram**

To receive a communication, the channel occupied interrupt is unmasked (CHnOM = 0):

- On a RX occupied interrupt, the receiving processor checks which channel became occupied, masks the associated channel occupied interrupt (CHnOM) and reads the communication data from memory.
- Once the complete communication data is retrieved, the channel status is cleared to free with CHnC. This gives memory access back to the sending processor and may generate the TX free interrupt.
- Once the channel status is cleared, the channel occupied interrupt is unmasked (CHnOM = 0).

12.3.3 IPCC Half-duplex channel mode

The Half-duplex channel mode is used when one processor sends a communication and the other processor sends a response to each communication (ping-pong).

In Half-duplex channel mode, a single dedicated memory location is assigned to communication data and response, and is used to transfer data in both directions. The sending processor channel status flag CHnF is assigned to the channel and used by both processors (see [Table 79](#)).

Once the processor A posted the communication data into memory, it sets the processor A channel status flag CHnF to occupied with CHnS (giving memory access to processor B).

Once the processor B retrieved the communication data from memory, it does not change the channel status flags. The memory access is kept by processor B for the response.

Once the processor B posted the response into memory, it clears the channel status flag CHnF to free with CHnC (giving memory access back to processor A).

Once the processor A retrieved the response from the memory, it does not change the channel status flags. The memory location access is kept by processor A for the next communication data.

Figure 116. IPCC Half-duplex channel mode transfer timing

Figure 117. IPCC Half-duplex - Send procedure state diagram

To send communication data:

- The sending processor waits for its response pending software variable to get 0.
  - Once the response pending software variable is 0 the communication data is posted.
- Once the complete communication data has been posted, the channel status flag CHnF is set to occupied with CHnS and the response pending software variable is set to 1 (this gives memory access and generates the RX occupied interrupt to the receiving processor).
- Once the channel status flag CHnF is set, the channel free interrupt is unmasked (CHnFM = 0).

To send a response:

- The receiving processor waits for its response pending software variable to get 1.
  - Once the response pending software variable is 1 the response is posted.
- Once the complete response is posted, the channel status flag CHnF is cleared to free with CHnC and the response pending software variable is set to 0 (this gives memory access and generates the TX free interrupt to the sending processor).
- Once the channel status flag CHnF is cleared, the channel occupied interrupt is unmasked (CHnOM = 0).

Figure 118. IPCC Half-duplex - Receive procedure state diagram

To receive communication data the channel occupied interrupt is unmasked ( $\text{CHnOM} = 0$ ):

- On a RX occupied interrupt, the receiving processor checks which channel became occupied, masks the associated channel occupied interrupt ( $\text{CHnOM}$ ) and reads the communication data from the memory.
- Once the complete communication data is retrieved, the response pending software variable is set. The channel status is not changed, access to the memory is kept to post the subsequent response.

To receive the response the channel free interrupt is unmasked ( $\text{CHnFM} = 0$ ):

- On a TX free interrupt, the sending processor checks which channel became free, masks the associated channel free interrupt ( $\text{CHnFM}$ ) and reads the response from the memory.
- Once the complete response is retrieved, the response pending software variable is cleared. The channel status is not changed, access to the memory is kept to post the subsequent communication data.

### 12.3.4 IPCC interrupts

There are four interrupt lines:

- two RX channel occupied interrupts, one for each processor:
  - Interrupt enable RXOIE per processor
  - Individual mask  $\text{CHnOM}$  per channel
- two TX channel free interrupts, one for each processor:
  - Interrupt enable TXFIE per processor
  - Individual mask  $\text{CHnFM}$  per channel

The RX occupied interrupt is used by the receiving processor and indicates when an unmasked channel status indicates occupied ( $\text{CHnF} = 1$ ).

The TX free interrupt is used by the sending processor, and indicates when an unmasked channel status indicates free (CHnF = 0).

## 12.4 IPCC registers

The peripheral registers must be accessed by words (32-bit). Byte (8-bit) and half-word (16-bit) accesses are not permitted and does not generate a bus error.

### 12.4.1 IPCC processor 1 control register (IPCC\_C1CR)

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **TXFIE**: Processor 1 transmit channel free interrupt enable

Associated with IPCC\_C1TOC2SR.

1: Enable an unmasked processor 1 transmit channel free to generate a TX free interrupt.

0: Processor 1 TX free interrupt disabled

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **RXOIE**: Processor 1 receive channel occupied interrupt enable

Associated with IPCC\_C2TOC1SR.

1: Enable an unmasked processor 1 receive channel occupied to generate an RX occupied interrupt.

0: Processor 1 RX occupied interrupt disabled

### 12.4.2 IPCC processor 1 mask register (IPCC\_C1MR)

Address offset: 0x004

Reset value: 0xFFFF FFFF

|      |      |      |      |      |      |      |      |      |      |       |       |       |       |       |       |

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:16 **CH[6:1]FM**: Processor 1 transmit channel x status set

Associated with IPCC\_C1TOC2SR.CHxF.

1: Transmit channel x free interrupt masked

0: Transmit channel x free interrupt not masked

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:0 **CH[6:1]OM**: Processor 1 receive channel x status clear

Associated with IPCC\_C2TOC1SR.CHxF.

1: Receive channel x occupied interrupt masked

0: Receive channel x occupied interrupt not masked

### 12.4.3 IPCC processor 1 status set clear register (IPCC\_C1SCR)

Address offset: 0x008

Reset value: 0x0000 0000

Reading this register always returns 0x0000 0000.

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:16 **CH[6:1]S**: Processor 1 transmit channel x status set

Associated with IPCC\_C1TOC2SR.CHxF.

1: Processor 1 transmit channel x status bit set

0: No action

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:0 **CH[6:1]C**: Processor 1 receive channel x status clear

Associated with IPCC\_C2TOC1SR.CHxF

1: Processor 1 receive channel x status bit cleared

0: No action

## 12.4.4 IPCC processor 1 to processor 2 status register (IPCC\_C1TOC2SR)

Address offset: 0x00C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      | rw    |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0     |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | RXOIE |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      | rw    |

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **TXFIE**: Processor 2 Transmit channel free interrupt enable

Associated with IPCC\_C2TOC1SR.

1: Enable an unmasked processor 2 transmit channel free to generate a TX free interrupt.

0: Processor 2 TX free interrupt disabled

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **RXOIE**: Processor 2 receive channel occupied interrupt enable

Associated with IPCC\_C1TOC2SR.

1: Enable an unmasked processor 2 receive channel occupied to generate an RX occupied interrupt.

0: Processor 2 RX occupied interrupt disabled

## 12.4.6 IPCC processor 2 mask register (IPCC\_C2MR)

Address offset: 0x014

Reset value: 0xFFFF FFFF

|      |      |      |      |      |      |      |      |      |      |       |       |       |       |       |       |
|------|------|------|------|------|------|------|------|------|------|-------|-------|-------|-------|-------|-------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21    | 20    | 19    | 18    | 17    | 16    |

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:16 **CH[6:1]FM**: Processor 2 transmit channel x free interrupt mask

Associated with IPCC\_C2TOC1SR.CHxF.

1: Transmit channel x free interrupt masked

0: Transmit channel x free interrupt not masked

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:0 **CH[6:1]OM**: Processor 2 receive channel x occupied interrupt mask

Associated with IPCC\_C1TOC2SR.CHxF.

1: Receive channel x occupied interrupt masked

0: Receive channel x occupied interrupt not masked

## 12.4.7 IPCC processor 2 status set clear register (IPCC\_C2SCR)

Address offset: 0x018

Reset value: 0x0000 0000

Reading this register always returns 0x0000 0000.

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 13 General-purpose I/Os (GPIO)

### 13.1 Introduction

Each general-purpose I/O port has four 32-bit configuration registers (GPIOx\_MODER, GPIOx\_OTYPER, GPIOx\_OSPEEDR and GPIOx\_PUPDR), two 32-bit data registers (GPIOx\_IDR and GPIOx\_ODR) and a 32-bit set/reset register (GPIOx\_BSRR). In addition all GPIOs have a 32-bit locking register (GPIOx\_LCKR) and two 32-bit alternate function selection registers (GPIOx\_AFRH and GPIOx\_AFLR).

### 13.2 GPIO main features

- Output states: push-pull or open drain + pull-up/down
- Output data from output data register (GPIOx\_ODR) or peripheral (alternate function output)
- Speed selection for each I/O
- Input states: floating, pull-up/down, analog
- Input data to input data register (GPIOx\_IDR) or peripheral (alternate function input)
- Bit set and reset register (GPIOx\_BSRR) for bitwise write access to GPIOx\_ODR
- Locking mechanism (GPIOx\_LCKR) provided to freeze the I/O port configurations
- Analog function
- Alternate function selection registers
- Fast toggle capable of changing every two clock cycles
- Highly flexible pin multiplexing allows the use of I/O pins as GPIOs or as one of several peripheral functions

### 13.3 GPIO functional description

Subject to the specific hardware characteristics of each I/O port listed in the datasheet, each port bit of the general-purpose I/O (GPIO) ports can be individually configured by software in several modes:

- Input floating
- Input pull-up
- Input-pull-down
- Analog
- Output open-drain with pull-up or pull-down capability
- Output push-pull with pull-up or pull-down capability
- Alternate function push-pull with pull-up or pull-down capability
- Alternate function open-drain with pull-up or pull-down capability

Each I/O port bit is freely programmable, however the I/O port registers have to be accessed as 32-bit words, half-words or bytes. The purpose of the GPIOx\_BSRR register is to allow atomic read/modify accesses to any of the GPIOx\_ODR registers. In this way, there is no risk of an IRQ occurring between the read and the modify access.

Figure 119 and Figure 120 show the basic structures of a standard and a 5-Volt tolerant I/O port bit, respectively. Table 81 gives the possible port bit configurations.

**Figure 119. Basic structure of an I/O port bitt**

**Figure 120. Basic structure of a 5-Volt tolerant I/O port bit**

1.  $V_{DD\_FT}$  is a potential specific to five-volt tolerant I/Os and different from  $V_{DD}$ .

1. GP = general-purpose, PP = push-pull, PU = pull-up, PD = pull-down, OD = open-drain, AF = alternate function.

### 13.3.1 General-purpose I/O (GPIO)

During and just after reset, the alternate functions are not active and most of the I/O ports are configured in input floating mode.

When the pin is configured as output, the value written to the output data register (GPIOx\_ODR) is output on the I/O pin. It is possible to use the output driver in push-pull mode or open-drain mode (only the low level is driven, high level is HI-Z).

The input data register (GPIOx\_IDR) captures the data present on the I/O pin at every AHB clock cycle.

All GPIO pins have weak internal pull-up and pull-down resistors, which can be activated or not depending on the value in the GPIOx\_PUPDR register.

### 13.3.2 I/O pin alternate function multiplexer and mapping

The device I/O pins are connected to on-board peripherals/modules through a multiplexer that allows only one peripheral alternate function (AF) connected to an I/O pin at a time. In this way, there can be no conflict between peripherals available on the same I/O pin.

Each I/O pin has a multiplexer with up to sixteen alternate function inputs (AF0 to AF15) that can be configured through the GPIOx\_AFRL (for pin 0 to 7) and GPIOx\_AFRH (for pin 8 to 15) registers:

- After reset the multiplexer selection is alternate function 0 (AF0). The I/Os are configured in alternate function mode through GPIOx\_MODER register.
- The specific alternate function assignments for each pin are detailed in the device datasheet.
- Cortex-M4 with FPU EVENTOUT is mapped on AF15

In addition to this flexible I/O multiplexing architecture, each peripheral has alternate functions mapped onto different I/O pins to optimize the number of peripherals available in smaller packages.

To use an I/O in a given configuration, the user has to proceed as follows:

- **System function:** MCOx pins have to be configured in alternate function mode.
- **GPIO:** configure the desired I/O as output, input or analog in the GPIOx\_MODER register.
- **Peripheral alternate function:**
  - Connect the I/O to the desired AFx in one of the GPIOx\_AFRL or GPIOx\_AFRH register.
  - Select the type, pull-up/pull-down and output speed via the GPIOx\_OTYPER, GPIOx\_PUPDR and GPIOx\_OSPEEDER registers, respectively.
  - Configure the desired I/O as an alternate function in the GPIOx\_MODER register.
- **Additional functions:**
  - For the ADC and DAC, configure the desired I/O in analog mode in the GPIOx\_MODER register and configure the required function in the ADC and DAC registers.

As indicated above, for the additional functions (such as DAC or OPAMP), the output is controlled by the corresponding peripheral. Care must be taken to select the I/O port analog function before enabling the additional function output in the peripheral control register.
  - For the additional functions like RTC\_OUT, RTC\_LSCO, TAMP\_xxx, WKUPx and oscillators, configure the required function in the related RTC, PWR and RCC registers. These functions have priority over the configuration in the standard GPIO registers. For details about I/O control by the RTC, refer to [Section 50.3: RTC functional description](#).
- **EVENTOUT**
  - Configure the I/O pin used to output the core EVENTOUT signal by connecting it to AF15.

Refer to the “Alternate function mapping” table in the device datasheet for the detailed mapping of the alternate function I/O pins.

### 13.3.3 I/O port control registers

Each of the GPIO ports has four 32-bit memory-mapped control registers (GPIOx\_MODER, GPIOx\_OTYPER, GPIOx\_OSPEEDR, GPIOx\_PUPDR) to configure up to 16 I/Os. The GPIOx\_MODER register is used to select the I/O mode (input, output, AF, analog). The GPIOx\_OTYPER and GPIOx\_OSPEEDR registers are used to select the output type (push-pull or open-drain) and speed. The GPIOx\_PUPDR register is used to select the pull-up/pull-down whatever the I/O direction.

### 13.3.4 I/O port data registers

Each GPIO has two 16-bit memory-mapped data registers: input and output data registers (GPIOx\_IDR and GPIOx\_ODR). GPIOx\_ODR stores the data to be output, it is read/write accessible. The data input through the I/O are stored into the input data register (GPIOx\_IDR), a read-only register.

See [Section 13.4.5: GPIO port input data register \(GPIOx\\_IDR\) \(x = A to K, Z\)](#) and [Section 13.4.6: GPIO port output data register \(GPIOx\\_ODR\) \(x = A to K, Z\)](#) for the register descriptions.

### 13.3.5 I/O data bitwise handling

The bit set reset register (GPIOx\_BSRR) is a 32-bit register which allows the application to set and reset each individual bit in the output data register (GPIOx\_ODR). The bit set reset register has twice the size of GPIOx\_ODR.

To each bit in GPIOx\_ODR, correspond two control bits in GPIOx\_BSRR: BS(i) and BR(i). When written to 1, bit BS(i) **sets** the corresponding ODR(i) bit. When written to 1, bit BR(i) **resets** the ODR(i) corresponding bit.

Writing any bit to 0 in GPIOx\_BSRR does not have any effect on the corresponding bit in GPIOx\_ODR. If there is an attempt to both set and reset a bit in GPIOx\_BSRR, the set action takes priority.

Using the GPIOx\_BSRR register to change the values of individual bits in GPIOx\_ODR is a “one-shot” effect that does not lock the GPIOx\_ODR bits. The GPIOx\_ODR bits can always be accessed directly. The GPIOx\_BSRR register provides a way of performing atomic bitwise handling.

There is no need for the software to disable interrupts when programming the GPIOx\_ODR at bit level: it is possible to modify one or more bits in a single atomic AHB write access.

### 13.3.6 GPIO locking mechanism

It is possible to freeze the GPIO control registers by applying a specific write sequence to the GPIOx\_LCKR register. The frozen registers are GPIOx\_MODER, GPIOx\_OTYPER, GPIOx\_OSPEEDR, GPIOx\_PUPDR, GPIOx\_AFRL and GPIOx\_AFRH.

To write the GPIOx\_LCKR register, a specific write / read sequence has to be applied. When the right LOCK sequence is applied to bit 16 in this register, the value of LCKR[15:0] is used to lock the configuration of the I/Os (during the write sequence the LCKR[15:0] value must be the same). When the LOCK sequence has been applied to a port bit, the value of the port bit can no longer be modified until the next MCU reset or peripheral reset. Each GPIOx\_LCKR bit freezes the corresponding bit in the control registers (GPIOx\_MODER, GPIOx\_OTYPER, GPIOx\_OSPEEDR, GPIOx\_PUPDR, GPIOx\_AFRL and GPIOx\_AFRH).

The LOCK sequence (refer to [Section 13.4.8: GPIO port configuration lock register \(GPIOx\\_LCKR\)](#) ( $x = A$  to  $K, Z$ )) can only be performed using a word (32-bit long) access to the GPIOx\_LCKR register due to the fact that GPIOx\_LCKR bit 16 has to be set at the same time as the [15:0] bits.

For more details refer to LCKR register description in [Section 13.4.8: GPIO port configuration lock register \(GPIOx\\_LCKR\)](#) ( $x = A$  to  $K, Z$ ).

### 13.3.7 I/O alternate function input/output

Two registers are provided to select one of the alternate function inputs/outputs available for each I/O. With these registers, the user can connect an alternate function to some other pin as required by the application.

This means that a number of possible peripheral functions are multiplexed on each GPIO using the GPIOx\_AFRL and GPIOx\_AFRH alternate function registers. The application can thus select any one of the possible functions for each I/O. The AF selection signal being common to the alternate function input and alternate function output, a single channel is selected for the alternate function input/output of a given I/O.

To know which functions are multiplexed on each GPIO pin refer to the device datasheet.

### 13.3.8 External interrupt/wakeup lines

All ports have external interrupt capability. To use external interrupt lines, the port must not be configured in analog mode.

Refer to [Section 24: Extended interrupt and event controller \(EXTI\)](#).

### 13.3.9 Input configuration

When the I/O port is programmed as input:

- The output buffer is disabled
- The Schmitt trigger input is activated
- The pull-up and pull-down resistors are activated depending on the value in the GPIOx\_PUPDR register
- The data present on the I/O pin are sampled into the input data register every AHB clock cycle
- A read access to the input data register provides the I/O state

[Figure 121](#) shows the input configuration of the I/O port bit.

Figure 121. Input floating/pull up/pull down configurations

### 13.3.10 Output configuration

When the I/O port is programmed as output:

- The output buffer is enabled:
  - Open drain mode: A “0” in the Output register activates the N-MOS whereas a “1” in the Output register leaves the port in Hi-Z (the P-MOS is never activated)
  - Push-pull mode: A “0” in the Output register activates the N-MOS whereas a “1” in the Output register activates the P-MOS
- The Schmitt trigger input is activated
- The pull-up and pull-down resistors are activated depending on the value in the GPIOx\_PUPDR register
- The data present on the I/O pin are sampled into the input data register every AHB clock cycle
- A read access to the input data register gets the I/O state
- A read access to the output data register gets the last written value

Figure 122 shows the output configuration of the I/O port bit.

Figure 122. Output configuration

### 13.3.11 I/O compensation cell

This cell is used to control the I/O commutation slew rate ( $t_{\text{fall}}$  /  $t_{\text{rise}}$ ) to reduce the I/O noise on power supply.

The cell is split into two blocks:

- The first block provides an optimal code for the current PVT. The code stored in this block can be read when the READY flag of the SYSCFG\_CMPCR is set.
- The second block controls the I/O slew rate. The user selects the code to be applied automatically or to program it by software.

The I/O compensation cell features 2 voltage ranges: 1.62 to 2.0 V and 2.7 to 3.6 V.

### 13.3.12 Alternate function configuration

When the I/O port is programmed as alternate function:

- The output buffer can be configured in open-drain or push-pull mode
- The output buffer is driven by the signals coming from the peripheral (transmitter enable and data)
- The Schmitt trigger input is activated
- The weak pull-up and pull-down resistors are activated or not depending on the value in the GPIOx\_PUPDR register
- The data present on the I/O pin are sampled into the input data register every AHB clock cycle
- A read access to the input data register gets the I/O state

*Figure 123* shows the Alternate function configuration of the I/O port bit.

Figure 123. Alternate function configuration

### 13.3.13 Analog configuration

When the I/O port is programmed as analog configuration:

- The output buffer is disabled
- The Schmitt trigger input is deactivated, providing zero consumption for every analog value of the I/O pin. The output of the Schmitt trigger is forced to a constant value (0).
- The weak pull-up and pull-down resistors are disabled by hardware
- Read access to the input data register gets the value "0"

Figure 124 shows the high-impedance, analog-input configuration of the I/O port bits.

Figure 124. High impedance-analog configuration

Some pins/balls are directly connected to ANA0 and ANA1 ADC analog inputs (see Figure 125): there is a direct path between ANA0/ANA1 and PA0/PA1 pins/balls, through an

analog switch (refer to [Section 14.3.2: SYSCFG peripheral mode configuration set register \(SYSCFG\\_PMCSETR\)](#) for details on how to configure analog switches).

**Figure 125. Analog inputs connected to ADC inputs**

1. VDD\_FT is a potential specific to 5V tolerant I/Os. It is distinct from VDD.

### 13.3.14 Using the HSE or LSE oscillator pins as GPIOs

When the HSE or LSE oscillator is switched OFF (default state after reset), the related oscillator pins can be used as normal GPIOs.

When the HSE or LSE oscillator is switched ON (by setting the HSEON or LSEON bit in the RCC\_CSR register) the oscillator takes control of its associated pins and the GPIO configuration of these pins has no effect. This is also true in External clock mode.

### 13.3.15 Using the GPIO pins in the backup supply domain

The PC13/PC14/PC15/PI8 GPIO functionality is lost when the core supply domain is powered off (when the device enters Standby mode). In this case, if their GPIO configuration is not bypassed by the RTC configuration, these pins are set in an analog input mode.

For details about I/O control by the RTC, refer to [Section 50.3: RTC functional description](#).

### 13.3.16 TrustZone security (only for GPIOZ)

The TrustZone security is always activated On GPIOZ. Each I/O pin of GPIOZ port can be individually configured as secure through the GPIOZ\_SECCFGR register.

When the selected I/O pin is configured as secure, its corresponding configuration bits for alternate function AFI, AFO, mode selection, I/O data are secure against a non-secure access:

- Input data are not redirected to another peripheral
- Output data are not replaced by another peripheral
- Secure I/O data can not be redirected to a non-secure I/O whatever the I/O is configured as alternate function or through peripherals as analog, USB, RTC, wakeup pins in PWR controller
- Non-secure I/O data can not be redirected to a secure peripheral

After reset, all GPIOZ I/O pins are secure.

[Table 82](#) gives a summary of the I/O port secured bits following the security configuration bit in the GPIOZ\_SECCFGR register.

- Secured bits: read and write operations are only allowed by a secure access. Non-secure read or write accesses on secured bits are RAZ/WI. There is no illegal access event generated.
- Non-secure bits: no restriction. Read and write operations are allowed by both secure and non-secure accesses.

**Table 82. GPIO secured bits**

| Secure configuration bit  | Secured bit  | Register name | Non-secure access on secure bits |
|---------------------------|--------------|---------------|----------------------------------|
| SECy = 1 in GPIOx_SECCFGR | MODEy[1:0]   | GPIOx_MODER   | RAZ/WI                           |
|                           | OTy          | GPIOx_OTYPER  |                                  |
|                           | OSPEEDy[1:0] | GPIOx_OSPEEDR |                                  |
|                           | PUPDy[1:0]   | GPIOx_PUPDR   |                                  |
|                           | IDy          | GPIOx_IDR     |                                  |
|                           | ODy          | GPIOx_ODR     |                                  |
|                           | BSy          | GPIOx_BSRR    |                                  |
|                           | LCKy         | GPIOx_LCKR    |                                  |
|                           | AFSELy[3:0]  | GPIOx_AFRL    |                                  |
|                           | BRy          | GPIOx_AFRH    |                                  |
|                           |              | GPIOx_BRR     |                                  |

GPIOx, x= Z, and y=0..7.

## 13.4 GPIO registers

This section gives a detailed description of the GPIO registers.

For a summary of register bits, register address offsets and reset values, refer to [Table 83](#).

The peripheral registers can be written in word, half word or byte mode.

### 13.4.1 GPIO port mode register (GPIOx\_MODER) (x = A to K, Z)

Address offset: 0x00

Reset value: 0xFFFF FFFF

|              |    |              |    |              |    |              |    |              |    |              |    |             |    |             |    |
|--------------|----|--------------|----|--------------|----|--------------|----|--------------|----|--------------|----|-------------|----|-------------|----|

Bits 31:0 **MODER[15:0][1:0]**: Port x configuration I/O pin y (y = 15 to 0)

These bits are written by software to configure the I/O mode.

00: Input mode

01: General purpose output mode

10: Alternate function mode

11: Analog mode

### 13.4.2 GPIO port output type register (GPIOx\_OTYPER) (x = A to K, Z)

Address offset: 0x04

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:0 **OSPEEDR[15:0][1:0]**: Port x configuration I/O pin y (y = 15 to 0)

These bits are written by software to configure the I/O output speed.

00: Low speed

01: Medium speed

10: High speed

11: Very high speed

*Note: Refer to the product datasheets for the values of OSPEEDRy bits versus V<sub>DD</sub> range and external load.*

### 13.4.4 GPIO port pull-up/pull-down register (GPIOx\_PUPDR) (x = A to K, Z)

Address offset: 0x0C

Reset value: 0x0000 0000

|              |    |              |    |              |    |              |    |              |    |              |    |             |    |             |    |
|--------------|----|--------------|----|--------------|----|--------------|----|--------------|----|--------------|----|-------------|----|-------------|----|

Bits 31:0 **PUPDR[15:0][1:0]**: Port x configuration I/O pin y (y = 15 to 0)

These bits are written by software to configure the I/O pull-up or pull-down

00: No pull-up, pull-down

01: Pull-up

10: Pull-down

11: Reserved

### 13.4.5 GPIO port input data register (GPIOx\_IDR) (x = A to K, Z)

Address offset: 0x10

Reset value: 0x0000 XXXX

|       |       |       |       |       |       |      |      |      |      |      |      |      |      |      |      |
|-------|-------|-------|-------|-------|-------|------|------|------|------|------|------|------|------|------|------|
| 31    | 30    | 29    | 28    | 27    | 26    | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|       |       |       |       |       |       |      |      |      |      |      |      |      |      |      |      |
| 15    | 14    | 13    | 12    | 11    | 10    | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| IDR15 | IDR14 | IDR13 | IDR12 | IDR11 | IDR10 | IDR9 | IDR8 | IDR7 | IDR6 | IDR5 | IDR4 | IDR3 | IDR2 | IDR1 | IDR0 |
| r     | r     | r     | r     | r     | r     | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **IDR[15:0]**: Port x input data I/O pin y (y = 15 to 0)

These bits are read-only. They contain the input value of the corresponding I/O port.

### 13.4.6 GPIO port output data register (GPIOx\_ODR) (x = A to K, Z)

Address offset: 0x14

Reset value: 0x0000 0000

|       |       |       |       |       |       |      |      |      |      |      |      |      |      |      |      |
|-------|-------|-------|-------|-------|-------|------|------|------|------|------|------|------|------|------|------|
| 31    | 30    | 29    | 28    | 27    | 26    | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|       |       |       |       |       |       |      |      |      |      |      |      |      |      |      |      |
| 15    | 14    | 13    | 12    | 11    | 10    | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| ODR15 | ODR14 | ODR13 | ODR12 | ODR11 | ODR10 | ODR9 | ODR8 | ODR7 | ODR6 | ODR5 | ODR4 | ODR3 | ODR2 | ODR1 | ODR0 |
| rw    | rw    | rw    | rw    | rw    | rw    | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **ODR[15:0]**: Port output data I/O pin y (y = 15 to 0)

These bits can be read and written by software.

*Note: For atomic bit set/reset, the ODR bits can be individually set and/or reset by writing to the GPIOx\_BSRR register (x = A..F).*

### 13.4.7 GPIO port bit set/reset register (GPIOx\_BSRR) (x = A to K, Z)

Address offset: 0x18

Reset value: 0x0000 0000

|      |      |      |      |      |      |     |     |     |     |     |     |     |     |     |     |
|------|------|------|------|------|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 31   | 30   | 29   | 28   | 27   | 26   | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  |
| BR15 | BR14 | BR13 | BR12 | BR11 | BR10 | BR9 | BR8 | BR7 | BR6 | BR5 | BR4 | BR3 | BR2 | BR1 | BR0 |
| w    | w    | w    | w    | w    | w    | w   | w   | w   | w   | w   | w   | w   | w   | w   | w   |
| 15   | 14   | 13   | 12   | 11   | 10   | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| BS15 | BS14 | BS13 | BS12 | BS11 | BS10 | BS9 | BS8 | BS7 | BS6 | BS5 | BS4 | BS3 | BS2 | BS1 | BS0 |
| w    | w    | w    | w    | w    | w    | w   | w   | w   | w   | w   | w   | w   | w   | w   | w   |

Bits 31:16 **BR[15:0]**: Port x reset I/O pin y (y = 15 to 0)

These bits are write-only. A read to these bits returns the value 0x0000.

0: No action on the corresponding ODRx bit

1: Resets the corresponding ODRx bit

*Note: If both BSx and BRx are set, BSx has priority.*

Bits 15:0 **BS[15:0]**: Port x set I/O pin y (y = 15 to 0)

These bits are write-only. A read to these bits returns the value 0x0000.

0: No action on the corresponding ODRx bit

1: Sets the corresponding ODRx bit

### 13.4.8 GPIO port configuration lock register (GPIOx\_LCKR) (x = A to K, Z)

This register is used to lock the configuration of the port bits when a correct write sequence is applied to bit 16 (LCKK). The value of bits [15:0] is used to lock the configuration of the GPIO. During the write sequence, the value of LCKR[15:0] must not change. When the LOCK sequence has been applied on a port bit, the value of this port bit can no longer be modified until the next MCU reset or peripheral reset.

*Note: A specific write sequence is used to write to the GPIOx\_LCKR register. Only word access (32-bit long) is allowed during this locking sequence.*

Each lock bit freezes a specific configuration register (control and alternate function registers).

Address offset: 0x1C

Reset value: 0x0000 0000

|       |       |       |       |       |       |      |      |      |      |      |      |      |      |      |      |
|-------|-------|-------|-------|-------|-------|------|------|------|------|------|------|------|------|------|------|
| 31    | 30    | 29    | 28    | 27    | 26    | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LCKK |
|       |       |       |       |       |       |      |      |      |      |      |      |      |      |      | rw   |
| 15    | 14    | 13    | 12    | 11    | 10    | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| LCK15 | LCK14 | LCK13 | LCK12 | LCK11 | LCK10 | LCK9 | LCK8 | LCK7 | LCK6 | LCK5 | LCK4 | LCK3 | LCK2 | LCK1 | LCK0 |
| rw    | rw    | rw    | rw    | rw    | rw    | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **LCKK**: Lock key

This bit can be read any time. It can only be modified using the lock key write sequence.

0: Port configuration lock key not active

1: Port configuration lock key active. The GPIOx\_LCKR register is locked until the next MCU reset or peripheral reset.

LOCK key write sequence:

WR LCKR[16] = '1' + LCKR[15:0]

WR LCKR[16] = '0' + LCKR[15:0]

WR LCKR[16] = '1' + LCKR[15:0]

RD LCKR

RD LCKR[16] = '1' (this read operation is optional but it confirms that the lock is active)

*Note: During the LOCK key write sequence, the value of LCK[15:0] must not change.*

*Any error in the lock sequence aborts the lock.*

*After the first lock sequence on any bit of the port, any read access on the LCKK bit returns '1' until the next MCU reset or peripheral reset.*

Bits 15:0 **LCK[15:0]**: Port x lock I/O pin y (y = 15 to 0)

These bits are read/write but can only be written when the LCKK bit is '0'.

0: Port configuration not locked

1: Port configuration locked

### 13.4.9 GPIO alternate function low register (GPIOx\_AFRL) (x = A to K, Z)

Address offset: 0x20

Reset value: 0x0000 0000

|           |    |    |    |           |    |    |    |           |    |    |    |           |    |    |    |
|-----------|----|----|----|-----------|----|----|----|-----------|----|----|----|-----------|----|----|----|

### 13.4.11 GPIO port bit reset register (GPIOx\_BRR) (x = A to K, Z)

Address offset: 0x28

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| BR15 | BR14 | BR13 | BR12 | BR11 | BR10 | BR9  | BR8  | BR7  | BR6  | BR5  | BR4  | BR3  | BR2  | BR1  | BR0  |
| w    | w    | w    | w    | w    | w    | w    | w    | w    | w    | w    | w    | w    | w    | w    | w    |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **BR[15:0]**: Port x reset IO pin y (y = 15 to 0)

These bits are write-only. A read to these bits returns the value 0x0000.

0: No action on the corresponding ODx bit

1: Reset the corresponding ODx bit

### 13.4.12 GPIO secure configuration register (GPIOZ\_SECCFGR)

This register provides access security control and can be written only by a secure access. It is used to configure a selected I/O as secure. A non-secure write access to this register is discarded. Read returns the current GPIOZ pin security setting.

Address offset: 0x30

Reset value: 0x0000 00FF

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|

Bits 31:8 Reserved

Bits 7:0 **SEC[7:0]**: I/O pin of Port Z secure bit enable y (y= 0..7)

These bits control the security I/O port pin.

0: The I/O pin is non-secure

1: The I/O pin is secure. Refer to [Table 82: GPIO secured bits](#) for all corresponding secured bits.

### 13.4.13 GPIO hardware configuration register 10 (GPIOx\_HWCFCGR10) (x = A to K, Z)

Address offset: 0x3C8

Reset value: 0x0000 1240

Reset value: Block Z: 0x0001 1240

|               |      |      |      |                |      |      |      |              |    |    |    |              |    |    |    |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:20 **OR\_CFG[3:0]**: Option register configuration

0: Non-active

1: Active

Bits 19:16 **SEC\_CFG[3:0]**: Security mechanism activation

0: Non-active

1: Active

Bits 15:12 **LOCK\_CFG[3:0]**: Lock mechanism activation

0: Non-active

1: Active

Bits 11:8 **SPEED\_CFG[3:0]**: Number of speed lines for each I/O

- 1: One line
- 2: Two lines

Bits 7:4 **AF\_SIZE[3:0]**: Number of AF available for each I/O

Accepted value: 1 to 4

- 1: One AF/IO
- 2: Four AF/IO
- 3: Eight AF/IO
- 4: 16 AF/IO

Bits 3:0 **AHB\_IOP[3:0]**: Bus interface configuration

- 0: AHB
- 1: IOP

#### 13.4.14 GPIO hardware configuration register 9 (GPIOx\_HWCFCGR9) (x = A to K, Z)

Address offset: 0x3CC

Reset value: 0x0000 FFFF

Reset value: Block K: 0x0000 00FF

Reset value: Block Z: 0x0000 00FF

|             |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|-------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31          | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.        | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|             |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15          | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| EN_IO[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| r           | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **EN\_IO[15:0]**: Presence granularity, each bit indicate the presence of the IO

- 0: IO not present
- 1: IO present

#### 13.4.15 GPIO hardware configuration register 8 (GPIOx\_HWCFCGR8) (x = A to K, Z)

Address offset: 0x3D0

Reset value: 0xFFFF FFFF

Reset value: Block K: 0x0000 0000

Reset value: Block Z: 0x0000 0000

|                 |    |    |    |                 |    |    |    |                 |    |    |    |                 |    |    |    |
|-----------------|----|----|----|-----------------|----|----|----|-----------------|----|----|----|-----------------|----|----|----|

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7           | 6    | 5    | 4    | 3           | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MAJREV[3:0] |      |      |      | MINREV[3:0] |      |      |      |
|      |      |      |      |      |      |      |      | r           | r    | r    | r    | r           | r    | r    | r    |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision

These bits return the GPIO major revision.

Major revision is 4.

Bits 3:0 **MINREV[3:0]**: Minor revision

These bits return the GPIO minor revision.

Minor revision is 0.

### 13.4.25 GPIO identification register (GPIOx\_IPIDR) (x = A to K, Z)

Address offset: 0x3F8

Reset value: 0x000F 0003

|              |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| IPIDR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r            | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| IPIDR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r            | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **IPIDR[31:0]**: GPIO identifier

These bits return the GPIO identifier value.

13.4.26 GPIO size identification register (GPIOx\_SIDR) (x = A to K, Z)

Address offset: 0x3FC

Reset value: 0xA3C5 DD01

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SIDR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r           | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| SIDR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r           | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **SIDR[31:0]**: Size identifier register  
These bits return the size of the memory region allocated to GPIO registers.

## 13.4.27 GPIO register map

The following table gives the GPIO register map and reset values.

Table 83. GPIO register map and reset values

| Offset | Register name                          | 31             | 30   | 29   | 28             | 27   | 26   | 25             | 24   | 23   | 22             | 21   | 20   | 19             | 18   | 17   | 16             | 15    | 14    | 13            | 12    | 11    | 10            | 9    | 8    | 7             | 6    | 5    | 4             | 3    | 2    | 1             | 0    |      |               |      |      |               |      |      |               |      |      |               |      |      |               |   |  |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 14 System configuration controller (SYSCFG)

The system configuration controller is mainly used to manage the compensation cell and other IOs and system related settings. This section applies to the whole STM32MP157 family, unless otherwise specified.

### 14.1 I/O compensation cell

By default the I/O compensation cell is not used. However when the I/O output buffer speed is configured in 50 MHz mode and above, it is recommended to use the compensation cell for a slew rate control on I/O  $t_{f(IO)out}/t_{r(IO)out}$  commutation to reduce the I/O noise on the power supply.

**Note:** When enabled, the compensation cell has only impact on I/Os with  $GPIOx\_OSPEEDRy = 0b10$  or  $0b11$ .

When the compensation cell is enabled, a READY flag is set to indicate that the compensation cell is ready and can be used, the compensation value is then continuously updated.

Figure 126. I/O compensation control overview

Sequence to enable IO compensation:

1. Ensure the CSI oscillator is enabled and ready (in RCC)
2. Set SYSCFG\_CMPENSETR.MCU\_EN or MPU\_EN=1
3. Wait SYSCFG\_CMPCR.READY = 1
4. Set SYSCFG\_CMPCR.SW\_CTRL = 0

Sequence to disable the IO compensation, holding the current compensation value (e.g. before going to STOP):

1. Copy actual value of SYSCFG\_CMPCR.APSRC[3:0]/ANSRC[3:0] in SYSCFG\_CMPCR.RAPSRC[3:0]/RANSRC[3:0]
2. Set SYSCFG\_CMPCR.SW\_CTRL = 1
3. Set SYSCFG\_CMPENCLRR.MCU\_EN and MPU\_EN=1

Note: the CSI oscillator is disabled automatically in Stop mode if not requested for other usages, and the CSI is always OFF in Standby mode.

## 14.2 Ethernet clock source

Depending on the external ethernet PHY, the ETH\_CLK clock can have various usage:

- The GMII and RGMII clocks: PG5 can be used to receive either 125 MHz from PHY or internally the ETH\_CLK clock at 125 MHz (ETH\_CLK can be fed externally to another pin if needed).
- The RMII clock: the ETH\_CLK clock at 50 MHz can be output on PA1 and at the same time used by the PHY for REF\_CLK.
- ALL: the ETH\_CLK clock can be used for the PHY reference clock.

**Figure 127. Ethernet clock source**

MS44738V2

The ethernet clock source is controlled through the SYSCFG\_PMCSETR/CLRR registers.

## 14.3 SYSCFG registers

### 14.3.1 SYSCFG boot pins control register (SYSCFG\_BOOTR)

Address offset: 0x000

Reset value: 0x0000 000X

This register is used to know the state of BOOT pins and to control pull-up to reduce the static power consumption on the pin set to high level.

|      |      |      |      |      |      |      |      |      |          |          |          |      |       |       |       |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | BOOT2_PD | BOOT1_PD | BOOT0_PD | Res. | BOOT2 | BOOT1 | BOOT0 |
|      |      |      |      |      |      |      |      |      | rw       | rw       | rw       |      | r     | r     | r     |

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **BOOT2\_PD**: BOOT2 pin pull-down disable. This is used to save power in case the BOOT2 pin is connected to VDD.

0: (enabled) pull-down enabled. The BOOT2 pin can be left open and will take a value of 0 if open.

1: (disabled) pull-down disabled. The BOOT2 pin must not be left open.

Bit 5 **BOOT1\_PD**: BOOT1 pin pull-down disable. This is used to save power in case the BOOT1 pin is connected to VDD

0: (enabled) pull-down enabled. The BOOT1 pin can be left open and will take a value of 0 if open.

1: (disabled) pull-down disabled. The BOOT1 pin must not be left open.

Bit 4 **BOOT0\_PD**: BOOT0 pin pull-down disable. This is used to save power in case the BOOT0 pin is connected to VDD

0: (enabled) pull-down enabled. The BOOT0 pin can be left open and will take a value of 0 if open.

1: (disabled) pull-down disabled. The BOOT0 pin must not be left open.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **BOOT2**: BOOT2 pin value

0: (low) BOOT2 pin connected to VSS (or left open if BOOT2\_PD=0)

1: (high) BOOT2 pin connected to VDD

Bit 1 **BOOT1**: BOOT1 pin value

0: (low) BOOT1 pin connected to VSS (or left open if BOOT1\_PD=0)

1: (high) BOOT1 pin connected to VDD

Bit 0 **BOOT0**: BOOT0 pin value

0: (low) BOOT0 pin connected to VSS (or left open if BOOT0\_PD=0)

1: (high) BOOT0 pin connected to VDD

### 14.3.2 SYSCFG peripheral mode configuration set register (SYSCFG\_PMCSETR)

Address offset: 0x004

Reset value: 0x0000 0000

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **ANA1\_SEL**: controls analog connection between the ANA1 and PA1 pin.

Set by software.

0: Writing '0' has no effect, reading '0' means no connection. For best ADC performance the ANA1 input must be used for package having ANA1 pin present.

1: Writing '1' set this bit, reading '1' means ANA1 internally connected to PA1. Must only be used on package not having ANA1 pin.

Bit 24 **ANA0\_SEL**: controls analog connection between ANA0 and PA0 pin.

Set by software.

0: Writing '0' has no effect, reading '0' means no connection. For best ADC performance ANA0 input must be used for package having ANA0 pin present.

1: Writing '1' set this bit, reading '1' means ANA0 internally connected to PA0. Must only be used on package not having ANA0 pin.

Bits 23:21 **ETH\_SEL[2:0]**: Ethernet PHY interface selection.

Set by software. Writing bit as '0' has no effect, set individual bits by writing '1', reading means

000: GMII or MII

001: RGMII

010: Reserved

011: Reserved

100: RMII

101: Reserved

110: Reserved

111: Reserved

*Note:* Configuration must be done while the ETH is under reset and before enabling the ETH clocks

Bit 20 **ETH\_SELMI**: controls MII or GMII when ETH\_SEL[2:0] = 0b000.

Set by software.

0: (GMII) Writing '0' has no effect, reading '0' means MII/GMII clock mux controlled by ETH GMAC (GMII PHY use case)

1: (MII) Writing '1' set this bit, reading '1' means MII/GMII clock mux forced in MII mode (MII PHY use case)

Bits 19:18 Reserved, must be kept at reset value.

- Bit 17 **ETH\_REF\_CLK\_SEL**: Ethernet 50MHz RMII clock selection.  
Set by software.  
0: Writing '0' has no effect, reading '0' means External clock is used. Need selection of AFMux. Could be used with all PHY  
1: Writing '1' set this bit, reading '1' means Internal clock ETH\_CLK1 from RCC is used regardless AFMux. Could be used only with RMII PHY.
- Bit 16 **ETH\_CLK\_SEL**: Gigabit Ethernet 125 MHz clock selection. Only useful for GMII or RGMII PHY  
Set by software.  
0: Writing '0' has no effect, reading '0' means External clock is used. Need selection of AFMux  
1: Writing '1' set this bit, reading '1' means Internal clock ETH\_CLK1 from RCC is used regardless AFMux
- Bits 15:10 Reserved, must be kept at reset value.
- Bit 9 **ANASWVDD**: GPIO analog switches control voltage selection  
Set by software.  
0: Writing '0' has no effect, reading '0' means IOs analog switches supplied by VDDA (**EN\_BOOSTER**=0) or Booster output (**EN\_BOOSTER**=1)  
1: Writing '1' set this bit, reading '1' means IOs analog switches supplied by VDD (regardless **EN\_BOOSTER** bit, which should be cleared to avoid unwanted power consumption). Useful to avoid using Booster (add current consumption) when VDDA < 2.7V, but VDD > 2.7V. When both VDD < 2.7V and VDDA < 2.7V, the Booster is still needed to get full AC performances from IOs analog switches.
- Bit 8 **EN\_BOOSTER**: Pad Booster enable.  
Set by software.  
used to reduce the Total Harmonic Distortion of the IOs analog switches when VDDA and VDD supplies are below 2.7V. Activating the booster allows to guaranty the AC performance on IOs analog switches. When activated the performance of the analog switch is the same on the full voltage range. This bit is only useful when **ANASWVDD**=0  
0: Writing '0' has no effect, reading '0' means Booster is disabled  
1: Writing '1' set this bit, reading '1' means Booster is enabled. Note that this will add a current consumption on VDD
- Bits 7:6 Reserved, must be kept at reset value.
- Bit 5 **I2C6\_FMP**: Fast Mode Plus (FM+) enable  
Set by software.  
0: Writing '0' has no effect, reading '0' means I2C6 usage is possible up to 400 kHz  
1: Writing '1' set this bit, reading '1' means the I2C6 SCL & SDA pads in Fast Mode Plus (FM+), as soon as the correspondent alternate function is selected. The pad low drive is enhanced to allow usage up to 1 MHz.
- Bit 4 **I2C5\_FMP**: Fast Mode Plus (FM+) Enable  
Set by software.  
0: Writing '0' has no effect, reading '0' means I2C5 usage is possible up to 400 kHz  
1: Writing '1' set this bit, reading '1' means the I2C5 SCL & SDA pads in Fast Mode Plus (FM+), as soon as the correspondent alternate function is selected. The pad low drive is enhanced to allow usage up to 1 MHz.

**Bit 3 I2C4\_FMP: Fast Mode Plus (FM+) Enable**

Set by software.

0: Writing '0' has no effect, reading '0' means I2C4 usage is possible up to 400 kHz

1: Writing '1' set this bit, reading '1' means the I2C4 SCL &amp; SDA pads in Fast Mode Plus (FM+), as soon as the correspondent alternate function is selected. The pad low drive is enhanced to allow usage up to 1MHz.

**Bit 2 I2C3\_FMP: Fast Mode Plus (FM+) Enable**

Set by software.

0: Writing '0' has no effect, reading '0' means I2C3 usage is possible up to 400kHz

1: Writing '1' set this bit, reading '1' means the I2C3 SCL &amp; SDA pads in Fast Mode Plus (FM+), as soon as the correspondent alternate function is selected. The pad low drive is enhanced to allow usage up to 1 MHz.

**Bit 1 I2C2\_FMP: Fast Mode Plus (FM+) Enable**

Set by software.

0: Writing '0' has no effect, reading '0' means I2C2 usage is possible up to 400 kHz

1: Writing '1' set this bit, reading '1' means the I2C2 SCL &amp; SDA pads in Fast Mode Plus (FM+), as soon as the correspondent alternate function is selected. The pad low drive is enhanced to allow usage up to 1 MHz.

**Bit 0 I2C1\_FMP: Fast Mode Plus (FM+) Enable**

Set by software.

0: Writing '0' has no effect, reading '0' means I2C1 usage is possible up to 400 kHz

1: Writing '1' set this bit, reading '1' means the I2C1 SCL &amp; SDA pads in Fast Mode Plus (FM+), as soon as the correspondent alternate function is selected. The pad low drive is enhanced to allow usage up to 1 MHz.

**14.3.3 SYSCFG peripheral mode configuration clear register (SYSCFG\_PMCCLRR)**

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **ANA1\_SEL**: controls analog connection between the ANA1 and PA1 pin.

Cleared by software.

0: Writing '0' has no effect, reading '0' means no connection. For best ADC performance the ANA1 input must be used for package having ANA1 pin present.

1: Writing '1' clear this bit, reading '1' means ANA1 internally connected to PA1. Must only be used on package not having ANA1 pin.

Bit 24 **ANA0\_SEL**: controls analog connection between ANA0 and PA0 pin.

Cleared by software.

0: Writing '0' has no effect, reading '0' means no connection. For best ADC performance ANA0 input must be used for package having ANA0 pin present.

1: Writing '1' clear this bit, reading '1' means ANA0 internally connected to PA0. Must only be used on package not having ANA0 pin.

Bits 23:21 **ETH\_SEL[2:0]**: Ethernet PHY interface selection.

Cleared by software. Writing bit as '0' has no effect, clear individual bits by writing '1', reading means

000: GMII or MII

001: RGMII

010: Reserved

011: Reserved

100: RMII

101: Reserved

110: Reserved

111: Reserved

*Note: Configuration must be done while the ETH is under reset and before enabling the ETH clocks*

Bit 20 **ETH\_SELMI**: controls MII or GMII when ETH\_SEL[2:0] = 0b000.

Cleared by software.

0: (GMII) Writing '0' has no effect, reading '0' means MII/GMII clock mux controlled by ETH GMAC (GMII PHY use case)

1: (MII) Writing '1' clear this bit, reading '1' means MII/GMII clock mux forced in MII mode (MII PHY use case)

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **ETH\_REF\_CLK\_SEL**: Ethernet 50MHz RMII clock selection.

Cleared by software.

0: Writing '0' has no effect, reading '0' means External clock is used. Need selection of AFMux. Could be used with all PHY

1: Writing '1' clear this bit, reading '1' means Internal clock ETH\_CLK1 from RCC is used regardless AFMux. Could be used only with RMII PHY.

Bit 16 **ETH\_CLK\_SEL**: Gigabit Ethernet 125 MHz clock selection. Only useful for GMII or RGMII PHY

Cleared by software.

0: Writing '0' has no effect, reading '0' means External clock is used. Need selection of AFMux

1: Writing '1' clear this bit, reading '1' means Internal clock ETH\_CLK1 from RCC is used regardless AFMux

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **ANASWVDD**: GPIO analog switches control voltage selection

Cleared by software.

0: Writing '0' has no effect, reading '0' means IOs analog switches supplied by VDDA (**EN\_BOOSTER**=0) or Booster output (**EN\_BOOSTER**=1)

1: Writing '1' clear this bit, reading '1' means IOs analog switches supplied by VDD (regardless **EN\_BOOSTER** bit, which should be cleared to avoid unwanted power consumption). Useful to avoid using Booster (add current consumption) when VDDA < 2.7V, but VDD > 2.7V.

Bit 8 **EN\_BOOSTER**: Pad Booster enable.

Cleared by software.

used to reduce the Total Harmonic Distortion of the IOs analog switches when VDDA and VDD supplies are below 2.7V. Activating the booster allows to guaranty the AC performance on IOs analog switches. When activated the performance of the analog switch is the same on the full voltage range. This bit is only useful when **ANASWVDD**=0

0: Writing '0' has no effect, reading '0' means Booster is disabled

1: Writing '1' clear this bit, reading '1' means Booster is enabled. Note that this will add a current consumption on VDD.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **I2C6\_FMP**: Fast Mode Plus (FM+) enable

Cleared by software.

0: Writing '0' has no effect, reading '0' means I2C6 usage is possible up to 400 kHz

1: Writing '1' clear this bit, reading '1' means the I2C6 SCL & SDA pads in Fast Mode Plus (FM+), as soon as the correspondent alternate function is selected. The pad low drive is enhanced to allow usage up to 1 MHz.

Bit 4 **I2C5\_FMP**: Fast Mode Plus (FM+) Enable

Cleared by software.

0: Writing '0' has no effect, reading '0' means I2C5 usage is possible up to 400 kHz

1: Writing '1' clear this bit, reading '1' means the I2C5 SCL & SDA pads in Fast Mode Plus (FM+), as soon as the correspondent alternate function is selected. The pad low drive is enhanced to allow usage up to 1 MHz.

Bit 3 **I2C4\_FMP**: Fast Mode Plus (FM+) Enable

Cleared by software.

0: Writing '0' has no effect, reading '0' means I2C4 usage is possible up to 400 kHz

1: Writing '1' clear this bit, reading '1' means the I2C4 SCL & SDA pads in Fast Mode Plus (FM+), as soon as the correspondent alternate function is selected. The pad low drive is enhanced to allow usage up to 1MHz.

**Bit 2 I2C3\_FMP: Fast Mode Plus (FM+) Enable**

Cleared by software.

0: Writing '0' has no effect, reading '0' means I2C3 usage is possible up to 400kHz

1: Writing '1' clear this bit, reading '1' means the I2C3 SCL &amp; SDA pads in Fast Mode Plus (FM+), as soon as the correspondent alternate function is selected. The pad low drive is enhanced to allow usage up to 1 MHz.

**Bit 1 I2C2\_FMP: Fast Mode Plus (FM+) Enable**

Cleared by software.

0: Writing '0' has no effect, reading '0' means I2C2 usage is possible up to 400 kHz

1: Writing '1' clear this bit, reading '1' means the I2C2 SCL &amp; SDA pads in Fast Mode Plus (FM+), as soon as the correspondent alternate function is selected. The pad low drive is enhanced to allow usage up to 1 MHz.

**Bit 0 I2C1\_FMP: Fast Mode Plus (FM+) Enable**

Cleared by software.

0: Writing '0' has no effect, reading '0' means I2C1 usage is possible up to 400 kHz

1: Writing '1' clear this bit, reading '1' means the I2C1 SCL &amp; SDA pads in Fast Mode Plus (FM+), as soon as the correspondent alternate function is selected. The pad low drive is enhanced to allow usage up to 1 MHz.

**14.3.4 SYSCFG IO control set register (SYSCFG\_IOTRSLSETR)**

Address offset: 0x018

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      | rs         | rs           | rs         | rs             | rs           |

Bits 31:5 Reserved, must be kept at reset value.

**Bit 4 HSLVEN\_SPI: High Speed Low Voltage Pad mode Enable.**

Set by software.

Controls the speed of \_h and \_e pads when a SPly\_x signal is selected in AFMUX.

0: Writing '0' has no effect, reading '0' means High Speed mode disabled

1: Writing '1' enables High Speed mode, reading '1' means High Speed mode enabled<sup>(1)(2)</sup>**Bit 3 HSLVEN\_SDMMC: High Speed Low Voltage Pad mode Enable.**

Set by software.

Controls the speed of \_h and \_e pads when a SDMMCy\_x signal is selected in AFMUX.

0: Writing '0' has no effect, reading '0' means High Speed mode disabled

1: Writing '1' enables High Speed mode, reading '1' means High Speed mode enabled<sup>(1)(2)</sup>

Bit 2 **HSLVEN\_ETH**: High Speed Low Voltage Pad mode Enable.

Set by software.

Controls the speed of \_h and \_e pads when a ETH\_x signal is selected in AFMUX.

0: Writing '0' has no effect, reading '0' means High Speed mode disabled

1: Writing '1' enables High Speed mode, reading '1' means High Speed mode enabled<sup>(1)(2)</sup>

Bit 1 **HSLVEN\_QUADSPI**: High Speed Low Voltage Pad mode Enable.

Set by software.

Controls the speed of \_h and \_e pads when a QUADSPI\_x signal is selected in AFMUX.

0: Writing '0' has no effect, reading '0' means High Speed mode disabled

1: Writing '1' enables High Speed mode, reading '1' means High Speed mode enabled<sup>(1)(2)</sup>

Bit 0 **HSLVEN\_TRACE**: High Speed Low Voltage Pad mode Enable.

Set by software.

Controls the speed of \_h and \_e pads when a TRACEx signal is selected in AFMUX.

0: Writing '0' has no effect, reading '0' means High Speed mode disabled

1: Writing '1' enables High Speed mode, reading '1' means High Speed mode enabled<sup>(1)(2)</sup>

1. This bit is not taken into account if the OTP bit (**product\_below\_2V5**) is 0 (default)
2. Enabling High Speed mode while VDD > 2.7V can damage the IC. See pad characteristics for details.

---

**Danger:**    **Enabling High Speed mode while VDD > 2.7V can damage the IC.**  
                  **See pad characteristics for details**

---

### 14.3.5 SYSCFG IO control clear register (SYSCFG\_IOCTRLCLR)

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **HSLVEN\_SPI**: High Speed Low Voltage Pad mode Enable.

Cleared by software.

Controls the speed of `_h` and `_e` pads when a `SPIy_x` signal is selected in AFMUX.

0: Writing '0' has no effect, reading '0' means High Speed mode disabled

1: Writing '1' disables High Speed mode, reading '1' means High Speed mode enabled<sup>(1)(2)</sup>

Bit 3 **HSLVEN\_SDMMC**: High Speed Low Voltage Pad mode Enable.

Cleared by software.

Controls the speed of `_h` and `_e` pads when a `SDMMCy_x` signal is selected in AFMUX.

0: Writing '0' has no effect, reading '0' means High Speed mode disabled

1: Writing '1' disables High Speed mode, reading '1' means High Speed mode enabled<sup>(1)(2)</sup>

Bit 2 **HSLVEN\_ETH**: High Speed Low Voltage Pad mode Enable.

Cleared by software.

Controls the speed of `_h` and `_e` pads when a `ETH_x` signal is selected in AFMUX.

0: Writing '0' has no effect, reading '0' means High Speed mode disabled

1: Writing '1' disables High Speed mode, reading '1' means High Speed mode enabled<sup>(1)(2)</sup>

Bit 1 **HSLVEN\_QUADSPI**: High Speed Low Voltage Pad mode Enable.

Cleared by software.

Controls the speed of `_h` and `_e` pads when a `QUADSPI_x` signal is selected in AFMUX.

0: Writing '0' has no effect, reading '0' means High Speed mode disabled

1: Writing '1' disables High Speed mode, reading '1' means High Speed mode enabled<sup>(1)(2)</sup>

Bit 0 **HSLVEN\_TRACE**: High Speed Low Voltage Pad mode Enable.

Cleared by software.

Controls the speed of `_h` and `_e` pads when a `TRACEx` signal is selected in AFMUX.

0: Writing '0' has no effect, reading '0' means High Speed mode disabled

1: Writing '1' disables High Speed mode, reading '1' means High Speed mode enabled<sup>(1)(2)</sup>

1. This bit is not taken into account if the OTP bit (**product\_below\_2V5**) is 0 (default)

2. Enabling High Speed mode while  $VDD > 2.7V$  can damage the IC. See pad characteristics for details.

---

**Danger:**    **Enabling High Speed mode while  $VDD > 2.7V$  can damage the IC.**

| APSRC[3:0] |      |      |      | ANSRC[3:0] |      |      |       | RAPSRC[3:0] |      |      |      | RANSRC[3:0] |      |         |      |
| r          | r    | r    | r    | r          | r    | r    | r     | rw          | rw   | rw   | rw   | rw          | rw   | rw      | rw   |
| 15         | 14   | 13   | 12   | 11         | 10   | 9    | 8     | 7           | 6    | 5    | 4    | 3           | 2    | 1       | 0    |
| Res.       | Res. | Res. | Res. | Res.       | Res. | Res. | READY | Res.        | Res. | Res. | Res. | Res.        | Res. | SW_CTRL | Res. |
|            |      |      |      |            |      |      | r     |             |      |      |      |             |      | rw      |      |

Bits 31:28 **APSRC[3:0]**: PMOS I/O Compensation value provided by compensation cell.  
Value sent to IOs compensation when SW\_CTRL = 0 and READY = 1

Bits 27:24 **ANSRC[3:0]**: NMOS I/O Compensation value provided by compensation cell.  
Value sent to IOs when SW\_CTRL = 0 and READY = 1

Bits 23:20 **RAPSRC[3:0]**: PMOS I/O Compensation value sent to IOs when SW\_CTRL = 1

0000: reserved

0001: maximum compensation of fast conditions

....

1000: compensation for typical conditions

....

1110: maximum compensation of slow conditions

1111: reserved

*Note: If compensation is needed, it is recommended to use automatic compensation*

Bits 19:16 **RANSRC[3:0]**: NMOS I/O Compensation value sent to IOs when SW\_CTRL = 1

0000: reserved

0001: maximum compensation of slow conditions

....

0111: compensation for typical conditions

....

1110: maximum compensation of fast conditions

1111: reserved

*Note: If compensation is needed, it is recommended to use automatic compensation*

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **READY**: Compensation cell ready flag

0: I/O compensation cell not ready.

1: I/O compensation cell ready, the values of APSRC[3:0] and ANSRC[3:0] are valid

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **SW\_CTRL**: Compensation Software Control

0: IO compensation values come from compensation values in ANSRC[3:0] and APSRC[3:0]

1: IO compensation values come from RANSRC[3:0] and RAPSRC[3:0] register values

*Note: SW\_CTRL = 0 is not taken into account until READY = 1.*

*This means that whenever SW\_CTRL, the RANSRC[3:0] and RAPSRC[3:0] are used for IO compensation when the compensation cell is in power down (CMP\_PD = 0, which is the case after a reset).*

Bit 0 Reserved, must be kept at reset value.

### 14.3.8 SYSCFG compensation cell enable set register (SYSCFG\_CMPENSETR)

Address offset: 0x024

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |        |        |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|--------|--------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17     | 16     |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.   | Res.   |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |        |        |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1      | 0      |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MCU_EN | MPU_EN |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      | rs     | rs     |

Bits 31:2 Reserved, must be kept at reset value.

#### Bit 1 **MCU\_EN**: Compensation cell enable

Set by software.

0: (power\_down) Writing '0' has no effect, reading '0' mean I/O compensation cell in power-down mode if MPU\_EN=0

1: (enabled) Writing '1' enable I/O compensation cell, reading '1' mean I/O compensation cell is enabled

*Note: The CSI oscillator must be enabled and ready (controlled in RCC) before MPU\_EN could be set to 1. Similarly, the CSI oscillator could be disabled only if MPU\_EN and MCU\_EN are set to 0.*

#### Bit 0 **MPU\_EN**: Compensation cell enable

Set by software.

0: (power\_down) Writing '0' has no effect, reading '0' mean I/O compensation cell in power-down mode if MCU\_EN=0

1: (enabled) Writing '1' enable I/O compensation cell, reading '1' mean I/O compensation cell is enabled

*Note: The CSI oscillator must be enabled and ready (controlled in RCC) before MPU\_EN could be set to 1. Similarly, the CSI oscillator could be disabled only if MPU\_EN and MCU\_EN are set to 0.*

### 14.3.9 SYSCFG compensation cell enable clear register (SYSCFG\_CMPENCLRR)

Address offset: 0x028

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |        |        |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|--------|--------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17     | 16     |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.   | Res.   |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |        |        |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1      | 0      |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MCU_EN | MPU_EN |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      | rc_w1  | rc_w1  |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **MCU\_EN**: Compensation cell enable

Cleared by software.

0: (power\_down) Writing '0' has no effect, reading '0' mean I/O compensation cell in power-down mode if MPU\_EN=0

1: (enabled) Writing '1' clear MCU\_EN bit, reading '1' mean /O compensation cell is enabled

*Note: The CSI oscillator must be enabled and ready (controlled in RCC) before MPU\_EN could be set to 1. Similarly, the CSI oscillator could be disabled only if MPU\_EN and MCU\_EN are set to 0.*

Bit 0 **MPU\_EN**: Compensation cell enable

Cleared by software.

0: (power\_down) Writing '0' has no effect, reading '0' mean I/O compensation cell in powerdown mode if MCU\_EN=0

1: (enabled) Writing '1' clear MPU\_EN bit, reading '1' mean /O compensation cell is enabled

*Note: The CSI oscillator must be enabled and ready (controlled in RCC) before MPU\_EN could be set to 1. Similarly, the CSI oscillator could be disabled only if MPU\_EN and MCU\_EN are set to 0.*

### 14.3.10 SYSCFG control timer break register (SYSCFG\_CBR)

Address offset: 0x02C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PVDL | Res. | CLL  |
|      |      |      |      |      |      |      |      |      |      |      |      |      | rs   |      | rs   |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **PVDL**: PVD lock enable bit

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the PVD connection to TIM1/8/15/16/17 Break input, as well as the PVDE and PLS[2:0] in the PWR\_CR1 register.

0: PVD interrupt disconnected from TIM1/8/15/16/17 Break input. PVDE and PLS[2:0] bits can be programmed by the application.

1: PVD interrupt connected to TIM1/8/15/16/17 Break input. PVDE and PLS[2:0] bits are read only.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **CLL**: Cortex-M4 LOCKUP (Hardfault) output enable bit

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the connection of Cortex-M4 LOCKUP (Hardfault) output to TIM1/8/15/16/17 Break input

0: Cortex-M4 LOCKUP output disconnected from TIM1/8/15/16/17 Break inputs

1: Cortex-M4 LOCKUP output connected to TIM1/8/15/16/17 Break inputs

### 14.3.11 SYSCFG version register (SYSCFG\_VERR)

Address offset: 0x03F4

Reset value: 0x0000 0020

|      |      |      |      |      |      |      |      |             |      |      |      |             |      |      |      |
|------|------|------|------|------|------|------|------|-------------|------|------|------|-------------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23          | 22   | 21   | 20   | 19          | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.        | Res. | Res. | Res. | Res.        | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |             |      |      |      |             |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7           | 6    | 5    | 4    | 3           | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MAJREV[3:0] |      |      |      | MINREV[3:0] |      |      |      |
|      |      |      |      |      |      |      |      | r           | r    | r    | r    | r           | r    | r    | r    |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision

These bits return the SYSCFG major revision.

Major revision is 2.

Bits 3:0 **MINREV[3:0]**: Minor revision

These bits return the SYSCFG minor revision.

Minor revision is 0.

### 14.3.12 SYSCFG identification register (SYSCFG\_IPIDR)

Address offset: 0x03F8

Reset value: 0x0003 0001

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ID[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ID[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **ID[31:0]**: SYSCFG identifier

These bits return the SYSCFG identifier value.

14.3.13 SYSCFG size identification register (SYSCFG\_SIDR)

Address offset: 0x03FC

Reset value: 0xA3C5 DD01

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SID[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| SID[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **SID[31:0]**: Size identification  
These bits return the size of the memory region allocated to SYSCFG registers.

### 14.3.14 SYSCFG interface register map

Table 84 gives the SYSCFG interface register map and reset values.

**Table 84. SYSCFG interface register map and reset values**

| Offset        | Register           | 31         | 30   | 29   | 28         | 27   | 26   | 25          | 24       | 23           | 22          | 21   | 20        | 19   | 18   | 17   | 16              | 15          | 14   | 13   | 12   | 11   | 10   | 9        | 8          | 7      | 6      | 5      | 4        | 3        | 2        | 1        | 0        |          |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 15 Extended TrustZone® protection controller (ETZPC)

### 15.1 ETZPC introduction

The ETZPC configures TrustZone security in a SoC having bus masters and slaves with programmable-security attributes (securable resources) such as:

- On-chip RAM/ROM with programmable secure region size
- AHB and APB peripherals to be made secure
- AHB and APB peripherals to be set as isolated

### 15.2 ETZPC features

- 32-bit APB4 interface
- ETZPC is always Write-secure
- Register set to control SoC security settings for:
  - securable on-chip RAM and ROM secure region size
  - access rights for securable AHB and APB peripherals
  - resource isolation to Cortex-M4 domain for AHB and APB peripherals
- Locking of the security configuration per memory region and per peripheral
- Configurable memory region size in 4 Kbyte steps

### 15.3 Extended TrustZone architecture and ETZPC

- The Arm TrustZone model supports the isolation between:
  - A secure world, where security sensitive applications are run and critical resources are located; secure transactions are signaled with AxPROT[1] = 0 on the AXI bus
  - A non-secure or public world (Linux user space); non-secure transactions are signaled with AxPROT[1] = 1 on the AXI bus.
  - The STM32MP157 TrustZone architecture is extended beyond AXI and Cortex-A with AXI/AHB sideband signals to propagate the secure/non-secure transaction attributes to AHB and APB agents.
- AHB and APB peripherals are categorized as:
  - **secure:**  
These peripherals are protected by an AHB/APB firewall stub used to reject any non-secure access.  
Non secure writes are ignored with a Bus error.  
Non secure reads do not proceed to the peripheral, zeros are returned on the bus with a bus error.
  - **securable:**  
These peripherals are protected by an AHB/APB firewall, which is controlled by ETZPC to define its security mode.  
When the peripheral is configured as secure by ETPC: non-secure writes are ignored with a Bus error, non-secure reads do not proceed to the peripheral, and zeros are returned on the bus with a Bus error. Only secure reads and writes can

proceed to the peripheral.

When the peripheral is configured as non-secure by the ETPC, both secure and non-secure reads and writes can proceed to the peripheral.

- **non-secure:**  
These peripherals are connected directly to AHB/APB and both secure and non-secure read and write can proceed to the peripheral.
- **TrustZone-aware:**  
These peripherals are connected directly to the AHB or APB4 bus and implement a specific TrustZone behavior, for example a subset of registers can be made secure according to the peripheral state, or to its programming interface.

*Note: The Bus error is conditioned to interconnect clocking (for example, illicit access to an unclocked peripheral does not generate a bus error).*

- AXI bus masters drive the AxPROT[1] signal according to their secure state; an AXI bus master can be:
  - a) non-secure (in which case AxPROT[1]=1)
  - b) TrustZone capable (Cortex-A7, MDMA) in which case AxPROT[1] is driven low when the bus master is in secure state.
- AHB bus masters are normally non secure.  
It is expected that the ETZPC is programmed during secure BOOT and not changed later:
  - The TZMA secure region size can only be changed by secure software.

*Note: Before releasing a RAM region to the non-secure world by programming the TZMA to decrease the secure region size, the RAM should be cleared.*

## 15.4 ETZPC functional description

The ETZPC consists of a set of registers to control securable IPs through:

- **r0size[]** bits to define each TZMA secure region size.  
**decprot[1:0]** bits to control each AHB/APB securable peripheral access permissions as:
  - decprot[1:0] = 00: the peripheral is secure; read/write accesses are only allowed by the secure world.
  - decprot[1:0] = 01: the peripheral is write secure; read accesses are allowed by both secure and non-secure worlds, but only write accesses by the secure world are allowed
  - decprot[1:0] = 10: The peripheral is non-secure and certain MCU peripherals are isolated, according to [Table 90: decprot bits for isolable peripherals \(type 2\) and behavior](#).
  - decprot[1:0] = 11: the peripheral is non-secure; both read and write access are allowed by both the secure and non-secure worlds.

By default, after reset, memory regions are secure and all peripherals are read/ write secure.

**r0size[]** and **decprot[]** can be individually locked to prevent security configuration changes until next reset.

## 15.5 STM32MP157 security architecture

IP security properties can be classified as:

- TrustZone capable bus master IPs, as listed in [Table 88: STM32MP157 TrustZone-capable bus masters](#).
- TrustZone aware Peripherals whose behavior is conditioned to transaction security, as listed in [Table 86: STM32MP157 TrustZone-aware peripherals](#).
- TrustZone securable peripherals which rely on some AHB stub or on the AHB2APB bridge to control IP access according to decprot[] bits and transaction security. These are listed in [Table 85: STM32MP157 secure and securable peripherals](#) with type P.
- TrustZone secure (always secure) peripherals, as listed in [Table 85: STM32MP157 secure and securable peripherals](#) with type S or WS (write Secure).

Note: *Debug access port (DAP) security properties are set via the DBG authentication interface.*

The STM32MP157 security architecture is shown in [Figure 128: STM32MP157 security architecture](#).

Figure 128. STM32MP157 security architecture

The STM32MP157 security architecture is based on an extended version of Arm TrustZone with:

- TrustZone extension to AHB
- AHB stubs to protect securable AHB peripherals
- AHB2APB bridge using PPROT[1] signal propagation to TrustZone aware IPs listed in [Table 86: STM32MP157 TrustZone-aware peripherals](#)
- AHB2APB bridge to protect the securable APB peripherals listed in [Table 85: STM32MP157 secure and securable peripherals](#)
- TZMA firewalls for ROM and SYSRAM shown in [Table 87: STM32MP157 memory firewalls](#).

Table 85. STM32MP157 secure and securable peripherals

| IP      | Type <sup>(1)</sup> | Bus  | comment                     |
|---------|---------------------|------|-----------------------------|
| DDRPHYC | P                   | APB4 | DDR PHY                     |
| DDRCTRL | P                   | APB4 | DDR controller              |

|------------|-----|----------------------------------------------------------------------------------------------------------------------|
| Cortex-A7  | AXI | Cortex-A7 is TrustZone capable.                                                                                      |
| MDMA       | AXI | M MDMA channels can be set as secure or non-secure.                                                                  |
| DAP AXI-AP | AXI | AXI-AP is made TrustZone aware according to debug authentication interface (spiden, spniden) controlled by the BSEC. |

## 15.6 STM32MP157 MCU resource isolation

The ETZPC can be used to define a set of resources to be accessed only by the Cortex-M4 domain (MCU resource isolation). Besides the Cortex-M4, the domain may also include several DMA masters assigned to the MCU isolation domain.

Resources and DMA masters that can be assigned to MCU isolation domains are listed in [Table 92: Programmable options according to resource type](#) with type =2 and type =3. This concerns a large set of resources, with access restricted to the Cortex-M4 and DMA master under its control for application safety purposes.

Resource isolation is programmed by the decprot[] bits and access filtering using AHB stubs and AHB2APB firewalling according to the Master IDs.

Because security and MCU resource isolation peripherals are not orthogonal, the resources listed in [Table 92](#) are of 3 types as follows:

- **type 1:** securable peripherals
  - the decprot[] bits define access rules according to [Table 89](#)
  - failed access are reported with a bus error
- **type 2:** isolable only peripherals
  - the decprot[] bits define access rules according to [Table 90](#)
  - failed access are reported with a bus error
- **type 3:** peripherals which are both securable and isolable
  - the decprot[] bits define access rules according to [Table 91](#)
  - failed access are reported with a bus error.

Any resource not listed in [Table 92: Programmable options according to resource type](#) is accessible by any bus master (for example, non secured).

The debug AXI-AP is non-secure but able to access MCU resources.

**Table 89. decprot bits for securable peripherals (type 1) and behavior**

| decprot[1:0] | Comment                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------|
| 0b00         | The peripheral is RW secure.<br>Default after reset.                                                           |
| 0b01         | The peripheral is write-secure (for example, only write secure are allowed, read can be secure or non-secure). |
| 0b10         | Reserved. (Undefined behavior but does not weaken security.)                                                   |
| 0b11         | The peripheral is not secure (read and write by secure and non-secure means).                                  |

**Table 90. decprot bits for isolable peripherals (type 2) and behavior**

| decprot[1:0] | Comment                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0b0x         | Reserved. (Undefined behavior but does not weaken security).                                                                                                  |
| 0b10         | Peripheral RW access only by the Cortex-M4 domain.<br>(Cortex-A7 and other bus masters not in the Cortex-M4 domains are denied whether secure or non secure). |
| 0b11         | The peripheral is not secure (read and write by secure and non-secure means).<br>Default after reset.                                                         |

**Table 91. decprot bits for securable and Isolable Peripherals (type 3) and behavior**

| decprot[1:0] | Comment                                                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0b00         | The peripheral is RW secure.<br>Default after reset.                                                                                                 |
| 0b01         | The peripheral is write-secure (for example, only secure writes are allowed, read can be secure or non-secure).                                      |
| 0b10         | Peripheral RW access only by Cortex-M4 domain.<br>(Cortex-A7 and other Bus master not in Cortex-M4 domains are denied whether secure or non secure). |
| 0b11         | The peripheral is not secure (read and write by secure and non secure means).<br>Default after reset.                                                |

Programmable values of decprot[] bits according to resource type are summarized in [Table 92](#)

**Table 92. Programmable options according to resource type**

| Resource type                  | 0b00<br>(secured) | 0b01<br>(Write secured) | 0b10<br>(MCU isolation) | 0b11<br>(non-secured) |
|--------------------------------|-------------------|-------------------------|-------------------------|-----------------------|
| 1: Securable                   | Prog (default)    | Prog                    | No                      | Prog                  |
| 2: MCU isolation               | No                | No                      | Prog                    | Prog (default)        |
| 3: Securable and MCU Isolation | Prog              | Prog                    | Prog                    | Prog (default)        |

*Note:* Default after reset indicated by “\*”.

**Bus master and MCU resource isolation:**

Bus masters listed in [Table 93: DECPROT assignment](#) (DMA1, DMA2, OTG, SDMMC3, ETH1) may be assigned to the MCU isolation domain according to their control port decprot[] bit programming value. In this case they have granted access to other MCU isolated resources.

**Failed access behaviors:**

Whether it is a security or isolation violation, failed writes are ignored and failed reads are returned as zeros. Furthermore a bus error is asserted to either raise an exception with the Cortex CPUs, or to be flagged by an interrupt with DMA IPs.

*Note:* The only exception is GPIOZ (Tz-aware IP), which fails silently.

Any write access to ETZPC locked settings is also silently ignored.

All peripherals concerned by security and MCU resource isolation, and controlled by the ETZPC are listed in [Table 93](#) with the corresponding IP decprot[] bits.

**Table 93. DECPROT assignment**

| Index | decprot bits    | IP      | Bus  | Default | Bus master | Type | Attributes |
|-------|-----------------|---------|------|---------|------------|------|------------|
| 0     | DECPROT0[1:0]   | STGENC  | APB5 | 0b00    | -          | 1    | Securable  |
| 1     | DECPROT0[3:2]   | BKPSRAM | AHB5 | 0b00    | -          | 1    | Securable  |
| 2     | DECPROT0[5:4]   | IWDG1   | APB5 | 0b00    | -          | 1    | Securable  |
| 3     | DECPROT0[7:6]   | USART1  | APB5 | 0b00    | -          | 1    | Securable  |
| 4     | DECPROT0[9:8]   | SPI6    | APB5 | 0b00    | -          | 1    | Securable  |
| 5     | DECPROT0[11:10] | I2C4    | APB5 | 0b00    | -          | 1    | Securable  |
| 6     | DECPROT0[13:12] | -       | -    | 0b00    | -          | -    | Reserved   |
| 7     | DECPROT0[15:14] | RNG1    | AHB5 | 0b00    | -          | 1    | Securable  |
| 8     | DECPROT0[17:16] | HASH1   | AHB5 | 0b00    | -          | 1    | Securable  |
| 9     | DECPROT0[19:18] | CRYP1   | AHB5 | 0b00    | -          | 1    | Securable  |
| 10    | DECPROT0[21:20] | DDRCTRL | APB4 | 0b00    | -          | 1    | Securable  |
| 11    | DECPROT0[23:22] | DDRPHYC | APB4 | 0b00    | -          | 1    | Securable  |

Table 93. DECPROT assignment (Continued)

| Index | decprot bits    | IP      | Bus  | Default | Bus master | Type | Attributes                         |
|-------|-----------------|---------|------|---------|------------|------|------------------------------------|
| 12    | DECPROT0[25:24] | I2C6    | APB5 | 0b00    | -          | 1    | Securable                          |
| 13    | DECPROT0[27:26] | -       | -    | 0b00    | -          | -    | Reserved                           |
| 14    | DECPROT0[29:28] | -       | -    | 0b00    | -          | -    | Reserved                           |
| 15    | DECPROT0[31:30] | -       | -    | 0b00    | -          | -    | Reserved                           |
| 16    | DECPROT1[1:0]   | TIM2    | APB1 | 0b11    | -          | 2    | Not securable, MCU isolation only  |
| 17    | DECPROT1[3:2]   | TIM3    | APB1 | 0b11    | -          | 2    | Not securable, MCU isolation only. |
| 18    | DECPROT1[5:4]   | TIM4    | APB1 | 0b11    | -          | 2    | Not securable, MCU isolation only. |
| 19    | DECPROT1[7:6]   | TIM5    | APB1 | 0b11    | -          | 2    | Not securable, MCU isolation only. |
| 20    | DECPROT1[9:8]   | TIM6    | APB1 | 0b11    | -          | 2    | Not securable, MCU isolation only. |

1. FDCAN use one decprot[] for several APB regions

2. USBPHYC associated to OTG cannot be isolated

## 15.7 ETZPC registers

The ETZPC registers are accessed only by word (32-bit).

ETZPC registers are write-secure (that is, read accesses are allowed by secure and non-secure domains).

The ETZPC\_DECPROT<sub>x</sub> registers are used to control security and resource isolation for all peripherals listed in [Table 93: DECPROT assignment](#) according to the index (from 0 to 95).

**Caution:** The ETZPC is programmed during early boot, it should not be changed afterwards, locks bits can enforce this; propagation of the ETZPC decprot[] bits take some delay, 2 cycle APB should be observed before security rule is applied.

### 15.7.1 ETZPC ROM secure size definition (ETZPC\_TZMA0\_SIZE)

Address offset: 0x000

Reset value: 0x0000 03FF

|      |      |      |      |      |      |             |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|-------------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25          | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| LOCK | Res. | Res. | Res. | Res. | Res. | Res.        | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| rs   |      |      |      |      |      |             |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9           | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | R0SIZE[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      |      | rw          | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bit 31 **LOCK**: To lock r0size settings of the TZMA

0: r0size[] can be written

1: r0size[] cannot be modified until the next reset, therefore the write to r0size is silently ignored (for example no APB SLVERR).

Bits 30:10 Reserved, must be kept at reset value.

Bits 9:0 **R0SIZE[9:0]**

Defines the size of the secure ROM at the lower values, and non-secure ROM at the higher values:

0x000: all ROM is non-secure

0x001: 4 Kbyte ROM secure

0x002: 8 Kbyte ROM secure

....

0x020 to 0x3FF: 128 Kbyte ROM secure (for example all ROM secure)

## 15.7.2 ETZPC RAM secure size definition (ETZPC\_TZMA1\_SIZE)

Address offset: 0x004

Reset value: 0x0000 03FF

|      |      |      |      |      |      |             |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|-------------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25          | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| LOCK | Res. | Res. | Res. | Res. | Res. | Res.        | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| rs   |      |      |      |      |      |             |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9           | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | R0SIZE[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      |      | rw          | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bit 31 **LOCK**: To lock r0size settings of the TZMA

0: r0size[] can be written

1: r0size[] can not be modified until next reset, therefore the write to r0size is silently ignored (for example APB SLVERR)

Bits 30:10 Reserved, must be kept at reset value.

Bits 9:0 **R0SIZE[9:0]**

Defines the size of the secure RAM at the lower values, and non-secure RAM at the higher values:

0x000: all RAM is non-secure

0x001: 4 Kbyte RAM secure

0x002: 8 Kbyte RAM secure

....

0x040 to 0x3FF: 256 Kbyte RAM secure (for example all RAM secure)

### 15.7.3 ETZPC securable peripheral control register x (ETZPC\_DECPROT<sub>x</sub>)

Address offset:  $0x010 + 0x004 * (x - 0)$  ( $x = 0$  to  $5$ )

Reset value: Block 0: 0x0000 0000

Reset value: Block 1: 0xFFFF FFFF

Reset value: Block 2: 0xFFFF FFFF

Reset value: Block 3: 0xFFFF FFFF

Reset value: Block 4: 0xFFFF FFFF

Reset value: Block 3: 0xFFFF FFFF

Register reset values according to values in [Table 93: DECPROT assignment](#) column 'Default';

see also register map

Define security and isolation for peripheral at index ( $16 * x + y$ ) in [Table 93](#) according to ETZPC\_DECPROT<sub>x</sub> with ( $x = 0$  to  $5$ ) and ( $y = 0$  to  $15$ ) according to:

decproty[1:0]:

00: read and write secure

01: read non-secure and write secure

10: non-secure but MCU isolated

11: non-secure.

Permissible values of decproty[1:0] are according to the securable and/or MCU isolation attributes in [Table 93](#) column 'Attribute'

|                    |    |                    |    |                    |    |                    |    |                    |    |                    |    |                   |    |                   |    |
|--------------------|----|--------------------|----|--------------------|----|--------------------|----|--------------------|----|--------------------|----|-------------------|----|-------------------|----|

| rw                 | rw | rw                 | rw | rw                 | rw | rw                 | rw | rw                 | rw | rw                 | rw | rw                | rw | rw                | rw |
| 15                 | 14 | 13                 | 12 | 11                 | 10 | 9                  | 8  | 7                  | 6  | 5                  | 4  | 3                 | 2  | 1                 | 0  |
| DECPROT7<br>[1:0]  |    | DECPROT6<br>[1:0]  |    | DECPROT5<br>[1:0]  |    | DECPROT4<br>[1:0]  |    | DECPROT3<br>[1:0]  |    | DECPROT2<br>[1:0]  |    | DECPROT1<br>[1:0] |    | DECPROT0<br>[1:0] |    |
| rw                 | rw | rw                 | rw | rw                 | rw | rw                 | rw | rw                 | rw | rw                 | rw | rw                | rw | rw                | rw |

Bits 31:30 **DECPROT15[1:0]**: Settings for peripheral with index ( $16 * x + 15$ ) in reference manual table [DECPROT assignment](#).

Bits 29:28 **DECPROT14[1:0]**: Settings for peripheral with index ( $16 * x + 14$ ) in reference manual table [DECPROT assignment](#).

Bits 27:26 **DECPROT13[1:0]**: Settings for peripheral with index ( $16 * x + 13$ ) in reference manual table [DECPROT assignment](#).

Bits 25:24 **DECPROT12[1:0]**: Settings for peripheral with index ( $16 * x + 12$ ) in reference manual table [DECPROT assignment](#).

Bits 23:22 **DECPROT11[1:0]**: Settings for peripheral with index ( $16 * x + 11$ ) in reference manual table [DECPROT assignment](#).

Bits 21:20 **DECPROT10[1:0]**: Settings for peripheral with index ( $16 * x + 10$ ) in reference manual table [DECPROT assignment](#).

- Bits 19:18 **DECPROT9[1:0]**: Settings for peripheral with index  $(16 \times x + 9)$  in reference manual table [DECPROT assignment](#).
- Bits 17:16 **DECPROT8[1:0]**: Settings for peripheral with index  $(16 \times x + 8)$  in reference manual table [DECPROT assignment](#).
- Bits 15:14 **DECPROT7[1:0]**: Settings for peripheral with index  $(16 \times x + 7)$  in reference manual table [DECPROT assignment](#).
- Bits 13:12 **DECPROT6[1:0]**: Settings for peripheral with index  $(16 \times x + 6)$  in reference manual table [DECPROT assignment](#).
- Bits 11:10 **DECPROT5[1:0]**: Settings for peripheral with index  $(16 \times x + 5)$  in reference manual table [DECPROT assignment](#).
- Bits 9:8 **DECPROT4[1:0]**: Settings for peripheral with index  $(16 \times x + 4)$  in reference manual table [DECPROT assignment](#).
- Bits 7:6 **DECPROT3[1:0]**: Settings for peripheral with index  $(16 \times x + 3)$  in reference manual table [DECPROT assignment](#).
- Bits 5:4 **DECPROT2[1:0]**: Settings for peripheral with index  $(16 \times x + 2)$  in reference manual table [DECPROT assignment](#).
- Bits 3:2 **DECPROT1[1:0]**: Settings for peripheral with index  $(16 \times x + 1)$  in reference manual table [DECPROT assignment](#).
- Bits 1:0 **DECPROT0[1:0]**: Settings for peripheral with index  $(16 \times x + 0)$  in reference manual table [DECPROT assignment](#).

### 15.7.4 ETZPC decprot lock x register (ETZPC\_DECROT\_LOCKx)

Address offset:  $0x030 + 0x004 * (x-0)$  ( $x = 0$  to  $2$ )

Reset value:  $0x0000\ 0000$

|            |            |            |            |            |            |            |            |            |            |            |            |            |            |            |            |

Bit 31 **LOCK31**: Lock of security for peripheral with index ( $32*x + 31$ ) as defined by reference manual table [DECROT assignment](#).

0: not locked

1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)

Bit 30 **LOCK30**: Lock of security for peripheral with index ( $32*x + 30$ ) as defined by reference manual table [DECROT assignment](#).

0: not locked

1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)

Bit 29 **LOCK29**: Lock of security for peripheral with index ( $32*x + 29$ ) as defined by reference manual table [DECROT assignment](#).

0: not locked

1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)

Bit 28 **LOCK28**: Lock of security for peripheral with index ( $32*x + 28$ ) as defined by reference manual table [DECROT assignment](#).

0: not locked

1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)

Bit 27 **LOCK27**: Lock of security for peripheral with index ( $32*x + 27$ ) as defined by reference manual table [DECROT assignment](#).

0: not locked

1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)

Bit 26 **LOCK26**: Lock of security for peripheral with index ( $32*x + 26$ ) as defined by reference manual table [DECROT assignment](#).

0: not locked

1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)

Bit 25 **LOCK25**: Lock of security for peripheral with index ( $32*x + 25$ ) as defined by reference manual table [DECROT assignment](#).

0: not locked

1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)

- Bit 24 **LOCK24**: Lock of security for peripheral with index  $(32 \times x + 24)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 23 **LOCK23**: Lock of security for peripheral with index  $(32 \times x + 23)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are LOCKed until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 22 **LOCK22**: Lock of security for peripheral with index  $(32 \times x + 22)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 21 **LOCK21**: Lock of security for peripheral with index  $(32 \times x + 21)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 20 **LOCK20**: Lock of security for peripheral with index  $(32 \times x + 20)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 19 **LOCK19**: Lock of security for peripheral with index  $(32 \times x + 19)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 18 **LOCK18**: Lock of security for peripheral with index  $(32 \times x + 18)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: decprot[] bits are locked until next reset
- Bit 17 **LOCK17**: Lock of security for peripheral with index  $(32 \times x + 17)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 16 **LOCK16**: Lock of security for peripheral with index  $(32 \times x + 16)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 15 **LOCK15**: Lock of security for peripheral with index  $(32 \times x + 15)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)

- Bit 14 **LOCK14**: Lock of security for peripheral with index  $(32 \times x + 14)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 13 **LOCK13**: Lock of security for peripheral with index  $(32 \times x + 13)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 12 **LOCK12**: Lock of security for peripheral with index  $(32 \times x + 12)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 11 **LOCK11**: Lock of security for peripheral with index  $(32 \times x + 11)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 10 **LOCK10**: Lock of security for peripheral with index  $(32 \times x + 10)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 9 **LOCK9**: Lock of security for peripheral with index  $(32 \times x + 9)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 8 **LOCK8**: Lock of security for peripheral with index  $(32 \times x + 8)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 7 **LOCK7**: Lock of security for peripheral with index  $(32 \times x + 7)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 6 **LOCK6**: Lock of security for peripheral with index  $(32 \times x + 6)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)

- Bit 5 **LOCK5**: Lock of security for peripheral with index  $(32 \times x + 5)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 4 **LOCK4**: Lock of security for peripheral with index  $(32 \times x + 4)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 3 **LOCK3**: Lock of security for peripheral with index  $(32 \times x + 3)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 2 **LOCK2**: Lock of security for peripheral with index  $(32 \times x + 2)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: decprot[] bits are locked until next reset
- Bit 1 **LOCK1**: Lock of security for peripheral with index  $(32 \times x + 1)$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)
- Bit 0 **LOCK0**: Lock of security for peripheral with index  $32 \times x$  as defined by reference manual table [DECPROT assignment](#).  
0: not locked  
1: peripheral decprot[] bits are locked until next reset, therefore the write to decprot[] is silently ignored (for example no APB SLVERR)

### 15.7.5 ETZPC IP HW configuration register (ETZPC\_HWCFGR)

Address offset: 0x3F0

Reset value: 0x0000 6002

|                  |    |    |    |    |    |    |    |                  |    |    |    |    |    |    |    |

Bits 31:0 **ID[31:0]**: Identification code.

This field returns the Identification code of ETZPC

### 15.7.8 ETZPC IP version register (ETZPC\_SIDR)

Address offset: 0x3FC

Reset value: 0xA3C5 DD01

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 16 Block interconnects

### 16.1 Peripheral interconnects

#### 16.1.1 Introduction

Several peripherals have direct interconnections between them. This allows autonomous communication and synchronization between peripherals, saving processor resources and reducing power supply consumption.

In addition, these hardware connections remove software latency and allow the design of a predictable system.

This also saves pins and GPIOs.

Depending on the peripheral, these interconnections can operate in Run, Sleep or Stop modes.

#### 16.1.2 Connection overview

There are several types of connections, as listed below.

##### **Asynchronous connections (A)**

The source output signal is sampled by the destination clock, leading to the possible introduction of jitter in the latency between the source output event and the destination event detection.

##### **Synchronous connections (S)**

Both source and destination are synchronous (they run on the same clock), and the latency from the source to the destination is deterministic. No jitter is introduced.

##### **Break/fault connection for TIM outputs (B)**

The source output signal disables the timer outputs through a pure combinatorial logic path, without any latency.

## 17 MDMA controller (MDMA)

### 17.1 MDMA introduction

The master direct memory access (MDMA) is used in order to provide high-speed data transfer between memory and memory or between peripherals and memory. Data can be quickly moved by the MDMA without any CPU action. This keeps the CPU resources free for other operations.

The MDMA controller provides a master AXI interface for main memory and peripheral registers access (system access port).

The MDMA works in conjunction with the standard DMA controllers (DMA1 or DMA2). It offers up to 32 channels, each dedicated to manage memory access requests from one of the DMA stream memory buffer or other peripherals (w/ integrated FIFO).

### 17.2 MDMA main features

- AXI master bus architecture.
- 32 channels
- Up to 40 hardware trigger sources
- Each channel request can be selected among any of the request sources. This selection is software-configurable and allows several peripherals to initiate DMA requests. The trigger selection can be automatically changed at the end of one block transfer.
- All the channels are identical and can be connected either to a standard DMA or a peripheral request (acknowledge by data read/write) system or to a peripheral request/acknowledge system
- Each channel also supports software trigger
- One 256-level memory buffer, split in two 128-level first-in, first-out (FIFO), that is used to store temporary the data to be transferred (in burst or single transfer mode), for 1 or 2 consecutive buffers. The FIFO stores the data that are transferred during the current channel block transfer (up to the block transfer size). The 2nd FIFO can be used for the next buffer to be transferred, either for the same channel or for the next channel transfer.
- The priorities between the DMA channels are software-programmable (4 levels consisting of very high, high, medium, low) or hardware in case of equality (channel 0 has priority over channel 1, etc.)
- Independent source and destination transfer width (byte, half-word, word, double-word): when the data widths of the source and destination are not equal, the MDMA can pack/unpack the necessary data to optimize the bandwidth.
- The size and address increment for both source and destination can be independently selected.

*Note: Based on this separation, some more advanced packing/unpacking operations are available at software level. As an example, 2 x 16-bit data blocks can be interleaved together using two MDMA channels, in the destination memory, by simply programming the 2 channels with an increment step of 4 bytes and a data size of 16-bit + a start address shifted by 2 between the 2 channels.*

- Incrementing, decrementing or non incrementing/fixed addressing for source and destination
- Data packing/unpacking is always done respecting the little endian convention: lower address in a data entity (double word, word or half word) contains always the lowest significant byte. This is independent of the address increment/decrement mode of both source and destination.
- Supports incremental burst transfers. The size of the burst is software-configurable, up to 128 bytes. For larger data sizes the burst length is limited, as to respect the maximum 128 bytes data burst size (e.g. 16x64-bit or 32x32-bit).
- For the TCM memory accesses, the burst access is only allowed when the increment and data size are identical and lower than or equal to 32-bit.
- 5 event flags (MDMA Channel Transfer Complete, MDMA Block Transfer complete, MDMA Block Repeat Transfer Complete, MDMA buffer transfer Complete, MDMA Transfer Error) are available and can generate interrupts.

### 17.3.3 MDMA overview

The MDMA controller performs a direct memory transfer: as an AXI master, it can take the control of the AXI bus matrix to initiate AXI transactions.

It can carry out the following transactions:

- memory-to-memory (software triggered)
- peripheral-to-memory
- memory-to-peripheral

For the last two transaction types, the memory can also be replaced by a memory-mapped peripheral, which has no control over the MDMA flow. When these types of transaction are used and the request is coming from a standard DMA (DMA1 or DMA2), the peripheral register access is replaced by a memory access to the memory buffer used by this DMA.

*Note:* *Non-incrementing/decrementing mode is not used for memory accesses.*

The source and destination are simply defined by the address (peripherals being memory mapped also).

The AHB slave port is used to program the MDMA controller (it supports 8/16/32-bit accesses).

The size of the data array to be transferred for a single request is one of the following:

1. The buffer transfer size
2. The block size
3. Repeated block
4. Complete channel data (until the linked list pointer for the channel is null)

The choice of the size is done through the TRGM[1:0] (Trigger mode) selection field.

The user must choose one of them based on the data array size available (usually in the DMA1/2 memory buffer) and the “real time” requirements for other MDMA channels (knowing that a buffer transfer is the minimum data aggregate to be transferred by the MDMA without doing a new arbitration between MDMA channel requests).

For each channel, there are three key data array sizes:

1. Burst size: this is the length of the data transfer which can be performed in burst mode. This burst length defines the maximum transfer length which cannot be interrupted at bus arbitration level and can block other masters from accessing the bus)
2. Buffer transfer size: this is the length of the data array to be transferred, on a channel, before checking for MDMA requests on other channels. This is the data array transfer lengths which cannot be interrupted at MDMA level (from other channel requests).
3. Block size: this value has two meanings which can be used together:
  - a) main: this is length of the data block which is described in a block structure of the MDMA linked list (corresponds to one entry in the linked list)
  - b) selectable: when TRGM[1:0] equals 01, this is the length of the data array which is transferred on a single MDMA request activation (for the respective channel)

### 17.3.4 MDMA channel

Each of the DMA controller channel provides a unidirectional transfer link between a source and a destination.

Each channel can perform:

- Single block transfer: one block is transferred. At the end of the block, the DMA channel is disabled and an End of Channel Transfer interrupt is generated.
- Repeated block transfer: a number of blocks is transferred before disabling the channel
- Linked list transfer: when the transfer of the current data block (or last block in a repeat) is completed, a new block control structure is loaded from memory and a new block transfer is started.

The minimum amount of data to be transferred for each request (buffer size, up to 128-bytes) is programmable. The total amount of data in a block, is programmable up to 64 Kbytes. This value is decremented after each transfer. When this counter reaches 0, the end of the block is reached and an action is taken based on the repeat counter (for repeated block transfer) and/or linked list structure value.

*Note: If the block length is not a multiple of the buffer length, the last buffer transfer in the block is shorter, covering the remaining bytes to be transferred in the current block.*

If the link structure address points to a valid memory address, the MDMA reloads the whole channel descriptor structure register contents from memory at this address. Then, a new block transfer is then executed (on the next MDMA channel request) based on this information.

If the link structure address is 0x0, at the end of the current/repeated block transfer, the MDMA channel is disabled and the end of channel transfer interrupt is generated.

### 17.3.5 Source, destination and transfer modes

Both the source and destination transfers can address peripherals and memories in the entire 4-Gbyte area, at addresses comprised between 0x0000 0000 and 0xFFFF FFFF.

The source/destination addresses can be fixed (e.g. FIFO/single data register peripherals) or incremented/decremented. The transfer can be done in single access or in burst mode (programmable).

### 17.3.6 Pointer update

The source and destination memory pointers can optionally be automatically post-incremented/decremented or kept constant after each transfer depending on the SINC[1:0] and DINC[1:0] bits in the MDMA\_CxCR register.

Disabling the increment mode is useful when the peripheral source or destination data are accessed through a single register/FIFO mode.

If the increment/decrement mode is enabled, the address of the next data transfer is the address of the previous one incremented/decrement by 1, 2, 4 or 8 depending on the increment size programmed in the SINCOS[1:0] or DINCOS[1:0] bits in the MDMA\_CxCR register.

In order to optimize the packing operation, the increment offset size and the data size are programmable independently.

### 17.3.7 MDMA buffer transfer

This is the minimum logical amount of data (up to 128 bytes) which is transferred on an MDMA request event, on one channel.

An MDMA buffer transfer consists of a sequence of a given number of data transfers (done as single or burst data transfers). The number of data items to be transferred and their width (8-bit, 16-bit, 32-bit or 64-bit) are software programmable. The length of the burst used for data transfers is also programmable, independently.

After an event requiring a data array to be transferred, the DMA/peripheral sends a request signal to the MDMA controller. The MDMA controller serves the request depending on the channel priorities.

The request is acknowledged either by writing the mask data value to the address given mask address, when these registers are set or by hardware ACK signal.

If the mask address register is not set (0x00 value), the request can be reset by simply reading/writing the data to the peripheral. In this case, if the request is done by a destination peripheral, the write must be set as non bufferable, in order to avoid a false new MDMA request.

The total amount of data to be transferred, on the current channel, following a MDMA request, is determined by the TRGM[1:0] field.

If TRGM[1:0] equals 00, a single buffer is transferred, then the MDMA waits for another request on the same channel.

*Note: In this case, the hardware request for the currently active channel (data in the FIFO) is not considered again until the end of the write phase for this channel. In this case, even if the channel would still be active at the end of the read phase, another channel (even with lower priority) could start the read phase. Because of this, lower priority channels can be interleaved with current channel transfer.*

If TRGM[1:0] is different from 00 (multiple buffers need to be transferred), the `mdma_strx` for the current channel remains active (internally memorized) until the whole transfer defined by TRGM (block, repeated block or whole channel/linked list data) is completed. However, after transferring an individual buffer, the MDMA enters in a new arbitration phase (between new external requests and internally memorized ones). If no other higher priority, channel request is active, a new buffer transfer is started for the same channel.

*Note: When TRGM[1:0] is different from 00, a larger array of data is transferred for a single request. But, as the channel arbitration is done after each buffer transfer, no higher level MDMA requests would be blocked for the more than a buffer transfer period, on any lower priority channel.*

### 17.3.8 Request arbitration

An arbiter manages the MDMA channel requests based on their priority. When MDMA is idle and after the end of each buffer transfer, all MDMA requests (hardware or software) are checked for all enabled channels.

Priorities are managed in two stages:

- Software: each stream priority can be configured in the MDMA\_CxCR register. There are four levels:
  - Very high priority
  - High priority
  - Medium priority
  - Low priority
- Hardware: at hardware level, the channel priority is fixed. If two requests have the same software priority level, the channel with the lower number takes priority over the stream with the higher number. For example, Channel 2 takes priority over Channel 4 when they have the same software priority level.

### 17.3.9 FIFO

A FIFO structure is used to temporarily store data coming from the source before writing them to the destination. There is a central FIFO structure which is used for all channels.

In order to maximize data bandwidth and bus usage, the following mechanisms are used, allowing multiple read/write operation to be executed in parallel.

- During a buffer transfer, as soon as the FIFO contains enough data for a destination burst transfer, the write operation starts.
- When the complete data for a buffer transfer has been read into the FIFO, the arbitration procedure is started. Following that, the next buffer data to be transferred can be read to the FIFO.

When an active channel is disabled due to an error, during a buffer transfer, the remaining data in the internal FIFO is discarded.

### 17.3.10 Block transfer

A block is a “contiguous” array of data, up to 64 Kbytes, which is transferred by successive buffer transfers.

Each block of data is defined by the start address and the block length. When a block transfer is completed, one of the following three actions can be executed:

- The block is part of a repeated block transfer: the block length is reloaded and new block start address is computed (based on the information in the MDMA\_CxBRUR register)
- It is a single block or the last block in a repeated block transfer: the next block information is loaded from the memory (using the linked list address information, from the MDMA\_CxLAR)
- It is the last block which needs to be transferred for the current MDMA channel (MDMA\_CxLAR = 0): the channel is disabled and no further MDMA requests are accepted for this channel

### 17.3.11 Block repeat mode

The block repeat mode allows to repeat a block transfer, with different start addresses for source and destination.

When the repeat block mode is active (repeat counter non 0), at the end of the current block transfer, the block parameters are updated (the BNDT value reloaded and SAR/DAR values updated according to BRSUM/BRDUM configuration), and the repeat counter decremented by 1.

When the repeat block counter reaches 0, this last block is treated as a single block transfer.

### 17.3.12 Linked list mode

The Linked list mode allows to load a new MDMA configuration (CxTCR, CxBNDTR, CxSAR, CxDAR, CxBRUR, CxLAR, CxTBR, CxMAR and CxMDR registers), from the address given in the CxLAR register. This address must address a memory mapped on the AXI system bus.

Following this operation, the channel is ready to accept new requests, as defined in the block/repeated block modes above, or continue the transfer if TRGM[1:0] equals 11.

The trigger source can be automatically changed, when loading the CxTBR value.

The TRGM and SWRM values must not be changed when TRGM[1:0] equals 11.

### 17.3.13 MDMA transfer completion

Different events can generate an end of transfer by setting the CTCIF bit in the status register (MDMA\_CxISR):

- The MDMA\_CxBNDTR counter has reached zero, the Block Repeat Counter is 0 and the Link list pointer address is 0
- The channel is disabled before the end of transfer (by clearing the EN bit in the MDMA\_CxCR register) and all the remaining data have been transferred from the FIFO to the destination

### 17.3.14 MDMA transfer suspension

At any time, a MDMA transfer can be suspended in order to be restarted later on or to be definitively disabled before the end of the MDMA transfer.

There are two cases:

- The channel is disabled, with no later-on restart from the point where it was stopped. There is no particular action to do, besides clearing the EN bit in the MDMA\_CxCR register to disable the channel. The stream can take time to be disabled (on going buffer transfer is completed first). The transfer complete interrupt flag is set in order to indicate the end of transfer. The value of the EN bit in MDMA\_CxCR is now 0 to confirm the channel interruption. The MDMA\_CxNDTR register contains the number of remaining data items at the moment when the channel was stopped so that the software can determine how many data items have been transferred before the channel was interrupted.
- The channel is suspended before the number of remaining bytes to be transferred in the MDMA\_CxBNDTR register reaches 0. The aim is to restart the transfer later by re-enabling the channel. The channel transfer complete interrupt flag CTCIF is set in order to indicate the end of transfer. If the MDMA\_CxBNDTR, SAR and DAR registers are not modified by software, the transfer continues when the channel is re-enabled. CTCIF must also be reset before restarting the channel.

*Note:* If the completed buffer is the last of the block, the configuration registers are also updated before disabling the channel, in order to be correctly prepared for a soft restart.

*Note:* Before reprogramming the channel, software must wait the CTCIF register is set, in order to guarantee that any ongoing operation has been completed.

### 17.3.15 Error management

The MDMA controller can detect the following errors:

The transfer error interrupt flag (TEIF) is set when:

- A bus error occurs during a MDMA read or a write access
- The address alignment does not correspond to the data size
- The block size is not a multiple of the data size (for source and/or destination): this error is activated on the last transfer and the error address points to the last transfer (which cannot be done)

## 17.4 MDMA interrupts

For each MDMA channel, an interrupt can be produced on the following events:

- Channel Transfer Completed
- Block-Transfer Completed
- Block-Transfer Repeat Completed
- buffer Transfer Completed
- Transfer Error

Separate interrupt enable control bits are available for flexibility as shown in [Table 99](#).

Table 99. MDMA interrupt requests

| Interrupt event                 | Event flag | Enable control bit |
|---------------------------------|------------|--------------------|
| Channel Transfer Completed      | CTCIF      | CTCIE              |
| Block-Transfer Repeat completed | BTRIF      | BTRIE              |
| Block-Transfer completed        | BTIF       | BTIE               |
| buffer Transfer Completed       | TCIF       | TCIE               |
| Transfer Error                  | TEIF       | TEIE               |

**Note:** Before setting an Enable control bit to 1, the corresponding event flag must be cleared, otherwise an interrupt might be immediately generated, if the bit is already set.

**Note:** When at least one interrupt flag and the respective enable control bit are set, the channel interrupt bit is set in the SGISR. The Interrupt output or the Secure Interrupt output is also activated. This generates an interrupt if the respective interrupt channel is enabled in the NVIC.

## 17.5 MDMA registers

The MDMA registers can be accessed in word/half-word or byte format.

### 17.5.1 MDMA global interrupt/status register (MDMA\_GISR0)

Address offset: 0x00

Reset value: 0x0000 0000

|       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| 31    | 30    | 29    | 28    | 27    | 26    | 25    | 24    | 23    | 22    | 21    | 20    | 19    | 18    | 17    | 16    |
| GIF31 | GIF30 | GIF29 | GIF28 | GIF27 | GIF26 | GIF25 | GIF24 | GIF23 | GIF22 | GIF21 | GIF20 | GIF19 | GIF18 | GIF17 | GIF16 |
| r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     |
| 15    | 14    | 13    | 12    | 11    | 10    | 9     | 8     | 7     | 6     | 5     | 4     | 3     | 2     | 1     | 0     |
| GIF15 | GIF14 | GIF13 | GIF12 | GIF11 | GIF10 | GIF9  | GIF8  | GIF7  | GIF6  | GIF5  | GIF4  | GIF3  | GIF2  | GIF1  | GIF0  |
| r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     |

Bits 31:0 **GIF[31:0]**: Channel x global interrupt flag (x=0..31)

This bit is set and reset by hardware. It is a logical OR of all the Channel x interrupt flags (CTCIF, BTIF, BTRIF, TEIF) which are enabled in the interrupt mask register (CTCIEx, BTIEx, BRTIEx, TEIEx)

0: No interrupt generated by channel x

1: Interrupt generated by channel x

### 17.5.2 MDMA secure global interrupt/status register (MDMA\_SGISR0)

Address offset: 0x08

Reset value: 0x0000 0000

|       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| 31    | 30    | 29    | 28    | 27    | 26    | 25    | 24    | 23    | 22    | 21    | 20    | 19    | 18    | 17    | 16    |
| GIF31 | GIF30 | GIF29 | GIF28 | GIF27 | GIF26 | GIF25 | GIF24 | GIF23 | GIF22 | GIF21 | GIF20 | GIF19 | GIF18 | GIF17 | GIF16 |
| r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     |
| 15    | 14    | 13    | 12    | 11    | 10    | 9     | 8     | 7     | 6     | 5     | 4     | 3     | 2     | 1     | 0     |
| GIF15 | GIF14 | GIF13 | GIF12 | GIF11 | GIF10 | GIF9  | GIF8  | GIF7  | GIF6  | GIF5  | GIF4  | GIF3  | GIF2  | GIF1  | GIF0  |
| r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     | r     |

Bits 31:0 **GIF[31:0]**: Channel x global interrupt flag (x=...)

This bit is set and reset by hardware. It is a logical OR of all the Channel x interrupt flags (CTCIF, BTIF, BRTIF, TEIF) which are enabled in the interrupt mask register (CTCIEx, BTIEx, BRTIEx, TEIEx)

0: No interrupt generated by channel x

1: Interrupt generated by channel x

### 17.5.3 MDMA channel x interrupt/status register (MDMA\_CxISR)

Address offset:  $0x40 + 0x40 * x$ , (x = 0 to 31)

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |       |       |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|-------|-------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18    | 17    | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.  | Res.  | CRQA |
|      |      |      |      |      |      |      |      |      |      |      |      |      |       |       | r    |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2     | 1     | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TCIF | BTIF | BRTIF | CTCIF | TEIF |
|      |      |      |      |      |      |      |      |      |      |      | r    | r    | r     | r     | r    |

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **CRQA**: Channel x ReQuest Active flag

This bit is set by software writing 1 to the SWRQx bit in the MDMA\_CxCR register, in order to request a MDMA transfer, and the channel x is enabled.

It is also set by hardware when the channel request become active and the channel is enabled. The hardware request memorized until it is served.

It is cleared by hardware, when the Channel x Request is completed (after the source write phase of the last buffer transfer due for the current request).

0: The MDMA transfer mdma\_strx is inactive for channel x.

1: The MDMA transfer mdma\_strx is active for channel x

This bit is also reset by hardware when the channel is disabled (in case of transfer error or when reaching the end of the channel data transfer - repeat block = 0 and linked list pointer null - or by software programming the channel enable bit to 0 before that).

Bits 15:5 Reserved, must be kept at reset value.

**Bit 4 TCIF:** Channel x buffer transfer complete interrupt flag

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the MDMA\_IFCRy register.

0: No buffer transfer complete event on channel x

1: A buffer transfer complete event occurred on channel x

TC is set when a single buffer was transferred. It is activated on each channel transfer request.

This can be used as a debug feature (without interrupt), indicating that (at least) an MDMA buffer transfer had been generated since the last flag reset.

**Bit 3 BTIF:** Channel x block transfer complete interrupt flag

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the MDMA\_IFCRy register.

0: No block transfer complete event on channel x

1: A block transfer complete event occurred on channel x

**Bit 2 BRTIF:** Channel x block repeat transfer complete interrupt flag

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the MDMA\_IFCRy register.

0: No block repeat transfer complete event on channel x

1: A block repeat transfer complete event occurred on channel x

**Bit 1 CTCIF:** Channel x Channel Transfer Complete interrupt flag

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the MDMA\_IFCRy register.

0: No channel transfer complete event on channel x

1: A channel transfer complete event occurred on channel x

CTC is set when the last block was transferred and the channel has been automatically disabled.

CTC is also set when the channel is suspended, as a result of writing EN bit to 0.

**Bit 0 TEIF:** Channel x transfer error interrupt flag

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the MDMA\_IFCRy register.

0: No transfer error on stream x

1: A transfer error occurred on stream x

**17.5.4 MDMA channel x interrupt flag clear register (MDMA\_CxIFCR)**

Address offset:  $0x44 + 0x40 * x$ , ( $x = 0$  to  $31$ )

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |        |       |        |        |       |
|------|------|------|------|------|------|------|------|------|------|------|--------|-------|--------|--------|-------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20     | 19    | 18     | 17     | 16    |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLTCIF | CBTIF | CBRTIF | CCTCIF | CTEIF |
|      |      |      |      |      |      |      |      |      |      |      | w      | w     | w      | w      | w     |

Bits 31:5 Reserved, must be kept at reset value.

**Bit 4 CLTCIF:** Clear buffer Transfer Complete Interrupt Flag for channel x

Writing 1 into this bit clears TCIF in the MDMA\_ISRy register

- Bit 3 **CBTIF**: Channel x Clear block transfer complete interrupt flag  
Writing 1 into this bit clears BTIF in the MDMA\_ISRy register
- Bit 2 **CBRTIF**: Channel x clear block repeat transfer complete interrupt flag  
Writing 1 into this bit clears BRTIF in the MDMA\_ISRy register
- Bit 1 **CCTCIF**: Clear Channel transfer complete interrupt flag for channel x  
Writing 1 into this bit clears CTCIF in the MDMA\_ISRy register
- Bit 0 **CTEIF**: Channel x clear transfer error interrupt flag  
Writing 1 into this bit clears TEIF in the MDMA\_ISRy register

### 17.5.5 MDMA channel x error status register (MDMA\_CxESR)

Address offset:  $0x48 + 0x40 * x$ , ( $x = 0$  to  $31$ )

Reset value:  $0x0000\ 0000$

|      |      |      |      |      |      |      |      |      |          |      |      |      |      |      |      |

|      |      |      |      |      |      |      |      |      |          |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6        | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | BSE  | ASE  | TEMD | TELD | TED  | TEA[6:0] |      |      |      |      |      |      |
|      |      |      |      | r    | r    | r    | r    | r    | r        | r    | r    | r    | r    | r    | r    |

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **BSE**: Block Size Error

These bit is set by hardware, when the block size is not an integer multiple of the data size either for source or destination. TED indicates whether the problem is on the source or destination.

It is cleared by software writing 1 to the **CTEIF** bit in the MDMA\_IFCRy register.

0: No block size error.

1: Programmed block size is not an integer multiple of the data size.

Bit 10 **ASE**: Address/Size Error

These bit is set by hardware, when the programmed address is not aligned with the data size. TED indicates whether the problem is on the source or destination.

It is cleared by software writing 1 to the **CTEIF** bit in the MDMA\_IFCRy register.

0: No address/size error.

1: Programmed address is not coherent with the data size.

Bit 9 **TEMD**: Transfer Error Mask Data

These bit is set by hardware, in case of a transfer error while writing the Mask Data.

It is cleared by software writing 1 to the **CTEIF** bit in the MDMA\_IFCRy register.

0: No mask write access error.

1: The last transfer error on the channel was a related to a write of the Mask Data.

**Bit 8 TELD:** Transfer Error Link Data

These bit is set by hardware, in case of a transfer error while reading the block link data structure.

It is cleared by software writing 1 to the **CTEIF** bit in the MDMA\_IFCRy register.

0: No link data read access error.

1: The last transfer error on the channel was a related to a read of the Link Data structure.

**Bit 7 TED:** Transfer Error Direction

These bit is set and cleared by hardware, in case of an MDMA data transfer error.

0: The last transfer error on the channel was a related to a read access.

1: The last transfer error on the channel was a related to a write access.

**Bits 6:0 TEA[6:0]:** Transfer Error Address

These bits are set and cleared by hardware, in case of an MDMA data transfer error. It is used in conjunction with TED.

This field indicates the 7 LSBits of the address which generated a transfer/access error.

It can be used by software to retrieve the failing address, by adding this value (truncated to the buffer transfer length size) to the current SAR/DAR value.

*Note: The SAR/DAR current value doesn't reflect this last address due to the FIFO management system. The SAR/DAR are only updated at the end of a (buffer) transfer (of TLEN+1 bytes).*

*Note: It is not set in case of a link data error.*

### 17.5.6 MDMA channel x control register (MDMA\_CxCR)

This register is used to control the concerned channel.

Address offset:  $0x4C + 0x40 \times x$ , ( $x = 0$  to  $31$ )

Reset value:  $0x0000\ 0000$

|      |      |      |      |      |      |      |      |         |      |      |      |       |       |      |      |
|------|------|------|------|------|------|------|------|---------|------|------|------|-------|-------|------|------|

| Res. | WEX  | HEX  | BEX  | Res. | Res. | Res. | Res. | PL[1:0] |      | TCIE | BTIE | BRTIE | CTCIE | TEIE | EN   |
|      | rw   | rw   | rw   |      |      |      |      | rw      | rw   | rw   | rw   | rw    | rw    | rw   | rw   |

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **SWRQ**: Software Request

Writing 1 into this bit sets the CRQA in MDMA\_ISRy register, activating the request on Channel x

*Note: Either the whole CxCR register or the 8-bit/16-bit register at Address offset:  $0x4E + 0x40 \times \text{channel number}$  can be used for SWRQ activation.*

*In case of a software request, acknowledge is not generated (neither hardware signal, nor CxMAR write access).*

Bit 15 Reserved, must be kept at reset value.

Bit 14 **WEX**: Word Endianess exchange

This bit is set and cleared by software.

0: Little endianess preserved for words

1: word order exchanged in double word

When this bit is set, the word order in the destination double word is reversed: higher address word contains the data read from the lower address of the source.

If destination is not a double word, do not care of the value of this bit.

This bit is protected and can be written only if EN is 0.

Bit 13 **HEX**: Half word Endianess exchange

This bit is set and cleared by software.

0: Little endianess preserved for half words

1: half-word order exchanged in each word

When this bit is set, the half-word order in each destination word is reversed: higher address half-word contains the data read from the lower address of the source.

If destination length is shorter than word, do not care of the value of this bit.

This bit is protected and can be written only if EN is 0.

Bit 12 **BEX**: Byte Endianess exchange

This bit is set and cleared by software.

0: Little endianess preserved for bytes

1: byte order exchanged in each half-word

When this bit is set, the byte order in each destination Half Word is reversed: higher address word contains the data read from the lower address of the source.

If destination is byte, do not care of the value of this bit.

This bit is protected and can be written only if EN is 0.

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 Reserved, must be kept at reset value.

Bits 7:6 **PL[1:0]**: Priority level

These bits are set and cleared by software.

00: Low

01: Medium

10: High

11: Very high

These bits are protected and can be written only if EN is 0.

Bit 5 **TCIE**: buffer Transfer Complete interrupt enable

This bit is set and cleared by software.

0: TC interrupt disabled

1: TC interrupt enabled

Bit 4 **BTIE**: Block Transfer interrupt enable

This bit is set and cleared by software.

0: BT complete interrupt disabled

1: BT complete interrupt enabled

Bit 3 **BRTIE**: Block Repeat transfer interrupt enable

This bit is set and cleared by software.

0: BT interrupt disabled

1: BT interrupt enabled

Bit 2 **CTCIE**: Channel Transfer Complete interrupt enable

This bit is set and cleared by software.

0: TC interrupt disabled

1: TC interrupt enabled

Bit 1 **TEIE**: Transfer error interrupt enable

This bit is set and cleared by software.

0: TE interrupt disabled

1: TE interrupt enabled

Bit 0 **EN**: Channel enable / flag channel ready when read low

This bit is set and cleared by software.

0: Channel disabled

1: Channel enabled

This bit can be cleared by hardware:

- on a MDMA end of transfer (stream ready to be configured)
- if a transfer error occurs on the AXI master buses (bus error/hard fault)
- if another error condition is encountered (data alignment, block/data size incompatibility)

When this bit is reset by software, the ongoing buffer transfer (if any) is completed. All status/configuration registers keep their current values. If the channel is re enabled without writing these registers, the channel continues from the point where it was interrupted.

When this bit is read as 0, the software is allowed to program the configuration registers. It is forbidden to write these registers when the EN bit is read as 1 (writes are ignored).

*Note: When this bit is reset by software, it is recommended to wait for the CTCIF = 1, in order to ensure that any ongoing buffer transfer has been completed, before reprogramming the channel.*

### 17.5.7 MDMA channel x transfer configuration register (MDMA\_CxTCR)

This register is used to configure the concerned channel. In Linked List mode, at the end of a block (single or last block in repeated block transfer mode), this register is loaded from memory (from address given by current LAR[31:0] + 0x00).

Address offset: 0x50 + 0x40 \* x, (x = 0 to 31)

Reset value: 0x0000 0000

|               |             |           |    |             |    |             |           |            |    |            |    |           |             |           |    |

| DBURST<br>[0] | SBURST[2:0] |           |    | DINCOS[1:0] |    | SINCOS[1:0] |           | DSIZE[1:0] |    | SSIZE[1:0] |    | DINC[1:0] |             | SINC[1:0] |    |
| rw            | rw          | rw        | rw | rw          | rw | rw          | rw        | rw         | rw | rw         | rw | rw        | rw          | rw        | rw |

#### Bit 31 **BWM**: Bufferable Write Mode

This bit is set and cleared by software.

0: The destination write operation is non-bufferable.

1: The destination write operation is bufferable.

This bit is protected and can be written only if EN is 0.

*Note: All MDMA destination accesses are non-cacheable.*

#### Bit 30 **SWRM**: Software Request Mode

This bit is set and cleared by software. If a hardware or software request is currently active, the bit change is delayed until the current transfer is completed.

0: hardware request are taken into account: the transfer is initiated as defined by TRGM value and acknowledged by the MDMA ACKx signal.

If the CxMAR contains a valid address, the CxMDR value is also written at CxMAR address.

1: hardware request are ignored. Transfer is triggered by software writing 1 to the SWRQ bit.

This bit is protected and can be written only if EN is 0.

#### Bits 29:28 **TRGM[1:0]**: Trigger Mode

These bits are set and cleared by software.

00: Each MDMA request (software or hardware) triggers a buffer transfer

01: Each MDMA request (software or hardware) triggers a block transfer

10: Each MDMA request (software or hardware) triggers a repeated block transfer (if the block repeat is 0, a single block is transferred)

11: Each MDMA request (software or hardware) triggers the transfer of the whole data for the respective channel (e.g. linked list) until the channel reach the end and it is disabled.

*Note: If TRGM is 11 for the current block, all the values loaded at the end of the current block through the linked list mechanism must keep the same value (TRGM=11) and the same SWRM value, otherwise the result is undefined.*

These bits are protected and can be written only if EN is 0.

Bits 27:26 **PAM[1:0]**: Padding/Alignment mode

These bits are set and cleared by software.

00: Right aligned, padded w/ 0s (default)

*Note: if source data is larger than destination size, only the LSBs part of the source is written to the destination address. The reminder part is discarded.*

01: Right aligned, sign extended

10: Left aligned (padded with 0s)

*Note: if source data is larger than destination size, only the MSBs part of the source is written to the destination address. The reminder part is discarded.*

11: Reserved

When PKE = 1 or DSIZE=SSIZE, these bits are ignored.

These bits are protected and can be written only if EN is 0.

Bit 25 **PKE**: Pack Enable

This bit is set and cleared by software.

0: The source data is written to the destination as is.

If the Source Size is smaller than the destination, it is padded according to the PAM value.

If the Source data size is larger than the destination one, it is truncated. The alignment is done according to the PAM[1:0] value.

1: The source data is packed/unpacked into the destination data size. All data are right aligned, in Little Endian mode.

This bit is protected and can be written only if EN is 0

Bits 24:18 **TLEN[6:0]**: buffer Transfer Length (number of bytes - 1)

These bits are set and cleared by software.

The value of TLEN+1 represents the number of bytes to be transferred in a single transfer.

The Transfer Length MUST be a multiple of the data size (for both Source and Destination)

*Note: When the source/destination sizes are different and padding/truncation is used, the TLEN+1 refers to the source data array size.*

These bits are protected and can be written only if EN is 0

DBURST value must be programmed in order to ensure that the burst size is lower than the Transfer Size.

Bits 17:15 **DBURST[2:0]**: Destination burst transfer configuration

These bits are set and cleared by software.

000: single transfer

N: burst of  $2^N$  beats

These bits are protected and can be written only if EN is 0

DBURST value must be programmed as to ensure that the burst size is lower than the Transfer Length. If this is not ensured, the result is unpredictable.

*Note: When the destination bus is TCM/AHB (DBUS=1) and DINCOS=11 or DINC=00 or DINCOS/=DSIZE, DBURST must be programmed to 000 (single transfer), else the result is unpredictable.*

*Note: When the destination bus is system/AXI bus (DBUS=0) and DINC=00, DBURST must be maximum 100 (burst of 16), else the result is unpredictable.*

Bits 14:12 **SBURST[2:0]**: Source burst transfer configuration

These bits are set and cleared by software.

000: single transfer

N: burst of  $2^N$  beats

These bits are protected and can be written only if EN is 0

SBURST value must be programmed as to ensure that the burst size is lower than the transfer length. If this is not ensured, the result is unpredictable.

*Note: When the source bus is TCM (SBUS=1) and SINCOS=11 or SINC = 00 or SINCOS/=SSIZE, SBURST must be programmed to 000 (single transfer), else the result is unpredictable.*

*Note: When the source bus is system/AXI bus (SBUS=0) and SINC=00, SBURST must be maximum 100 (burst of 16), else the result is unpredictable.*

Bits 11:10 **DINCOS[1:0]**: Destination increment offset size

These bits are set and cleared by software.

00: byte (8-bit)

01: half-word (16-bit)

10: word (32-bit)

11: Double-Word (64-bit) -

This bits have no meaning if bit DINC[1:0] = '00'.

These bits are protected and can be written only if EN = '0'.

If DINCOS < DSIZE and DINC != 00, the result is unpredictable.

If destination is AHB and DBURST != 000, destination address must be aligned with DINCOS size, else the result is unpredictable.

Bits 9:8 **SINCOS[1:0]**: Source increment offset size

These bits are set and cleared by software.

00: byte (8-bit)

01: half-word (16-bit)

10: word (32-bit)

11: Double-Word (64-bit) -

This bits have no meaning if bit SINC[1:0] = '00'.

These bits are protected and can be written only if EN = '0'.

If SINCOS < SSIZE and SINC != 00, the result is unpredictable.

If source is TCM/AHB and SBURST != 000, source address must be aligned with SINCOS size, else the result is unpredictable.

Bits 7:6 **DSIZE[1:0]**: Destination data size

These bits are set and cleared by software.

00: byte (8-bit)

01: half-word (16-bit)

10: word (32-bit)

11: Double-Word (64-bit) -

These bits are protected and can be written only if EN is 0.

*Note: If a value of 11 is programmed for the TCM access/AHB port, a transfer error occurs (TEIF bit set)*

*If DINCOS < DSIZE and DINC != 00, the result is unpredictable.*

*Note: DSIZE = 11 (double-word) is forbidden when destination is TCM/AHB bus (DBUS=1).*

Bits 5:4 **SSIZE[1:0]**: Source data size

These bits are set and cleared by software.

00: Byte (8-bit)

01: Half-word (16-bit)

10: Word (32-bit)

11: Double-Word (64-bit)

These bits are protected and can be written only if EN is 0

*Note: If a value of 11 is programmed for the TCM access/AHB port, a transfer error occurs (TEIF bit set)*

*If SINCOS < SSIZE and SINC ≠ 00, the result is unpredictable.*

*Note: SSIZE = 11 (double-word) is forbidden when source is TCM/AHB bus (SBUS=1).*

Bits 3:2 **DINC[1:0]**: Destination increment mode

These bits are set and cleared by software.

00: Destination address pointer is fixed

10: Destination address pointer is incremented after each data transfer (increment is done according to DINCOS)

11: Destination address pointer is decremented after each data transfer (increment is done according to DINCOS)

These bits are protected and can be written only if EN is 0

*Note: When destination is AHB (DBUS=1), DINC = 00 is forbidden.*

Bits 1:0 **SINC[1:0]**: Source increment mode

These bits are set and cleared by software.

00: Source address pointer is fixed

10: Source address pointer is incremented after each data transfer (increment is done according to SINCOS)

11: Source address pointer is decremented after each data transfer (decrement is done according to SINCOS)

These bits are protected and can be written only if EN is 0

*Note: When source is AHB (SBUS=1), SINC = 00 is forbidden.*

## 17.5.8 MDMA channel x block number of data register (MDMA\_CxBNDTR)

In Linked List mode, at the end of a block (single or last block in repeated block transfer mode), this register is loaded from memory (from address given by current LAR[31:0] + 0x04).

Address offset: 0x54 + 0x40 \* x, (x = 0 to 31)

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |    |    |    |    |       |       |      |          |
|------------|----|----|----|----|----|----|----|----|----|----|----|-------|-------|------|----------|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19    | 18    | 17   | 16       |
| BRC[11:0]  |    |    |    |    |    |    |    |    |    |    |    | BRDUM | BRSUM | Res. | BNDT[16] |
| rW         | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW    | rW    |      | rW       |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3     | 2     | 1    | 0        |
| BNDT[15:0] |    |    |    |    |    |    |    |    |    |    |    |       |       |      |          |
| rW         | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW    | rW    | rW   | rW       |

Bits 31:20 **BRC[11:0]**: Block Repeat Count

This field contains the number of repetitions of the current block (0 to 4095). When the channel is enabled, this register is read-only, indicating the remaining number of blocks, excluding the current one. This register decrements after each complete block transfer. Once the last block transfer has completed, this register can either stay at zero or be reloaded automatically from memory (in Linked List mode - i.e. Link Address valid). These bits are protected and can be written only if EN is 0.

Bit 19 **BRDUM**: Block Repeat Destination address Update Mode

0: At the end of a Block transfer, the DAR register is updated by adding the DUV to the current DAR value (current Destination Address)  
 1: At the end of a block transfer, the DAR register is updated by subtracting the DUV from the current DAR value (current Destination Address)  
 These bits are protected and can be written only if EN is 0.

Bit 18 **BRSUM**: Block Repeat Source address Update Mode

0: At the end of a block transfer, the SAR register is updated by adding the SUV to the current SAR value (current Source Address)  
 1: At the end of a block transfer, the SAR register is updated by subtracting the SUV from the current SAR value (current Source Address)  
 These bits are protected and can be written only if EN is 0.

Bit 17 Reserved, must be kept at reset value.

Bits 16:0 **BNDT[16:0]**: Block Number of data bytes to transfer

Number of bytes to be transferred (0 up to 65536) in the current block. When the channel is enabled, this register is read-only, indicating the remaining data items to be transmitted. During the channel activity, this register decrements, indicating the number of data items remaining in the current block. Once the block transfer has completed, this register can either stay at zero or be reloaded automatically with the previously programmed value if the channel is configured in block Repeat mode. If the value of this register is zero, no transaction can be served even if the stream is enabled. These bits are protected and can be written only if EN is 0.

*Note: 1: If the BNDT value is not an integer multiple of the TLEN+1 value, the last transfer is shorter and contain only the remaining data in the Block.*

*Note: 2: The size of the block must be a multiple of the source and destination data size. If this is not true, an error is set and the no data is written.*

### 17.5.9 MDMA channel x source address register (MDMA\_CxSAR)

In Linked List mode, at the end of a Block (single or last Block in repeated Block transfer mode), this register is loaded from memory (from address given by current LAR[31:0] + 0x08).

Address offset:  $0x58 + 0x40 * x$ , ( $x = 0$  to  $31$ )

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SAR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| SAR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **SAR[31:0]**: Source address

These bits represent the base address of the peripheral data register from/to which the data is read. They must be aligned with the SSIZE (e.g. SAR[1:0] = 00 when SSIZE=10), but may be unaligned with the SINCOS.

When source is TCM/AHB, if address is not aligned with SINCOS, access must be programmed as single (SBURST=000).

These bits are write-protected and can be written only when bit EN = '0' in the DMA\_SxCR register. During the channel activity, this register is updated, reflecting the current address from which the data is read next.

When the block repeat mode is active, when a block transfer is completed, the source address is updated by adding/subtracting the SAU value to the current value (already updated after the last transfer in the block).

When the Linked List mode is active, at the end of a block (repeated or not) transfer, the SAR value is loaded from memory (from address LSA + m)

### 17.5.10 MDMA channel x destination address register (MDMA\_CxDAR)

In Linked List mode, at the end of a block (single or last block in repeated block transfer mode), this register is loaded from memory (from address given by current LAR[31:0] + 0x0C).

Address offset:  $0x5C + 0x40 * x$ , ( $x = 0$  to  $31$ )

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DAR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| DAR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DAR[31:0]**: Destination address

Base address of the destination address to which the data is written.

These bits are write-protected and can be written only when bit EN = '0' in the DMA\_SxCR register. Must be aligned with the DSIZE (e.g. DAR[0] = 0 when DSIZE=01), but may be unaligned with the DINCOS.

When destination is AHB, if address is not aligned with DINCOS, access must be programmed as single (DBURST=000).

During the channel activity, this register is updated, reflecting the current address to which the data is written next.

When the block repeat mode is active, when a block transfer is completed, the Destination address is updated by adding/subtracting the DAU value to the current value (after the last transfer in the block).

When the Linked List mode is active, at the end of a block (repeated or not) transfer, the DAR value is loaded from memory (from address LSA + m)

### 17.5.11 MDMA channel x block repeat address update register (MDMA\_CxBRUR)

In Linked List mode, at the end of a block (single or last block in repeated block transfer mode), this register is loaded from memory (from address given by current LAR[31:0] + 0x10).

Address offset:  $0x60 + 0x40 * x$ , ( $x = 0$  to  $31$ )

Reset value: 0x0000 0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DUV[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| SUV[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **DUV[15:0]**: Destination address Update Value

This value is used to update (by addition or subtraction) the current destination address at the end of a block transfer. Must be an integer multiple of DSIZE, in order to keep DAR aligned to DSIZE (e.g. DAR[1:0] = 00 when DSIZE=10).

If this value is 0, the next repetition of the block transfer continues to the next address.

When the block repeat mode is not active (BRC=0), this field is ignored.

These bits are write-protected and can be written only when bit EN = '0' in the MDMA\_CxCR register.

*Note: This field must be programmed to 0 when DINC[1:0] = 00.*

Bits 15:0 **SUV[15:0]**: Source address Update Value

This value is used to update (by addition or subtraction) the current source address at the end of a block Transfer. Must be an integer multiple of SSIZE, in order to keep SAR aligned to SSIZE (e.g. SAR[1:0] = 00 when SSIZE=10).

If this value is 0, the next repetition of the block transfer continues from the next address.

When the block repeat mode is not active (BRC=0), this field is ignored.

These bits are write-protected and can be written only when bit EN = '0' in the MDMA\_CxCR register.

*Note: This field must be programmed to 0 when SINC[1:0] = 00.*

### 17.5.12 MDMA channel x link address register (MDMA\_CxLAR)

In Linked List mode, at the end of a block (single or last block in repeated block transfer mode), this register is loaded from memory (from address given by current LAR[31:0] + 0x14).

**Note:** *The new value is only taken into account after all registers are updated, for the next end of block.*

Address offset:  $0x64 + 0x40 * x$ , ( $x = 0$  to  $31$ )

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| LAR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| LAR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | r  | r  | r  |

Bits 31:0 **LAR[31:0]**: Link Address Register

At the end of a (repeated) block Transfer, the current channel configuration registers (CxTCR, CxBNDTR, CxSAR, CxDAR, CxBRUR, CxMAR, CxMDR and the CxLAR register itself) are loaded with the data structure found at this address.

If the value of this register is 0, no register update takes place, the channel is disabled and the CTCIF is set, indicating the end of the transfer for this channel. These bits are write-protected and can be written only when bit EN = '0' in the MDMA\_CxCR register.

The channel configuration (LAR address) must be in the AXI address space.

LAR value must be aligned at a Double Word address, i.e. LAR[2:0] = 0x0

### 17.5.13 MDMA channel x trigger and bus selection register (MDMA\_CxTBR)

In Linked List mode, at the end of a block (single or last block in repeated block transfer mode), this register is loaded from memory (from address given by current LAR[31:0] + 0x18).

Address offset: 0x68 + 0x40 \* x, (x = 0 to 31)

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |           |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|-----------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21        | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.      | Res. | Res. | Res. | DBUS | SBUS |
|      |      |      |      |      |      |      |      |      |      |           |      |      |      | rw   | rw   |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5         | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TSEL[5:0] |      |      |      |      |      |
|      |      |      |      |      |      |      |      |      |      | rw        | rw   | rw   | rw   | rw   | rw   |

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **DBUS**: Destination BUS select

0: The system/AXI bus is used as destination (write operation) on channel x.

1: The AHB bus/TCM is used as destination (write operation) on channel x.

This bit is protected and can be written only if EN is 0.

Bit 16 **SBUS**: Source BUS select

0: The system/AXI bus is used as source (read operation) on channel x.

1: The AHB bus/TCM is used as source (read operation) on channel x.

This bit is protected and can be written only if EN is 0.

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:0 **TSEL[5:0]**: Trigger Selection

This bit field selects the hardware trigger (RQ) input for channel x. The ACK is sent on the ACK output having the same index value.

When SWRM bit is set (software request selected), this bit field is ignored.

These bits are write-protected and can be written only when bit EN = '0' in the MDMA\_CxCR register.

*Note: If multiple channels are triggered by the same event (have the same TSEL value), all of them are triggered in parallel. However, only the channel with the lowest index acknowledges the request (as software or hardware acknowledge).*

### 17.5.14 MDMA channel x mask address register (MDMA\_CxMAR)

In Linked List mode, at the end of a block (single or last block in repeated block transfer mode), this register is loaded from memory (from address given by current LAR[31:0] + 0x20).

Address offset:  $0x70 + 0x40 * x$ , ( $x = 0$  to  $31$ )

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| MAR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| MAR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **MAR[31:0]**: Mask address

When an ACK signal is generated, a write of the MDR value is also done to this address. This allows to clear the RQ signal generated by the DMA2 by writing to its Interrupt Clear register.

If the value of this register is 0, this function is disabled. These bits are write-protected and can be written only when bit EN = '0' in the MDMA\_CxCR register.

### 17.5.15 MDMA channel x mask data register (MDMA\_CxMDR)

In Linked List mode, at the end of a block (single or last block in repeated block transfer mode), this register is loaded from memory (from address given by current LAR[31:0] + 0x24).

Address offset:  $0x74 + 0x40 * x$ , ( $x = 0$  to  $31$ )

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| MDR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| MDR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **MDR[31:0]**: Mask Data

When an ACK signal is generated, a write of the MDR value is also done to the address defined by the MAR register. This allows to clear the RQ signal generated by the DMA2 by writing to its Interrupt Clear register.

These bits are write-protected and can be written only when bit EN = '0' in the MDMA\_CxCR register.

*Table 100* summarizes the MDMA registers.

[illegible]

Table 100. MDMA register map and reset values (continued)

| Offset                                    | Register name | 31         | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16  | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 18 Direct memory access controller (DMA)

### 18.1 DMA introduction

Direct memory access (DMA) is used in order to provide high-speed data transfer between peripherals and memory and between memory and memory. Data can be quickly moved by DMA without any CPU action. This keeps CPU resources free for other operations.

The DMA controller combines a powerful dual AHB master bus architecture with independent FIFO to optimize the bandwidth of the system, based on a complex bus matrix architecture.

The two DMA controllers (DMA1 and DMA2) have 16 streams in total (8 for each controller), each dedicated to managing memory access requests from one or more peripherals.

Each DMA stream is driven by one DMAMUX output channel (request). Any DMAMUX output request can be individually programmed in order to select the DMA request source signal, from any of the 116 available request input signals.

Refer to the [Section 19.3: DMAMUX implementation](#) for more information about the DMA requests and streams mapping.

Each DMA controller has an arbiter for handling the priority between DMA requests.

### 18.2 DMA main features

The main DMA features are:

- Dual AHB master bus architecture, one dedicated to memory accesses and one dedicated to peripheral accesses
- AHB slave programming interface supporting only 32-bit accesses
- 8 streams for each DMA controller, up to 116 channels (requests) per stream
- Four-word depth 32 first-in, first-out memory buffers (FIFOs) per stream, that can be used in FIFO mode or direct mode:
  - FIFO mode: with threshold level software selectable between 1/4, 1/2 or 3/4 of the FIFO size
  - Direct mode: each DMA request immediately initiates a transfer from/to the memory. When it is configured in direct mode (FIFO disabled), to transfer data in memory-to-peripheral mode, the DMA preloads only one data from the memory to the internal FIFO to ensure an immediate data transfer as soon as a DMA request is triggered by a peripheral.
- Each stream can be configured to be:
  - a regular channel that supports peripheral-to-memory, memory-to-peripheral and memory-to-memory transfers
  - a double buffer channel that also supports double buffering on the memory side
- Priorities between DMA stream requests are software-programmable (4 levels consisting of very high, high, medium, low) or hardware in case of equality (for example, request 0 has priority over request 1)
- Each stream also supports software trigger for memory-to-memory transfers

- Each stream request can be selected among up to 116 possible channel requests. This selection is software-configurable by the DMAMUX and allows 108 peripherals to initiate DMA requests
- The number of data items to be transferred can be managed either by the DMA controller or by the peripheral:
  - DMA flow controller: the number of data items to be transferred is software-programmable from 1 to 65535
  - Peripheral flow controller: the number of data items to be transferred is unknown and controlled by the source or the destination peripheral that signals the end of the transfer by hardware
- Independent source and destination transfer width (byte, half-word, word): when the data widths of the source and destination are not equal, the DMA automatically packs/unpacks the necessary transfers to optimize the bandwidth. This feature is only available in FIFO mode
- Incrementing or non-incrementing addressing for source and destination
- Supports incremental burst transfers of 4, 8 or 16 beats. The size of the burst is software-configurable, usually equal to half the FIFO size of the peripheral
- Each stream supports circular buffer management
- 5 event flags (DMA half transfer, DMA transfer complete, DMA transfer error, DMA FIFO error, direct mode error) logically ORed together in a single interrupt request for each stream

## 18.3 DMA functional description

### 18.3.1 DMA block diagram

The figure below shows the block diagram of a DMA.

Figure 130. DMA block diagram

### 18.3.2 DMA overview

The DMA controller performs direct memory transfer: as an AHB master, the DMA controller can take the control of the AHB bus matrix to initiate AHB transactions.

The DMA controller carries out the following transactions:

- peripheral-to-memory
- memory-to-peripheral
- memory-to-memory

The DMA controller provides two AHB master ports: the AHB memory port, intended to be connected to memories and the AHB peripheral port, intended to be connected to peripherals. However, to allow memory-to-memory transfers, the AHB peripheral port must also have access to the memories.

The AHB slave port is used to program the DMA controller (it supports only 32-bit accesses).

### 18.3.3 DMA transactions

A DMA transaction consists of a sequence of a given number of data transfers. The number of data items to be transferred and their width (8-bit, 16-bit or 32-bit) are software-programmable.

Each DMA transfer consists of three operations:

- a loading from the peripheral data register or a location in memory, addressed through the DMA\_SxPAR or DMA\_SxM0AR register
- a storage of the data loaded to the peripheral data register or a location in memory addressed through the DMA\_SxPAR or DMA\_SxM0AR register
- a post-decrement of the DMA\_SxNDTR register, containing the number of transactions that still have to be performed

After an event, the peripheral sends a request signal to the DMA controller. The DMA controller serves the request depending on the channel priorities. As soon as the DMA controller accesses the peripheral, an Acknowledge signal is sent to the peripheral by the DMA controller. The peripheral releases its request as soon as it gets the Acknowledge signal from the DMA controller. Once the request has been deasserted by the peripheral, the DMA controller releases the Acknowledge signal. If there are more requests, the peripheral can initiate the next transaction.

### 18.3.4 DMA request mapping

The DMA request mapping from peripherals to DMA streams is described in [Section 19.3.2: DMAMUX mapping](#).

### 18.3.5 Arbiter

An arbiter manages the 8 DMA stream requests based on their priority for each of the two AHB master ports (memory and peripheral ports) and launches the peripheral/memory access sequences.

Priorities are managed in two stages:

- Software: each stream priority can be configured in the DMA\_SxCR register. There are four levels:
  - Very high priority
  - High priority
  - Medium priority
  - Low priority
- Hardware: If two requests have the same software priority level, the stream with the lower number takes priority over the stream with the higher number. For example, stream 2 takes priority over stream 4.

### 18.3.6 DMA streams

Each of the 8 DMA controller streams provides a unidirectional transfer link between a source and a destination.

Each stream can be configured to perform:

- Regular type transactions: memory-to-peripherals, peripherals-to-memory or memory-to-memory transfers
- Double-buffer type transactions: double buffer transfers using two memory pointers for the memory (while the DMA is reading/writing from/to a buffer, the application can write/read to/from the other buffer).

The amount of data to be transferred (up to 65535) is programmable and related to the source width of the peripheral that requests the DMA transfer connected to the peripheral AHB port. The register that contains the amount of data items to be transferred is decremented after each transaction.

### 18.3.7 Source, destination and transfer modes

Both source and destination transfers can address peripherals and memories in the entire 4 Gbytes area, at addresses comprised between 0x0000 0000 and 0xFFFF FFFF.

The direction is configured using the DIR[1:0] bits in the DMA\_SxCR register and offers three possibilities: memory-to-peripheral, peripheral-to-memory or memory-to-memory transfers.

The table below describes the corresponding source and destination addresses.

**Table 101. Source and destination address**

| Bits DIR[1:0] of the DMA_SxCR register | Direction            | Source address | Destination address |
|----------------------------------------|----------------------|----------------|---------------------|
| 00                                     | Peripheral-to-memory | DMA_SxPAR      | DMA_SxM0AR          |
| 01                                     | Memory-to-peripheral | DMA_SxM0AR     | DMA_SxPAR           |
| 10                                     | Memory-to-memory     | DMA_SxPAR      | DMA_SxM0AR          |
| 11                                     | Reserved             | -              | -                   |

When the data width (programmed in the PSIZE or MSIZE bits in the DMA\_SxCR register) is a half-word or a word, respectively, the peripheral or memory address written into the DMA\_SxPAR or DMA\_SxM0AR/M1AR registers has to be aligned on a word or half-word address boundary, respectively.

#### Peripheral-to-memory mode

[Figure 131](#) describes this mode.

When this mode is enabled (by setting the bit EN in the DMA\_SxCR register), each time a peripheral request occurs, the stream initiates a transfer from the source to fill the FIFO.

When the threshold level of the FIFO is reached, the contents of the FIFO are drained and stored into the destination.

The transfer stops once the DMA\_SxNDTR register reaches zero, when the peripheral requests the end of transfers (in case of a peripheral flow controller) or when the EN bit in the DMA\_SxCR register is cleared by software.

In direct mode (when the DMDIS value in the DMA\_SxFCR register is '0'), the threshold level of the FIFO is not used: after each single data transfer from the peripheral to the FIFO, the corresponding data are immediately drained and stored into the destination.

The stream has access to the AHB source or destination port only if the arbitration of the corresponding stream is won. This arbitration is performed using the priority defined for each stream using the PL[1:0] bits in the DMA\_SxCR register.

**Figure 131. Peripheral-to-memory mode**

1. For double-buffer mode.

### Memory-to-peripheral mode

[Figure 132](#) describes this mode.

When this mode is enabled (by setting the EN bit in the DMA\_SxCR register), the stream immediately initiates transfers from the source to entirely fill the FIFO.

Each time a peripheral request occurs, the contents of the FIFO are drained and stored into the destination. When the level of the FIFO is lower than or equal to the predefined threshold level, the FIFO is fully reloaded with data from the memory.

The transfer stops once the DMA\_SxNDTR register reaches zero, when the peripheral requests the end of transfers (in case of a peripheral flow controller) or when the EN bit in the DMA\_SxCR register is cleared by software.

In direct mode (when the DMDIS value in the DMA\_SxFCR register is '0'), the threshold level of the FIFO is not used. Once the stream is enabled, the DMA preloads the first data to transfer into an internal FIFO. As soon as the peripheral requests a data transfer, the DMA transfers the preloaded value into the configured destination. It then reloads again the empty internal FIFO with the next data to be transfer. The preloaded data size corresponds to the value of the PSIZE bitfield in the DMA\_SxCR register.

The stream has access to the AHB source or destination port only if the arbitration of the corresponding stream is won. This arbitration is performed using the priority defined for each stream using the PL[1:0] bits in the DMA\_SxCR register.

**Figure 132. Memory-to-peripheral mode**

1. For double-buffer mode.

### Memory-to-memory mode

The DMA channels can also work without being triggered by a request from a peripheral. This is the memory-to-memory mode, described in [Figure 133](#).

When the stream is enabled by setting the Enable bit (EN) in the DMA\_SxCR register, the stream immediately starts to fill the FIFO up to the threshold level. When the threshold level is reached, the FIFO contents are drained and stored into the destination.

The transfer stops once the DMA\_SxNDTR register reaches zero or when the EN bit in the DMA\_SxCR register is cleared by software.

The stream has access to the AHB source or destination port only if the arbitration of the corresponding stream is won. This arbitration is performed using the priority defined for each stream using the PL[1:0] bits in the DMA\_SxCR register.

**Note:** When memory-to-memory mode is used, the circular and direct modes are not allowed.

### Figure 133. Memory-to-memory mode

1. For double-buffer mode.

### 18.3.8 Pointer incrementation

Peripheral and memory pointers can optionally be automatically post-incremented or kept constant after each transfer depending on the PINC and MINC bits in the DMA\_SxCR register.

Disabling the increment mode is useful when the peripheral source or destination data is accessed through a single register.

If the increment mode is enabled, the address of the next transfer is the address of the previous one incremented by 1 (for bytes), 2 (for half-words) or 4 (for words) depending on the data width programmed in the PSIZE or MSIZE bits in the DMA SxCR register.

In order to optimize the packing operation, it is possible to fix the increment offset size for the peripheral address whatever the size of the data transferred on the AHB peripheral port. The PINCOS bit in the DMA\_SxCR register is used to align the increment offset size with the data size on the peripheral AHB port, or on a 32-bit address (the address is then incremented by 4). The PINCOS bit has an impact on the AHB peripheral port only.

If the PINCOS bit is set, the address of the following transfer is the address of the previous one incremented by 4 (automatically aligned on a 32-bit address), whatever the PSIZE value. The AHB memory port, however, is not impacted by this operation.

### 18.3.9 Circular mode

The circular mode is available to handle circular buffers and continuous data flows (e.g. ADC scan mode). This feature can be enabled using the CIRC bit in the DMA\_SxCR register.

When the circular mode is activated, the number of data items to be transferred is automatically reloaded with the initial value programmed during the stream configuration phase, and the DMA requests continue to be served.

**Note:** *In the circular mode, it is mandatory to respect the following rule in case of a burst mode configured for memory:*

$DMA\_SxNDTR = \text{Multiple of } ((Mburst\ beat) \times (Msize)/(Psize)), \text{ where:}$

- $(Mburst\ beat) = 4, 8 \text{ or } 16$  (depending on the MBURST bits in the DMA\_SxCR register)
- $((Msize)/(Psize)) = 1, 2, 4, 1/2 \text{ or } 1/4$  (Msize and Psize represent the MSIZE and PSIZE bits in the DMA\_SxCR register. They are byte dependent)
- $DMA\_SxNDTR = \text{Number of data items to transfer on the AHB peripheral port}$

*For example: Mburst beat = 8 (INCR8), MSIZE = '00' (byte) and PSIZE = '01' (half-word), in this case: DMA\_SxNDTR must be a multiple of  $(8 \times 1/2 = 4)$ .*

*If this formula is not respected, the DMA behavior and data integrity are not guaranteed.*

*NDTR must also be a multiple of the Peripheral burst size multiplied by the peripheral data size, otherwise this could result in a bad DMA behavior.*

### 18.3.10 Double-buffer mode

This mode is available for all the DMA1 and DMA2 streams.

The double-buffer mode is enabled by setting the DBM bit in the DMA\_SxCR register.

A double-buffer stream works as a regular (single buffer) stream with the difference that it has two memory pointers. When the double-buffer mode is enabled, the circular mode is automatically enabled (CIRC bit in DMA\_SxCR is not relevant) and at each end of transaction, the memory pointers are swapped.

In this mode, the DMA controller swaps from one memory target to another at each end of transaction. This allows the software to process one memory area while the second memory area is being filled/used by the DMA transfer. The double-buffer stream can work in both directions (the memory can be either the source or the destination) as described in [Table 102: Source and destination address registers in double-buffer mode \(DBM = 1\)](#).

**Note:** *In double-buffer mode, it is possible to update the base address for the AHB memory port on-the-fly (DMA\_SxM0AR or DMA\_SxM1AR) when the stream is enabled, by respecting the following conditions:*

- *When the CT bit is '0' in the DMA\_SxCR register, the DMA\_SxM1AR register can be written. Attempting to write to this register while CT = '1' sets an error flag (TEIF) and the stream is automatically disabled.*
- *When the CT bit is '1' in the DMA\_SxCR register, the DMA\_SxM0AR register can be written. Attempting to write to this register while CT = '0', sets an error flag (TEIF) and the stream is automatically disabled.*

*To avoid any error condition, it is advised to change the base address as soon as the TCIF flag is asserted because, at this point, the targeted memory must have changed from*

memory 0 to 1 (or from 1 to 0) depending on the value of CT in the DMA\_SxCR register in accordance with one of the two above conditions.

For all the other modes (except the double-buffer mode), the memory address registers are write-protected as soon as the stream is enabled.

**Table 102. Source and destination address registers in double-buffer mode (DBM = 1)**

| Bits DIR[1:0] of the DMA_SxCR register | Direction                  | Source address          | Destination address     |
|----------------------------------------|----------------------------|-------------------------|-------------------------|
| 00                                     | Peripheral-to-memory       | DMA_SxPAR               | DMA_SxM0AR / DMA_SxM1AR |
| 01                                     | Memory-to-peripheral       | DMA_SxM0AR / DMA_SxM1AR | DMA_SxPAR               |
| 10                                     | Not allowed <sup>(1)</sup> |                         |                         |
| 11                                     | Reserved                   | -                       | -                       |

1. When the double-buffer mode is enabled, the circular mode is automatically enabled. Since the memory-to-memory mode is not compatible with the circular mode, when the double-buffer mode is enabled, it is not allowed to configure the memory-to-memory mode.

### 18.3.11 Programmable data width, packing/unpacking, endianness

The number of data items to be transferred has to be programmed into DMA\_SxNDTR (number of data items to transfer bit, NDT) before enabling the stream (except when the flow controller is the peripheral, PFCTRL bit in DMA\_SxCR is set).

When using the internal FIFO, the data widths of the source and destination data are programmable through the PSIZE and MSIZE bits in the DMA\_SxCR register (can be 8-, 16- or 32-bit).

When PSIZE and MSIZE are not equal:

- The data width of the number of data items to transfer, configured in the DMA\_SxNDTR register is equal to the width of the peripheral bus (configured by the PSIZE bits in the DMA\_SxCR register). For instance, in case of peripheral-to-memory, memory-to-peripheral or memory-to-memory transfers and if the PSIZE[1:0] bits are configured for half-word, the number of bytes to be transferred is equal to  $2 \times \text{NDT}$ .
- The DMA controller only copes with little-endian addressing for both source and destination. This is described in [Table 103: Packing/unpacking and endian behavior \(bit PINC = MINC = 1\)](#).

This packing/unpacking procedure may present a risk of data corruption when the operation is interrupted before the data are completely packed/unpacked. So, to ensure data coherence, the stream may be configured to generate burst transfers: in this case, each group of transfers belonging to a burst are indivisible (refer to [Section 18.3.12: Single and burst transfers](#)).

In direct mode (DMDIS = 0 in the DMA\_SxFCR register), the packing/unpacking of data is not possible. In this case, it is not allowed to have different source and destination transfer data widths: both are equal and defined by the PSIZE bits in the DMA\_SxCR register. MSIZE bits are not relevant.

Table 103. Packing/unpacking and endian behavior (bit PINC = MINC = 1)

| AHB memory port width | AHB peripheral port width | Number of data items to transfer (NDT) | Memory transfer number | Memory port address / byte lane | Peripheral transfer number | Peripheral port address / byte lane |                            |
|-----------------------|---------------------------|----------------------------------------|------------------------|---------------------------------|----------------------------|-------------------------------------|----------------------------|
|                       |                           |                                        |                        |                                 |                            | PINCOS = 1                          | PINCOS = 0                 |
| 8                     | 8                         | 4                                      | 1                      | 0x0 / B0[7:0]                   | 1                          | 0x0 / B0[7:0]                       | 0x0 / B0[7:0]              |
|                       |                           |                                        | 2                      | 0x1 / B1[7:0]                   | 2                          | 0x4 / B1[7:0]                       | 0x1 / B1[7:0]              |
|                       |                           |                                        | 3                      | 0x2 / B2[7:0]                   | 3                          | 0x8 / B2[7:0]                       | 0x2 / B2[7:0]              |
|                       |                           |                                        | 4                      | 0x3 / B3[7:0]                   | 4                          | 0xC / B3[7:0]                       | 0x3 / B3[7:0]              |
| 8                     | 16                        | 2                                      | 1                      | 0x0 / B0[7:0]                   | 1                          | 0x0 / B1[B0[15:0]]                  | 0x0 / B1[B0[15:0]]         |
|                       |                           |                                        | 2                      | 0x1 / B1[7:0]                   | 2                          | 0x4 / B3[B2[15:0]]                  | 0x2 / B3[B2[15:0]]         |
|                       |                           |                                        | 3                      | 0x2 / B2[7:0]                   |                            |                                     |                            |
|                       |                           |                                        | 4                      | 0x3 / B3[7:0]                   |                            |                                     |                            |
| 8                     | 32                        | 1                                      | 1                      | 0x0 / B0[7:0]                   | 1                          | 0x0 / B3[B2[B1[B0[31:0]]]]          | 0x0 / B3[B2[B1[B0[31:0]]]] |
|                       |                           |                                        | 2                      | 0x1 / B1[7:0]                   |                            |                                     |                            |
|                       |                           |                                        | 3                      | 0x2 / B2[7:0]                   |                            |                                     |                            |
|                       |                           |                                        | 4                      | 0x3 / B3[7:0]                   |                            |                                     |                            |
| 16                    | 8                         | 4                                      | 1                      | 0x0 / B1[B0[15:0]]              | 1                          | 0x0 / B0[7:0]                       | 0x0 / B0[7:0]              |
|                       |                           |                                        | 2                      | 0x2 / B3[B2[15:0]]              | 2                          | 0x4 / B1[7:0]                       | 0x1 / B1[7:0]              |
|                       |                           |                                        | 3                      |                                 | 3                          | 0x8 / B2[7:0]                       | 0x2 / B2[7:0]              |
|                       |                           |                                        | 4                      |                                 | 4                          | 0xC / B3[7:0]                       | 0x3 / B3[7:0]              |
| 16                    | 16                        | 2                                      | 1                      | 0x0 / B1[B0[15:0]]              | 1                          | 0x0 / B1[B0[15:0]]                  | 0x0 / B1[B0[15:0]]         |
|                       |                           |                                        | 2                      | 0x2 / B1[B0[15:0]]              | 2                          | 0x4 / B3[B2[15:0]]                  | 0x2 / B3[B2[15:0]]         |
| 16                    | 32                        | 1                                      | 1                      | 0x0 / B1[B0[15:0]]              | 1                          | 0x0 / B3[B2[B1[B0[31:0]]]]          | 0x0 / B3[B2[B1[B0[31:0]]]] |
|                       |                           |                                        | 2                      | 0x2 / B3[B2[15:0]]              |                            |                                     |                            |
| 32                    | 8                         | 4                                      | 1                      | 0x0 / B3[B2[B1[B0[31:0]]]]      | 1                          | 0x0 / B0[7:0]                       | 0x0 / B0[7:0]              |
|                       |                           |                                        | 2                      |                                 | 2                          | 0x4 / B1[7:0]                       | 0x1 / B1[7:0]              |
|                       |                           |                                        | 3                      |                                 | 3                          | 0x8 / B2[7:0]                       | 0x2 / B2[7:0]              |
|                       |                           |                                        | 4                      |                                 | 4                          | 0xC / B3[7:0]                       | 0x3 / B3[7:0]              |
| 32                    | 16                        | 2                                      | 1                      | 0x0 / B3[B2[B1[B0[31:0]]]]      | 1                          | 0x0 / B1[B0[15:0]]                  | 0x0 / B1[B0[15:0]]         |
|                       |                           |                                        |                        |                                 | 2                          | 0x4 / B3[B2[15:0]]                  | 0x2 / B3[B2[15:0]]         |
| 32                    | 32                        | 1                                      | 1                      | 0x0 / B3[B2[B1[B0[31:0]]]]      | 1                          | 0x0 / B3[B2[B1[B0[31:0]]]]          | 0x0 / B3[B2[B1[B0[31:0]]]] |
|                       |                           |                                        |                        |                                 |                            |                                     |                            |

**Note:** Peripheral port may be the source or the destination (it could also be the memory source in the case of memory-to-memory transfer).

PSIZE, MSIZE and NDT[15:0] must be configured so as to ensure that the last transfer is not incomplete. This can occur when the data width of the peripheral port (PSIZE bits) is lower than the data width of the memory port (MSIZE bits). This constraint is summarized in the table below.

Table 104. Restriction on NDT versus PSIZE and MSIZE

| PSIZE[1:0] of DMA_SxCR | MSIZE[1:0] of DMA_SxCR | NDT[15:0] of DMA_SxNDTR  |
|------------------------|------------------------|--------------------------|
| 00 (8-bit)             | 01 (16-bit)            | Must be a multiple of 2. |
| 00 (8-bit)             | 10 (32-bit)            | Must be a multiple of 4. |
| 01 (16-bit)            | 10 (32-bit)            | Must be a multiple of 2. |

### 18.3.12 Single and burst transfers

The DMA controller can generate single transfers or incremental burst transfers of 4, 8 or 16 beats.

The size of the burst is configured by software independently for the two AHB ports by using the MBURST[1:0] and PBURST[1:0] bits in the DMA\_SxCR register.

The burst size indicates the number of beats in the burst, not the number of bytes transferred.

To ensure data coherence, each group of transfers that form a burst are indivisible: AHB transfers are locked and the arbiter of the AHB bus matrix does not degrant the DMA master during the sequence of the burst transfer.

Depending on the single or burst configuration, each DMA request initiates a different number of transfers on the AHB peripheral port:

- When the AHB peripheral port is configured for single transfers, each DMA request generates a data transfer of a byte, half-word or word depending on the PSIZE[1:0] bits in the DMA\_SxCR register
- When the AHB peripheral port is configured for burst transfers, each DMA request generates 4,8 or 16 beats of byte, half word or word transfers depending on the PBURST[1:0] and PSIZE[1:0] bits in the DMA\_SxCR register.

The same as above has to be considered for the AHB memory port considering the MBURST and MSIZE bits.

In direct mode, the stream can only generate single transfers and the MBURST[1:0] and PBURST[1:0] bits are forced by hardware.

The address pointers (DMA\_SxPAR or DMA\_SxM0AR registers) must be chosen so as to ensure that all transfers within a burst block are aligned on the address boundary equal to the size of the transfer.

The burst configuration has to be selected in order to respect the AHB protocol, where bursts **must not** cross the 1 Kbyte address boundary because the minimum address space that can be allocated to a single slave is 1 Kbyte. This means that the 1-Kbyte address boundary **must not** be crossed by a burst block transfer, otherwise an AHB error is generated, that is not reported by the DMA registers.

### 18.3.13 FIFO

#### FIFO structure

The FIFO is used to temporarily store data coming from the source before transmitting them to the destination.

Each stream has an independent 4-word FIFO and the threshold level is software-configurable between 1/4, 1/2, 3/4 or full.

To enable the use of the FIFO threshold level, the direct mode must be disabled by setting the DMDIS bit in the DMA\_SxFCR register.

The structure of the FIFO differs depending on the source and destination data widths, and is described in the figure below.

Figure 134. FIFO structure

ai15951

### FIFO threshold and burst configuration

Caution is required when choosing the FIFO threshold (bits FTH[1:0] of the DMA\_SxFCR register) and the size of the memory burst (MBURST[1:0] of the DMA\_SxCR register): The content pointed by the FIFO threshold must exactly match an integer number of memory burst transfers. If this is not in the case, a FIFO error (flag FEIFx of the DMA\_HISR or DMA\_LISR register) is generated when the stream is enabled, then the stream is automatically disabled. The allowed and forbidden configurations are described in the table below. The forbidden configurations are highlighted in gray in the table.

**Table 105. FIFO threshold configurations**

| MSIZE     | FIFO level | MBURST = INCR4      | MBURST = INCR8      | MBURST = INCR16     |
|-----------|------------|---------------------|---------------------|---------------------|
| Byte      | 1/4        | 1 burst of 4 beats  | Forbidden           | Forbidden           |
|           | 1/2        | 2 bursts of 4 beats | 1 burst of 8 beats  |                     |
|           | 3/4        | 3 bursts of 4 beats | Forbidden           |                     |
|           | Full       | 4 bursts of 4 beats | 2 bursts of 8 beats | 1 burst of 16 beats |
| Half-word | 1/4        | Forbidden           | Forbidden           | Forbidden           |
|           | 1/2        | 1 burst of 4 beats  |                     |                     |
|           | 3/4        | Forbidden           |                     |                     |
|           | Full       | 2 bursts of 4 beats | 1 burst of 8 beats  |                     |
| Word      | 1/4        | Forbidden           | Forbidden           |                     |
|           | 1/2        |                     |                     |                     |
|           | 3/4        |                     |                     |                     |
|           | Full       | 1 burst of 4 beats  |                     |                     |

In all cases, the burst size multiplied by the data size must not exceed the FIFO size (data size can be: 1 (byte), 2 (half-word) or 4 (word)).

Incomplete burst transfer at the end of a DMA transfer may happen if one of the following conditions occurs:

- For the AHB peripheral port configuration: the total number of data items (set in the DMA\_SxNDTR register) is not a multiple of the burst size multiplied by the data size.
- For the AHB memory port configuration: the number of remaining data items in the FIFO to be transferred to the memory is not a multiple of the burst size multiplied by the data size.

In such cases, the remaining data to be transferred is managed in single mode by the DMA, even if a burst transaction is requested during the DMA stream configuration.

**Note:** *When burst transfers are requested on the peripheral AHB port and the FIFO is used (DMDIS = 1 in the DMA\_SxCR register), it is mandatory to respect the following rule to avoid permanent underrun or overrun conditions, depending on the DMA stream direction:*

*If  $(PBURST \times PSIZE) = FIFO\_SIZE$  (4 words),  $FIFO\_Threshold = 3/4$  is forbidden with  $PSIZE = 1, 2$  or  $4$  and  $PBURST = 4, 8$  or  $16$ .*

*This rule ensures that enough FIFO space at a time is free to serve the request from the peripheral.*

### FIFO flush

The FIFO can be flushed when the stream is disabled by resetting the EN bit in the DMA\_SxCR register and when the stream is configured to manage peripheral-to-memory or memory-to-memory transfers. If some data are still present in the FIFO when the stream is disabled, the DMA controller continues transferring the remaining data to the destination (even though stream is effectively disabled). When this flush is completed, the transfer complete status bit (TCIFx) in the DMA\_LISR or DMA\_HISR register is set.

The remaining data counter DMA\_SxNDTR keeps the value in this case to indicate how many data items are currently available in the destination memory.

Note that during the FIFO flush operation, if the number of remaining data items in the FIFO to be transferred to memory (in bytes) is less than the memory data width (for example 2 bytes in FIFO while MSIZE is configured to word), data is sent with the data width set in the MSIZE bit in the DMA\_SxCR register. This means that memory is written with an undesired value. The software may read the DMA\_SxNDTR register to determine the memory area that contains the good data (start address and last address).

If the number of remaining data items in the FIFO is lower than a burst size (if the MBURST bits in DMA\_SxCR register are set to configure the stream to manage burst on the AHB memory port), single transactions are generated to complete the FIFO flush.

### Direct mode

By default, the FIFO operates in direct mode (DMDIS bit in the DMA\_SxFCR is reset) and the FIFO threshold level is not used. This mode is useful when the system requires an immediate and single transfer to or from the memory after each DMA request.

When the DMA is configured in direct mode (FIFO disabled), to transfer data in memory-to-peripheral mode, the DMA preloads one data from the memory to the internal FIFO to ensure an immediate data transfer as soon as a DMA request is triggered by a peripheral.

To avoid saturating the FIFO, it is recommended to configure the corresponding stream with a high priority.

This mode is restricted to transfers where:

- the source and destination transfer widths are equal and both defined by the PSIZE[1:0] bits in DMA\_SxCR (MSIZE[1:0] bits are not relevant)
- burst transfers are not possible (PBURST[1:0] and MBURST[1:0] bits in DMA\_SxCR are don't care)

Direct mode must not be used when implementing memory-to-memory transfers.

## 18.3.14 DMA transfer completion

Different events can generate an end of transfer by setting the TCIFx bit in the DMA\_LISR or DMA\_HISR status register:

- In DMA flow controller mode:
  - The DMA\_SxNDTR counter has reached zero in the memory-to-peripheral mode.
  - The stream is disabled before the end of transfer (by clearing the EN bit in the DMA\_SxCR register) and (when transfers are peripheral-to-memory or memory-

to-memory) all the remaining data have been flushed from the FIFO into the memory.

- In Peripheral flow controller mode:
  - The last external burst or single request has been generated from the peripheral and (when the DMA is operating in peripheral-to-memory mode) the remaining data have been transferred from the FIFO into the memory
  - The stream is disabled by software, and (when the DMA is operating in peripheral-to-memory mode) the remaining data have been transferred from the FIFO into the memory

*Note:* The transfer completion is dependent on the remaining data in FIFO to be transferred into memory only in the case of peripheral-to-memory mode. This condition is not applicable in memory-to-peripheral mode.

If the stream is configured in noncircular mode, after the end of the transfer (that is when the number of data to be transferred reaches zero), the DMA is stopped (EN bit in DMA\_SxCR register is cleared by Hardware) and no DMA request is served unless the software reprograms the stream and re-enables it (by setting the EN bit in the DMA\_SxCR register).

### 18.3.15 DMA transfer suspension

At any time, a DMA transfer can be suspended to be restarted later on or to be definitively disabled before the end of the DMA transfer.

There are two cases:

- The stream disables the transfer with no later-on restart from the point where it was stopped. There is no particular action to do, except to clear the EN bit in the DMA\_SxCR register to disable the stream. The stream may take time to be disabled (ongoing transfer is completed first). The transfer complete interrupt flag (TCIF in the DMA\_LISR or DMA\_HISR register) is set in order to indicate the end of transfer. The value of the EN bit in DMA\_SxCR is now '0' to confirm the stream interruption. The DMA\_SxNDTR register contains the number of remaining data items at the moment when the stream was stopped so that the software can determine how many data items have been transferred before the stream was interrupted.
- The stream suspends the transfer before the number of remaining data items to be transferred in the DMA\_SxNDTR register reaches 0. The aim is to restart the transfer later by re-enabling the stream. In order to restart from the point where the transfer was stopped, the software has to read the DMA\_SxNDTR register after disabling the stream by writing the EN bit in DMA\_SxCR register (and then checking that it is at '0') to know the number of data items already collected. Then:
  - The peripheral and/or memory addresses have to be updated in order to adjust the address pointers
  - The SxNDTR register has to be updated with the remaining number of data items to be transferred (the value read when the stream was disabled)
  - The stream may then be re-enabled to restart the transfer from the point it was stopped

*Note:* A transfer complete interrupt flag (TCIF in DMA\_LISR or DMA\_HISR) is set to indicate the end of transfer due to the stream interruption.

### 18.3.16 Flow controller

The entity that controls the number of data to be transferred is known as the flow controller. This flow controller is configured independently for each stream using the PFCTRL bit in the DMA\_SxCR register.

The flow controller can be:

- The DMA controller: in this case, the number of data items to be transferred is programmed by software into the DMA\_SxNDTR register before the DMA stream is enabled.
- The peripheral source or destination: this is the case when the number of data items to be transferred is unknown. The peripheral indicates by hardware to the DMA controller when the last data are being transferred. This feature is only supported for peripherals that are able to signal the end of the transfer.

When the peripheral flow controller is used for a given stream, the value written into the DMA\_SxNDTR has no effect on the DMA transfer. Actually, whatever the value written, it is forced by hardware to 0xFFFF as soon as the stream is enabled, to respect the following schemes:

- Anticipated stream interruption: EN bit in DMA\_SxCR register is reset to 0 by the software to stop the stream before the last data hardware signal (single or burst) is sent by the peripheral. In such a case, the stream is switched off and the FIFO flush is triggered in the case of a peripheral-to-memory DMA transfer. The TCIFx flag of the corresponding stream is set in the status register to indicate the DMA completion. To know the number of data items transferred during the DMA transfer, read the DMA\_SxNDTR register and apply the following formula:
  - $\text{Number\_of\_data\_transferred} = 0xFFFF - \text{DMA\_SxNDTR}$
- Normal stream interruption due to the reception of a last data hardware signal: the stream is automatically interrupted when the peripheral requests the last transfer (single or burst) and when this transfer is complete. the TCIFx flag of the corresponding stream is set in the status register to indicate the DMA transfer completion. To know the number of data items transferred, read the DMA\_SxNDTR register and apply the same formula as above.
- The DMA\_SxNDTR register reaches 0: the TCIFx flag of the corresponding stream is set in the status register to indicate the forced DMA transfer completion. The stream is automatically switched off even though the last data hardware signal (single or burst) has not been yet asserted. The already transferred data is not lost. This means that a maximum of 65535 data items can be managed by the DMA in a single transaction, even in peripheral flow control mode.

*Note: When configured in memory-to-memory mode, the DMA is always the flow controller and the PFCTRL bit is forced to 0 by hardware.*

*The circular mode is forbidden in the peripheral flow controller mode.*

### 18.3.17 Summary of the possible DMA configurations

The table below summarizes the different possible DMA configurations. The forbidden configurations are highlighted in gray in the table.

**Table 106. Possible DMA configurations**

| DMA transfer mode    | Source              | Destination         | Flow controller | Circular mode | Transfer type | Direct mode | Double-buffer mode |
|----------------------|---------------------|---------------------|-----------------|---------------|---------------|-------------|--------------------|
| Peripheral-to-memory | AHB peripheral port | AHB memory port     | DMA             | Possible      | single        | Possible    | Possible           |
|                      |                     |                     |                 |               | burst         | Forbidden   |                    |
|                      |                     |                     | Peripheral      | Forbidden     | single        | Possible    | Forbidden          |
|                      |                     |                     |                 |               | burst         | Forbidden   |                    |
| Memory-to-peripheral | AHB memory port     | AHB peripheral port | DMA             | Possible      | single        | Possible    | Possible           |
|                      |                     |                     |                 |               | burst         | Forbidden   |                    |
|                      |                     |                     | Peripheral      | Forbidden     | single        | Possible    | Forbidden          |

|                      |                     |                     |                 |               | burst         |             |                    |

### 18.3.18 Stream configuration procedure

The following sequence must be followed to configure a DMA stream x (where x is the stream number):

1. If the stream is enabled, disable it by resetting the EN bit in the DMA\_SxCR register, then read this bit in order to confirm that there is no ongoing stream operation. Writing this bit to 0 is not immediately effective since it is actually written to 0 once all the current transfers are finished. When the EN bit is read as 0, this means that the stream is ready to be configured. It is therefore necessary to wait for the EN bit to be cleared before starting any stream configuration. All the stream dedicated bits set in the status register (DMA\_LISR and DMA\_HISR) from the previous data block DMA transfer must be cleared before the stream can be re-enabled.
2. Set the peripheral port register address in the DMA\_SxPAR register. The data is moved from/ to this address to/ from the peripheral port after the peripheral event.
3. Set the memory address in the DMA\_SxMA0R register (and in the DMA\_SxMA1R register in the case of a double-buffer mode). The data is written to or read from this memory after the peripheral event.
4. Configure the total number of data items to be transferred in the DMA\_SxNDTR register. After each peripheral event or each beat of the burst, this value is decremented.
5. Use DMAMUX to route a DMA request line to the DMA channel.
6. If the peripheral is intended to be the flow controller and if it supports this feature, set the PFCTRL bit in the DMA\_SxCR register.
7. Configure the stream priority using the PL[1:0] bits in the DMA\_SxCR register.
8. Configure the FIFO usage (enable or disable, threshold in transmission and reception)

9. Configure the data transfer direction, peripheral and memory incremented/fixed mode, single or burst transactions, peripheral and memory data widths, circular mode, double-buffer mode and interrupts after half and/or full transfer, and/or errors in the DMA\_SxCR register.
10. Activate the stream by setting the EN bit in the DMA\_SxCR register.

As soon as the stream is enabled, it can serve any DMA request from the peripheral connected to the stream.

Once half the data have been transferred on the AHB destination port, the half-transfer flag (HTIF) is set and an interrupt is generated if the half-transfer interrupt enable bit (HTIE) is set. At the end of the transfer, the transfer complete flag (TCIF) is set and an interrupt is generated if the transfer complete interrupt enable bit (TCIE) is set.

---

**Warning:** To switch off a peripheral connected to a DMA stream request, it is mandatory to, first, switch off the DMA stream to which the peripheral is connected, then to wait for EN bit = 0. Only then can the peripheral be safely disabled.

---

### 18.3.19 Error management

The DMA controller can detect the following errors:

- **Transfer error:** the transfer error interrupt flag (TEIFx) is set when:
  - a bus error occurs during a DMA read or a write access
  - a write access is requested by software on a memory address register in double-buffer mode whereas the stream is enabled and the current target memory is the one impacted by the write into the memory address register (refer to [Section 18.3.10: Double-buffer mode](#))
- **FIFO error:** the FIFO error interrupt flag (FEIFx) is set if:
  - a FIFO underrun condition is detected
  - a FIFO overrun condition is detected (no detection in memory-to-memory mode because requests and transfers are internally managed by the DMA)
  - the stream is enabled while the FIFO threshold level is not compatible with the size of the memory burst (refer to [Table 105: FIFO threshold configurations](#))
- **Direct mode error:** the direct mode error interrupt flag (DMEIFx) can only be set in the peripheral-to-memory mode while operating in direct mode and when the MINC bit in the DMA\_SxCR register is cleared. This flag is set when a DMA request occurs while the previous data have not yet been fully transferred into the memory (because the memory bus was not granted). In this case, the flag indicates that 2 data items were be transferred successively to the same destination address, which could be an issue if the destination is not able to manage this situation

In direct mode, the FIFO error flag can also be set under the following conditions:

- In the peripheral-to-memory mode, the FIFO can be saturated (overrun) if the memory bus is not granted for several peripheral requests.
- In the memory-to-peripheral mode, an underrun condition may occur if the memory bus has not been granted before a peripheral request occurs.

If the TEIFx or the FEIFx flag is set due to incompatibility between burst size and FIFO threshold level, the faulty stream is automatically disabled through a hardware clear of its EN bit in the corresponding stream configuration register (DMA\_SxCR).

If the DMEIFx or the FEIFx flag is set due to an overrun or underrun condition, the faulty stream is not automatically disabled and it is up to the software to disable or not the stream by resetting the EN bit in the DMA\_SxCR register. This is because there is no data loss when this kind of errors occur.

When the stream's error interrupt flag (TEIF, FEIF, DMEIF) in the DMA\_LISR or DMA\_HISR register is set, an interrupt is generated if the corresponding interrupt enable bit (TEIE, FEIE, DMIE) in the DMA\_SxCR or DMA\_SxFCR register is set.

**Note:** *When a FIFO overrun or underrun condition occurs, the data is not lost because the peripheral request is not acknowledged by the stream until the overrun or underrun condition is cleared. If this acknowledge takes too much time, the peripheral itself may detect an overrun or underrun condition of its internal buffer and data might be lost.*

## 18.4 DMA interrupts

For each DMA stream, an interrupt can be produced on the following events:

- Half-transfer reached
- Transfer complete
- Transfer error
- FIFO error (overrun, underrun or FIFO level error)
- Direct mode error

Separate interrupt enable control bits are available for flexibility as shown in the table below.

**Table 107. DMA interrupt requests**

| Interrupt event       | Event flag | Enable control bit |
|-----------------------|------------|--------------------|
| Half-transfer         | HTIF       | HTIE               |
| Transfer complete     | TCIF       | TCIE               |
| Transfer error        | TEIF       | TEIE               |
| FIFO overrun/underrun | FEIF       | FEIE               |
| Direct mode error     | DMEIF      | DMEIE              |

**Note:** *Before setting an enable control bit EN = 1, the corresponding event flag must be cleared, otherwise an interrupt is immediately generated.*

## 18.5 DMA registers

The DMA registers have to be accessed by words (32 bits).

### 18.5.1 DMA low interrupt status register (DMA\_LISR)

Address offset: 0x00

Reset value: 0x0000 0000

| 31   | 30   | 29   | 28   | 27    | 26    | 25    | 24     | 23   | 22    | 21    | 20    | 19    | 18     | 17   | 16    |
|------|------|------|------|-------|-------|-------|--------|------|-------|-------|-------|-------|--------|------|-------|
| Res. | Res. | Res. | Res. | TCIF3 | HTIF3 | TEIF3 | DMEIF3 | Res. | FEIF3 | TCIF2 | HTIF2 | TEIF2 | DMEIF2 | Res. | FEIF2 |
|      |      |      |      | r     | r     | r     | r      |      | r     | r     | r     | r     | r      |      | r     |
| 15   | 14   | 13   | 12   | 11    | 10    | 9     | 8      | 7    | 6     | 5     | 4     | 3     | 2      | 1    | 0     |
| Res. | Res. | Res. | Res. | TCIF1 | HTIF1 | TEIF1 | DMEIF1 | Res. | FEIF1 | TCIF0 | HTIF0 | TEIF0 | DMEIF0 | Res. | FEIF0 |
|      |      |      |      | r     | r     | r     | r      |      | r     | r     | r     | r     | r      |      | r     |

Bits 31:28, 15:12 Reserved, must be kept at reset value.

Bits 27, 21, 11, 5 **TCIF[3:0]**: stream x transfer complete interrupt flag (x = 3 to 0)

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the DMA\_LIFCR register.

0: no transfer complete event on stream x

1: a transfer complete event occurred on stream x

Bits 26, 20, 10, 4 **HTIF[3:0]**: stream x half transfer interrupt flag (x = 3 to 0)

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the DMA\_LIFCR register.

0: no half transfer event on stream x

1: a half transfer event occurred on stream x

Bits 25, 19, 9, 3 **TEIF[3:0]**: stream x transfer error interrupt flag (x = 3 to 0)

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the DMA\_LIFCR register.

0: no transfer error on stream x

1: a transfer error occurred on stream x

Bits 24, 18, 8, 2 **DMEIF[3:0]**: stream x direct mode error interrupt flag (x = 3 to 0)

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the DMA\_LIFCR register.

0: No direct mode error on stream x

1: a direct mode error occurred on stream x

Bits 23, 17, 7, 1 Reserved, must be kept at reset value.

Bits 22, 16, 6, 0 **FEIF[3:0]**: stream x FIFO error interrupt flag (x = 3 to 0)

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the DMA\_LIFCR register.

0: no FIFO error event on stream x

1: a FIFO error event occurred on stream x

## 18.5.2 DMA high interrupt status register (DMA\_HISR)

Address offset: 0x04

Reset value: 0x0000 0000

| 31   | 30   | 29   | 28   | 27    | 26    | 25    | 24     | 23   | 22    | 21    | 20    | 19    | 18     | 17   | 16    |
|------|------|------|------|-------|-------|-------|--------|------|-------|-------|-------|-------|--------|------|-------|
| Res. | Res. | Res. | Res. | TCIF7 | HTIF7 | TEIF7 | DMEIF7 | Res. | FEIF7 | TCIF6 | HTIF6 | TEIF6 | DMEIF6 | Res. | FEIF6 |
|      |      |      |      | r     | r     | r     | r      |      | r     | r     | r     | r     | r      |      | r     |
| 15   | 14   | 13   | 12   | 11    | 10    | 9     | 8      | 7    | 6     | 5     | 4     | 3     | 2      | 1    | 0     |
| Res. | Res. | Res. | Res. | TCIF5 | HTIF5 | TEIF5 | DMEIF5 | Res. | FEIF5 | TCIF4 | HTIF4 | TEIF4 | DMEIF4 | Res. | FEIF4 |
|      |      |      |      | r     | r     | r     | r      |      | r     | r     | r     | r     | r      |      | r     |

Bits 31:28, 15:12 Reserved, must be kept at reset value.

Bits 27, 21, 11, 5 **TCIF[7:4]**: stream x transfer complete interrupt flag (x = 7 to 4)

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the DMA\_HIFCR register.

0: no transfer complete event on stream x

1: a transfer complete event occurred on stream x

Bits 26, 20, 10, 4 **HTIF[7:4]**: stream x half transfer interrupt flag (x = 7 to 4)

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the DMA\_HIFCR register.

0: no half transfer event on stream x

1: a half transfer event occurred on stream x

Bits 25, 19, 9, 3 **TEIF[7:4]**: stream x transfer error interrupt flag (x = 7 to 4)

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the DMA\_HIFCR register.

0: no transfer error on stream x

1: a transfer error occurred on stream x

Bits 24, 18, 8, 2 **DMEIF[7:4]**: stream x direct mode error interrupt flag (x = 7 to 4)

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the DMA\_HIFCR register.

0: no direct mode error on stream x

1: a direct mode error occurred on stream x

Bits 23, 17, 7, 1 Reserved, must be kept at reset value.

Bits 22, 16, 6, 0 **FEIF[7:4]**: stream x FIFO error interrupt flag (x = 7 to 4)

This bit is set by hardware. It is cleared by software writing 1 to the corresponding bit in the DMA\_HIFCR register.

0: no FIFO error event on stream x

1: a FIFO error event occurred on stream x

### 18.5.3 DMA low interrupt flag clear register (DMA\_LIFCR)

Address offset: 0x08

Reset value: 0x0000 0000

| 31   | 30   | 29   | 28   | 27     | 26     | 25     | 24      | 23   | 22     | 21     | 20     | 19     | 18      | 17   | 16     |
|------|------|------|------|--------|--------|--------|---------|------|--------|--------|--------|--------|---------|------|--------|
| Res. | Res. | Res. | Res. | CTCIF3 | CHTIF3 | CTEIF3 | CDMEIF3 | Res. | CFEIF3 | CTCIF2 | CHTIF2 | CTEIF2 | CDMEIF2 | Res. | CFEIF2 |
|      |      |      |      | w      | w      | w      | w       |      | w      | w      | w      | w      | w       |      | w      |
| 15   | 14   | 13   | 12   | 11     | 10     | 9      | 8       | 7    | 6      | 5      | 4      | 3      | 2       | 1    | 0      |

|      |      |      |      | w      | w      | w      | w       |      | w      | w      | w      | w      | w       |      | w      |

Bits 31:28, 15:12 Reserved, must be kept at reset value.

Bits 27, 21, 11, 5 **CTCIF[3:0]**: stream x clear transfer complete interrupt flag (x = 3 to 0)

Writing 1 to this bit clears the corresponding TCIFx flag in the DMA\_LISR register.

Bits 26, 20, 10, 4 **CHTIF[3:0]**: stream x clear half transfer interrupt flag (x = 3 to 0)

Writing 1 to this bit clears the corresponding HTIFx flag in the DMA\_LISR register.

Bits 25, 19, 9, 3 **CTEIF[3:0]**: Stream x clear transfer error interrupt flag (x = 3 to 0)

Writing 1 to this bit clears the corresponding TEIFx flag in the DMA\_LISR register.

Bits 24, 18, 8, 2 **CDMEIF[3:0]**: stream x clear direct mode error interrupt flag (x = 3 to 0)

Writing 1 to this bit clears the corresponding DMEIFx flag in the DMA\_LISR register.

Bits 23, 17, 7, 1 Reserved, must be kept at reset value.

Bits 22, 16, 6, 0 **CFEIF[3:0]**: stream x clear FIFO error interrupt flag (x = 3 to 0)

Writing 1 to this bit clears the corresponding CFEIFx flag in the DMA\_LISR register.

### 18.5.4 DMA high interrupt flag clear register (DMA\_HIFCR)

Address offset: 0x0C

Reset value: 0x0000 0000

| 31   | 30   | 29   | 28   | 27     | 26     | 25     | 24      | 23   | 22     | 21     | 20     | 19     | 18      | 17   | 16     |
|------|------|------|------|--------|--------|--------|---------|------|--------|--------|--------|--------|---------|------|--------|
| Res. | Res. | Res. | Res. | CTCIF7 | CHTIF7 | CTEIF7 | CDMEIF7 | Res. | CFEIF7 | CTCIF6 | CHTIF6 | CTEIF6 | CDMEIF6 | Res. | CFEIF6 |
|      |      |      |      | w      | w      | w      | w       |      | w      | w      | w      | w      | w       |      | w      |
| 15   | 14   | 13   | 12   | 11     | 10     | 9      | 8       | 7    | 6      | 5      | 4      | 3      | 2       | 1    | 0      |

|      |      |      |      | w      | w      | w      | w       |      | w      | w      | w      | w      | w       |      | w      |

Bits 31:28, 15:12 Reserved, must be kept at reset value.

Bits 27, 21, 11, 5 **CTCIF[7:4]**: stream x clear transfer complete interrupt flag (x = 7 to 4)

Writing 1 to this bit clears the corresponding TCIFx flag in the DMA\_HISR register.

Bits 26, 20, 10, 4 **CHTIF[7:4]**: stream x clear half transfer interrupt flag (x = 7 to 4)

Writing 1 to this bit clears the corresponding HTIFx flag in the DMA\_HISR register.

Bits 25, 19, 9, 3 **CTEIF[7:4]**: stream x clear transfer error interrupt flag (x = 7 to 4)

Writing 1 to this bit clears the corresponding TEIFx flag in the DMA\_HISR register.

Bits 24, 18, 8, 2 **CDMEIF[7:4]**: stream x clear direct mode error interrupt flag (x = 7 to 4)

Writing 1 to this bit clears the corresponding DMEIFx flag in the DMA\_HISR register.

Bits 23, 17, 7, 1 Reserved, must be kept at reset value.

Bits 22, 16, 6, 0 **CFEIF[7:4]**: stream x clear FIFO error interrupt flag (x = 7 to 4)

Writing 1 to this bit clears the corresponding CFEIFx flag in the DMA\_HISR register.

### 18.5.5 DMA stream x configuration register (DMA\_SxCR)

This register is used to configure the concerned stream.

Address offset:  $0x10 + 0x18 * x$ , (x = 0 to 7)

Reset value: 0x0000 0000

|        |            |      |            |      |      |      |             |          |             |        |            |      |      |         |    |

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:23 **MBURST[1:0]**: memory burst transfer configuration

These bits are set and cleared by software.

00: single transfer

01: INCR4 (incremental burst of 4 beats)

10: INCR8 (incremental burst of 8 beats)

11: INCR16 (incremental burst of 16 beats)

These bits are protected and can be written only if EN is '0'.

In direct mode, these bits are forced to 0x0 by hardware as soon as bit EN= '1'.

Bits 22:21 **PBURST[1:0]**: peripheral burst transfer configuration

These bits are set and cleared by software.

00: single transfer

01: INCR4 (incremental burst of 4 beats)

10: INCR8 (incremental burst of 8 beats)

11: INCR16 (incremental burst of 16 beats)

These bits are protected and can be written only if EN is '0'.

In direct mode, these bits are forced to 0x0 by hardware.

Bit 20 **TRBUFF**: Enable the DMA to handle bufferable transfers.

0: bufferable transfers not enabled

1: bufferable transfers enabled

*Note: This bit must be set to 1 if the DMA stream manages UART/USART/LPUART transfers.*

Bit 19 **CT**: current target (only in double-buffer mode)

This bit is set and cleared by hardware. It can also be written by software.

0: current target memory is Memory 0 (addressed by the DMA\_SxM0AR pointer)

1: current target memory is Memory 1 (addressed by the DMA\_SxM1AR pointer)

This bit can be written only if EN is '0' to indicate the target memory area of the first transfer.

Once the stream is enabled, this bit operates as a status flag indicating which memory area is the current target.

- Bit 18 **DBM**: double-buffer mode  
This bit is set and cleared by software.  
0: no buffer switching at the end of transfer  
1: memory target switched at the end of the DMA transfer  
This bit is protected and can be written only if EN is '0'.
- Bits 17:16 **PL[1:0]**: priority level  
These bits are set and cleared by software.  
00: low  
01: medium  
10: high  
11: very high  
These bits are protected and can be written only if EN is '0'.
- Bit 15 **PINCOS**: peripheral increment offset size  
This bit is set and cleared by software  
0: The offset size for the peripheral address calculation is linked to the PSIZE  
1: The offset size for the peripheral address calculation is fixed to 4 (32-bit alignment).  
This bit has no meaning if bit PINC = '0'.  
This bit is protected and can be written only if EN = '0'.  
This bit is forced low by hardware when the stream is enabled (bit EN = '1') if the direct mode is selected or if PBURST are different from "00".
- Bits 14:13 **MSIZE[1:0]**: memory data size  
These bits are set and cleared by software.  
00: byte (8-bit)  
01: half-word (16-bit)  
10: word (32-bit)  
11: reserved  
These bits are protected and can be written only if EN is '0'.  
In direct mode, MSIZE is forced by hardware to the same value as PSIZE as soon as bit EN = '1'.
- Bits 12:11 **PSIZE[1:0]**: peripheral data size  
These bits are set and cleared by software.  
00: byte (8-bit)  
01: half-word (16-bit)  
10: word (32-bit)  
11: reserved  
These bits are protected and can be written only if EN is '0'.
- Bit 10 **MINC**: memory increment mode  
This bit is set and cleared by software.  
0: memory address pointer is fixed  
1: memory address pointer is incremented after each data transfer (increment is done according to MSIZE)  
This bit is protected and can be written only if EN is '0'.
- Bit 9 **PINC**: peripheral increment mode  
This bit is set and cleared by software.  
0: peripheral address pointer is fixed  
1: peripheral address pointer is incremented after each data transfer (increment is done according to PSIZE)  
This bit is protected and can be written only if EN is '0'.

**Bit 8 CIRC:** circular mode

This bit is set and cleared by software and can be cleared by hardware.

0: circular mode disabled

1: circular mode enabled

When the peripheral is the flow controller (bit PFCTRL = 1) and the stream is enabled (bit EN = 1), then this bit is automatically forced by hardware to 0.

It is automatically forced by hardware to 1 if the DBM bit is set, as soon as the stream is enabled (bit EN = '1').

**Bits 7:6 DIR[1:0]:** data transfer direction

These bits are set and cleared by software.

00: peripheral-to-memory

01: memory-to-peripheral

10: memory-to-memory

11: reserved

These bits are protected and can be written only if EN is '0'.

**Bit 5 PFCTRL:** peripheral flow controller

This bit is set and cleared by software.

0: DMA is the flow controller

1: The peripheral is the flow controller

This bit is protected and can be written only if EN is '0'.

When the memory-to-memory mode is selected (bits DIR[1:0]=10), then this bit is automatically forced to 0 by hardware.

**Bit 4 TCIE:** transfer complete interrupt enable

This bit is set and cleared by software.

0: TC interrupt disabled

1: TC interrupt enabled

**Bit 3 HTIE:** half transfer interrupt enable

This bit is set and cleared by software.

0: HT interrupt disabled

1: HT interrupt enabled

**Bit 2 TEIE:** transfer error interrupt enable

This bit is set and cleared by software.

0: TE interrupt disabled

1: TE interrupt enabled

**Bit 1 DMEIE:** direct mode error interrupt enable

This bit is set and cleared by software.

0: DME interrupt disabled

1: DME interrupt enabled

Bit 0 **EN**: stream enable / flag stream ready when read low

This bit is set and cleared by software.

0: stream disabled

1: stream enabled

This bit may be cleared by hardware:

- on a DMA end of transfer (stream ready to be configured)
- if a transfer error occurs on the AHB master buses
- when the FIFO threshold on memory AHB port is not compatible with the size of the burst

When this bit is read as 0, the software is allowed to program the configuration and FIFO bits registers. It is forbidden to write these registers when the EN bit is read as 1.

*Note: Before setting EN bit to '1' to start a new transfer, the event flags corresponding to the stream in DMA\_LISR or DMA\_HISR register must be cleared.*

### 18.5.6 DMA stream x number of data register (DMA\_SxNDTR)

Address offset:  $0x14 + 0x18 * x$ , ( $x = 0$  to  $7$ )

Reset value: 0x0000 0000

|           |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|-----------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31        | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.      | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|           |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15        | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| NDT[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| rw        | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **NDT[15:0]**: number of data items to transfer (0 up to 65535)

This register can be written only when the stream is disabled. When the stream is enabled, this register is read-only, indicating the remaining data items to be transmitted. This register decrements after each DMA transfer.

Once the transfer is completed, this register can either stay at zero (when the stream is in normal mode) or be reloaded automatically with the previously programmed value in the following cases:

- when the stream is configured in circular mode.
- when the stream is enabled again by setting EN bit to '1'.

If the value of this register is zero, no transaction can be served even if the stream is enabled.

### 18.5.7 DMA stream x peripheral address register (DMA\_SxPAR)

Address offset:  $0x18 + 0x18 * x$ , ( $x = 0$  to  $7$ )

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| PAR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| PAR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **PAR[31:0]**: peripheral address

Base address of the peripheral data register from/to which the data is read/written.

These bits are write-protected and can be written only when bit EN = '0' in the DMA\_SxCR register.

### 18.5.8 DMA stream x memory 0 address register (DMA\_SxM0AR)

Address offset:  $0x1C + 0x18 * x$ , ( $x = 0$  to  $7$ )

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| M0A[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| M0A[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **M0A[31:0]**: memory 0 address

Base address of memory area 0 from/to which the data is read/written.

These bits are write-protected. They can be written only if:

- the stream is disabled (bit EN = '0' in the DMA\_SxCR register) or
- the stream is enabled (EN = '1' in DMA\_SxCR register) and bit CT = '1' in the DMA\_SxCR register (in double-buffer mode).

### 18.5.9 DMA stream x memory 1 address register (DMA\_SxM1AR)

Address offset:  $0x20 + 0x18 * x$ , ( $x = 0$  to  $7$ )

Reset value:  $0x0000\ 0000$

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| M1A[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| M1A[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **M1A[31:0]**: memory 1 address (used in case of double-buffer mode)

Base address of memory area 1 from/to which the data is read/written.

This register is used only for the double-buffer mode.

These bits are write-protected. They can be written only if:

- the stream is disabled (bit EN= '0' in the DMA\_SxCR register) or
- the stream is enabled (EN='1' in DMA\_SxCR register) and bit CT = '0' in the DMA\_SxCR register.

### 18.5.10 DMA stream x FIFO control register (DMA\_SxFCR)

Address offset:  $0x24 + 0x18 * x$ , ( $x = 0$  to  $7$ )

Reset value:  $0x0000\ 0021$

|      |      |      |      |      |      |      |      |      |      |         |      |      |       |          |      |
|------|------|------|------|------|------|------|------|------|------|---------|------|------|-------|----------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21      | 20   | 19   | 18    | 17       | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.    | Res. | Res. | Res.  | Res.     | Res. |
|      |      |      |      |      |      |      |      |      |      |         |      |      |       |          |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5       | 4    | 3    | 2     | 1        | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | FEIE | Res. | FS[2:0] |      |      | DMDIS | FTH[1:0] |      |
|      |      |      |      |      |      |      |      | rw   |      | r       | r    | r    | rw    | rw       | rw   |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **FEIE**: FIFO error interrupt enable

This bit is set and cleared by software.

0: FE interrupt disabled

1: FE interrupt enabled

Bit 6 Reserved, must be kept at reset value.

Bits 5:3 **FS[2:0]**: FIFO status

These bits are read-only.

000:  $0 < \text{fifo\_level} < 1/4$

001:  $1/4 \leq \text{fifo\_level} < 1/2$

010:  $1/2 \leq \text{fifo\_level} < 3/4$

011:  $3/4 \leq \text{fifo\_level} < \text{full}$

100: FIFO is empty

101: FIFO is full

others: no meaning

These bits are not relevant in the direct mode (DMDIS bit is zero).

Bit 2 **DMDIS**: direct mode disable

This bit is set and cleared by software. It can be set by hardware.

0: direct mode enabled

1: direct mode disabled

This bit is protected and can be written only if EN is '0'.

This bit is set by hardware if the memory-to-memory mode is selected (DIR bit in DMA\_SxCR are "10") and the EN bit in the DMA\_SxCR register is '1' because the direct mode is not allowed in the memory-to-memory configuration.

Bits 1:0 **FTH[1:0]**: FIFO threshold selection

These bits are set and cleared by software.

00: 1/4 full FIFO

01: 1/2 full FIFO

10: 3/4 full FIFO

11: full FIFO

These bits are not used in the direct mode when the DMIS value is zero.

These bits are protected and can be written only if EN is '0'.

### 18.5.11 DMA hardware configuration 2 register (DMA\_HWCFCGR2)

Address offset: 0x3EC

Reset value: 0x0000 0001

| 31   | 30   | 29   | 28   | 27   | 26               | 25   | 24   | 23   | 22   | 21   | 20               | 19   | 18   | 17             | 16   |
|------|------|------|------|------|------------------|------|------|------|------|------|------------------|------|------|----------------|------|
| Res. | Res. | Res. | Res. | Res. | Res.             | Res. | Res. | Res. | Res. | Res. | Res.             | Res. | Res. | Res.           | Res. |
|      |      |      |      |      |                  |      |      |      |      |      |                  |      |      |                |      |
| 15   | 14   | 13   | 12   | 11   | 10               | 9    | 8    | 7    | 6    | 5    | 4                | 3    | 2    | 1              | 0    |
| Res. | Res. | Res. | Res. | Res. | CHSEL_WIDTH[2:0] |      |      | Res. | Res. | Res. | WRITE_BUFFERABLE | Res. | Res. | FIFO_SIZE[1:0] |      |
|      |      |      |      |      | r                | r    | r    |      |      |      | r                |      |      | r              | r    |

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:8 **CHSEL\_WIDTH[2:0]**: bit width of the CHSEL field of any DMA\_SxCR register common to all streams

In [0..6] range:

0: no programmable selection

1: 2 channels programmable selection

2: up to 8 channels programmable selection

3: up to 16 channels programmable selection

4: up to 32 channels programmable selection

5: up to 64 channels programmable selection

6: up to 128 channels programmable selection

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **WRITE\_BUFFERABLE**:

0: DMA acknowledge signal is de-asserted one cycle after occurred both 1) the last cycle of the data phase of the bus access on its AHB peripheral master port and 2) the de-assertion of the peripheral request

1: DMA acknowledge signal is de-asserted exactly one cycle after the last cycle of the data phase of the bus access on its AHB peripheral master port

In any case, DMA acknowledge signal is asserted one cycle after the address phase of the bus access on its AHB peripheral master port.

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **FIFO\_SIZE[1:0]**: FIFO size, common to all streams

In [0..3] range:

0: 2-word FIFO

1: 4-word FIFO

2: 8-word FIFO

3: 16-word FIFO

**18.5.12 DMA hardware configuration 1 register (DMA\_HWCFCGR1)**

Address offset: 0x3F0

Reset value: 0x2222 2222

|      |      |                   |    |      |      |                   |    |      |      |                   |    |      |      |                   |    |

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:28 **DMA\_DEF7[1:0]**: type of the stream 7

0: none

1: regular

2: double-buffer

3: Reserved

Bits 27:26 Reserved, must be kept at reset value.

Bits 25:24 **DMA\_DEF6[1:0]**: type of the stream 6

0: none

1: regular

2: double-buffer

3: Reserved

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:20 **DMA\_DEF5[1:0]**: type of the stream 5

- 0: none
- 1: regular
- 2: double-buffer
- 3: Reserved

Bits 19:18 Reserved, must be kept at reset value.

Bits 17:16 **DMA\_DEF4[1:0]**: type of the stream 4

- 0: none
- 1: regular
- 2: double-buffer
- 3: Reserved

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:12 **DMA\_DEF3[1:0]**: type of the stream 3

- 0: none
- 1: regular
- 2: double-buffer
- 3: Reserved

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:8 **DMA\_DEF2[1:0]**: type of the stream 2

- 0: none
- 1: regular
- 2: double-buffer
- 3: Reserved

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **DMA\_DEF1[1:0]**: type of the stream 1

- 0: none
- 1: regular
- 2: double-buffer
- 3: Reserved

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **DMA\_DEF0[1:0]**: type of the stream 0

- 0: none
- 1: regular
- 2: double-buffer
- 3: Reserved

### 18.5.13 DMA version register (DMA\_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0014

This register identifies the version of the IP.

|      |      |      |      |      |      |      |      |             |      |      |      |             |      |      |      |

Refer to [Section 2.5](#) for the register boundary addresses.

## 19 DMA request multiplexer (DMAMUX)

### 19.1 Introduction

A peripheral indicates a request for DMA transfer by setting its DMA request signal. The DMA request is pending until it is served by the DMA controller that generates a DMA acknowledge signal, and the corresponding DMA request signal is deasserted.

In this document, the set of control signals required for the DMA request/acknowledge protocol is not explicitly shown or described, and it is referred to as DMA request line.

The DMAMUX request multiplexer enables routing a DMA request line between the peripherals and the DMA controllers of the product. The routing function is ensured by a programmable multi-channel DMA request line multiplexer. Each channel selects a unique DMA request line, unconditionally or synchronously with events from its DMAMUX synchronization inputs. The DMAMUX may also be used as a DMA request generator from programmable events on its input trigger signals.

The number of DMAMUX instances and their main characteristics are specified in [Section 19.3.1](#).

The assignment of DMAMUX request multiplexer inputs to the DMA request lines from peripherals and to the DMAMUX request generator outputs, the assignment of DMAMUX request multiplexer outputs to DMA controller channels, and the assignment of DMAMUX synchronizations and trigger inputs to internal and external signals depend on the product implementation, and are detailed in [Section 19.3.2](#).

## 19.2 DMAMUX main features

- 16-channel programmable DMA request line multiplexer output
- 8-channel DMA request generator
- 8 trigger inputs to DMA request generator
- 8 synchronization inputs
- Per DMA request generator channel:
  - DMA request trigger input selector
  - DMA request counter
  - Event overrun flag for selected DMA request trigger input
- Per DMA request line multiplexer channel output:
  - 108 input DMA request lines from peripherals
  - One DMA request line output
  - Synchronization input selector
  - DMA request counter
  - Event overrun flag for selected synchronization input
  - One event output, for DMA request chaining
- Identification registers, with associated IP revision and hardware configuration.

## 19.3 DMAMUX implementation

### 19.3.1 DMAMUX instantiation

DMAMUX is instantiated with the hardware configuration parameters listed in the following table.

**Table 109. DMAMUX instantiation**

| Feature                                     | DMAMUX |
|---------------------------------------------|--------|
| Number of DMAMUX output request channels    | 16     |
| Number of DMAMUX request generator channels | 8      |
| Number of DMAMUX request trigger inputs     | 8      |
| Number of DMAMUX synchronization inputs     | 8      |
| Number of DMAMUX peripheral request inputs  | 108    |

### 19.3.2 DMAMUX mapping

The mapping of resources to DMAMUX is hardwired.

DMAMUX is used with DMA1 and DMA2:

- DMAMUX channels 0 to 7 are connected to DMA1 channels 0 to 7
- DMAMUX channels 8 to 15 are connected to DMA2 channels 0 to 7

Table 110. DMAMUX: assignment of multiplexer inputs to resources

| DMA request MUX input | Resource       | DMA request MUX input | Resource  | DMA request MUX input | Resource    |
|-----------------------|----------------|-----------------------|-----------|-----------------------|-------------|
| 1                     | dmamux_req_gen | 44                    | USART2_TX | 87                    | SAI1_A      |

## 19.4 DMAMUX functional description

### 19.4.1 DMAMUX block diagram

Figure 135 shows the DMAMUX block diagram.

Figure 135. DMAMUX block diagram

DMAMUX features two main sub-blocks: the request line multiplexer and the request line generator.

The implementation assigns:

- DMAMUX request multiplexer sub-block inputs (**dmamux\_reqx**) from peripherals (**dmamux\_req\_inx**) and from channels of the DMAMUX request generator sub-block (**dmamux\_req\_genx**)
- DMAMUX request outputs to channels of DMA controllers (**dmamux\_req\_outx**)
- Internal or external signals to DMA request trigger inputs (**dmamux\_trgx**)
- Internal or external signals to synchronization inputs (**dmamux\_syncx**)

## 19.4.2 DMAMUX signals

*Table 113* lists the DMAMUX signals.

**Table 113. DMAMUX signals**

| Signal name     | Description                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------|
| dmamux_hclk     | DMAMUX AHB clock                                                                                      |
| dmamux_req_inx  | DMAMUX DMA request line inputs from peripherals                                                       |
| dmamux_trgx     | DMAMUX DMA request triggers inputs (to request generator sub-block)                                   |
| dmamux_req_genx | DMAMUX request generator sub-block channels outputs                                                   |
| dmamux_reqx     | DMAMUX request multiplexer sub-block inputs (from peripheral requests and request generator channels) |
| dmamux_syncx    | DMAMUX synchronization inputs (to request multiplexer sub-block)                                      |
| dmamux_req_outx | DMAMUX requests outputs (to DMA controllers)                                                          |
| dmamux_evtx     | DMAMUX events outputs                                                                                 |
| dmamux_ovr_it   | DMAMUX overrun interrupts                                                                             |

## 19.4.3 DMAMUX channels

A DMAMUX channel is a DMAMUX request multiplexer channel that may include, depending on the selected input of the request multiplexer, an additional DMAMUX request generator channel.

A DMAMUX request multiplexer channel is connected and dedicated to one single channel of DMA controller(s).

### Channel configuration procedure

Follow the sequence below to configure both a DMAMUX x channel and the related DMA channel y:

1. Set and configure completely the DMA channel y, except enabling the channel y.
2. Set and configure completely the related DMAMUX y channel.
3. Last, activate the DMA channel y by setting the EN bit in the DMA y channel register.

## 19.4.4 DMAMUX request line multiplexer

The DMAMUX request multiplexer with its multiple channels ensures the actual routing of DMA request/acknowledge control signals, named DMA request lines.

Each DMA request line is connected in parallel to all the channels of the DMAMUX request line multiplexer.

A DMA request is sourced either from the peripherals or from the DMAMUX request generator.

The DMAMUX request line multiplexer channel x selects the DMA request line number as configured by the DMAREQ\_ID field in the DMAMUX\_CxCR register.

**Note:** *The null value in the field DMAREQ\_ID corresponds to no DMA request line selected. It is not allowed to configure a same non-null DMAREQ\_ID to two different channels of the DMAMUX request line multiplexer.*

On top of the DMA request selection, the synchronization mode and/or the event generation may be configured and enabled, if required.

### Synchronization mode and channel event generation

Each DMAMUX request line multiplexer channel x can be individually synchronized by setting the synchronization enable (SE) bit in the DMAMUX\_CxCR register.

DMAMUX has multiple synchronization inputs. The synchronization inputs are connected in parallel to all the channels of the request multiplexer.

The synchronization input is selected via the SYNC\_ID field in the DMAMUX\_CxCR register of a given channel x.

When a channel is in this synchronization mode, the selected input DMA request line is propagated to the multiplexer channel output, once is detected a programmable rising/falling edge on the selected input synchronization signal, via the SPOL[1:0] field of the DMAMUX\_CxCR register.

Additionally, there is a programmable DMA request counter, internally to the DMAMUX request multiplexer, which may be used for the channel request output generation and also possibly for an event generation. An event generation on the channel x output is enabled through the EGE bit (event generation enable) of the DMAMUX\_CxCR register.

As shown in [Figure 137](#), upon the detected edge of the synchronization input, the pending selected input DMA request line is connected to the DMAMUX multiplexer channel x output.

**Note:** *If a synchronization event occurs while there is no pending selected input DMA request line, it is discarded. The following asserted input request lines is not connected to the DMAMUX multiplexer channel output until a synchronization event occurs again.*

From this point on, each time the connected DMAMUX request is served by the DMA controller (a served request is deasserted), the DMAMUX request counter is decremented. At its underrun, the DMA request counter is automatically loaded with the value in NBREQ field of the DMAMUX\_CxCR register and the input DMA request line is disconnected from the multiplexer channel x output.

Thus, the number of DMA requests transferred to the multiplexer channel x output following a detected synchronization event, is equal to the value in NBREQ field, plus one.

**Note:** *The NBREQ field value shall only be written by software when both synchronization enable bit SE and event generation enable EGE bit of the corresponding multiplexer channel x are disabled.*

Figure 136. Synchronization mode of the DMAMUX request line multiplexer channel

Figure 137. Event generation of the DMA request line multiplexer channel

If EGE is enabled, the multiplexer channel generates a channel event, as a pulse of one AHB clock cycle, when its DMA request counter is automatically reloaded with the value of the programmed NBREQ field, as shown in [Figure 136](#) and [Figure 137](#).

*Note:* If EGE is enabled and NBREQ = 0, an event is generated after each served DMA request.

*Note:* A synchronization event (edge) is detected if the state following the edge remains stable for more than two AHB clock cycles.

Upon writing into DMAMUX\_CxCR register, the synchronization events are masked during three AHB clock cycles.

### Synchronization overrun and interrupt

If a new synchronization event occurs before the request counter underrun (the internal request counter programmed via the NBREQ field of the DMAMUX\_CxCR register), the synchronization overrun flag bit SOFx is set in the DMAMUX\_CSR status register.

*Note:* The request multiplexer channel x synchronization must be disabled (DMAMUX\_CxCR.SE = 0) at the completion of the use of the related channel of the DMA controller. Else, upon a new detected synchronization event, there is a synchronization overrun due to the absence of a DMA acknowledge (that is, no served request) received from the DMA controller.

The overrun flag SOFx is reset by setting the associated clear synchronization overrun flag bit CSOFx in the DMAMUX\_CFR register.

Setting the synchronization overrun flag generates an interrupt if the synchronization overrun interrupt enable bit SOIE is set in the DMAMUX\_CxCR register.

## 19.4.5 DMAMUX request generator

The DMAMUX request generator produces DMA requests following trigger events on its DMA request trigger inputs.

The DMAMUX request generator has multiple channels. DMA request trigger inputs are connected in parallel to all channels.

The outputs of DMAMUX request generator channels are inputs to the DMAMUX request line multiplexer.

Each DMAMUX request generator channel x has an enable bit GE (generator enable) in the corresponding DMAMUX\_RGxCR register.

The DMA request trigger input for the DMAMUX request generator channel x is selected through the SIG\_ID (trigger signal ID) field in the corresponding DMAMUX\_RGxCR register.

Trigger events on a DMA request trigger input can be rising edge, falling edge or either edge. The active edge is selected through the GPOL (generator polarity) field in the corresponding DMAMUX\_RGxCR register.

Upon the trigger event, the corresponding generator channel starts generating DMA requests on its output. Each time the DMAMUX generated request is served by the connected DMA controller (a served request is deasserted), a built-in (inside the DMAMUX request generator) DMA request counter is decremented. At its underrun, the request generator channel stops generating DMA requests and the DMA request counter is automatically reloaded to its programmed value upon the next trigger event.

Thus, the number of DMA requests generated after the trigger event is GNBREQ + 1.

**Note:** The GNBREQ field value must be written by software only when the enable GE bit of the corresponding generator channel x is disabled.

A trigger event (edge) is detected if the state following the edge remains stable for more than two AHB clock cycles.

Upon writing into DMAMUX\_RGxCR register, the trigger events are masked during three AHB clock cycles.

### Trigger overrun and interrupt

If a new DMA request trigger event occurs before the DMAMUX request generator counter underrun (the internal counter programmed via the GNBREQ field of the DMAMUX\_RGxCR register), and if the request generator channel x was enabled via GE, then the request trigger event overrun flag bit OFx is asserted by the hardware in the status DMAMUX\_RGSR register.

**Note:** The request generator channel x must be disabled (DMAMUX\_RGxCR.GE = 0) at the completion of the usage of the related channel of the DMA controller. Else, upon a new detected trigger event, there is a trigger overrun due to the absence of an acknowledge (that is, no served request) received from the DMA.

The overrun flag OFx is reset by setting the associated clear overrun flag bit COFx in the DMAMUX\_RGCFR register.

Setting the DMAMUX request trigger overrun flag generates an interrupt if the DMA request trigger event overrun interrupt enable bit OIE is set in the DMAMUX\_RGxCR register.

## 19.5 DMAMUX interrupts

An interrupt can be generated upon:

- a synchronization event overrun in each DMA request line multiplexer channel
- a trigger event overrun in each DMA request generator channel

For each case, per-channel individual interrupt enable, status and clear flag register bits are available.

**Table 114. DMAMUX interrupts**

| Interrupt signal | Interrupt event                                                                   | Event flag | Clear bit | Enable bit |
|------------------|-----------------------------------------------------------------------------------|------------|-----------|------------|
| dmamuxovr_it     | Synchronization event overrun on channel x of the DMAMUX request line multiplexer | SOFx       | CSOFx     | SOIE       |
|                  | Trigger event overrun on channel x of the DMAMUX request generator                | OFx        | COFx      | OIE        |

## 19.6 DMAMUX registers

Refer to the table containing register boundary addresses for the DMAMUX base address.

DMAMUX registers may be accessed per (8-bit) byte, (16-bit) half-word, or (32-bit) word. The address must be aligned with the data size.

### 19.6.1 DMAMUX request line multiplexer channel x configuration register (DMAMUX\_CxCR)

Address offset:  $0x000 + 0x04 * x$  ( $x = 0$  to  $15$ )

Reset value: 0x0000 0000

|      |      |      |      |      |              |     |      |            |                |    |    |    |           |    |    |
|------|------|------|------|------|--------------|-----|------|------------|----------------|----|----|----|-----------|----|----|
| 31   | 30   | 29   | 28   | 27   | 26           | 25  | 24   | 23         | 22             | 21 | 20 | 19 | 18        | 17 | 16 |

| Res. | Res. | Res. | Res. | Res. | Res.         | EGE | SOIE | Res.       | DMAREQ_ID[6:0] |    |    |    |           |    |    |
|      |      |      |      |      |              | rw  | rw   |            | rw             | rw | rw | rw | rw        | rw | rw |

Bits 31:27 Reserved, must be kept at reset value.

Bits 26:24 **SYNC\_ID[2:0]**: Synchronization identification

Selects the synchronization input (see [Table 112: DMAMUX: assignment of synchronization inputs to resources](#)).

Bits 23:19 **NBREQ[4:0]**: Number of DMA requests minus 1 to forward

Defines the number of DMA requests to forward to the DMA controller after a synchronization event, and/or the number of DMA requests before an output event is generated.

This field shall only be written when both SE and EGE bits are low.

Bits 18:17 **SPOL[1:0]**: Synchronization polarity

Defines the edge polarity of the selected synchronization input:

00: no event, i.e. no synchronization nor detection.

01: rising edge

10: falling edge

11: rising and falling edge

Bit 16 **SE**: Synchronization enable

0: synchronization disabled

1: synchronization enabled

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **EGE**: Event generation enable

0: event generation disabled

1: event generation enabled

Bit 8 **SOIE**: Synchronization overrun interrupt enable

0: interrupt disabled

1: interrupt enabled

Bit 7 Reserved, must be kept at reset value.

Bits 6:0 **DMAREQ\_ID[6:0]**: DMA request identification

Selects the input DMA request. See the DMAMUX table about assignments of multiplexer inputs to resources.

### 19.6.2 DMAMUX request line multiplexer interrupt channel status register (DMAMUX\_CSR)

Address offset: 0x080

Reset value: 0x0000 0000

|       |       |       |       |       |       |      |      |      |      |      |      |      |      |      |      |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SOF[15:0]**: Synchronization overrun event flag

The flag is set when a synchronization event occurs on a DMA request line multiplexer channel x, while the DMA request counter value is lower than NBREQ.

The flag is cleared by writing 1 to the corresponding CSOFx bit in DMAMUX\_CFR register.

### 19.6.3 DMAMUX request line multiplexer interrupt clear flag register (DMAMUX\_CFR)

Address offset: 0x084

Reset value: 0x0000 0000

|         |         |         |         |         |         |        |        |        |        |        |        |        |        |        |        |

| 15      | 14      | 13      | 12      | 11      | 10      | 9      | 8      | 7      | 6      | 5      | 4      | 3      | 2      | 1      | 0      |
| CSOF 15 | CSOF 14 | CSOF 13 | CSOF 12 | CSOF 11 | CSOF 10 | CSOF 9 | CSOF 8 | CSOF 7 | CSOF 6 | CSOF 5 | CSOF 4 | CSOF 3 | CSOF 2 | CSOF 1 | CSOF 0 |
| w       | w       | w       | w       | w       | w       | w      | w      | w      | w      | w      | w      | w      | w      | w      | w      |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CSOF[15:0]**: Clear synchronization overrun event flag

Writing 1 in each bit clears the corresponding overrun flag SOFx in the DMAMUX\_CSR register.

### 19.6.4 DMAMUX request generator channel x configuration register (DMAMUX\_RGxCR)

Address offset:  $0x100 + 0x04 * x$  ( $x = 0$  to  $7$ )

Reset value:  $0x0000\ 0000$

|      |      |      |      |      |      |      |      |             |      |      |      |      |             |    |    |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | OIE  | Res.        | Res. | Res. | Res. | Res. | SIG_ID[2:0] |    |    |
|      |      |      |      |      |      |      | rw   |             |      |      |      |      | rw          | rw | rw |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:19 **GNBREQ[4:0]**: Number of DMA requests to be generated (minus 1)

Defines the number of DMA requests to be generated after a trigger event. The actual number of generated DMA requests is  $GNBREQ + 1$ .

*Note: This field shall only be written when GE bit is disabled.*

Bits 18:17 **GPOL[1:0]**: DMA request generator trigger polarity

Defines the edge polarity of the selected trigger input

00: no event. I.e. none trigger detection nor generation.

01: rising edge

10: falling edge

11: rising and falling edge

Bit 16 **GE**: DMA request generator channel x enable

0: DMA request generator channel x disabled

1: DMA request generator channel x enabled

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **OIE**: Trigger overrun interrupt enable

0: interrupt on a trigger overrun event occurrence is disabled

1: interrupt on a trigger overrun event occurrence is enabled

Bits 7:3 Reserved, must be kept at reset value.

Bits 2:0 **SIG\_ID[2:0]**: Signal identification

Selects the DMA request trigger input used for the channel x of the DMA request generator

### 19.6.5 DMAMUX request generator interrupt status register (DMAMUX\_RGSR)

Address offset: 0x140

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |

|      |      |      |      |      |      |      |      | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **OF[7:0]**: Trigger overrun event flag

The flag is set when a new trigger event occurs on DMA request generator channel x, before the request counter underrun (the internal request counter programmed via the GNBREQ field of the DMAMUX\_RGxCR register).

The flag is cleared by writing 1 to the corresponding COFx bit in the DMAMUX\_RGCFR register.

### 19.6.6 DMAMUX request generator interrupt clear flag register (DMAMUX\_RGCFR)

Address offset: 0x144

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | COF7 | COF6 | COF5 | COF4 | COF3 | COF2 | COF1 | COF0 |
|      |      |      |      |      |      |      |      | w    | w    | w    | w    | w    | w    | w    | w    |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **COF[7:0]**: Clear trigger overrun event flag

Writing 1 in each bit clears the corresponding overrun flag OFx in the DMAMUX\_RGSR register.

### 19.6.7 DMAMUX size identification register (DMAMUX\_SIDR)

Address offset: 0x3FC

Reset value: 0xA3C5 DD01

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SID[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| SID[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **SID[31:0]**: Size identification

This register identifies an IP size of 1 kB address space.

### 19.6.8 DMAMUX IP identification register (DMAMUX\_IPIDR)

Address offset: 0x3F8

Reset value: 0x0010 0011

This register identifies the IP.

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| ID[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **ID[31:0]**: IP identification

### 19.6.9 DMAMUX version register (DMAMUX\_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0011

This register identifies the IP version.

|      |      |      |      |      |      |      |      |             |      |      |      |             |      |      |      |

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7           | 6    | 5    | 4    | 3           | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MAJREV[3:0] |      |      |      | MINREV[3:0] |      |      |      |
|      |      |      |      |      |      |      |      | r           | r    | r    | r    | r           | r    | r    | r    |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major IP revision

Bits 3:0 **MINREV[3:0]**: Minor IP revision

### 19.6.10 DMAMUX hardware configuration 1 register (DMAMUX\_HWCFGR1)

Address offset: 0x3F0

Reset value: 0x0808 6C10

|                         |    |    |    |    |    |    |    |                      |    |    |    |    |    |    |    |
|-------------------------|----|----|----|----|----|----|----|----------------------|----|----|----|----|----|----|----|

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 20 Graphic processor unit (GPU)

### 20.1 Introduction

The GPU is a dedicated graphics processing unit accelerating numerous 3D graphics applications such as graphical user interface (GUI), menu display or animations.

It works together with an optimized software stack design for industry-standard APIs with support for Android and Linux embedded development platforms.

### 20.2 GPU main features

3D hardware features:

- OpenGL ES 2.0 / 1.1 compliance, including extensions; OpenVG 1.1
- IEEE 32-bit floating-point pipeline
- Ultra-threaded, unified vertex and fragment (pixel) shaders
- Low bandwidth at both high and low data rates
- Low CPU loading
- Up to 12 programmable elements per vertex
- Dependent texture operation with high-performance
- Alpha blending
- Depth and stencil compare
- Support for 8 fragment shader simultaneous textures
- Support for 4 vertex shader simultaneous textures
- Point sampling, bi-linear sampling, tri-linear filtering, and cubic textures
- 8k x 8k texture size and 8 k x 8 k rendering target
- 4 Vertex DMA streams

API support:

- OpenGL ES 1.1 and 2.0
- OpenVG 1.1
- EGL 1.4
- OpenGL 2.1

## 21 Interrupt list

### 21.1 NVIC interrupts

Table 116. STM32MP157 interrupt mapping for Cortex®-M4

| Position | Priority | Type of priority | Acronym        | Description                                     | Address                         | EXTI event (1) |

1. - The absence of parenthesis around EXTI event numbers indicates that the EXTI output is connected to the NVIC. The EXTI configuration may impact the interrupt line state (i.e. EXTI may mask the interrupt).  
- The presence of parenthesis () around EXTI event numbers indicates that the EXTI output is not connected to the NVIC. The EXTI configuration cannot impact the interrupt line state.  
See [Section 24: Extended interrupt and event controller \(EXTI\)](#) for details.
2. Check device datasheet for availability.

## 21.2 GIC Interrupts

Table 117. STM32MP157 interrupt mapping for Cortex®-A7 GIC

| Num                                | ID | Acronym | Description                                             | EXTI event (1) |
|------------------------------------|----|---------|---------------------------------------------------------|----------------|
| <b>SGI (Rising Edge triggered)</b> |    |         |                                                         |                |
| 0                                  | 0  | SGI0    | software generated interrupt 0 (recommended non-secure) | -              |
| 1                                  | 1  | SGI1    | software generated interrupt 1 (recommended non-secure) | -              |
| 2                                  | 2  | SGI2    | software generated interrupt 2 (recommended non-secure) | -              |
| 3                                  | 3  | SGI3    | software generated interrupt 3 (recommended non-secure) | -              |
| 4                                  | 4  | SGI4    | software generated interrupt 4 (recommended non-secure) | -              |
| 5                                  | 5  | SGI5    | software generated interrupt 5 (recommended non-secure) | -              |
| 6                                  | 6  | SGI6    | software generated interrupt 6 (recommended non-secure) | -              |
| 7                                  | 7  | SGI7    | software generated interrupt 7 (recommended non-secure) | -              |
| 8                                  | 8  | SGI8    | software generated interrupt 8 (recommended secure)     | -              |
| 9                                  | 9  | SGI9    | software generated interrupt 9 (recommended secure)     | -              |
| 10                                 | 10 | SGI10   | software generated interrupt 10 (recommended secure)    | -              |
| 11                                 | 11 | SGI11   | software generated interrupt 11 (recommended secure)    | -              |
| 12                                 | 12 | SGI12   | software generated interrupt 12 (recommended secure)    | -              |
| 13                                 | 13 | SGI13   | software generated interrupt 13 (recommended secure)    | -              |
| 14                                 | 14 | SGI14   | software generated interrupt 14 (recommended secure)    | -              |
| 15                                 | 15 | SGI15   | software generated interrupt 15 (recommended secure)    | -              |

| 212 to 255 | 244 to 287 | -                | Reserved                                                         | -              |

- The absence of parenthesis around EXTI event numbers indicates that the EXTI output is connected to the GIC. The EXTI configuration may impact the interrupt line state (i.e. EXTI may mask the interrupt).
  - The presence of parenthesis () around EXTI event numbers indicates that the EXTI output is not connected to the GIC. The EXTI configuration cannot impact the interrupt line state.

See [Section 24: Extended interrupt and event controller \(EXTI\)](#) for details.
- Check device datasheet for availability.

## 21.3 EXTI events

Table 118. STM32MP157 EXTI Events

| Event Input | Source                                           | Event type   | Wakeup target | Connection to rxev | TrustZone |
|-------------|--------------------------------------------------|--------------|---------------|--------------------|-----------|
| 0           | EXTI[0]                                          | Configurable | MPU & MCU     | Yes                | Yes       |

## 22 Nested Vectored Interrupt Controllers (NVIC)

### 22.1 NVIC features

The nested vector interrupt controller NVIC includes the following features:

- 150 maskable interrupt channels
- 16 programmable priority levels (4 bits of interrupt priority are used)
- Low-latency exception and interrupt handling
- Power management control
- Implementation of system control registers

The NVIC and the Cortex-M4 processor core are closely coupled, which enables low latency interrupt processing and efficient processing of late arriving interrupts.

All the interrupts including the Cortex-M4 core exceptions are managed by the NVIC. For more information on exceptions and NVIC programming, refer to Cortex<sup>®</sup>-M4 programming manual PM0214.

### 22.2 SysTick calibration value register

As the SysTick is not running on a fixed frequency, there is no SysTick calibration value available. The SysTick reload counter should be set according to the required time base and the `mcu_ck` frequency value set in RCC.

### 22.3 Interrupt and exception vectors

See the interrupt tables for STM32MP157 devices in *Interrupt list* section.

## 23 Global interrupt controller (GIC)

### 23.1 Introduction

The following Arm® specifications provides additional details on the GIC:

- Arm® Generic Interrupt Controller - Architecture Specification v2.0
- Cortex®-A7 MPCore Technical Reference Manual Revision: r0p5

### 23.2 GIC main features

The integrated GIC collates and arbitrates from a large number of interrupt sources.

It provides:

- Masking of interrupts
- Prioritization of interrupts
- Distribution of the interrupts to the target processors
- Tracking the status of interrupts
- Generation of interrupts by software
- Support for security extensions
- Support for virtualization extensions

### 23.3 GIC functional description

The GIC is a single functional unit located in the Cortex-A7 MPCore processor. The GIC consists of a shared distributor block and several CPU interfaces. For each processor in the multiprocessor device, there is:

- one CPU interface
- a virtual interface control
- a virtual CPU interface.

The GIC registers are memory-mapped, and the base address is visible into the configuration base address (CBAR) for each processor in the cluster.

Memory regions used for these registers must be marked as device or strongly-ordered in the translation tables.

Memory regions marked as normal memory cannot access any of the GIC registers, instead access caches or external memory as required.

*Figure 139* shows the GIC block diagram.

Figure 139. GIC block diagram

## 23.4 Interrupt sources

All interrupt sources are identified by a unique ID.

The Cortex-A7 MPCore processor has the following interrupt sources:

### 23.4.1 Software generated interrupts (SGI)

SGIs are generated by writing to the software generated interrupt register (GICD\_SGIR). A maximum of 16 SGIs, ID0-ID15, can be generated for each processor interface. An SGI has edge-triggered properties. The software triggering of the interrupt is equivalent to the edge transition of the interrupt signal on a peripheral input.

Arm recommends to use SGI ID0-ID7 for non-secure interrupts and SGI ID8-ID15 for secure interrupts.

### 23.4.2 Private peripheral interrupts (PPI)

A PPI is an interrupt generated by a peripheral that is specific to a single processor. There are seven PPIs for each CPU interface:

#### Legacy nFIQ signal (PPI0) - NOT USED

When the GIC interrupt bypass is in effect, such as after reset, the external nFIQ signal bypasses the interrupt distributor logic and directly drives the interrupt request to the corresponding processor.

When a processor uses the GIC rather than the external nFIQ signal, by enabling its own CPU interface, the nFIQ signal is treated like other interrupt lines and uses ID28. The interrupt is active-low level-sensitive.

#### Secure physical timer event (PPI1)

This is the event generated from the secure physical timer and uses ID29. The interrupt is level-sensitive.

#### Non-secure physical timer event (PPI2)

This is the event generated from the non-secure physical timer and uses ID30. The interrupt is level-sensitive.

#### Legacy nIRQ signal (PPI3) - NOT USED

When the GIC interrupt bypass is in effect, such as after reset, the external nIRQ signal bypasses the interrupt distributor logic and directly drives the interrupt request to the corresponding processor.

When a processor uses the GIC rather than the external nIRQ signal, by enabling its own CPU interface, the nIRQ signal is treated like other interrupt lines and uses ID31. The interrupt is active-low level-sensitive.

#### Virtual timer event (PPI4)

This is the event generated from the virtual timer and uses ID27. The interrupt is level-sensitive.

#### Hypervisor timer event (PPI5)

This is the event generated from the physical timer in hypervisor mode and uses ID26. The interrupt is level-sensitive.

#### Virtual maintenance interrupt (PPI6)

The virtualization extensions support in the Arm Generic Interrupt Controller Architecture Specification, permits for a maintenance interrupt to be generated under several conditions. The virtual maintenance interrupt uses ID25. The interrupt is level-sensitive.

### 23.4.3 Shared peripheral interrupts (SPI)

SPIs are triggered by events generated on associated interrupt input lines. The GIC supports up to 256 SPIs corresponding to the external IRQS signal.

SPIs start at ID32. The SPIs can be configured to be edge-triggered or active-high level-sensitive.

### 23.4.4 Interrupt priority formats

The Cortex-A7 MPCore processor implements a 5-bit version of the interrupt priority field for 32 interrupt priority levels.

## 23.5 GIC distributor (GICD)

The GIC distributor (GICD) centralizes all interrupt sources, determines the priority of each interrupt, and, for each CPU interface, forwards the interrupt with the highest priority to the interface for priority masking and preemption handling.

The GICD provides a programming interface for:

- globally enabling the forwarding of interrupts to the CPU interfaces
- enabling or disabling each interrupt
- setting the priority level of each interrupt
- setting the target processor list of each interrupt
- setting each peripheral interrupt to be level-sensitive or edge-triggered
- setting each interrupt as either group 0 or group 1
- sending an SGI to one or more target processors
- visibility of the state of each interrupt
- a mechanism for software to set or clear the pending state of a peripheral interrupt.

The GICD\_IPRIORITYRx, GICD\_ITARGETSRx, GICD\_CPENDSGIRx, and GICD\_SPENDSGIRx registers are byte-accessible and halfword-accessible.

All other registers are word-accessible.

### 23.5.1 GICD control register (GICD\_CTLR)

Address offset: 0x000

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |            |            |

|      |      |      |      |      |      |      |      |      |      |      |      |      |      | rw         | rw         |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **ENABLEGRP1**: enable group 1 interrupts

Global enable for forwarding pending group 1 interrupts from the GICD to the CPU interfaces

Bit 0 **ENABLEGRP0**: enable group 0 interrupts

Global enable for forwarding pending group 0 interrupts from the GICD to the CPU interfaces

### 23.5.2 GICD control non-secure access register (GICD\_CTLRNS)

Address offset: 0x000

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |        |

| 15        | 14   | 13   | 12   | 11   | 10           | 9    | 8    | 7              | 6    | 5    | 4                  | 3    | 2    | 1    | 0    |
| LSPI[4:0] |      |      |      |      | SECURITYEXTN | Res. | Res. | CPUNUMBER[2:0] |      |      | ITLINESNUMBER[4:0] |      |      |      |      |
| r         | r    | r    | r    | r    | r            |      |      | r              | r    | r    | r                  | r    | r    | r    | r    |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:11 **LSPI[4:0]**: lockable shared peripheral interrupt

Returns the number of LSPIs that the interrupt controller contains (0b1111 = 31 LSPIs, these are the interrupts of IDs 32-62).

Bit 10 **SECURITYEXTN**: security extension

Indicates whether the GIC implements the security extensions. This bit always returns a value of 1, indicating that the security extensions are implemented.

Bits 9:8 Reserved, must be kept at reset value.

Bits 7:5 **CPUNUMBER[2:0]**: number of processors interfaces

Indicates the number of implemented processors interfaces in the GIC (0b001 = 2 processors)

Bits 4:0 **ITLINESNUMBER[4:0]**: number of interrupt lines

Indicates the number of interrupts that the GIC supports (0b01000 = Up to 288 interrupts, 256 external interrupts)

### 23.5.4 GICD implementer identification register (GICD\_IIDR)

Address offset: 0x008

Reset value: 0x0100 143B

|                |    |    |    |                   |    |    |    |      |      |      |      |              |    |    |    |
|----------------|----|----|----|-------------------|----|----|----|------|------|------|------|--------------|----|----|----|

| NSATT | Res. | Res. | Res. | Res. | Res. | Res.                  | Res. | Res. | Res. | Res. | Res. | SGIINTID[3:0] |      |                    |    |
| w     |      |      |      |      |      |                       |      |      |      |      |      |               |      |                    |    |

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **TARGETLISTFILTER[1:0]**: target list filter

Determines how the distributor must process the requested SGI

0: Forward the interrupt to the CPU interfaces specified in the CPUTARGETLIST field

1: Forward the interrupt to all CPU interfaces except the processor which requested the interrupt

2: Forward the interrupt only to the CPU interface of the processor which requested the interrupt

3: Reserved, must be kept at reset value.

Bits 23:18 Reserved, must be kept at reset value.

Bits 17:16 **CPUTARGETLIST[1:0]**: CPU target list

When TARGETLISTFILTER = 0b00, defines the CPU interfaces to which the GICD must forward the interrupt. Each bit of CPUTARGETLIST[1:0] refers to the corresponding CPU interface. If this field is 0 when TARGETLISTFILTER is 0b00, the GICD does not forward the interrupt to any CPU interface.

Bit 15 **NSATT**: non-secure attribute

It specifies the required security value of the SGI:

0 - Forward the SGI specified in the SGIINTID field to a specified CPU interface only if the SGI is configured as group 0 on that interface.

1 - Forward the SGI specified in the SGIINTID field to a specified CPU interfaces only if the SGI is configured as group 1 on that interface.

This field is writable only by a secure access. Any non-secure write to the GICD\_SGIR generates an SGI only if the specified SGI is programmed as group 1.

Bits 14:4 Reserved, must be kept at reset value.

Bits 3:0 **SGIINTID[3:0]**: SGI interrupt ID

The value of this field is the interrupt ID of the SGI to forward to the specified CPU interfaces, in the range 0-15 (for example: a value of 0b0011 specifies interrupt ID 3).

### 23.5.23 GICD SGI clear-pending register x (GICD\_CPENDSGIRx)

Address offset:  $0xF10 + 0x4 * x$ , ( $x = 0$  to 3)

Reset value: 0x0000 0000

For SGI  $x * 4$  to SGI  $x * 4 + 3$

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **SGI\_CLEAR\_PENDING3[1:0]**: clear-pending state for SGI  $[x * 4 + 3]$

Writing a 1 clears the pending state of the SGI  $[x * 4 + 3]$  for the corresponding source processor, and no longer targets the processor performing the write.

Writing a 0 has no effect.

Reading a bit identifies whether the SGI  $[x * 4 + 3]$  is pending, from the corresponding source processor, on the reading processor.

Bits 23:18 Reserved, must be kept at reset value.

Bits 17:16 **SGI\_CLEAR\_PENDING2[1:0]**: clear-pending state for SGI  $[x * 4 + 2]$

Writing a 1 clears the pending state of the SGI  $[x * 4 + 2]$  for the corresponding source processor, and no longer targets the processor performing the write.

Writing a 0 has no effect.

Reading a bit identifies whether the SGI  $[x * 4 + 2]$  is pending, from the corresponding source processor, on the reading processor.

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:8 **SGI\_CLEAR\_PENDING1[1:0]**: clear-pending state for SGI  $[x * 4 + 1]$

Writing a 1 clears the pending state of the SGI  $[x * 4 + 1]$  for the corresponding source processor, and no longer targets the processor performing the write.

Writing a 0 has no effect.

Reading a bit identifies whether the SGI  $[x * 4 + 1]$  is pending, from the corresponding source processor, on the reading processor.

Bits 7:2 Reserved, must be kept at reset value.

Bits 1:0 **SGI\_CLEAR\_PENDING0[1:0]**: clear-pending state for SGI  $[x * 4]$

Writing a 1 clears the pending state of the SGI  $[x * 4]$  for the corresponding source processor, and no longer targets the processor performing the write.

Writing a 0 has no effect.

Reading a bit identifies whether the SGI  $[x * 4]$  is pending, from the corresponding source processor, on the reading processor.

### 23.5.24 GICD SGI set-pending register x (GICD\_SPENDSGIRx)

Address offset:  $0xF20 + 0x4 * x$ , ( $x = 0$  to  $3$ )

Reset value:  $0x0000\ 0000$

For SGI  $x * 4$  to SGI  $x * 4 + 3$

|      |      |      |      |      |      |                       |    |      |      |      |      |      |      |                       |    |

| Res. | Res. | Res. | Res. | Res. | Res. | SGI_SET_PENDING1[1:0] |    | Res. | Res. | Res. | Res. | Res. | Res. | SGI_SET_PENDING0[1:0] |    |
|      |      |      |      |      |      | rw                    | rw |      |      |      |      |      |      | rw                    | rw |

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **SGI\_SET\_PENDING3[1:0]**: set-pending state for SGI  $[x * 4 + 3]$

Writing a 1 sets the pending state of the SGI  $[x * 4 + 3]$  for the corresponding source processor.

Writing a 0 has no effect.

Reading a bit identifies whether the SGI  $[x * 4 + 3]$  is pending, from the corresponding source processor, on the reading processor.

Bits 23:18 Reserved, must be kept at reset value.

Bits 17:16 **SGI\_SET\_PENDING2[1:0]**: set-pending state for SGI  $[x * 4 + 2]$

Writing a 1 sets the pending state of the SGI  $[x * 4 + 2]$  for the corresponding source processor.

Writing a 0 has no effect.

Reading a bit identifies whether the SGI  $[x * 4 + 2]$  is pending, from the corresponding source processor, on the reading processor.

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:8 **SGI\_SET\_PENDING1[1:0]**: set-pending state for SGI  $[x * 4 + 1]$

Writing a 1 sets the pending state of the SGI  $[x * 4 + 1]$  for the corresponding source processor.

Writing a 0 has no effect.

Reading a bit identifies whether the SGI  $[x * 4 + 1]$  is pending, from the corresponding source processor, on the reading processor.

Bits 7:2 Reserved, must be kept at reset value.

Bits 1:0 **SGI\_SET\_PENDING0[1:0]**: set-pending state for SGI  $[x * 4]$

Writing a 1 sets the pending state of the SGI  $[x * 4]$  for the corresponding source processor.

Writing a 0 has no effect.

Reading a bit identifies whether the SGI  $[x * 4]$  is pending, from the corresponding source processor, on the reading processor.

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 23.6 GIC CPU Interface (GICC)

Each CPU interface provides a programming interface for:

- enabling the signaling of interrupt requests by the CPU interface
- acknowledging an interrupt
- indicating completion of the processing of an interrupt
- setting an interrupt priority mask for the processor
- defining the preemption policy for the processor
- determining the highest priority pending interrupt for the processor.

All the registers are word-accessible.

### 23.6.1 GICC control register (GICC\_CTLR)

Address offset: 0x000

Reset value: 0bxxxx xxxx xxxx xxxx xxxx x000 0000 0000

|      |      |      |      |      |           |          |               |               |               |               |      |       |        |            |            |
|------|------|------|------|------|-----------|----------|---------------|---------------|---------------|---------------|------|-------|--------|------------|------------|
| 31   | 30   | 29   | 28   | 27   | 26        | 25       | 24            | 23            | 22            | 21            | 20   | 19    | 18     | 17         | 16         |
| Res. | Res. | Res. | Res. | Res. | Res.      | Res.     | Res.          | Res.          | Res.          | Res.          | Res. | Res.  | Res.   | Res.       | Res.       |
|      |      |      |      |      |           |          |               |               |               |               |      |       |        |            |            |
| 15   | 14   | 13   | 12   | 11   | 10        | 9        | 8             | 7             | 6             | 5             | 4    | 3     | 2      | 1          | 0          |
| Res. | Res. | Res. | Res. | Res. | EOIMODENS | EOIMODES | IRQBYPDISGRP1 | FIQBYPDISGRP1 | IRQBYPDISGRP0 | FIQBYPDISGRP0 | CBPR | FIQEN | ACKCTL | ENABLEGRP1 | ENABLEGRP0 |
|      |      |      |      |      | rw        | rw       | rw            | rw            | rw            | rw            | rw   | rw    | rw     | rw         | rw         |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **EOIMODENS**: Alias of EOIMODENS from the non-secure copy of this register.

Bit 9 **EOIMODES**:EOI mode for secure accesses

Controls the behavior of accesses to GICC\_EOIR and GICC\_DIR registers. This control applies only to secure accesses.

Bit 8 **IRQBYPDISGRP1**: Alias of IRQBYPDISGRP1 from the non-secure copy of this register.

Bit 7 **FIQBYPDISGRP1**: Alias of FIQBYPDISGRP1 from the non-secure copy of this register.

Bit 6 **IRQBYPDISGRP0**: IRQ bypass disable for group 0 interrupts

When the signaling of IRQs by the CPU interface is disabled, this bit partly controls whether the bypass IRQ signal is signaled to the processor.

Bit 5 **FIQBYPDISGRP0**: FIQ bypass disable for group 0 interrupts

When the signaling of FIQs by the CPU interface is disabled, this bit partly controls whether the bypass FIQ signal is signaled to the processor.

Bit 4 **CBPR**: BPR control

Controls whether the GICC\_BPR provides common control to group 0 and group 1 interrupts.

Bit 3 **FIQEN**: FIQ enable for group 0 interrupts

Controls whether the CPU interface signals group 0 interrupts to a target processor using the FIQ or the IRQ signal.

The GIC always signals group 1 interrupts using the IRQ signal.

Bit 2 **ACKCTL**: Acknowledge control

When the highest priority pending interrupt is a group 1 interrupt, this bit determines both:

- whether a read of GICC\_IAR acknowledges the interrupt, or returns a spurious interrupt ID
- whether a read of GICC\_HPIR returns the ID of the highest priority pending interrupt, or returns a spurious interrupt ID.

Arm deprecates use of this bit and strongly recommends using a software model where this bit is set to 0.

Bit 1 **ENABLEGRP1**: Enable group 1 interrupts

It enables for the signaling of group 1 interrupts by the CPU interface to the connected processor.

Bit 0 **ENABLEGRP0**: Enable group 0 interrupts

It enables for the signaling of group 0 interrupts by the CPU interface to the connected processor.

### 23.6.2 GICC control non-secure access register (GICC\_CTLRNS)

Address offset: 0x000

Reset value: 0bxxxx xxxx xxxx xxxx xx0x x00x xxx0

|      |      |      |      |      |      |           |      |      |               |               |      |      |      |      |            |

| Res. | Res. | Res. | Res. | Res. | Res. | EOIMODENS | Res. | Res. | IRQBYPDISGRP1 | FIQBYPDISGRP1 | Res. | Res. | Res. | Res. | ENABLEGRP1 |
|      |      |      |      |      |      | rw        |      |      | rw            | rw            |      |      |      |      | rw         |

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **EOIMODENS**: EOI mode for non-secure accesses

It controls the behavior of accesses to GICC\_EOIR and GICC\_DIR registers.

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 **IRQBYPDISGRP1**: IRQ bypass for group 1 interrupts

When the signaling of IRQs by the CPU interface is disabled, this bit partly controls whether the bypass IRQ signal is signaled to the processor.

Bit 5 **FIQBYPDISGRP1**: FIQ bypass disable for group 1 interrupts

When the signaling of FIQs by the CPU interface is disabled, this bit partly controls whether the bypass FIQ signal is signaled to the processor.

Bits 4:1 Reserved, must be kept at reset value.

Bit 0 **ENABLEGRP1**: Enable group1 interrupts

Enable for the signaling of group 1 interrupts by the CPU interface to the connected processor.

### 23.6.3 GICC input priority mask register (GICC\_PMR)

Address offset: 0x004

Reset value: 0bxxxx xxxx xxxx xxxx xxxx xxxx 0000 0xxx

|      |      |      |      |      |      |      |      |               |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|---------------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23            | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.          | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |               |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7             | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PRIORITY[4:0] |      |      |      |      | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      | rw            | rw   | rw   | rw   | rw   |      |      |      |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:3 **PRIORITY[4:0]**: priority mask level for the CPU interface

If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the processor.

Bits 2:0 Reserved, must be kept at reset value.

### 23.6.4 GICC binary point register (GICC\_BPR)

Address offset: 0x008

Reset value: 0bxxxx xxxx xxxx xxxx xxxx xxxx x010

|      |      |      |      |      |      |      |      |      |      |      |      |      |                   |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|-------------------|------|------|

|      |      |      |      |      |      |      |      |      |      |      |      |      | rw                | rw   | rw   |

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **BINARY\_POINT[2:0]**:

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field. It is used to determine interrupt preemption and a sub-priority field. Minimum value is 2.

### 23.6.5 GICC binary point non-secure access register (GICC\_BPRNS)

Address offset: 0x008

Reset value: 0bxxxx xxxx xxxx xxxx xxxx xxxx x011

|      |      |      |      |      |      |      |      |      |      |      |      |      |                   |      |      |

|      |      |      |      |      |       | r                 | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

For SGIs in a multiprocessor implementation, this field identifies the processor that requested the interrupt. It returns the number of the CPU interface that made the request.

For example, a value of 1 means the request was generated by a write to the GICD\_SGIR on CPU interface 1.

Bits 9:0 **INTERRUPT\_ID[9:0]**: The interrupt ID

### 23.6.7 GICC end of interrupt register (GICC\_EOIR)

Address offset: 0x010

Reset value: 0xFFFF XXXX

|      |      |      |      |      |       |               |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|-------|---------------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26    | 25            | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res.  | Res.          | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |       |               |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10    | 9             | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | CPUID | EOIINTID[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      | w     | w             | w    | w    | w    | w    | w    | w    | w    | w    | w    |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

On a multiprocessor implementation, if the write refers to an SGI, this field contains the CPUID value from the corresponding GICC\_IAR access.

Bits 9:0 **EOIINTID[9:0]**:

It contains the interrupt ID value from the corresponding GICC\_IAR access.

### 23.6.8 GICC running priority register (GICC\_RPR)

Address offset: 0x014

Reset value: 0bxxxx xxxx xxxx xxxx xxxx 1111 1111

|      |      |      |      |      |      |      |      |               |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|---------------|------|------|------|------|------|------|------|

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:3 **PRIORITY[4:0]**: current running priority on the CPU interface

Bits 2:0 Reserved, must be kept at reset value.

### 23.6.9 GICC highest priority pending interrupt register (GICC\_HPPIR)

Address offset: 0x018

Reset value: 0bxxxx xxxx xxxx xxxx xxx0 0011 1111 1111

|      |      |      |      |      |       |                |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|-------|----------------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26    | 25             | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res.  | Res.           | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |       |                |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10    | 9              | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | CPUID | PENDINTID[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      | r     | r              | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

On a multiprocessor implementation, if the PENDINTID field returns the ID of an SGI, this field contains the CPUID value for that interrupt. This identifies the processor that generated the interrupt.

Bits 9:0 **PENDINTID[9:0]**: interrupt ID of the highest-priority pending interrupt

### 23.6.10 GICC aliased binary point register (GICC\_ABPR)

Address offset: 0x01C

Reset value: 0bxxxx xxxx xxxx xxxx xxxx xxxx x011

GICC\_ABPR is an alias of the non-secure GICC\_BPR. When GICC\_CTLR.CBPR is set to 0, a secure access to this register is equivalent to a non-secure access to GICC\_BPR.

|      |      |      |      |      |      |      |      |      |      |      |      |      |                   |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|-------------------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18                | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.              | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |                   |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2                 | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | BINARY_POINT[2:0] |      |      |
|      |      |      |      |      |      |      |      |      |      |      |      |      | rw                | rw   | rw   |

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **BINARY\_POINT[2:0]**:

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field. It is used to determine interrupt preemption, and a subpriority field. Minimum value is 3.

### 23.6.11 GICC aliased interrupt acknowledge register (GICC\_AIAR)

Address offset: 0x020

Reset value: 0bxxxx xxxx xxxx xxxx x011 1111 1111

GICC\_AIAR is an alias of the non-secure view of GICC\_IAR. A secure access to this register is identical to a non-secure access to GICC\_IAR.

|      |      |      |      |      |       |                   |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|-------|-------------------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26    | 25                | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res.  | Res.              | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |       |                   |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10    | 9                 | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | CPUID | INTERRUPT_ID[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      | r     | r                 | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

For SGIs in a multiprocessor implementation, this field identifies the processor that requested the interrupt. It returns the number of the CPU interface that made the request.

For example, a value of 1 means the request was generated by a write to the GICD\_SGIR on CPU interface 1.

Bits 9:0 **INTERRUPT\_ID[9:0]**: interrupt ID

### 23.6.12 GICC aliased end of interrupt register (GICC\_AEOIR)

Address offset: 0x024

Reset value: 0xXXXX XXXX

GICC\_AEOIR is an alias of the Non-secure GICC\_EOIR. A secure access to this register is similar to a non-secure access to GICC\_EOIR, except that the GICC\_CTLR.EOImodeS bit is used.

|      |      |      |      |      |       |              |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|-------|--------------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26    | 25           | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res.  | Res.         | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |       |              |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10    | 9            | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | CPUID | EOINTID[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      | w     | w            | w    | w    | w    | w    | w    | w    | w    | w    | w    |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

On a multiprocessor implementation, when processing an SGI, this field must contain the CPUID value from the corresponding GICC\_AIAR, or non-secure GICC\_IAR, access.

Bits 9:0 **EOINTID[9:0]**:

It contains the interrupt ID value from the corresponding GICC\_AIAR, or non-secure GICC\_IAR, access.

### 23.6.13 GICC aliased highest priority pending interrupt register (GICC\_AHPPIR)

Address offset: 0x028

Reset value: 0bxxxx xxxx xxxx xxx0 0011 1111 1111

ICC\_AHPPIR is an alias of the non-secure GICC\_HPPIR. A secure access to this register is equivalent to a non-secure access to GICC\_HPPIR.

|      |      |      |      |      |       |                |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|-------|----------------|------|------|------|------|------|------|------|------|------|

| 15   | 14   | 13   | 12   | 11   | 10    | 9              | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | CPUID | PENDINTID[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      | r     | r              | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

On a multiprocessor implementation, if the PENDINTID field returns the ID of an SGI, this field contains the CPUID value for that interrupt. This identifies the processor that generated the interrupt.

Bits 9:0 **PENDINTID[9:0]**: interrupt ID of the highest-priority pending interrupt

It contains the interrupt ID of the highest-priority pending interrupt. If that interrupt is a group 1 interrupt, its value is the spurious interrupt ID, 1023.

### 23.6.14 GICC active priority register (GICC\_APR0)

Address offset: 0x0D0

Reset value: 0x0000 0000

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| 15   | 14   | 13   | 12   | 11   | 10    | 9                 | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | CPUID | INTERRUPT_ID[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      |       | w                 | w    | w    | w    | w    | w    | w    | w    | w    | w    |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:CPU ID

For an SGI in a multiprocessor implementation, this field identifies the processor that requested the interrupt

Bits 9:0 **INTERRUPT\_ID[9:0]**: interrupt ID

## 23.6.18 GICC register map

Table 120. GICC register map and reset values

| Offset | Register    | 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   | 15   | 14   | 13   | 12   | 11   | 10       | 9                 | 8    | 7             | 6    | 5    | 4    | 3    | 2    | 1                 | 0    |   |  |  |  |  |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 23.7 GIC virtual interface control, common (GICH)

The virtual interface control registers are management registers. Configuration software on the Cortex-A7 MPCore processor must ensure they are accessible only by a hypervisor or similar software.

All the registers are word-accessible.

### 23.7.1 GICH hypervisor control register (GICH\_HCR)

Address offset: 0x000

Reset value: 0b0000 0xxx xxxx xxxx xxxx 0000 0000

|               |      |      |      |      |      |      |      |          |          |          |          |      |         |      |      |

Bits 31:27 **EOICOUNT[4:0]**: end-of-interrupt counter

Counts the number of EOIs received that do not have a corresponding entry in the list registers. The virtual CPU interface increments this field automatically when a matching EOI is received. When EOIs that do not clear a bit in the active priorities register, GICH\_APR does not cause an increment.

Although not possible under correct operation, if an EOI occurs when the value of this field is 31, this field wraps to 0.

The maintenance interrupt is asserted whenever this field is non-zero and the LRENPIE bit is set to 1.

Bits 26:8 Reserved, must be kept at reset value.

Bit 7 **VGRP1DIE**: virtual machine disable group 1 interrupt enable

Enables the signaling of a maintenance interrupt while signaling of group 1 interrupts from the virtual CPU interface to the connected virtual machine, is disabled.

Bit 6 **VGRP1EIE**: virtual machine enable group 1 interrupt enable

Enables the signaling of a maintenance interrupt while signaling of group 1 interrupts from the virtual CPU interface to the connected virtual machine, is enabled.

Bit 5 **VGRP0DIE**: virtual machine disable group 0 interrupt enable

Enables the signaling of a maintenance interrupt while signaling of group 0 interrupts from the virtual CPU interface to the connected virtual machine, is disabled.

Bit 4 **VGRP0EIE**: virtual machine enable group 0 interrupt enable

Enables the signaling of a maintenance interrupt while signaling of group 0 interrupts from the virtual CPU interface to the connected virtual machine, is enabled.

Bit 3 **NPIE**: no pending interrupt enable

Enables the signaling of a maintenance interrupt while no pending interrupts are present in the list registers.

Bit 2 **LRENPIE**: list register entry not present interrupt enable

Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid list register entry for an EOI request.

Bit 1 **UIE**: underflow interrupt enable.

Enables the signaling of a maintenance interrupt when the list registers are empty, or hold only one valid entry.

Bit 0 **EN**: global enable bit for the virtual CPU interface

### 23.7.2 GICH VGIC type register (GICH\_VTR)

Address offset: 0x004

Reset value: 0x9000 0003

|              |      |      |              |      |      |      |      |      |      |      |               |      |      |      |      |

Bits 31:29 **PRIBITS[2:0]**: priority bits

Indicates the number of priority bits implemented, minus one.

For example, 0x4 means 5 bits of priority and 32 priority levels.

Bits 28:26 **PREBITS[2:0]**: preemption bits

Indicates the number of preemption bits implemented, minus one.

For example, 0x4 means 5 bits of preemption and 32 preemption levels

Bits 25:5 Reserved, must be kept at reset value.

Bits 4:0 **LISTREGS[4:0]**: list registers

Indicates the number of implemented list registers, minus one.

For example, 0x3 means 4 list registers.

### 23.7.3 GICH virtual machine control register (GICH\_VMCR)

Address offset: 0x008

Reset value: 0b0000 0xxx 0100 11x1 xxxx xx0x xxx0 0000

|                |      |      |      |      |      |      |      |           |      |      |            |         |          |          |          |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **VGRP1D**: disabled group 1 maintenance interrupt

Asserted whenever GICH\_HCR.VGRP1DIE is set and GICH\_VMCR.VMGRP1EN=0.

Bit 6 **VGRP1E**: enabled group 1 maintenance interrupt

Asserted whenever GICH\_HCR.VGRP1EIE is set and GICH\_VMCR.VMGRP1EN=1.

Bit 5 **VGRP0D**: disabled group 0 maintenance interrupt

Asserted whenever GICH\_HCR.VGRP0DIE is set and GICH\_VMCR.VMGRP0EN=0.

Bit 4 **VGRP0E**: enabled group 0 maintenance interrupt

Asserted whenever GICH\_HCR.VGRP0EIE is set and GICH\_VMCR.VMGRP0EN=1.

Bit 3 **NP**: no pending maintenance interrupt

Asserted whenever GICH\_HCR.NPIE=1 and no list register is in pending state.

Bit 2 **LREN**P: list register entry not present maintenance interrupt

Asserted whenever GICH\_HCR.LRENPIE=1 and GICH\_HCR.EOICOUNT is non-zero.

Bit 1 **U**: underflow maintenance interrupt

Asserted whenever GICH\_HCR.UIE is set and if none, or only one, of the list register entries are marked as a valid interrupt, that is, if the corresponding GICH\_LR $x$ .STATE bits do not equal 0x0.

Bit 0 **EOI**: End of interrupt maintenance interrupt

Asserted whenever at least one list register is asserting an EOI Interrupt., which means at least one bit in GICH\_EISR $x$ =1.

### 23.7.5 GICH end of interrupt status register (GICH\_EISR0)

Address offset: 0x020

Reset value: 0bxxxx xxxx xxxx xxxx xxxx xxxx 0000

|              |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| APR0[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **APR0[31:0]**: active priority

### 23.7.8 GICH list register x (GICH\_LRx)

Address offset: 0x100 + 0x4 \* x, (x = 0 to 3)

Reset value: 0x0000 0000

|                 |      |            |    |               |    |                |    |    |      |      |      |                 |    |    |    |
|-----------------|------|------------|----|---------------|----|----------------|----|----|------|------|------|-----------------|----|----|----|
| 31              | 30   | 29         | 28 | 27            | 26 | 25             | 24 | 23 | 22   | 21   | 20   | 19              | 18 | 17 | 16 |
| HW              | GRP1 | STATE[1:0] |    | PRIORITY[4:0] |    |                |    |    | Res. | Res. | Res. | PHYSICALID[9:6] |    |    |    |
| rw              | rw   | rw         | rw | rw            | rw | rw             | rw | rw |      |      |      | rw              | rw | rw | rw |
| 15              | 14   | 13         | 12 | 11            | 10 | 9              | 8  | 7  | 6    | 5    | 4    | 3               | 2  | 1  | 0  |
| PHYSICALID[5:0] |      |            |    |               |    | VIRTUALID[9:0] |    |    |      |      |      |                 |    |    |    |
| rw              | rw   | rw         | rw | rw            | rw | rw             | rw | rw | rw   | rw   | rw   | rw              | rw | rw | rw |

Bit 31 **HW**: hardware interrupt

Indicates whether this virtual interrupt is a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the ID that the PhysicalID field indicates.

Bit 30 **GRP1**: Indicates whether this virtual interrupt is a group 1 virtual interrupt

Bits 29:28 **STATE[1:0]**: state of the interrupt

Bits 27:23 **PRIORITY[4:0]**: priority of the interrupt

Bits 22:20 Reserved, must be kept at reset value.

Bits 19:10 **PHYSICALID[9:0]**: physical ID

The function of this bit depends on the value of the GICH\_LR.HW bit, as follows.

1) When GICH\_LR.HW is set to 0, bits [9:0] have the following meanings:

- [19] EOI when this interrupt triggers an EOI maintenance interrupt
  - [12:10] CPUID If the interrupt has the VirtualID for an SGI, that is, 0-15. This field shows the requesting CPU ID. This appears in the relevant field of the virtual machine interrupt acknowledge register, GICV\_IAR or GICV\_AIAR. Otherwise, this field must be set to 0.
- 2) When GICH\_LR.HW is set to 1, PHYSICALID[9:0] indicates the physical interrupt ID that the hypervisor forwards to the GICD.

If the value of PHYSICALID is 0-15, or 1020-1023, behavior is **unpredictable**.

If the value of PHYSICALID is 16-31, this field applies to the PPI associated with the same physical CPUID as the virtual CPU interface requesting the deactivation.

Bits 9:0 **VIRTUALID[9:0]**: virtual ID

This ID is returned to the guest OS when the interrupt is acknowledged through the VM interrupt acknowledge register, GICV\_IAR. Each valid interrupt stored in the list registers must have a unique virtual ID for that virtual CPU interface.

If the value of VIRTUALID is 1020-1023, behavior is **unpredictable**.

## 23.7.9 GICH register map

Table 121. GICH register map and reset values

| Offset        | Register    | 31             | 30   | 29           | 28   | 27   | 26   | 25   | 24   | 23        | 22   | 21         | 20   | 19   | 18   | 17   | 16   | 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7        | 6        | 5        | 4             | 3       | 2        | 1        | 0        |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 23.8 GIC virtual CPU interface (GICV)

The virtual CPU interface forwards virtual interrupts to a connected Cortex-A7 MPCore processor, subject to the normal GIC handling and prioritization rules. The virtual interface control registers control virtual CPU interface operation, and in particular, the virtual CPU interface uses the contents of the List registers to determine when to signal virtual interrupts.

When a processor accesses the virtual CPU interface, the list registers are updated.

All the registers are word-accessible.

### 23.8.1 GICV virtual machine control register (GICV\_CTLR)

Address offset: 0x000

Reset value: 0bxxxx xxxx xxxx xxxx x000 0000 0000

|      |      |      |      |      |      |         |      |      |      |      |      |       |        |            |            |
|------|------|------|------|------|------|---------|------|------|------|------|------|-------|--------|------------|------------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25      | 24   | 23   | 22   | 21   | 20   | 19    | 18     | 17         | 16         |
| Res. | Res. | Res. | Res. | Res. | Res. | Res.    | Res. | Res. | Res. | Res. | Res. | Res.  | Res.   | Res.       | Res.       |
|      |      |      |      |      |      |         |      |      |      |      |      |       |        |            |            |
| 15   | 14   | 13   | 12   | 11   | 10   | 9       | 8    | 7    | 6    | 5    | 4    | 3     | 2      | 1          | 0          |
| Res. | Res. | Res. | Res. | Res. | Res. | EOIMODE | Res. | Res. | Res. | Res. | CBPR | FIQEN | ACKCTL | ENABLEGRP1 | ENABLEGRP0 |
|      |      |      |      |      |      | rw      |      |      |      |      | rw   | rw    | rw     | rw         | rw         |

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **EOIMODE**: end of interrupt mode

Controls the behavior associated with the GICV\_EOIR, GICV\_AEOIR, and GICV\_DIR registers.

Bits 8:5 Reserved, must be kept at reset value.

Bit 4 **CBPR**: BPR control

Controls whether the GICV\_BPR controls both group 0 and group 1 virtual interrupts.

Bit 3 **FIQEN**: FIQ enable for group 0 interrupts

Controls whether interrupts marked as group 0 are presented as virtual FIQs.

Bit 2 **ACKCTL**: acknowledge control

Controls whether a read of the GICV\_IAR, when the highest priority pending interrupt is a group 1 interrupt, causes the CPU interface to acknowledge the interrupt.

Arm deprecates use of this bit. Arm strongly recommends that software is written to operate with this bit always set to 0.

Bit 1 **ENABLEGRP1**:

Enables the signaling of group 1 virtual interrupts by the virtual CPU interface to the virtual machine.

Bit 0 **ENABLEGRP0**:

Enables the signaling of group 0 virtual interrupts by the virtual CPU interface to the virtual machine.

### 23.8.2 GICV VM priority mask register (GICV\_PMR)

Address offset: 0x004

Reset value: 0bxxxx xxxx xxxx xxxx xxxx xxxx 0000 0xxx

|      |      |      |      |      |      |      |      |               |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|---------------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23            | 22   | 21   | 20   | 19   | 18   | 17   | 16   |

|      |      |      |      |      |      |      |      |               |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7             | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PRIORITY[4:0] |      |      |      |      | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      | rw            | rw   | rw   | rw   | rw   |      |      |      |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:3 **PRIORITY[4:0]**: priority mask level for the virtual CPU interface

Only virtual interrupts with higher priority than the value in this register can be signaled to the processor

Bits 2:0 Reserved, must be kept at reset value.

### 23.8.3 GICV VM binary point register (GICV\_BPR)

Address offset: 0x008

Reset value: 0bxxxx xxxx xxxx xxxx xxxx xxxx x010

|      |      |      |      |      |      |      |      |      |      |      |      |      |                   |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|-------------------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18                | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.              | Res. | Res. |

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2                 | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | BINARY_POINT[2:0] |      |      |
|      |      |      |      |      |      |      |      |      |      |      |      |      | rw                | rw   | rw   |

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **BINARY\_POINT[2:0]**:

The value of this field controls how the 8-bit virtual interrupt priority field is split into a group priority field, used to determine virtual interrupt preemption, and a subpriority field. Minimum value is 2.

### 23.8.4 GICV VM interrupt acknowledge register (GICV\_IAR)

Address offset: 0x00C

Reset value: 0bxxxx xxxx xxxx xxxx xxx0 0011 1111 1111

| Res. | Res. | Res. | Res. | Res. | CPUID | INTERRUPT_ID[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      |       | r                 | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

If the GICH\_LRx.HW bit is set to 0, indicating that the interrupt is triggered in software, then CPUID of the GICH\_LRx, that indicate the CPU ID, are returned in the GICV\_IAR.CPUID field. Otherwise GICV\_IAR.CPUID field reads as zero.

Bits 9:0 **INTERRUPT\_ID[9:0]**: The interrupt ID

### 23.8.5 GICV VM end of interrupt register (GICV\_EOIR)

Address offset: 0x010

Reset value: 0xXXXX XXXX

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

|      |      |      |      |      |       |               |   |   |   |   |   |   |   |   |   |
|------|------|------|------|------|-------|---------------|---|---|---|---|---|---|---|---|---|
| 15   | 14   | 13   | 12   | 11   | 10    | 9             | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | CPUID | EOIINTID[9:0] |   |   |   |   |   |   |   |   |   |
|      |      |      |      |      | w     | w             | w | w | w | w | w | w | w | w | w |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

On a multiprocessor implementation, if the write refers to an SGI, this field contains the CPUID value from the corresponding GICV\_IAR access.

Bits 9:0 **EOIINTID[9:0]**:

If the GICH\_LRx.HW bit in the matching list register is set to 1, indicating a hardware interrupt, then a deactivate request is sent to the physical Distributor, identifying the Physical ID from the corresponding field in the list register.

### 23.8.6 GICV VM running priority register (GICV\_RPR)

Address offset: 0x014

Reset value: 0bxxxx xxxx xxxx xxxx xxxx xxxx 1111 1111

|      |      |      |      |      |      |      |      |               |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|---------------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23            | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.          | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7             | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | PRIORITY[4:0] |      |      |      |      | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      | r             | r    | r    | r    | r    |      |      |      |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:3 **PRIORITY[4:0]**: current running priority on the virtual CPU interface

Bits 2:0 Reserved, must be kept at reset value.

### 23.8.7 GICV VM highest priority pending interrupt register (GICV\_HPIR)

Address offset: 0x018

Reset value: 0bxxxx xxxx xxxx xxxx xxx0 0011 1111 1111

|      |      |      |      |      |       |                |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|-------|----------------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26    | 25             | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res.  | Res.           | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |       |                |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10    | 9              | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | CPUID | PENDINTID[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      | r     | r              | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**: On a multiprocessor implementation, if GICH\_LRx.HW bit=0, this field contains the CPUID value for that virtual interrupt. This identifies the virtual processor that generated the virtual interrupt.

Bits 9:0 **PENDINTID[9:0]**: The virtual interrupt ID of the highest priority pending virtual interrupt

### 23.8.8 GICV VM aliased binary point register (GICV\_ABPR)

Address offset: 0x01C

Reset value: 0bxxxx xxxx xxxx xxxx xxxx xxxx x011

|      |      |      |      |      |      |      |      |      |      |      |      |      |                   |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|-------------------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18                | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.              | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |                   |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2                 | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | BINARY_POINT[2:0] |      |      |
|      |      |      |      |      |      |      |      |      |      |      |      |      | rw                | rw   | rw   |

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **BINARY\_POINT[2:0]**:

The value of this field controls how the 8-bit virtual interrupt priority field is split into a group priority field, used to determine virtual interrupt preemption, and a subpriority field. Minimum value is 3.

### 23.8.9 GICV VM aliased interrupt register (GICV\_AIAR)

Address offset: 0x020

Reset value: 0bxxxx xxxx xxxx xxxx xxx0 0011 1111 1111

|      |      |      |      |      |       |                   |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|-------|-------------------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26    | 25                | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res.  | Res.              | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |       |                   |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10    | 9                 | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | CPUID | INTERRUPT_ID[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      | r     | r                 | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**: If the GICH\_LRx.HW bit is set to 0, indicating that the interrupt is triggered in software, then CPUID of the GICH\_LRx, that indicate the CPU ID, are returned in the GICV\_AIAR.CPUID field. Otherwise GICV\_AIAR.CPUID field reads as zero..

Bits 9:0 **INTERRUPT\_ID[9:0]**: The interrupt ID. If the GICH\_LRx.Grp1 bit is 0, the interrupt is Group 0. The spurious interrupt ID 1023 is returned and the interrupt is not acknowledged.

### 23.8.10 GICV VM aliased end of interrupt register (GICV\_AEOIR)

Address offset: 0x024

Reset value: 0xFFFF XXXX

|      |      |      |      |      |       |               |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|-------|---------------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26    | 25            | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res.  | Res.          | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |       |               |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10    | 9             | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | CPUID | EOIINTID[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      | w     | w             | w    | w    | w    | w    | w    | w    | w    | w    | w    |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

On a multiprocessor implementation, if the write refers to an SGI, this field contains the CPUID value from the corresponding GICV\_IAR access.

Bits 9:0 **EOIINTID[9:0]**:

If the GICH\_LRx.HW bit in the matching list register is set to 1, indicating a hardware interrupt, then a deactivate request is sent to the physical Distributor, identifying the Physical ID from the corresponding field in the list register.

### 23.8.11 GICV VM aliased highest priority pending interrupt register (GICV\_AHPPIR)

Address offset: 0x028

Reset value: 0bxxxx xxxx xxxx xxx0 0011 1111 1111

|      |      |      |      |      |       |                |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|-------|----------------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26    | 25             | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |

| 15   | 14   | 13   | 12   | 11   | 10    | 9              | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | CPUID | PENDINTID[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      | r     | r              | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

If the GICH\_LRx.HW bit in the matching List register is set to 1, indicating a hardware interrupt, then a deactivate request is sent to the physical Distributor, identifying the physical ID from the corresponding field in the List register.

Bits 9:0 **PENDINTID[9:0]**:

The virtual interrupt ID of the highest-priority pending virtual interrupt, if that virtual interrupt is a group 1 virtual interrupt. Otherwise, the spurious virtual interrupt ID, 1023.

### 23.8.12 GICV VM active priority register (GICV\_APR0)

Address offset: 0x0D0

Reset value: 0x0000 0000

The GICV\_APR0 is an alias of GICH\_APR.

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| APR0[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 24 Extended interrupt and event controller (EXTI)

The Extended interrupt and event controller (EXTI) manages the individual CPU and system wakeup through configurable and direct event inputs. It provides wakeup requests to the power control, and generates an interrupt request to the CPUs NVIC and events to the CPUs event input. For each CPU an additional event generation block (EVG) is needed to generate the CPU event signal.

The EXTI wakeup requests allow the system to be woken up from STOP modes, and the CPU to be woken up from the CSTOP and CSTANDBY modes.

The interrupt request and event request generation can also be used in RUN modes.

The EXTI also includes the EXTI mux IOport selection.

CPU1 = MPU and CPU2 = MCU

### 24.1 EXTI main features

The EXTI main features are the following:

- 76 input events supported
- Two CPUs supported
- All event inputs allow to wake up the system
- Events which do not have an associated wakeup flag in the peripheral, have a flag in the EXTI and generate an interrupt to the CPU from the EXTI
- Some events can be used to generate a CPU wakeup event

The asynchronous event inputs are classified in two groups:

- Configurable events (signals from I/Os or peripherals able to generate a pulse)
  - Configurable events have the following features:
    - Selectable active trigger edge
    - Interrupt pending status register bit independent for the rising and falling edge.
    - Individual interrupt and event generation mask, used for conditioning the CPU wakeup, interrupt and event generation
    - SW trigger possibility
- Direct events (interrupt and wakeup sources from peripherals having an associated flag which requiring to be cleared in the peripheral)
  - Direct events have the following features:
    - Fixed rising edge active trigger
    - No interrupt pending status register bit in the EXTI (the interrupt pending status flag is provided by the peripheral generating the event)
    - Individual interrupt and event generation mask, used for conditioning the CPU wakeup and event generation
    - No SW trigger possibility
- TrustZone secure events
  - The access to control and configuration bits of secure input events can be made secure.
- EXTI IO port selection

## 24.2 EXTI block diagram

The EXTI consists of a register block accessed via an AHB interface, the event input Trigger block, the masking block, and EXTI mux as shown in [Figure 140](#).

The register block contains all the EXTI registers.

The event input trigger block provides event input edge trigger logic.

The masking block provides the event input distribution to the different wakeup, interrupt and event outputs, and the masking of these.

The EXTI mux provides the IO port selection on to the EXTI event signal.

**Figure 140. EXTI block diagram**

**Table 123. EXTI pin overview**

| Pin name              | I/O | Description                                                                                                              |
|-----------------------|-----|--------------------------------------------------------------------------------------------------------------------------|
| AHB interface         | I/O | EXTI register bus interface. When one event is configured to allow security, the AHB interface supports secure accesses. |
| hclk                  | I   | AHB bus clock and EXTI system clock.                                                                                     |
| Configurable event(y) | I   | Asynchronous wakeup events from peripherals that do not have an associated interrupt and flag in the peripheral.         |
| Direct event(x)       | I   | Synchronous and asynchronous wakeup events from peripherals having an associated interrupt and flag in the peripheral.   |
| IOPort(n)             | I   | GPIOs block IO ports[15:0].                                                                                              |
| exti[15:0]            | O   | EXTI output port to trigger other IPs.                                                                                   |
| it_exti_per (y)       | O   | Interrupts to the CPU1 to CPU(m) associated with Configurable event (y).                                                 |
| c(m)_evt_exti         | O   | High level sensitive event output for CPU(m) synchronous to hclk. (m= 2)                                                 |
| c(m)_evt_rst          | I   | Asynchronous reset input to clear c(m)_evt_exti. (m= 2)                                                                  |

Table 123. EXTI pin overview (continued)

| Pin name    | I/O | Description                                                    |
|-------------|-----|----------------------------------------------------------------|
| sys_wakeup  | O   | Asynchronous system wakeup request to PWR for ck_sys and hclk. |
| c(m)_wakeup | O   | Wakeup request to PWR for CPU(m), synchronous to hclk. (m= 2)  |

| Pin name  | I/O | Description                                                             |
|-----------|-----|-------------------------------------------------------------------------|
| c_fclk    | I   | CPU free running clock.                                                 |
| c_evt_in  | I   | High level sensitive Events input from EXTI, asynchronous to CPU clock. |
| c_event   | O   | Event pulse, synchronous to CPU clock.                                  |
| c_evt_rst | O   | Event reset signal, synchronous to CPU clock.                           |

### 24.2.1 EXTI connections between peripherals and CPU

The peripherals able to generate wakeup or interrupt events when the system is in STOP mode or a CPU is in CSTOP mode are connected to the EXTI.

- Peripheral wakeup signals that generate a pulse or which do not have an interrupt status bits in the peripheral, are connected to an EXTI configurable event input. For these events the EXTI provides a status pending bit that has to be cleared. It is the EXTI interrupt associated with the status bit that will interrupt the CPU.
- Peripheral interrupt and wakeup signals that have a status bit in the peripheral that has to be cleared in the peripheral, are connected to an EXTI direct event input. There is no status pending bit within the EXTI. The interrupt or wakeup is cleared by the CPU in the peripheral. It is the peripheral interrupt that will interrupt the CPU directly.
- All GPIO ports input to the EXTI multiplexer, allowing to select a port pin to wake up the system via a configurable event.

The EXTI configurable event interrupts are connected to the respective NVIC(a) of each CPU(m).

The dedicated EXTI/EVG CPU(m) event is connected to the respective CPU(m) rxev input.

The EXTI CPU(m) wakeup signals are connected to the PWR block, and are used to wake up the system and CPU(m) sub-system bus clocks.

## 24.3 EXTI functional description

Depending on the EXTI event input type and wakeup target(s), different logic implementations are used. The applicable features are controlled from register bits:

- Active trigger edge enable, by rising edge selection  
*EXTI rising trigger selection register (EXTI\_RTSR1),*  
*EXTI rising trigger selection register (EXTI\_RTSR2),*  
*EXTI rising trigger selection register (EXTI\_RTSR3),*  
 and falling edge selection  
*EXTI falling trigger selection register (EXTI\_FTSR1),*  
*EXTI falling trigger selection register (EXTI\_FTSR2),*  
*EXTI falling trigger selection register (EXTI\_FTSR3).*
- Software trigger, by  
*EXTI software interrupt event register (EXTI\_SWIER1),*  
*EXTI software interrupt event register (EXTI\_SWIER2),*  
*EXTI software interrupt event register (EXTI\_SWIER3).*
- Interrupt pending flag, by  
*EXTI rising edge pending register (EXTI\_RPR1),*  
*EXTI rising edge pending register (EXTI\_RPR2)*  
*EXTI rising edge pending register (EXTI\_RPR3)*  
*EXTI falling edge pending register (EXTI\_FPR2)*  
*EXTI falling edge pending register (EXTI\_FPR3).*
- CPU wakeup and interrupt enable, by  
*EXTI CPU wakeup with interrupt mask register (EXTI\_IMR1),*  
*EXTI CPU2 wakeup with interrupt mask register (EXTI\_C2IMR1),*  
*EXTI CPU wakeup with interrupt mask register (EXTI\_IMR2),*  
*EXTI CPU2 wakeup with interrupt mask register (EXTI\_C2IMR2),*  
*EXTI CPU wakeup with interrupt mask register (EXTI\_IMR3)*  
*EXTI CPUm wakeup with interrupt mask register (EXTI\_C2IMR3).*
- CPU wakeup and event enable, by  
*EXTI CPU wakeup with event mask register (EXTI\_EMR1),*  
*EXTI CPU2 wakeup with event mask register (EXTI\_C2EMR1)*  
*EXTI CPU wakeup with event mask register (EXTI\_EMR2),*  
*EXTI CPU2 wakeup with event mask register (EXTI\_C2EMR2),*  
*EXTI CPU wakeup with event mask register (EXTI\_EMR3)*  
*EXTI CPU2 wakeup with event mask register (EXTI\_C2EMR3).*

**Table 125. EXTI event input configurations and register control**

| Event input type | Logic implementation                  | EXTI_RTSR | EXTI_FTSR | EXTI_SWIER | EXTI_R/FPR | EXTI_CmIMR | EXTI_CmEMR <sup>(1)</sup> |
|------------------|---------------------------------------|-----------|-----------|------------|------------|------------|---------------------------|
| Configurable     | Configurable event input wakeup logic | x         | x         | x          | x          | x          | x                         |
| Direct           | Direct event input wakeup logic       | -         | -         | -          | -          | x          | x                         |

1. Only for input events with configuration "rxev generation" enabled.

### 24.3.1 EXTI configurable event input wakeup

Figure 141 is a detailed representation of the logic associated with configurable event inputs which will wake up the CPU(m) sub-system bus clocks and generated an EXTI pending flag and interrupt to the CPU(m) and or a CPU(m) wakeup event.

Figure 141. Configurable event trigger logic CPU wakeup

1. Only for the input events that support CPU rxev generation c(n)\_event.

The software interrupt event register allows to trigger configurable events by software, writing the corresponding register bit, irrespective of the edge selection setting.

The rising edge and falling edge selection registers allow to enable and select the configurable event active trigger edge or both edges.

Each CPU has its dedicated interrupt mask register and a dedicated event mask registers. The enabled event allows to generate an event on the CPU. All events for a CPU are OR-ed together into a single CPU event signal. The event pending registers (EXTI\_RPR and EXTI\_FPR) is not set for an unmasked CPU event.

The configurable events have unique interrupt pending request registers, shared by the CPUs. The pending register is only set for an unmasked interrupt. Each configurable event provides a common interrupt to all CPUs. The configurable event interrupts need to be acknowledged by software in the EXTI\_RPR and/or EXTI\_FPR registers.

When a CPU(m) interrupt or CPU(m) event is enabled the asynchronous edge detection circuit is reset by the clocked delay and rising edge detect pulse generator. This guarantees that the EXTI hclk clock is woken up before the asynchronous edge detection circuit is reset.

**Note:** A detected configurable event interrupt pending request, may be cleared by any CPU. The system is unable to enter into Low-power modes as long as an interrupt pending request is active.

### 24.3.2 EXTI direct event input wakeup

Figure 142 is a detailed representation of the logic associated with direct event inputs waking up the system.

The direct events do not have an associated EXTI interrupt. The EXTI only wakes up the system and CPU sub-system clocks and may generate a CPU wakeup event. The peripheral synchronous interrupt, associated with the direct wakeup event wakes up the CPU.

The EXTI direct event is able to generate a CPU event. This CPU event wakes up the CPU. The CPU event may occur before the associated Peripheral interrupt flag is set.

**Note:** *The direct events are cleared in the peripheral generating the event. When a direct event input enabled by CPU(m) is cleared by another CPU before the CPU(m) clock is running, the CPU(m) no longer receives a CPU(m) interrupt nor a CPU(m) event and does not wake up. However the system stays in RUN mode, generating the CPU(m) clock. For this reason CPU(m) direct events must NOT be cleared by the other CPU.*

Figure 142. Direct event trigger logic CPU wakeup

1. Only for the input events that support CPU rxev generation c(n)\_event.

### 24.3.3 EXTI mux selection

The EXTI mux allows to select GPIOs as interrupts and wakeup. The GPIOs are connected via 16 EXTI mux lines to the first 16 EXTI events as configurable event. The selection of GPIO port as EXTI mux output, is controlled by registers: [EXTI external interrupt selection register 1 \(EXTI\\_EXTICR1\)](#) to [EXTI external interrupt selection register 4 \(EXTI\\_EXTICR4\)](#).

Figure 143. EXTI mux GPIO selection

The EXTIs mux outputs are available as output signals from the EXTI to trigger other IPs. The EXTI mux outputs are available independently from any masking in EXTI\_CmIMR1 and EXTI\_CmEMR1.

## 24.4 EXTI functional behavior

The direct event inputs are enabled in the respective peripheral generating the wakeup event. The configurable events are enabled by enabling at least one of the trigger edges.

Once an event input is enabled, the generation of a CPU(m) wakeup is conditioned by the CPU(m) interrupt mask and CPU(m) event mask.

Table 126. Masking functionality

| CPU interrupt enable<br>EXTI_CmIMR.IMn | CPU event enable<br>EXTI_CmEMR.EMn | Configurable event inputs<br>EXTI_RPR.RPIFn<br>EXTI_FPR.FPIFn | exti(n) interrupt <sup>(1)</sup> | CPU(m) event | CPU(m) wakeup      |
|----------------------------------------|------------------------------------|---------------------------------------------------------------|----------------------------------|--------------|--------------------|
| 0 for all CPUs                         | 0                                  | No                                                            | Masked                           | Masked       | Masked             |
|                                        | 1                                  |                                                               | Masked                           | Yes          | Yes                |
| 1 for any CPU                          | 0                                  | Status latched                                                | Yes                              | Masked       | Yes <sup>(2)</sup> |
|                                        | 1                                  |                                                               | Yes                              | Yes          | Yes                |

1. The single exti(n) interrupt goes to all CPUs. If no interrupt is required for CPU(m), the exti(n) interrupt must be masked in the CPU(m) NVIC.

2. Only if CPU(m) interrupt is enabled in EXTI\_CmIMR.IMn.

For configurable event inputs, when the enabled edge(s) occur on the event input, an event request is generated. When the associated CPU(m) interrupt is unmasked the corresponding pending bit EXTI\_RPR.RPIFn and/or EXTI\_FPR.FPIFn is/are set and the CPU(m) sub-system is woken up and CPU interrupt signal is activated. The EXTI\_RPR.RPIFn and/or EXTI\_FPR.FPIFn pending bit must be cleared by software writing, it to '1'. This clears the CPU interrupt.

For direct event inputs, when enabled in the associated peripheral, an event request is generated on the rising edge only. There is no corresponding CPU pending bit in the EXTI.

When the associated CPU(m) interrupt is unmasked the corresponding CPU sub-system is woken up. The CPU is woken up (interrupted) by the peripheral synchronous interrupt.

The CPU(m) event must be unmasked to generate an event. When the enabled edge(s) occur on the event input a CPU(m) event pulse is generated. There is no event pending bit.

For the configurable event inputs an event request can be generated by software when writing a '1' in the software interrupt/event register EXTI\_SWIER, generating a rising edge on the event. The rising edge event pending bit is set in EXTI\_RPR, irrespective of the setting in EXTI\_RTSR.

## 24.5 EXTI TrustZone security

The EXTI is able to secure register bits from being modified by non-secure accesses. The TrustZone security can individually be activated per input event via the register bits in EXTI\_TZENRn. At EXTI level the security consists in preventing a non-secure write access to:

- Change the settings of the secure configurable events.
- Change the masking of the secure input events.
- Clear pending status of the secure input events.

Note that the EXTI does not differentiate secure accesses from individual CPUs. Any CPU secure access can modify the secure register bits.

**Table 127. Register security overview**

| Register name | Access type | Security <sup>(1)</sup>                                       |
|---------------|-------------|---------------------------------------------------------------|
| EXTI_RTSRn    | RW          | Non-secure, security can be bit wise enabled in EXTI_TZENRn   |
| EXTI_FTSRn    | RW          |                                                               |
| EXTI_SWIERn   | RW          |                                                               |
| EXTI_RPRn     | RW          |                                                               |
| EXTI_FPRn     | RW          |                                                               |
| EXTI_TZENRn   | RW          | Always secure                                                 |
| EXTI_EXTICRx  | RW          | Non-secure, security can be field wise enabled in EXTI_TZENRn |
| EXTI_CmIMRn   | RW          | Non-secure, security can be bit wise enabled in EXTI_TZENRn   |
| EXTI_CmEMRn   | RW          |                                                               |
| EXTI_HWCFGRn  | R           | Non-secure                                                    |
| EXTI_VER      | R           |                                                               |
| EXTI_ID       | R           |                                                               |
| EXTI_SID      | R           |                                                               |

1. Security is enabled with the individual Input event. EXTI\_TZENRn registers.

When TZ security is enabled for an input event, the associated input event configuration and control bits can only be modified and read by a secure access, a non-secure write access is discarded and a read returns 0.

When input events are non-secure, the TZ security is disabled. The associated input event configuration and control bits can be modified and read by a secure access and non-secure access.

## 24.6 EXTI registers

The EXTI register map is divided as detailed in [Table 128](#).

**Table 128. EXTI register map sections**

| Address       | Description                                      |
|---------------|--------------------------------------------------|
| 0x000 - 0x01C | General configurable event [31:0] configuration  |
| 0x020 - 0x03C | General configurable event [63:32] configuration |
| 0x040 - 0x05C | General configurable event [95:64] configuration |
| 0x060 - 0x06C | EXTI IOport mux selection                        |
| 0x080 - 0x0BC | CPU1 input event configuration                   |
| 0x0C0 - 0x0FC | CPU2 input event configuration                   |

All the registers can be accessed with word (32-bit), half-word (16-bit) and byte (8-bit) access.

### 24.6.1 EXTI rising trigger selection register (EXTI\_RTSR1)

Address offset: 0x000

Reset value: 0x0000 0000

Contains only register bits for configurable events.

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | RT16 |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      | rw   |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| RT15 | RT14 | RT13 | RT12 | RT11 | RT10 | RT9  | RT8  | RT7  | RT6  | RT5  | RT4  | RT3  | RT2  | RT1  | RT0  |
| rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:0 **RT[16:0]**: Rising trigger event configuration bit of configurable event input x (x = 16 to 0)<sup>(1)</sup>.

When TZENx is disabled, RTx can be accessed with non-secure and secure access.

When TZENx is enabled, RTx can only be accessed with secure access. Non-secure write to RTx is discarded, non-secure read returns 0.

0: Rising trigger disabled (for event and Interrupt) for input line

1: Rising trigger enabled (for event and Interrupt) for input line

1. The configurable event inputs are edge triggered, no glitch must be generated on these inputs. If a rising edge on the configurable event input occurs during writing of the register, the associated pending bit is not set. Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

### 24.6.2 EXTI falling trigger selection register (EXTI\_FTSR1)

Address offset: 0x004

Reset value: 0x0000 0000

Contains only register bits for configurable events.

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | FT16 |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      | rw   |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| FT15 | FT14 | FT13 | FT12 | FT11 | FT10 | FT9  | FT8  | FT7  | FT6  | FT5  | FT4  | FT3  | FT2  | FT1  | FT0  |
| rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:0 **FT[16:0]**: Falling trigger event configuration bit of configurable event input x (x = 16 to 0)<sup>(1)</sup>.

When TZENx is disabled, FTx can be accessed with non-secure and secure access.

When TZENx is enabled, FTx can only be accessed with secure access. Non-secure write to FTx is discarded, non-secure read returns 0.

0: Falling trigger disabled (for event and Interrupt) for input line

1: Falling trigger enabled (for event and Interrupt) for input line.

1. The configurable event inputs are edge triggered, no glitch must be generated on these inputs. If a falling edge on the configurable event input occurs during writing of the register, the associated pending bit is not set. Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

### 24.6.3 EXTI software interrupt event register (EXTI\_SWIER1)

Address offset: 0x008

Reset value: 0x0000 0000

Contains only register bits for configurable events.

|       |       |       |       |       |       |      |      |      |      |      |      |      |      |      |       |
|-------|-------|-------|-------|-------|-------|------|------|------|------|------|------|------|------|------|-------|
| 31    | 30    | 29    | 28    | 27    | 26    | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16    |
| Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SWI16 |
|       |       |       |       |       |       |      |      |      |      |      |      |      |      |      | rw    |
| 15    | 14    | 13    | 12    | 11    | 10    | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0     |
| SWI15 | SWI14 | SWI13 | SWI12 | SWI11 | SWI10 | SWI9 | SWI8 | SWI7 | SWI6 | SWI5 | SWI4 | SWI3 | SWI2 | SWI1 | SWI0  |
| rw    | rw    | rw    | rw    | rw    | rw    | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw    |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:0 **SWI[16:0]**: Software interrupt on event x (x = 16 to 0)

When TZENx is disabled, SWIx can be accessed with non-secure and secure access.

When TZENx is enabled, SWIx can only be accessed with secure access. Non-secure write to SWx is discarded.

A software interrupt is generated independent from the setting in EXTI\_RTSR and EXTI\_FTSR. Will always return 0 when read.

0: Writing 0 has no effect.

1: Writing a 1 to this bit will trigger a rising edge event on event x.

This bit is auto cleared by HW.

### 24.6.4 EXTI rising edge pending register (EXTI\_RPR1)

Address offset: 0x00C

Reset value: 0x0000 0000

Contains only register bits for configurable events.

|        |        |        |        |        |        |       |       |       |       |       |       |       |       |       |        |
|--------|--------|--------|--------|--------|--------|-------|-------|-------|-------|-------|-------|-------|-------|-------|--------|
| 31     | 30     | 29     | 28     | 27     | 26     | 25    | 24    | 23    | 22    | 21    | 20    | 19    | 18    | 17    | 16     |
| Res.   | Res.   | Res.   | Res.   | Res.   | Res.   | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | RPIF16 |
|        |        |        |        |        |        |       |       |       |       |       |       |       |       |       | rc_w1  |
| 15     | 14     | 13     | 12     | 11     | 10     | 9     | 8     | 7     | 6     | 5     | 4     | 3     | 2     | 1     | 0      |
| RPIF15 | RPIF14 | RPIF13 | RPIF12 | RPIF11 | RPIF10 | RPIF9 | RPIF8 | RPIF7 | RPIF6 | RPIF5 | RPIF4 | RPIF3 | RPIF2 | RPIF1 | RPIF0  |
| rc_w1  | rc_w1  | rc_w1  | rc_w1  | rc_w1  | rc_w1  | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1  |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:0 **RPIF[16:0]**: configurable event inputs x (x = 16 to 0) rising edge Pending bit.

When TZENx is disabled, RPIF<sub>x</sub> can be accessed with non-secure and secure access.

When TZENx is enabled, RPIF<sub>x</sub> can only be accessed with secure access. Non-secure write to RPIF<sub>x</sub> is discarded, non-secure read returns 0.

0: No rising edge trigger request occurred

1: Rising edge trigger request occurred

This bit is set when the rising edge event or an EXTI\_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

### 24.6.5 EXTI falling edge pending register (EXTI\_FPR1)

Address offset: 0x010

Reset value: 0x0000 0000

Contains only register bits for configurable events.

|        |        |        |        |        |        |       |       |       |       |       |       |       |       |       |        |
|--------|--------|--------|--------|--------|--------|-------|-------|-------|-------|-------|-------|-------|-------|-------|--------|
| 31     | 30     | 29     | 28     | 27     | 26     | 25    | 24    | 23    | 22    | 21    | 20    | 19    | 18    | 17    | 16     |
| Res.   | Res.   | Res.   | Res.   | Res.   | Res.   | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | FPIF16 |
|        |        |        |        |        |        |       |       |       |       |       |       |       |       |       | rc_w1  |
| 15     | 14     | 13     | 12     | 11     | 10     | 9     | 8     | 7     | 6     | 5     | 4     | 3     | 2     | 1     | 0      |
| FPIF15 | FPIF14 | FPIF13 | FPIF12 | FPIF11 | FPIF10 | FPIF9 | FPIF8 | FPIF7 | FPIF6 | FPIF5 | FPIF4 | FPIF3 | FPIF2 | FPIF1 | FPIF0  |
| rc_w1  | rc_w1  | rc_w1  | rc_w1  | rc_w1  | rc_w1  | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1  |

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:0 **FPIF[16:0]**: configurable event inputs x (x = 16 to 0) falling edge pending bit.

When TZENx is disabled, FPIF<sub>x</sub> can be accessed with non-secure and secure access.

When TZENx is enabled, FPIF<sub>x</sub> can only be accessed with secure access. Non-secure write to FPIF<sub>x</sub> is discarded, non-secure read returns 0.

0: No falling edge trigger request occurred

1: rising edge trigger request occurred

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

### 24.6.6 EXTI TrustZone enable register (EXTI\_TZENR1)

Address offset: 0x014

Reset value: 0x0000 0000

This register provides TrustZone Write access security, a non-secure write access will generate a bus error. A non-secure read will return the register data.

Contains only register bits for TrustZone capable Input events.

|         |         |         |         |         |         |       |         |       |       |       |       |         |         |         |       |
|---------|---------|---------|---------|---------|---------|-------|---------|-------|-------|-------|-------|---------|---------|---------|-------|
| 31      | 30      | 29      | 28      | 27      | 26      | 25    | 24      | 23    | 22    | 21    | 20    | 19      | 18      | 17      | 16    |
| Res.    | Res.    | Res.    | Res.    | Res.    | TZEN 26 | Res.  | TZEN 24 | Res.  | Res.  | Res.  | Res.  | TZEN 19 | TZEN 18 | TZEN 17 | Res.  |
|         |         |         |         |         | rw      |       | rw      |       |       |       |       | rw      | rw      | rw      |       |
| 15      | 14      | 13      | 12      | 11      | 10      | 9     | 8       | 7     | 6     | 5     | 4     | 3       | 2       | 1       | 0     |
| TZEN 15 | TZEN 14 | TZEN 13 | TZEN 12 | TZEN 11 | TZEN 10 | TZEN9 | TZEN8   | TZEN7 | TZEN6 | TZEN5 | TZEN4 | TZEN3   | TZEN2   | TZEN1   | TZEN0 |
| rw      | rw      | rw      | rw      | rw      | rw      | rw    | rw      | rw    | rw    | rw    | rw    | rw      | rw      | rw      | rw    |

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **TZEN26**: TrustZone security enable on event input 26.

0: Event TrustZone disabled (non-secure)

1: Event TrustZone enabled (secure)

Bit 25 Reserved, must be kept at reset value.

Bit 24 **TZEN24**: TrustZone security enable on event input 24.

0: Event TrustZone disabled (non-secure)

1: Event TrustZone enabled (secure)

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:17 **TZEN[19:17]**: TrustZone security enable on event input x (x = 19 to 17)

0: Event TrustZone disabled (non-secure)

1: Event TrustZone enabled (secure)

Bit 16 Reserved, must be kept at reset value.

Bits 15:0 **TZEN[15:0]**: TrustZone security enable on event input x (x = 15 to 0)

0: Event TrustZone disabled (non-secure)

1: Event TrustZone enabled (secure)

### 24.6.7 EXTI rising trigger selection register (EXTI\_RTSR2)

Address offset: 0x020

Reset value: 0x0000 0000

Contains only register bits for configurable events.

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:0 Reserved, must be kept at reset value.

### 24.6.8 EXTI falling trigger selection register (EXTI\_FTSR2)

Address offset: 0x024

Reset value: 0x0000 0000

Contains only register bits for configurable events.

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:0 Reserved, must be kept at reset value.

## 24.6.12 EXTI TrustZone enable register (EXTI\_TZENR2)

Address offset: 0x034

Reset value: 0x0000 0000

This register provides TrustZone Write access security, a non-secure write access will generate a bus error. A non-secure read will return the register data.

Contains only register bits for TrustZone capable Input events.

|      |      |      |            |            |            |            |            |            |            |      |      |      |      |      |      |
|------|------|------|------------|------------|------------|------------|------------|------------|------------|------|------|------|------|------|------|

|      |      |      | rw         | rw         | rw         | rw         | rw         | rw         | rw         |      |      |      |      |      |      |
| 15   | 14   | 13   | 12         | 11         | 10         | 9          | 8          | 7          | 6          | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res.       | Res.       | Res.       | TZEN<br>41 | Res.       | Res.       | Res.       | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |            |            |            | rw         |            |            |            |      |      |      |      |      |      |

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:22 **TZEN[60:54]**: TrustZone security enable on Event input x (x = 60 to 54)

0: Event TrustZone disabled (non-secure)

1: Event TrustZone enabled (secure)

Bits 21:10 Reserved, must be kept at reset value.

Bit 9 **TZEN41**: TrustZone security enable on Event input 41

0: Event TrustZone disabled (non-secure)

1: Event TrustZone enabled (secure)

Bits 8:0 Reserved, must be kept at reset value.

## 24.6.13 EXTI rising trigger selection register (EXTI\_RTISR3)

Address offset: 0x040

Reset value: 0x0000 0000

Contains only register bits for configurable events.

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | RT74 | RT73 | Res. | Res. | Res. | Res. | RT68 | Res. | RT66 | RT65 | Res. |
|      |      |      |      |      | rw   | rw   |      |      |      |      | rw   |      | rw   | rw   |      |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **RT74**: Rising trigger event configuration bit of configurable Event input 74<sup>(1)</sup>

When TZEN74 is disabled, RT74 can be accessed with non-secure and secure access.

When TZEN74 is enabled, RT74 can only be accessed with secure access. Non-secure write to RT74 is discarded, non-secure read returns 0.

0: Rising trigger disabled (for event and interrupt) for input line

1: Rising trigger enabled (for event and interrupt) for input line

Bit 9 **RT73**: Rising trigger event configuration bit of configurable Event input 73<sup>(1)</sup>

When TZEN73 is disabled, RT73 can be accessed with non-secure and secure access.

When TZEN73 is enabled, RT73 can only be accessed with secure access. Non-secure write to RT73 is discarded, non-secure read returns 0.

0: Rising trigger disabled (for event and interrupt) for input line

1: Rising trigger enabled (for event and interrupt) for input line

Bits 8:5 Reserved, must be kept at reset value.

Bit 4 **RT68**: Rising trigger event configuration bit of configurable event input 68<sup>(1)</sup>

When TZEN68 is disabled, RT68 can be accessed with non-secure and secure access.

When TZEN68 is enabled, RT68 can only be accessed with secure access. Non-secure write to RT68 is discarded, non-secure read returns 0.

0: Rising trigger disabled (for event and interrupt) for input line

1: Rising trigger enabled (for event and interrupt) for input line

Bit 3 Reserved, must be kept at reset value.

Bit 2 **RT66**: Rising trigger event configuration bit of configurable event input 66<sup>(1)</sup>

When TZEN66 is disabled, RT66 can be accessed with non-secure and secure access.

When TZEN66 is enabled, RT66 can only be accessed with secure access. Non-secure write to RT66 is discarded, non-secure read returns 0.

0: Rising trigger disabled (for event and interrupt) for input line

1: Rising trigger enabled (for event and interrupt) for input line

Bit 1 **RT65**: Rising trigger event configuration bit of configurable event input 65<sup>(1)</sup>

When TZEN65 is disabled, RT65 can be accessed with non-secure and secure access.

When TZEN65 is enabled, RT65 can only be accessed with secure access. Non-secure write to RT65 is discarded, non-secure read returns 0.

0: Rising trigger disabled (for event and interrupt) for input line

1: Rising trigger enabled (for event and interrupt) for input line

Bit 0 Reserved, must be kept at reset value.

1. The configurable event inputs are edge triggered, no glitch must be generated on these inputs. If a rising edge on the configurable event input occurs during writing of the register, the associated pending bit is not set. Rising and falling edge triggers can be set for the same configurable Event input. In this case, both edges generate a trigger.

### 24.6.14 EXTI falling trigger selection register (EXTI\_FTSR3)

Address offset: 0x044

Reset value: 0x0000 0000

Contains only register bits for configurable events.

| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **FT74**: Falling trigger event configuration bit of configurable event input 74<sup>(1)</sup>

When TZEN74 is disabled, FT74 can be accessed with non-secure and secure access.

When TZEN74 is enabled, FT74 can only be accessed with secure access. Non-secure write to FT74 is discarded, non-secure read returns 0.

0: Falling trigger disabled (for event and interrupt) for input line

1: Falling trigger enabled (for event and interrupt) for input line

Bit 9 **FT73**: Falling trigger event configuration bit of configurable event input 73<sup>(1)</sup>

When TZEN73 is disabled, FT73 can be accessed with non-secure and secure access.

When TZEN73 is enabled, FT73 can only be accessed with secure access. Non-secure write to FT73 is discarded, non-secure read returns 0.

0: Falling trigger disabled (for event and interrupt) for input line

1: Falling trigger enabled (for event and interrupt) for input line

Bits 8:5 Reserved, must be kept at reset value.

Bit 4 **FT68**: Falling trigger event configuration bit of configurable event input 68<sup>(1)</sup>

When TZEN68 is disabled, FT68 can be accessed with non-secure and secure access.

When TZEN68 is enabled, FT68 can only be accessed with secure access. Non-secure write to FT68 is discarded, non-secure read returns 0.

0: Falling trigger disabled (for event and interrupt) for input line

1: Falling trigger enabled (for event and interrupt) for input line

Bit 3 Reserved, must be kept at reset value.

Bit 2 **FT66**: Falling trigger event configuration bit of configurable event input 66<sup>(1)</sup>

When TZEN66 is disabled, FT66 can be accessed with non-secure and secure access.

When TZEN66 is enabled, FT66 can only be accessed with secure access. Non-secure write to FT66 is discarded, non-secure read returns 0.

0: Falling trigger disabled (for event and interrupt) for input line

1: Falling trigger enabled (for event and interrupt) for input line

Bit 1 **FT65**: Falling trigger event configuration bit of configurable event input 65<sup>(1)</sup>

When TZEN65 is disabled, FT65 can be accessed with non-secure and secure access.

When TZEN65 is enabled, FT65 can only be accessed with secure access. Non-secure write to FT65 is discarded, non-secure read returns 0.

0: Falling trigger disabled (for event and interrupt) for input line

1: Falling trigger enabled (for event and interrupt) for input line

Bit 0 Reserved, must be kept at reset value.

- The configurable event inputs are edge triggered, no glitch must be generated on these inputs. If a falling edge on the configurable event input occurs during writing of the register, the associated pending bit will not be set. Rising and falling edge triggers can be set for the same configurable Event input. In this case, both edges generate a trigger.

### 24.6.15 EXTI software interrupt event register (EXTI\_SWIER3)

Address offset: 0x048

Reset value: 0x0000 0000

Contains only register bits for configurable events.

|      |      |      |      |      |       |       |      |      |      |      |       |      |       |       |      |
|------|------|------|------|------|-------|-------|------|------|------|------|-------|------|-------|-------|------|
| 31   | 30   | 29   | 28   | 27   | 26    | 25    | 24   | 23   | 22   | 21   | 20    | 19   | 18    | 17    | 16   |
| Res. | Res. | Res. | Res. | Res. | Res.  | Res.  | Res. | Res. | Res. | Res. | Res.  | Res. | Res.  | Res.  | Res. |
|      |      |      |      |      |       |       |      |      |      |      |       |      |       |       |      |
| 15   | 14   | 13   | 12   | 11   | 10    | 9     | 8    | 7    | 6    | 5    | 4     | 3    | 2     | 1     | 0    |

|      |      |      |      |      | rw    | rw    |      |      |      |      | rw    |      | rw    | rw    |      |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **SWI74**: Software interrupt on event 74

When TZEN74 is disabled, SWI74 can be accessed with non-secure and secure access.

When TZEN74 is enabled, SWI74 can only be accessed with secure access. Non-secure write to SWI74 is discarded.

A software interrupt is generated independent from the setting in EXTI\_RTISR and EXTI\_FTSR. Will always return 0 when read.

0: Writing 1 has no effect.

1: Writing a 1 to this bit will trigger a rising edge event on event 74. This bit is auto cleared by HW.

Bit 9 **SWI73**: Software interrupt on event 73

When TZEN73 is disabled, SWI73 can be accessed with non-secure and secure access.

When TZEN73 is enabled, SWI73 can only be accessed with secure access. Non-secure write to SWI73 is discarded.

A software interrupt is generated independent from the setting in EXTI\_RTISR and EXTI\_FTSR. Will always return 0 when read.

0: Writing 1 has no effect.

1: Writing a 1 to this bit will trigger a rising edge event on event 73. This bit is auto cleared by HW.

Bits 8:5 Reserved, must be kept at reset value.

Bit 4 **SWI68**: Software interrupt on event 68

When TZEN68 is disabled, SWI68 can be accessed with non-secure and secure access.

When TZEN68 is enabled, SWI68 can only be accessed with secure access. Non-secure write to SWI68 is discarded.

A software interrupt is generated independent from the setting in EXTI\_RTISR and EXTI\_FTSR. Will always return 0 when read.

0: Writing 1 has no effect.

1: Writing a 1 to this bit will trigger a rising edge event on event 68. This bit is auto cleared by HW.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **SWI66**: Software interrupt on event 66

When TZEN66 is disabled, SWI66 can be accessed with non-secure and secure access.

When TZEN66 is enabled, SWI66 can only be accessed with secure access. Non-secure write to SWI66 is discarded.

A software interrupt is generated independent from the setting in EXTI\_RTISR and EXTI\_FTSR. Will always return 0 when read.

0: Writing 1 has no effect.

1: Writing a 1 to this bit will trigger a rising edge event on event 66. This bit is auto cleared by HW.

Bit 1 **SWI65**: Software interrupt on event 65

When TZEN65 is disabled, SWI65 can be accessed with non-secure and secure access.

When TZEN65 is enabled, SWI65 can only be accessed with secure access. Non-secure write to SWI65 is discarded.

A software interrupt is generated independent from the setting in EXTI\_RTISR and EXTI\_FTSR. Will always return 0 when read.

0: Writing 1 has no effect.

1: Writing a 1 to this bit will trigger a rising edge event on event 65. This bit is auto cleared by HW.

Bit 0 Reserved, must be kept at reset value.

#### 24.6.16 EXTI rising edge pending register (EXTI\_RPR3)

Address offset: 0x04C

Reset value: 0x0000 0000

Contains only register bits for configurable events.

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **RPIF74**: configurable event inputs 74 rising edge pending bit.

When TZEN74 is disabled, RPIF74 can be accessed with non-secure and secure access.

When TZEN74 is enabled, RPIF74 can only be accessed with secure access. Non-secure write to RPIF74 is discarded, non-secure read returns 0.

0: No rising edge trigger request occurred

1: rising edge trigger request occurred

This bit is set when the rising edge event or an EXTI\_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

Bit 9 **RPIF73**: configurable event inputs 73 rising edge pending bit.

When TZEN73 is disabled, RPIF73 can be accessed with non-secure and secure access.

When TZEN73 is enabled, RPIF73 can only be accessed with secure access. Non-secure write to RPIF73 is discarded, non-secure read returns 0.

0: No rising edge trigger request occurred

1: rising edge trigger request occurred

This bit is set when the rising edge event or an EXTI\_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

Bits 8:5 Reserved, must be kept at reset value.

Bit 4 **RPIF68**: configurable event inputs 68 rising edge pending bit.

When TZEN68 is disabled, RPIF68 can be accessed with non-secure and secure access.

When TZEN68 is enabled, RPIF68 can only be accessed with secure access. Non-secure write to RPIF68 is discarded, non-secure read returns 0.

0: No rising edge trigger request occurred

1: rising edge trigger request occurred

This bit is set when the rising edge event or an EXTI\_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **RPIF66**: configurable event inputs 66 rising edge pending bit.

When TZEN66 is disabled, RPIF66 can be accessed with non-secure and secure access.

When TZEN66 is enabled, RPIF66 can only be accessed with secure access. Non-secure write to RPIF66 is discarded, non-secure read returns 0.

0: No rising edge trigger request occurred

1: rising edge trigger request occurred

This bit is set when the rising edge event or an EXTI\_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

Bit 1 **RPIF65**: configurable event inputs 65 rising edge pending bit.

When TZEN65 is disabled, RPIF65 can be accessed with non-secure and secure access.

When TZEN65 is enabled, RPIF65 can only be accessed with secure access. Non-secure write to RPIF65 is discarded, non-secure read returns 0.

0: No rising edge trigger request occurred

1: rising edge trigger request occurred

This bit is set when the rising edge event or an EXTI\_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

Bit 0 Reserved, must be kept at reset value.

## 24.6.17 EXTI falling edge pending register (EXTI\_FPR3)

Address offset: 0x050

Reset value: 0x0000 0000

Contains only register bits for configurable events.

|      |      |      |      |      |        |        |      |      |      |      |        |      |        |        |      |
|------|------|------|------|------|--------|--------|------|------|------|------|--------|------|--------|--------|------|
| 31   | 30   | 29   | 28   | 27   | 26     | 25     | 24   | 23   | 22   | 21   | 20     | 19   | 18     | 17     | 16   |

| Res. | Res. | Res. | Res. | Res. | FPIF74 | FPIF73 | Res. | Res. | Res. | Res. | FPIF68 | Res. | FPIF66 | FPIF65 | Res. |
|      |      |      |      |      | rc_w1  | rc_w1  |      |      |      |      | rc_w1  |      | rc_w1  | rc_w1  |      |

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **FPIF74**: configurable event inputs 74 falling edge pending bit.

When TZEN74 is disabled, FPIF74 can be accessed with non-secure and secure access.

When TZEN74 is enabled, FPIF74 can only be accessed with secure access. Non-secure write to FPIF74 is discarded, non-secure read returns 0.

0: No falling edge trigger request occurred

1: falling edge trigger request occurred

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

Bit 9 **FPIF73**: configurable event inputs 73 falling edge pending bit.

When TZEN73 is disabled, FPIF73 can be accessed with non-secure and secure access.

When TZEN73 is enabled, FPIF73 can only be accessed with secure access. Non-secure write to FPIF73 is discarded, non-secure read returns 0.

0: No falling edge trigger request occurred

1: falling edge trigger request occurred

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

Bits 8:5 Reserved, must be kept at reset value.

Bit 4 **FPIF68**: configurable event inputs 68 falling edge pending bit.

When TZEN68 is disabled, FPIF68 can be accessed with non-secure and secure access.

When TZEN68 is enabled, FPIF68 can only be accessed with secure access. Non-secure write to FPIF68 is discarded, non-secure read returns 0.

0: No falling edge trigger request occurred

1: falling edge trigger request occurred

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **FPIF66**: configurable event inputs 66 falling edge pending bit

When TZEN66 is disabled, FPIF66 can be accessed with non-secure and secure access.

When TZEN66 is enabled, FPIF66 can only be accessed with secure access. Non-secure write to FPIF66 is discarded, non-secure read returns 0.

0: No falling edge trigger request occurred

1: falling edge trigger request occurred

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

Bit 1 **FPIF65**: configurable event inputs 65 falling edge pending bit.

When TZEN65 is disabled, FPIF65 can be accessed with non-secure and secure access.

When TZEN65 is enabled, FPIF65 can only be accessed with secure access. Non-secure write to FPIF65 is discarded, non-secure read returns 0.

0: No falling edge trigger request occurred

1: falling edge trigger request occurred

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

Bit 0 Reserved, must be kept at reset value.

### 24.6.18 EXTI TrustZone enable register (EXTI\_TZENR3)

Address offset: 0x054

Reset value: 0x0000 0000

This register provides TrustZone Write access security, a non-secure write access will generate a bus error. A non-secure read will return the register data.

Contains only register bits for TrustZone capable Input events.

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:0 Reserved, must be kept at reset value.

### 24.6.19 EXTI external interrupt selection register 1 (EXTI\_EXTICR1)

Address offset: 0x060

Reset value: 0x0000 0000

EXTIm fields contain only the number of bits in line with the NBIOPORT[7:0] configuration.

|            |    |    |    |    |    |    |    |            |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23         | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| EXTI3[7:0] |    |    |    |    |    |    |    | EXTI2[7:0] |    |    |    |    |    |    |    |

| rw         | rw | rw | rw | rw | rw | rw | rw | rw         | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 **EXTI3[7:0]**: EXTI3 GPIO port selection

These bits are written by software to select the source input for EXTI3 external interrupt.

When TZEN3 is disabled, EXTI3 can be accessed with non-secure and secure access.

When TZEN3 is enabled, EXTI3 can only be accessed with secure access. Non-secure write is discarded, non-secure read returns 0.

### 24.6.23 EXTI CPU wakeup with interrupt mask register (EXTI\_IMR1)

Address offset: 0x080

Reset value: 0xFFFFE 0000

Contains register bits for configurable events and direct events.

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| IM31 | IM30 | IM29 | IM28 | IM27 | IM26 | IM25 | IM24 | IM23 | IM22 | IM21 | IM20 | IM19 | IM18 | IM17 | IM16 |
| rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| IM15 | IM14 | IM13 | IM12 | IM11 | IM10 | IM9  | IM8  | IM7  | IM6  | IM5  | IM4  | IM3  | IM2  | IM1  | IM0  |
| rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:0 **IM[31:0]**: CPU wakeup with interrupt mask on event input x (x = 31:0)<sup>(1)(2)</sup>.

When TZENx is disabled, IMx can be accessed with non-secure and secure access.

When TZENx is enabled, IMx can only be accessed with secure access. Non-secure write to IMx is discarded, non-secure read returns 0.

0: wakeup with interrupt request from Line x is masked

1: wakeup with interrupt request from Line x is unmasked

1. The reset value for configurable event inputs is set to '0' in order to disable the interrupt by default.
2. The reset value for direct event inputs is set to '1' in order to enable the interrupt by default.

#### 24.6.24 EXTI CPU2 wakeup with interrupt mask register (EXTI\_C2IMR1)

Address offset: 0x0C0

Reset value: 0xFFFFE 0000

Contains register bits for configurable events and direct events.

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **IM[75:64]**: CPU wakeup with interrupt mask on event input x (x = 75 to 64)<sup>(1)(2)</sup>

When TZENx is disabled, IMx can be accessed with non-secure and secure access.

When TZENx is enabled, IMx can only be accessed with secure access. Non-secure write to IMx is discarded, non-secure read returns 0.

0: wakeup with interrupt request from Line x is masked

1: wakeup with interrupt request from Line x is unmasked

1. The reset value for configurable event inputs is set to '0' in order to disable the interrupt by default.
2. The reset value for Direct event inputs is set to '1' in order to enable the interrupt by default.

### 24.6.32 EXTI CPUm wakeup with interrupt mask register (EXTI\_C2IMR3)

Address offset: 0x0E0

Reset value: 0x0000 0DE9

Contains register bits for configurable events and direct events.

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 25 Cyclic redundancy check calculation unit (CRC)

### 25.1 Introduction

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code from 8-, 16- or 32-bit data word and a generator polynomial.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the functional safety standards, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link time and stored at a given memory location.

### 25.2 CRC main features

- Uses CRC-32 (Ethernet) polynomial: 0x4C11DB7  
$$X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$$
- Alternatively, uses fully programmable polynomial with programmable size (7, 8, 16, 32 bits)
- Handles 8-, 16-, 32-bit data size
- Programmable CRC initial value
- Single input/output 32-bit data register
- Input buffer to avoid bus stall during calculation
- CRC computation done in 4 AHB clock cycles (HCLK) for the 32-bit data size
- General-purpose 8-bit register (can be used for temporary storage)
- Reversibility option on I/O data

## 25.3 CRC functional description

### 25.3.1 CRC block diagram

Figure 144. CRC calculation unit block diagram

### 25.3.2 CRC internal signals

Table 130. CRC internal input/output signals

| Signal name | Signal type   | Description |
|-------------|---------------|-------------|
| crc_hclk    | Digital input | AHB clock   |

### 25.3.3 CRC operation

The CRC calculation unit has a single 32-bit read/write data register (CRC\_DR). It is used to input new data (write access), and holds the result of the previous CRC calculation (read access).

Each write operation to the data register creates a combination of the previous CRC value (stored in CRC\_DR) and the new one. CRC computation is done on the whole 32-bit data word or byte by byte depending on the format of the data being written.

The CRC\_DR register can be accessed by word, right-aligned half-word and right-aligned byte. For the other registers only 32-bit access is allowed.

The duration of the computation depends on data width:

- 4 AHB clock cycles for 32-bit
- 2 AHB clock cycles for 16-bit
- 1 AHB clock cycles for 8-bit

An input buffer allows a second data to be immediately written without waiting for any wait states due to the previous CRC calculation.

The data size can be dynamically adjusted to minimize the number of write accesses for a given number of bytes. For instance, a CRC for 5 bytes can be computed with a word write followed by a byte write.

The input data can be reversed, to manage the various endianness schemes. The reversing operation can be performed on 8 bits, 16 bits and 32 bits depending on the REV\_IN[1:0] bits in the CRC\_CR register.

For example: input data 0x1A2B3C4D is used for CRC calculation as:

- 0x58D43CB2 with bit-reversal done by byte
- 0xD458B23C with bit-reversal done by half-word
- 0xB23CD458 with bit-reversal done on the full word

The output data can also be reversed by setting the REV\_OUT bit in the CRC\_CR register.

The operation is done at bit level: for example, output data 0x11223344 is converted into 0x22CC4488.

The CRC calculator can be initialized to a programmable value using the RESET control bit in the CRC\_CR register (the default value is 0xFFFFFFFF).

The initial CRC value can be programmed with the CRC\_INIT register. The CRC\_DR register is automatically initialized upon CRC\_INIT register write access.

The CRC\_IDR register can be used to hold a temporary value related to CRC calculation. It is not affected by the RESET bit in the CRC\_CR register.

### Polynomial programmability

The polynomial coefficients are fully programmable through the CRC\_POL register, and the polynomial size can be configured to be 7, 8, 16 or 32 bits by programming the POLYSIZE[1:0] bits in the CRC\_CR register. Even polynomials are not supported.

If the CRC data is less than 32-bit, its value can be read from the least significant bits of the CRC\_DR register.

To obtain a reliable CRC calculation, the change on-fly of the polynomial value or size can not be performed during a CRC calculation. As a result, if a CRC calculation is ongoing, the application must either reset it or perform a CRC\_DR read before changing the polynomial.

The default polynomial value is the CRC-32 (Ethernet) polynomial: 0x4C11DB7.

## 25.4 CRC registers

### 25.4.1 CRC data register (CRC\_DR)

Address offset: 0x00

Reset value: 0xFFFF FFFF

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW        | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| DR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW        | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 31:0 **DR[31:0]**: Data register bits

This register is used to write new data to the CRC calculator.

It holds the previous CRC calculation result when it is read.

If the data size is less than 32 bits, the least significant bits are used to write/read the correct value.

### 25.4.2 CRC independent data register (CRC\_IDR)

Address offset: 0x04

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| IDR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW         | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| IDR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW         | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 31:0 **IDR[31:0]**: General-purpose 32-bit data register bits

These bits can be used as a temporary storage location for four bytes.

This register is not affected by CRC resets generated by the RESET bit in the CRC\_CR register

### 25.4.3 CRC control register (CRC\_CR)

Address offset: 0x08

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |         |             |      |               |      |      |      |       |
|------|------|------|------|------|------|------|------|---------|-------------|------|---------------|------|------|------|-------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23      | 22          | 21   | 20            | 19   | 18   | 17   | 16    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.    | Res.        | Res. | Res.          | Res. | Res. | Res. | Res.  |
|      |      |      |      |      |      |      |      |         |             |      |               |      |      |      |       |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7       | 6           | 5    | 4             | 3    | 2    | 1    | 0     |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | REV_OUT | REV_IN[1:0] |      | POLYSIZE[1:0] |      | Res. | Res. | RESET |
|      |      |      |      |      |      |      |      | rw      | rw          | rw   | rw            | rw   |      |      | rs    |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **REV\_OUT**: Reverse output data

This bit controls the reversal of the bit order of the output data.

0: Bit order not affected

1: Bit-reversed output format

Bits 6:5 **REV\_IN[1:0]**: Reverse input data

These bits control the reversal of the bit order of the input data

00: Bit order not affected

01: Bit reversal done by byte

10: Bit reversal done by half-word

11: Bit reversal done by word

Bits 4:3 **POLYSIZE[1:0]**: Polynomial size

These bits control the size of the polynomial.

00: 32 bit polynomial

01: 16 bit polynomial

10: 8 bit polynomial

11: 7 bit polynomial

Bits 2:1 Reserved, must be kept at reset value.

Bit 0 **RESET**: RESET bit

This bit is set by software to reset the CRC calculation unit and set the data register to the value stored in the CRC\_INIT register. This bit can only be set, it is automatically cleared by hardware

### 25.4.4 CRC initial value (CRC\_INIT)

Address offset: 0x10

Reset value: 0xFFFF FFFF

|                 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31              | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| CRC_INIT[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw              | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15              | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CRC_INIT[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw              | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **CRC\_INIT[31:0]**: Programmable initial CRC value

This register is used to write the CRC initial value.

## 25.4.5 CRC polynomial (CRC\_POL)

Address offset: 0x14

Reset value: 0x04C1 1DB7

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| POL[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| POL[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **POL[31:0]**: Programmable polynomial

This register is used to write the coefficients of the polynomial to be used for CRC calculation.

If the polynomial size is less than 32 bits, the least significant bits have to be used to program the correct value.

## 25.4.6 CRC register map

Table 131. CRC register map and reset values

| Offset | Register name | 31             | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   | 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7       | 6           | 5              | 4 | 3    | 2    | 1     | 0 |
|--------|---------------|----------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|---------|-------------|----------------|---|------|------|-------|---|
| 0x00   | CRC_DR        | DR[31:0]       |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |         |             |                |   |      |      |       |   |
|        | Reset value   | 1              | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1       | 1           | 1              | 1 | 1    | 1    | 1     | 1 |
| 0x04   | CRC_IDR       | IDR[31:0]      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |         |             |                |   |      |      |       |   |
|        | Reset value   | 0              | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0    | 0       | 0           | 0              | 0 | 0    | 0    | 0     | 0 |
| 0x08   | CRC_CR        | Res.           | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | REV_OUT | REV_IN[1:0] | POLY_SIZE[1:0] |   | Res. | Res. | RESET |   |
|        | Reset value   |                |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      | 0       | 0           | 0              | 0 |      |      | 0     |   |
| 0x10   | CRC_INIT      | CRC_INIT[31:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |         |             |                |   |      |      |       |   |
|        | Reset value   | 1              | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1    | 1       | 1           | 1              | 1 | 1    | 1    | 1     | 1 |
| 0x14   | CRC_POL       | POL[31:0]      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |         |             |                |   |      |      |       |   |
|        | Reset value   | 0              | 0    | 0    | 0    | 0    | 1    | 0    | 0    | 1    | 1    | 0    | 0    | 0    | 0    | 0    | 1    | 0    | 0    | 0    | 1    | 1    | 1    | 0    | 1    | 1       | 0           | 1              | 1 | 0    | 1    | 1     | 1 |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 26 Flexible memory controller (FMC)

The Flexible memory controller (FMC) includes two memory controllers:

- The NOR/PSRAM memory controller
- The NAND memory controller

### 26.1 FMC main features

The FMC functional block makes the interface with: synchronous and asynchronous static memories, and NAND flash memory. Its main purposes are:

- to translate AXI transactions into the appropriate external device protocol
- to meet the access time requirements of the external memory devices

All external memories share the addresses, data and control signals with the controller. Each external device is accessed by means of a unique Chip Select. The FMC performs only one access at a time to an external device.

The main features of the FMC controller are the following:

- Interface with static-memory mapped devices including:
  - Static random access memory (SRAM)
  - NOR Flash memory/OneNAND Flash memory
  - PSRAM (4 memory banks)
  - Ferroelectric RAM (FRAM)
  - NAND Flash memory with ECC hardware to check up to 8 Kbytes of data
- Burst mode support for faster access to synchronous devices such as NOR Flash memory, PSRAM)
- Programmable continuous clock output for asynchronous and synchronous accesses
- 8-,16-bit wide data bus
- Independent Chip Select control for each memory bank
- Independent configuration for each memory bank
- Write enable and byte lane select outputs for use with PSRAM, SRAM devices
- External asynchronous wait control

At startup the FMC pins must be configured by the user application. The FMC input/output pins which are not used by the application can be used for other purposes.

After reset, the FMC controller is disabled. Once all the used memory controllers are configured, the FMC controller must be enabled by setting the FMCEN bit in the FMC\_BCR1 register.

The FMC registers that define the external device type and associated characteristics are set at boot time and do not change until the next reset or power-up. If some registers have to be re-configured, the FMC controller must be disabled (FMCEN bit set to 0x0). However, only few bits can be changed on the fly:

- FMCEN bit in the FMC\_BCR1 register
- ECCEN and PBEN bits in FMC\_PCR register
- FMC\_CISR register bits
- FMC command sequencer registers and FMC BCH registers

If some parameters have to be modified while the FMC controller is enabled, the FMC controller must be first disabled so that no further access is allowed to any memory controller during register modification. Once all needed configurations are updated, enable the FMC controller as follows:

1. Disable FMC by resetting the FMCEN bit in the FMC\_BCR1 register.
2. Wait ISOST[1:0] bits in FMC\_SR register to be set to 0b11.
3. Wait until PEF flag is set in the FMC\_SR register.
4. Program the registers with new values.
5. Enable the FMC by setting the FMCEN bit.

## 26.2 FMC implementation

Table 132. FMC features

| Modes/features                      | FMC1        |
|-------------------------------------|-------------|
| NAND Flash Chip Select outputs      | 2           |
| NAND Flash Ready/Busy               | 1           |
| NAND/NOR Flash with common WAIT pin | Yes (NWAIT) |

## 26.3 FMC block diagram

The FMC consists of the following main blocks:

- The NOR Flash/PSRAM/SRAM controller
- The NAND controller
- The AXI interface
- The AHB interface (including the FMC configuration registers)

The block diagram is shown in the below figure.

Figure 145. FMC block diagram

1. The FMC features two NCE chip select outputs.

## 26.4 FMC internal signals

[Table 133](#) gives the list of FMC internal signals. FMC pins (or external signals) are described in [Section 26.8.1: External memory interface signals](#).

**Table 133. FMC internal signals**

| Names      | Signal type    | Description         |
|------------|----------------|---------------------|
| fmc_it     | Digital output | FMC interrupt       |
| fmc_ker_ck | Digital input  | FMC kernel clock    |
| fmc_hclk   | Digital input  | FMC interface clock |

## 26.5 AHB interface

The AHB slave interface allows internal CPUs to configure the FMC registers.

The AHB clock (HCLK) is the reference clock for the FMC register accesses.

## 26.6 AXI interface

The AXI slave interface allows internal CPUs and other bus master peripherals to access the external memories.

AXI transactions are translated into the external device protocol. As the AXI data bus is 64-bit wide, the AXI transactions might be split into several consecutive 32- or 16- or 8-bit accesses according to data size accesses.

The FMC generates an AXI slave error when one of the following conditions is met:

- When reading or writing to an FMC bank (Bank 1 to 4) which is not enabled
- When reading or writing to any FMC bank while the FMC controller is disabled (FMCEN bit is reset)
- When reading or writing by the command sequencer to NAND bank while it is disabled
- When reading or writing to the NOR Flash memory bank while the MBKEN bit is reset in the FMC\_BCRx register

The kernel clock for the FMC controller is the asynchronous fmc\_ker\_ck clock (refer the Reset and Clock control (RCC) section for details on fmc\_ker\_ck clock source selection).

## 26.6.1 Supported memories and transactions

### General transaction rules

The requested AXI transaction data size can be 8-, 16-, 32- or 64-bit wide whereas the accessed external device has a fixed data width. This may lead to inconsistent transfers.

Therefore, some simple transaction rules must be followed:

- AXI transaction size and memory data size must be equal to prevent issues from occurring.
- AXI transaction size is greater than the memory size:  
In this case, the FMC splits the AXI transaction into smaller consecutive memory accesses to meet the external data width.
- AXI transaction size is smaller than the memory size:  
The transfer may or not be consistent depending on the type of external device:
  - Accesses to devices that have the byte select feature (SRAM, ROM, PSRAM)  
In this case, the FMC allows read/write transactions and accesses the right data through its byte lanes NBL[1:0].  
Bytes to be written are addressed by NBL[1:0].  
All memory bytes are read (NBL[1:0] are driven low during read transaction) and the useless ones are discarded.
  - Accesses to devices that do not have the byte select feature (NOR and NAND Flash memories)  
This situation occurs when a byte access is requested to a 16-bit wide Flash memory. Since the device cannot be accessed in byte mode (only 16-bit words can be read/written from/to the Flash memory), write transactions are not allowed while read transactions are allowed (the controller reads the entire 16-bit memory word and uses only the required byte).

### Wrap support for NOR Flash/PSRAM

Synchronous memories must be configured in linear burst mode of undefined length as not all masters can issue wrap transactions.

If a master generates a wrap transaction:

- The read operation is split into two linear burst transactions.
- The write operation is split into two linear burst transactions.

### Configuration registers

The FMC can be configured through a set of registers. Refer to [Section 26.8.6](#), for a detailed description of the NOR Flash/PSRAM controller registers. Refer to [Section 26.9.9](#), for a detailed description of the NAND Flash registers.

26.7 External device address mapping

From the FMC point of view, the external memory is divided into fixed-size banks of 256 Mbytes each (see [Figure 146](#)):

- Bank 1 is used to address up to 4 NOR Flash memories or PSRAM devices. This bank is split into four NOR/PSRAM subbanks with four dedicated Chip Selects, as follows:
  - Bank 1 - NOR/PSRAM 1
  - Bank 1 - NOR/PSRAM 2
  - Bank 1 - NOR/PSRAM 3
  - Bank 1 - NOR/PSRAM 4
- Bank 3 is used to address NAND Flash memory devices. The MPU memory attribute for this space must be reconfigured by software to Device.

For each bank, the type of memory to be used can be configured by the user application through the Configuration register.

Figure 146. FMC memory banks (Default mapping)

### 26.7.1 NOR/PSRAM address mapping

ADDR[27:26] bits are used to select one of the four memory banks as shown in [Table 134](#).

**Table 134. NOR/PSRAM bank selection**

| ADDR[27:26] <sup>(1)</sup> | Selected bank        |
|----------------------------|----------------------|
| 00                         | Bank 1 - NOR/PSRAM 1 |
| 01                         | Bank 1 - NOR/PSRAM 2 |
| 10                         | Bank 1 - NOR/PSRAM 3 |
| 11                         | Bank 1 - NOR/PSRAM 4 |

1. ADDR are internal address lines that are translated to external memory.

The ADDR[25:0] bits contain the external memory address. Since ADDR is a byte address whereas the memory is addressed at word level, the address actually issued to the memory varies according to the memory data width, as shown in the following table.

**Table 135. NOR/PSRAM External memory address**

| Memory width <sup>(1)</sup> | Data address issued to the memory | Maximum memory capacity (bits) |
|-----------------------------|-----------------------------------|--------------------------------|
| 8-bit                       | ADDR[25:0]                        | 64 Mbytes x 8 = 512 Mbit       |
| 16-bit                      | ADDR[25:1] >> 1                   | 64 Mbytes/2 x 16 = 512 Mbit    |

1. In case of a 16-bit external memory width, the FMC will internally use ADDR[25:1] to generate the address for external memory FMC\_A[24:0].  
Whatever the external memory width, FMC\_A[0] should be connected to external memory address A[0].

### 26.7.2 NAND Flash memory address mapping

The NAND bank is divided into memory areas as indicated in [Table 136](#).

**Table 136. NAND memory mapping and timing registers**

| Start address | End address | FMC bank            | Memory space | Timing register |
|---------------|-------------|---------------------|--------------|-----------------|
| 0x8800 0000   | 0x8FFF FFFF | Bank 3 - NAND Flash | Attribute    | FMC_PATT (0x8C) |
| 0x8000 0000   | 0x87FF FFFF |                     | Common       | FMC_PMEM (0x88) |

For NAND Flash memory, the common and attribute memory spaces are subdivided into three sections (see in [Table 137](#) below) located in the lower 256 Kbytes:

- Data section (first 64 Kbytes in the common/attribute memory space)
- Command section (second 64 Kbytes in the common / attribute memory space)
- Address section (next 128 Kbytes in the common / attribute memory space)

Table 137. NAND Flash bank selection

| Section name    | ADDR[17:16] | Address range   |
|-----------------|-------------|-----------------|
| Address section | 10          | 0x20000-0x3FFFF |
| Command section | 01          | 0x10000-0x1FFFF |
| Data section    | 00          | 0x00000-0x0FFFF |

The ADDR[25:24] bits allow the selection of the NAND Flash chip enable issued to the NAND memory as shown in [Table 138](#). It allows switching from one chip enable to another in order to address a given NAND Flash memory within a multipldie package.

Table 138. NAND chip enable selection

| ADDR[25:24]         | Chip Select Selection |
|---------------------|-----------------------|
| 00                  | NCE1                  |
| 01                  | NCE2                  |
| Other configuration | Reserved              |

The application software uses the 3 sections to access the NAND Flash memory:

- **To send a command to NAND Flash memory**, the software must write the command value to any memory location in the command section.
- **To specify the NAND Flash address that must be read or written**, the software must write the address value to any memory location in the address section. Since an address can be 4 or 5 bytes long (depending on the actual memory size), several consecutive write operations to the address section are required to specify the full address.
- **To read or write data**, the software reads or writes the data from/to any memory location in the data section.

Since the NAND Flash memory automatically increments addresses, there is no need to increment the address of the data section to access consecutive memory locations.

## 26.8 NOR Flash/PSRAM controller

The FMC generates the appropriate signal timings to drive the following types of memories:

- Asynchronous SRAM, FRAM and ROM
  - 8 bits
  - 16 bits
- PSRAM (CellularRAM™)
  - Asynchronous mode
  - Burst mode for synchronous accesses with configurable option to split burst access when crossing boundary page for CRAM 1.5.
  - Multiplexed or non-multiplexed
- NOR Flash memory
  - Asynchronous mode
  - Burst mode for synchronous accesses
  - Multiplexed or non-multiplexed

The FMC outputs a unique Chip Select signal, NE[4:1], per bank. All the other signals (addresses, data and control) are shared.

The FMC supports a wide range of devices through a programmable timings among which:

- Programmable wait states (up to 15)
- Programmable bus turnaround cycles (up to 15)
- Programmable output enable and write enable delays (up to 15)
- Independent read and write timings and protocol to support the widest variety of memories and timings
- Programmable continuous clock (FMC\_CLK) output.

The FMC output Clock (FMC\_CLK) is a submultiple of the `fmc_ker_ck` clock. It can be delivered to the selected external device either during synchronous accesses only or during asynchronous and synchronous accesses depending on the CCKEN bit configuration in the FMC\_BCR1 register:

- If the CCLKEN bit is reset, the FMC generates the clock (FMC\_CLK) only during synchronous accesses (Read/write transactions).
- If the CCLKEN bit is set, the FMC generates a continuous clock during asynchronous and synchronous accesses. To generate the FMC\_CLK continuous clock, Bank 1 must be configured in synchronous mode (see [Section 26.8.6: NOR/PSRAM controller registers](#)). Since the same clock is used for all synchronous memories, when a continuous output clock is generated and synchronous accesses are performed, the AXI data size has to be the same as the memory data width (MWID) otherwise the FMC\_CLK frequency will be changed depending on AXI data transaction (refer to [Section 26.8.5: Synchronous transactions](#) for FMC\_CLK divider ratio formula).

The size of each bank is fixed and equal to 64 Mbytes. Each bank is configured through dedicated registers (see [Section 26.8.6: NOR/PSRAM controller registers](#)).

The programmable memory parameters include access times (see [Table 139](#)) and support for wait management (for PSRAM and NOR Flash accessed in burst mode).

**Table 139. Programmable NOR/PSRAM access parameters**

| Parameter          | Function                                                                         | Access mode                       | Unit                            | Min. | Max. |
|--------------------|----------------------------------------------------------------------------------|-----------------------------------|---------------------------------|------|------|
| Address setup      | Duration of the address setup phase                                              | Asynchronous                      | FMC clock cycle (fmc_ker_ck)    | 0    | 15   |
| Address hold       | Duration of the address hold phase                                               | Asynchronous, muxed I/Os          | FMC clock cycle (fmc_ker_ck)    | 1    | 15   |
| NBL setup          | Duration of the Byte lanes setup phase                                           | Asynchronous                      | FMC clock cycle (fmc_ker_ck)    | 0    | 3    |
| Data setup         | Duration of the data setup phase                                                 | Asynchronous                      | FMC clock cycle (fmc_ker_ck)    | 1    | 256  |
| Data hold          | Duration of the data hold phase                                                  | Asynchronous                      | FMC clock cycle (fmc_ker_ck)    | 0    | 3    |
| Bust turn          | Duration of the bus turnaround phase                                             | Asynchronous and synchronous read | FMC clock cycle (fmc_ker_ck)    | 0    | 15   |
| Clock divide ratio | Number of FMC clock cycles (fmc_ker_ck) to build one memory clock cycle (CLK)    | Synchronous                       | FMC clock cycle (fmc_ker_ck)    | 2    | 16   |
| Data latency       | Number of clock cycles to issue to the memory before the first data of the burst | Synchronous                       | Memory clock cycle (fmc_ker_ck) | 2    | 17   |

### 26.8.1 External memory interface signals

[Table 140](#), [Table 141](#) and [Table 142](#) list the signals that are typically used to interface with NOR Flash memory, SRAM and PSRAM.

*Note:* The prefix “N” identifies the signals which are active low.

#### NOR Flash memory, non-multiplexed I/Os

**Table 140. Non-multiplexed I/O NOR Flash memory**

| FMC signal name | I/O | Function                                                                            |
|-----------------|-----|-------------------------------------------------------------------------------------|
| CLK             | O   | Clock (for synchronous access)                                                      |
| A[25:0]         | O   | Address bus                                                                         |
| D[15:0]         | I/O | Bidirectional data bus                                                              |
| NE[x]           | O   | Chip Select, x = 1..4                                                               |
| NOE             | O   | Output enable                                                                       |
| NWE             | O   | Write enable                                                                        |
| NL(=NADV)       | O   | Latch enable (this signal is called address valid, NADV, by some NOR Flash devices) |
| NWAIT           | I   | NOR Flash wait input signal to the FMC                                              |

The maximum capacity is 512 Mbits (26 address lines).

**NOR Flash memory, 16-bit multiplexed I/Os****Table 141. 16-bit multiplexed I/O NOR Flash memory**

| FMC signal name | I/O | Function                                                                                                                        |
|-----------------|-----|---------------------------------------------------------------------------------------------------------------------------------|
| CLK             | O   | Clock (for synchronous access)                                                                                                  |
| A[25:16]        | O   | Address bus                                                                                                                     |
| AD[15:0]        | I/O | 16-bit multiplexed, bidirectional address/data bus (the 16-bit address A[15:0] and data D[15:0] are multiplexed on the databus) |
| NE[x]           | O   | Chip Select, x = 1..4                                                                                                           |
| NOE             | O   | Output enable                                                                                                                   |
| NWE             | O   | Write enable                                                                                                                    |
| NL(=NADV)       | O   | Latch enable (this signal is called address valid, NADV, by some NOR Flash devices)                                             |
| NWAIT           | I   | NOR Flash wait input signal to the FMC                                                                                          |

The maximum capacity is 512 Mbits.

**PSRAM/SRAM/FRAM, non-multiplexed I/Os****Table 142. Non-multiplexed I/Os PSRAM/SRAM**

| FMC signal name | I/O | Function                                                                  |
|-----------------|-----|---------------------------------------------------------------------------|
| CLK             | O   | Clock (only for PSRAM synchronous access)                                 |
| A[25:0]         | O   | Address bus                                                               |
| D[15:0]         | I/O | Data bidirectional bus                                                    |
| NE[x]           | O   | Chip Select, x = 1..4 (called NCE by PSRAM (CellularRAM™ i.e. CRAM))      |
| NOE             | O   | Output enable                                                             |
| NWE             | O   | Write enable                                                              |
| NL(= NADV)      | O   | Address valid only for PSRAM input (memory signal name: NADV)             |
| NWAIT           | I   | PSRAM wait input signal to the FMC                                        |
| NBL[1:0]        | O   | Byte lane output. Byte 0 and Byte 1 control (upper and lower byte enable) |

The maximum capacity is 512 Mbits.

**PSRAM, 16-bit multiplexed I/Os****Table 143. 16-Bit multiplexed I/O PSRAM**

| FMC signal name | I/O | Function                       |
|-----------------|-----|--------------------------------|
| CLK             | O   | Clock (for synchronous access) |
| A[25:16]        | O   | Address bus                    |

**Table 143. 16-Bit multiplexed I/O PSRAM (continued)**

| FMC signal name | I/O | Function                                                                                                                        |
|-----------------|-----|---------------------------------------------------------------------------------------------------------------------------------|
| AD[15:0]        | I/O | 16-bit multiplexed, bidirectional address/data bus (the 16-bit address A[15:0] and data D[15:0] are multiplexed on the databus) |
| NE[x]           | O   | Chip Select, x = 1..4 (called NCE by PSRAM (CellularRAM™ i.e. CRAM))                                                            |
| NOE             | O   | Output enable                                                                                                                   |
| NWE             | O   | Write enable                                                                                                                    |
| NL(= NADV)      | O   | Address valid PSRAM input (memory signal name: NADV)                                                                            |
| NWAIT           | I   | PSRAM wait input signal to the FMC                                                                                              |
| NBL[1:0]        | O   | Byte lane output. Byte 0 and Byte 1 control (upper and lower byte enable)                                                       |

The maximum capacity is 512 Mbits (26 address lines).

## 26.8.2 Supported memories and transactions

[Table 144](#) below shows an example of the supported devices, access modes and transactions when the memory data bus is 16-bit wide for NOR Flash memory, PSRAM and SRAM. The transactions not allowed (or not supported) by the FMC are shown in gray in this example.

**Table 144. NOR Flash/PSRAM: Example of supported memories and transactions**

| Device                                       | Mode              | R/W | AXI data size | Memory data size | Allowed/ not allowed | Comments                  |
|----------------------------------------------|-------------------|-----|---------------|------------------|----------------------|---------------------------|
| NOR Flash<br>(muxed I/Os and non-muxed I/Os) | Asynchronous      | R   | 8             | 16               | Y                    | -                         |
|                                              | Asynchronous      | W   | 8             | 16               | N                    | -                         |
|                                              | Asynchronous      | R   | 16            | 16               | Y                    | -                         |
|                                              | Asynchronous      | W   | 16            | 16               | Y                    | -                         |

### 26.8.3 General timing rules

#### Signals synchronization

- All controller output signals change on the rising edge of the fmc\_ker\_ck clock
- In synchronous mode (read or write), all output signals change on the rising edge of fmc\_ker\_ck clock. Whatever the CLKDIV value, all outputs change as follows:
  - NOEL/NWEL/ NEL/NADVL/ NADVH /NBLL/ Address valid outputs change on the falling edge of FMC\_CLK clock.
  - NOEH/ NWEH / NEH/ NOEH/NBLH/ Address invalid outputs change on the rising edge of FMC\_CLK clock.

## 26.8.4 NOR Flash/PSRAM controller asynchronous transactions

### Asynchronous static memories (NOR Flash, PSRAM, SRAM, FRAM)

- Signals are synchronized by the internal clock `fmc_ker_ck`. This clock is not issued to the memory.
- The FMC always samples the data before de-asserting the Chip Select signal `NE`. This guarantees that the memory data hold timing constraint is met (minimum chip enable high to data transition is usually 0 ns)
- If the extended mode is enabled (`EXTMOD` bit is set in the `FMC_BCRx` register), up to four extended modes (A, B, C and D) are available. It is possible to mix A, B, C and D modes for read and write operations. For example, read operation can be performed in mode A and write in mode B.
- If the extended mode is disabled (`EXTMOD` bit is reset in the `FMC_BCRx` register), the FMC can operate in mode 1 or mode 2 as follows:
  - Mode 1 is the default mode when SRAM/PSRAM memory type is selected (`MTYP = 0x0` or `0x01` in the `FMC_BCRx` register)
  - Mode 2 is the default mode when NOR memory type is selected (`MTYP = 0x10` in the `FMC_BCRx` register).

### Mode 1 - SRAM/FRAM/PSRAM (CRAM)

The next figures show the read and write transactions for the supported modes followed by the required configuration of `FMC_BCRx`, and `FMC_BTRx`/`FMC_BWTRx` registers.

Figure 147. Mode 1 read access waveforms

Figure 148. Mode 1 write access waveforms

The DATAHLD time at the end of the read and write transaction guarantee the address and data hold time after the NOE/NWE rising edge. For write, the DATAST value must be greater than zero (DATAST > 0).

Table 145. FMC\_BCRx bitfields (mode 1)

| Bit number | Bit name    | Value to set                                                       |
|------------|-------------|--------------------------------------------------------------------|
| 31         | FMEN        | 0x1                                                                |
| 30-24      | Reserved    | 0x000                                                              |
| 23:22      | NBLSET[1:0] | As needed                                                          |
| 21         | Reserved    | 0x0                                                                |
| 20         | CCLKEN      | As needed                                                          |
| 19         | CBURSTRW    | 0x0 (no effect in asynchronous mode)                               |
| 18:16      | CPSIZE      | 0x0 (no effect in asynchronous mode)                               |
| 15         | ASYNCAWAIT  | Set to 1 if the memory supports this feature. Otherwise keep at 0. |
| 14         | EXTMOD      | 0x0                                                                |
| 13         | WAITEN      | 0x0 (no effect in asynchronous mode)                               |
| 12         | WREN        | As needed                                                          |
| 11         | WAITCFG     | Don't care                                                         |
| 10         | Reserved    | 0x0                                                                |
| 9          | WAITPOL     | Meaningful only if bit 15 is 1                                     |

Table 145. FMC\_BCRx bitfields (mode 1) (continued)

| Bit number | Bit name | Value to set                              |
|------------|----------|-------------------------------------------|
| 8          | BURSTEN  | 0x0                                       |
| 7          | Reserved | 0x1                                       |
| 6          | FACCEN   | Don't care                                |
| 5-4        | MWID     | As needed                                 |
| 3-2        | MTYP     | As needed, exclude 0x2 (NOR Flash memory) |
| 1          | MUXE     | 0x0                                       |
| 0          | MBKEN    | 0x1                                       |

Table 146. FMC\_BTRx bitfields (mode 1)

| Bit number | Bit name | Value to set                                                                                     |
|------------|----------|--------------------------------------------------------------------------------------------------|
| 31:30      | DATAHLD  | Duration of the Data hold phase (DATAHLD fmc_ker_ck cycles) for read accesses.                   |
| 29-28      | ACCMOD   | Don't care                                                                                       |
| 27-24      | DATLAT   | Don't care                                                                                       |
| 23-20      | CLKDIV   | Don't care                                                                                       |
| 19-16      | BUSTURN  | Time between NEx high to NEx low (BUSTURN fmc_ker_ck)                                            |
| 15-8       | DATAST   | Duration of the second access phase (DATAST fmc_ker_ck cycles).                                  |
| 7-4        | ADDHLD   | Don't care                                                                                       |
| 3-0        | ADDSET   | Duration of the first access phase (ADDSET fmc_ker_ck cycles).<br>Minimum value for ADDSET is 0. |

## Mode A - SRAM/FRAM/PSRAM (CRAM) OE toggling

Figure 149. Mode A read access waveforms

1. NBL[1:0] are driven low during the read access

Figure 150. Mode A write access waveforms

The differences compared with mode 1 are the toggling of NOE and the independent read and write timings.

**Table 147. FMC\_BCRx bitfields (mode A)**

| Bit number | Bit name    | Value to set                                                       |
|------------|-------------|--------------------------------------------------------------------|

## Mode 2/B - NOR Flash

Figure 151. Mode 2 and Mode B read access waveforms

Figure 152. Mode 2 write access waveforms

Figure 153. Mode B write access waveforms

The differences with mode 1 are the toggling of NWE and the independent read and write timings when extended mode is set (mode B).

Table 150. FMC\_BCRx bitfields (mode 2/B)

## Mode D - asynchronous access with extended address

Figure 156. Mode D read access waveforms

Figure 157. Mode D write access waveforms

The differences with Mode 1 are the toggling of NOE that goes on toggling after NADV changes and the independent read and write timings.

Table 156. FMC\_BCRx bitfields (mode D)

| Bit No. | Bit name    | Value to set                                                       |

### WAIT management for asynchronous accesses

If the asynchronous memory asserts the WAIT signal to indicate that it is not yet ready to accept or to provide data, the ASYNCWAIT bit has to be set in FMC\_BCRx register.

If the WAIT signal is active (high or low depending on the WAITPOL bit), the second access phase (Data setup phase), programmed by the DATAST bits, is extended until WAIT becomes inactive. Unlike the data setup phase, the first access phases (Address setup and Address hold phases), programmed by the ADDSET and ADDHLD bits, are not WAIT sensitive and so they are not prolonged.

The data setup phase must be programmed so that WAIT can be detected 4 fmc\_ker\_ck cycles before the end of the memory transaction. The following cases must be considered:

1. The memory asserts the WAIT signal aligned to NOE/NWE which toggles:

$$\text{DATAST} \geq (4 \times \text{FMCCLK}) + \text{max\_wait\_assertion\_time}$$

2. The memory asserts the WAIT signal aligned to NEx (or NOE/NWE not toggling):  
if

$$\text{max\_wait\_assertion\_time} > \text{address\_phase} + \text{hold\_phase}$$

then:

$$\text{DATAST} \geq (4 \times \text{FMCCLK}) + (\text{max\_wait\_assertion\_time} - \text{address\_phase} - \text{hold\_phase})$$

otherwise

$$\text{DATAST} \geq 4 \times \text{FMCCLK}$$

where max\_wait\_assertion\_time is the maximum time taken by the memory to assert the WAIT signal once NEx/NOE/NWE is low.

[Figure 160](#) and [Figure 161](#) show the number of fmc\_ker\_ck clock cycles that are added to the memory access phase after WAIT is released by the asynchronous memory (independently of the above cases).

**Figure 160. Asynchronous wait during a read access waveforms**

1. NWAIT polarity depends on WAITPOL bit setting in FMC\_BCRx register.

**Figure 161. Asynchronous wait during a write access waveforms**

1. NWAIT polarity depends on WAITPOL bit setting in FMC\_BCRx register.

**CellularRAM™ (PSRAM) refresh management**

The CellularRAM™ does not allow maintaining the chip select signal (NE) low for longer than the  $t_{CEM}$  timing specified in memory device. This timing can be programmed in the FMC\_PCSCNTR register. It defines the maximum duration of the NE low pulse (expressed in `fmc_ker_ck` cycles) in synchronous mode for PSRAM read or write accesses.

**26.8.5 Synchronous transactions**

The memory clock, FMC\_CLK, is a submultiple of `fmc_ker_ck`. It depends on the value of CLKDIV.

NOR Flash memories specify a minimum time from NADV assertion to FMC\_CLK high. To meet this constraint, the FMC does not issue the clock to the memory during the first internal clock cycle of the synchronous access (before NADV assertion). This guarantees that the rising edge of the memory clock occurs in the middle of the NADV low pulse.

**Data latency versus NOR memory latency**

The data latency is the number of cycles to wait before sampling the data. The DATLAT value must be consistent with the latency value specified in the NOR Flash configuration register. The FMC does not include the clock cycle when NADV is low in the data latency count.

**Caution:** Some NOR Flash memories include the NADV Low cycle in the data latency count, so that the exact relation between the NOR Flash latency and the FMC DATLAT parameter can be either:

- NOR Flash latency = (DATLAT + 2) CLK clock cycles
- or NOR Flash latency = (DATLAT + 3) CLK clock cycles

Some recent memories assert NWAIT during the latency phase. In such cases DATLAT can be set to its minimum value. As a result, the FMC samples the data and waits long enough to evaluate if the data are valid. Thus the FMC detects when the memory exits latency and real data are processed.

Other memories do not assert NWAIT during latency. In this case the latency must be set correctly for both the FMC and the memory, otherwise invalid data are mistaken for good data, or valid data are lost in the initial phase of the memory access.

**Single-burst transfer**

When the selected bank is configured in burst mode for synchronous accesses, if for example a single-burst transaction is requested on 16-bit memories, the FMC performs a burst transaction of length 1 (if the AXI transfer is 16 bits), or length 2 (if the AXI transfer is 32 bits) and de-assert the Chip Select signal when the last data is strobed.

Such transfers are not the most efficient in terms of cycles compared to asynchronous read operations. Nevertheless, a random asynchronous access would first require to re-program the memory access mode, which would altogether last longer.

### Cross boundary page for CellularRAM™ 1.5

CellularRAM™ 1.5 does not allow burst access to cross the page boundary. The FMC controller allows to split automatically the burst access when the memory page size is reached by configuring the CPSIZE bits in the FMC\_BCR1 register following the memory page size.

### Wait management

For synchronous NOR Flash memories, NWAIT is evaluated after the programmed latency period, which corresponds to (DATLAT+2) FMC\_CLK clock cycles.

If NWAIT is active (low level when WAITPOL = 0, high level when WAITPOL = 1), wait states are inserted until NWAIT is inactive (high level when WAITPOL = 0, low level when WAITPOL = 1).

When NWAIT is inactive, the data is considered valid either immediately (bit WAITCFG = 1) or on the next clock edge (bit WAITCFG = 0).

During wait-state insertion via the NWAIT signal, the controller continues to send clock pulses to the memory, keeping the Chip Select and output enable signals valid. It does not consider the data as valid.

In burst mode, there are two timing configurations for the NOR Flash NWAIT signal:

- The Flash memory asserts the NWAIT signal one data cycle before the wait state (default after reset).
- The Flash memory asserts the NWAIT signal during the wait state

The FMC supports both NOR Flash wait state configurations, for each Chip Select, thanks to the WAITCFG bit in the FMC\_BCRx registers (x = 0..3).

**Figure 162. Wait configuration waveforms**

**Figure 163. Synchronous multiplexed read mode waveforms - NOR, PSRAM (CRAM)**

1. Byte lane outputs (NBL are not shown; for NOR access, they are held high, and, for PSRAM (CRAM) access, they are held low).

**Table 161. FMC\_BCRx bitfields (Synchronous multiplexed read mode)**

| Bit No. | Bit name    | Value to set                                                                  |
|---------|-------------|-------------------------------------------------------------------------------|
| 31      | FMCEN       | 0x1                                                                           |
| 30-24   | Reserved    | 0x000                                                                         |
| 23:22   | NBLSET[1:0] | As needed                                                                     |

## 26.8.6 NOR/PSRAM controller registers

The peripheral registers have to be accessed by words (32-bit)

### SRAM/NOR-Flash chip-select control register for bank x (FMC\_BCRx)

Address offset:  $0x00 + 0x08 * (x - 1)$ , ( $x = 1$  to 4)

Reset value: Bank 1: 0x0000 30DB

Reset value: Bank 2: 0x0000 30D2

Reset value: Bank 3: 0x0000 30D2

Reset value: Bank 4: 0x0000 30D2

This register contains the control information of each memory bank, used for SRAMs, PSRAM, FRAM and NOR Flash memories.

|            |        |        |      |         |      |         |         |             |        |           |        |           |             |       |       |

Bit 31 **FMCEN**: FMC controller enable

This bit enables/disables the FMC controller.

0: FMC controller disabled

1: FMC controller enabled

*Note: The FMCEN bit of the FMC\_BCR2..4 registers is don't care. It is only enabled through the FMC\_BCR1 register.*

Bits 30:24 Reserved, must be kept at reset value.

Bits 23:22 **NBLSET[1:0]**: Byte lane (NBL) SETUP

These bits configure the NBL setup timing from NBLx low to Chip select NEx low.

00: NBL setup time is 0 fmc\_ker\_ck clock cycle.

01: NBL setup time is 1 fmc\_ker\_ck clock cycle.

10: NBL setup time is 2 fmc\_ker\_ck clock cycles.

11: NBL setup time is 3 fmc\_ker\_ck clock cycles.

Bit 21 Reserved, must be kept at reset value.

Bit 20 **CCLKEN**: Continuous clock enable.

This bit enables the FMC\_CLK clock output to external memory devices.

0: The FMC\_CLK is only generated during the synchronous memory access (read/write transaction). The FMC\_CLK clock ratio is specified by the programmed CLKDIV value in the FMC\_BCRx register (default after reset).

1: The FMC\_CLK is generated continuously during asynchronous and synchronous access. The FMC\_CLK clock is activated when the CCLKEN is set.

*Note: The CCLKEN bit of the FMC\_BCR2..4 registers is don't care. It is only enabled through the FMC\_BCR1 register. Bank 1 must be configured in synchronous mode to generate the FMC\_CLK continuous clock.*

*If CCLKEN bit is set, the FMC\_CLK clock ratio is specified by CLKDIV value in the FMC\_BTR1 register. CLKDIV in FMC\_BWTR1 is don't care.*

*If the synchronous mode is used and CCLKEN bit is set, the synchronous memories connected to other banks than Bank 1 are clocked by the same clock (the CLKDIV value in the FMC\_BTR2..4 and FMC\_BWTR2..4 registers for other banks has no effect.)*

Bit 19 **CBURSTRW**: Write burst enable.

For PSRAM (CRAM) operating in burst mode, the bit enables synchronous accesses during write operations. The enable bit for synchronous read accesses is the BURSTEN bit in the FMC\_BCRx register.

0: Write operations are always performed in asynchronous mode

1: Write operations are performed in synchronous mode.

Bits 18:16 **CPSIZE[2:0]**: CRAM Page size.

These bits are used for CellularRAM™ 1.5 which does not allow burst accesses to cross the address boundaries between pages. When these bits are configured, the FMC controller automatically splits the burst access when the memory page size is reached (refer to memory datasheet for page size).

000: No burst split when crossing page boundray. (default after reset).

001: 128 bytes

010: 256 bytes

011: 512 bytes

100: 1024 bytes

Others: Reserved.

Bit 15 **ASYNCAWAIT**: Wait signal during asynchronous transfers

This bit enables/disables wait signal usage by the FMC even during asynchronous transfers.

0: NWAIT signal not taken in to account during asynchronous transfers (default after reset)

1: NWAIT signal taken in to account during asynchronous transfers

Bit 14 **EXTMOD**: Extended mode enable.

This bit enables write timing programming for asynchronous accesses inside the FMC\_BWTR register, thus resulting in different timings for read and write operations.

0: Values inside FMC\_BWTR register not taken into account (default after reset)

1: Values inside FMC\_BWTR register taken into account

*Note: When the extended mode is disabled, the FMC can operate in Mode 1 or Mode 2 as follows:*

- *Mode 1 is the default mode when the SRAM/PSRAM memory type is selected (MTYP = 0x0 or 0x01)*
- *Mode 2 is the default mode when the NOR memory type is selected (MTYP = 0x10).*

Bit 13 **WAITEN**: Wait enable bit.

This bit enables/disables wait-state insertion via the NWAIT signal when accessing the memory in synchronous mode.

0: NWAIT signal disabled (its level not taken into account, no wait state inserted after the programmed Flash latency period)

1: NWAIT signal enabled (its level is taken into account after the programmed latency period to insert wait states if asserted) (default after reset)

Bit 12 **WREN**: Write enable bit.

This bit indicates whether write operations to the bank by the FMC are enabled/disabled:

0: Write operations to the bank by the FMC disabled. An AXI slave error is reported,

1: Write operations to the bank by the FMC enabled (default after reset).

Bit 11 **WAITCFG**: Wait timing configuration.

The NWAIT signal indicates whether the data from the memory are valid or if a wait state must be inserted when accessing the memory in synchronous mode. This configuration bit determines if NWAIT is asserted by the memory one clock cycle before the wait state or during the wait state:

0: NWAIT signal active one data cycle before wait state (default after reset),

1: NWAIT signal active during wait state (not used for PSRAM).

Bit 10 Reserved, must be kept at reset value.

Bit 9 **WAITPOL**: Wait signal polarity bit.

This bit defines the polarity of the wait signal from memory used for either in synchronous or asynchronous mode:

0: NWAIT active low (default after reset),

1: NWAIT active high.

Bit 8 **BURSTEN**: Burst enable bit.

This bit enables/disables synchronous accesses during read operations. It is valid only for synchronous memories operating in burst mode:

0: Burst mode disabled (default after reset). Read accesses are performed in asynchronous mode.

1: Burst mode enable. Read accesses are performed in synchronous mode.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **FACCEN**: Flash memory access enable

This bit enables NOR Flash memory access operations by deasserting the hardware reset signal ( $\overline{\text{RESET}}$  Low) when applicable. In this configuration the FMC is not connected to the Flash memory hardware reset signal ( $\overline{\text{RESET}}$ ) and the Flash memory reset is managed at board level.

0: Corresponding NOR Flash memory access is disabled

1: Corresponding NOR Flash memory access is enabled (default after reset)

Bits 5:4 **MWID[1:0]**: Memory data bus width.

This bit defines the external memory device width, valid for all type of memories.

00: 8 bits

01: 16 bits (default after reset)

10: Reserved.

11: Reserved.

Bits 3:2 **MTYP[1:0]**: Memory type.

This bit defines the type of external memory attached to the corresponding memory bank:

00: SRAM/ FRAM (default after reset for Bank 2...4)

01: PSRAM (CRAM)/FRAM

10: NOR Flash/OneNAND Flash (default after reset for Bank 1)

11: Reserved.

Bit 1 **MUXEN**: Address/data multiplexing enable bit.

When this bit is set, the address and data values are multiplexed on the data bus, valid only with NOR and PSRAM memories:

0: Address/Data non-multiplexed

1: Address/Data multiplexed on databus (default after reset)

Bit 0 **MBKEN**: Memory bank enable bit.

This bit enables the memory bank. After reset Bank1 is enabled, all others are disabled. Accessing a disabled bank causes an ERROR on AXI bus.

0: Corresponding memory bank is disabled

1: Corresponding memory bank is enabled

### SRAM/NOR-Flash chip-select timing registers for bank x (FMC\_BTRx)

Address offset:  $0x04 + 8 * (x - 1)$ , ( $x = 1$  to 4)

Reset value: 0x0FFF FFFF

This register contains the control information of each memory bank, used for SRAMs, PSRAM and NOR Flash memories. If the EXTMOD bit is set in the FMC\_BCRx register, then this register is partitioned for write and read access, that is, two registers are available: one to configure read accesses (this register) and one to configure write accesses (FMC\_BWTRx registers).

|              |    |             |    |             |    |    |    |             |    |    |    |              |    |    |    |
|--------------|----|-------------|----|-------------|----|----|----|-------------|----|----|----|--------------|----|----|----|
| 31           | 30 | 29          | 28 | 27          | 26 | 25 | 24 | 23          | 22 | 21 | 20 | 19           | 18 | 17 | 16 |
| DATAHLD[1:0] |    | ACCMOD[1:0] |    | DATLAT[3:0] |    |    |    | CLKDIV[3:0] |    |    |    | BUSTURN[3:0] |    |    |    |
| rw           | rw | rw          | rw | rw          | rw | rw | rw | rw          | rw | rw | rw | rw           | rw | rw | rw |
| 15           | 14 | 13          | 12 | 11          | 10 | 9  | 8  | 7           | 6  | 5  | 4  | 3            | 2  | 1  | 0  |
| DATAST[7:0]  |    |             |    |             |    |    |    | ADDHLD[3:0] |    |    |    | ADDSET[3:0]  |    |    |    |
| rw           | rw | rw          | rw | rw          | rw | rw | rw | rw          | rw | rw | rw | rw           | rw | rw | rw |

Bits 31:30 **DATAHLD[1:0]**: Data Hold phase duration

These bits are written by software to define the duration of the *data hold* phase in *fmc\_ker\_ck* cycles (refer to [Figure 160](#) to [Figure 161](#)), used in asynchronous accesses:

For read/write accesses:

00: DATAHLD phase duration = *fmc\_ker\_ck* clock cycle x 0 (default, read)/1 (default, write)

01: DATAHLD phase duration = *fmc\_ker\_ck* clock cycle x 1 (read)/2 (write)

10: DATAHLD phase duration = *fmc\_ker\_ck* clock cycle x 2 (read)/3 (write)

11: DATAHLD phase duration = *fmc\_ker\_ck* clock cycle x 3 (read)/4 (write)

Bits 29:28 **ACCMOD[1:0]**: Access mode

These bits specify the asynchronous access modes as shown in the timing diagrams. These bits are taken into account only when the EXTMOD bit in the FMC\_BCRx register is 1.

00: Access mode A

01: Access mode B

10: Access mode C

11: Access mode D

Bits 27:24 **DATLAT[3:0]**: Data latency for synchronous memory (see note below bit descriptions)

For synchronous access with read/write burst mode enabled (BURSTEN / CBURSTRW bits set), these bits define the number of memory clock cycles (+2) to issue to the memory before reading/writing the first data.

This timing parameter is not expressed in *fmc\_ker\_ck* periods, but in FMC\_CLK periods.

For asynchronous access, this value is don't care.

0000: Data latency of 2 FMC\_CLK clock cycles for first burst access

1111: Data latency of 17 FMC\_CLK clock cycles for first burst access (default value after reset)

Bits 23:20 **CLKDIV[3:0]**: Clock divide ratio (for FMC\_CLK signal)

These bits define FMC\_CLK clock output signal period, expressed in *fmc\_ker\_ck* cycles:

0000: Reserved.

0001: FMC\_CLK period = 2 x *fmc\_ker\_ck* periods

0010: FMC\_CLK period = 3 x *fmc\_ker\_ck* periods

1111: FMC\_CLK period = 16 x *fmc\_ker\_ck* periods (default value after reset)

This value is don't care when accessing NOR Flash memories, SRAM and PSRAM in asynchronous mode.

*Note: Refer to [Section 26.8.5: Synchronous transactions](#) for FMC\_CLK divider ratio formula)*

Bits 19:16 **BUSTURN[3:0]**: Bus turnaround phase duration

These bits are written by software to add a delay between the end of current read or write transaction and the next transaction on the same bank.

This delay allows matching the minimum time between consecutive transactions ( $t_{EHEL}$  from NEx high to NEx low) and the maximum time required by the memory to free the data bus after a read access ( $t_{EHQZ}$  from chip enable high to output Hi-Z). This delay is recommended for Mode D and muxed mode. For non-muxed memory, the bus turnaround delay can be set to a minimum value that respects the following condition:

$$(BUSTURN + 1) fmc\_ker\_ck \text{ period} \geq t_{EHELmin} \max(t_{EHELmin}, t_{EHQZmax})$$

For FRAMs, the bus turnaround delay should be configured to match the minimum precharge time ( $t_{PC}$ ). This delay is inserted between all consecutive transactions on the same bank (read/read, write/write, read/write and write/read) to match the  $t_{PC}$  memory timing, and the Chip select toggles between consecutive accesses.

$$(BUSTURN + 1) fmc\_ker\_ck \text{ period} \geq t_{PCmin}$$

0000: BUSTURN phase duration = 1 x fmc\_ker\_ck clock cycle added

...

1111: BUSTURN phase duration = 16 x fmc\_ker\_ck clock cycles added (default value after reset)

**Bits 15:8 DATAST[7:0]:** Data-phase duration

These bits are written by software to define the duration of the data phase (refer to [Figure 160](#) to [Figure 161](#)) used in asynchronous accesses:

0000 0000: Reserved.

0000 0001: DATAST phase duration = 1 x fmc\_ker\_ck clock cycles

0000 0010: DATAST phase duration = 2 x fmc\_ker\_ck clock cycles

...

1111 1111: DATAST phase duration = 255 x fmc\_ker\_ck clock cycles (default value after reset)

For each memory type and access mode data-phase duration, please refer to the respective figure ([Figure 160](#) to [Figure 161](#)).

Example of Mode 1, write access, DATAST=1:

Data-phase duration= DATAST+1 = 2 x fmc\_ker\_ck clock cycles.

*Note: This value is don't care in synchronous accesses.*

**Bits 7:4 ADDHLD[3:0]:** Address-hold phase duration

These bits are written by software to define the duration of the *address hold* phase (refer to [Figure 156](#) to [Figure 159](#)) used in mode D or multiplexed accesses:

0000: Reserved.

0001: ADDHLD phase duration = 1 x fmc\_ker\_ck clock cycle

0010: ADDHLD phase duration = 2 x fmc\_ker\_ck clock cycle

...

1111: ADDHLD phase duration = 15 x fmc\_ker\_ck clock cycles (default value after reset)

For each access mode address-hold phase duration, please refer to the respective figure ([Figure 156](#) to [Figure 159](#)).

*Note: This value is not used in synchronous accesses, and the address hold phase lasts always 1 memory clock period.*

**Bits 3:0 ADDSET[3:0]:** Address setup phase duration

These bits are written by software to define the duration of the *address setup* phase (refer to [Figure 160](#) to [Figure 161](#)), used in SRAMs, ROMs and asynchronous NOR Flash memories:

0000: ADDSET phase duration = 0 x fmc\_ker\_ck clock cycle

...

1111: ADDSET phase duration = 15 x fmc\_ker\_ck clock cycles (default value after reset)

For each access mode address setup phase duration, please refer to the respective figure (refer to [Figure 160](#) to [Figure 161](#)).

*Note: This value is don't care in synchronous accesses.*

*In Muxed mode or Mode D, the minimum value for ADDSET is 1.*

*Note: PSRAMs (CRAMs) have a variable latency due to internal refresh. Therefore these memories issue the NWAIT signal during the whole latency phase to extend the latency as needed.*

*On PSRAMs (CRAMs), DATLAT must be configured to 0 so that the FMC quickly exits its latency phase, starts sampling NWAIT from memory, and starts read or write operations when the memory is ready.*

*This method can be used also with the latest generation of synchronous Flash memories, which, unlike older Flash memories, issue the NWAIT signal (check the corresponding Flash memory datasheet).*

**SRAM/NOR-Flash write timing registers for bank x (FMC\_BWTRx)**

Address offset:  $0x104 + 8 * (x - 1)$ , ( $x = 1$  to  $4$ )

Reset value: 0x000F FFFF

This register contains the control information of each memory bank. It is used for SRAMs, FRAMs, PSRAMs and NOR Flash memories. When the EXTMOD bit is set in the FMC\_BCRx register, then this register is active for write access.

|              |    |             |    |      |      |      |      |             |      |      |      |              |    |    |    |

Bits 31:30 **DATAHLD[1:0]**: Data Hold phase duration

These bits are written by software to define the duration of the *data hold* phase in *fmc\_ker\_ck* cycles (refer to [Figure 161](#)), used in asynchronous write accesses:

00: DATAHLD phase duration = 1 x *fmc\_ker\_ck* clock cycle (default)

01: DATAHLD phase duration = 2 x *fmc\_ker\_ck* clock cycle

10: DATAHLD phase duration = 3 x *fmc\_ker\_ck* clock cycle

11: DATAHLD phase duration = 4 x *fmc\_ker\_ck* clock cycle

Bits 29:28 **ACCMOD[1:0]**: Access mode.

These bits specify the asynchronous access modes as shown in the next timing diagrams. These bits are taken into account only when the EXTMOD bit in the FMC\_BCRx register is 1.

00: Access mode A

01: Access mode B

10: Access mode C

11: Access mode D

Bits 27:20 Reserved, must be kept at reset value.

Bits 19:16 **BUSTURN[3:0]**: Bus turnaround phase duration

These bits are written by software to add a delay between the end of current write transaction and the next transaction on the same bank.

For FRAMs, the bus turnaround delay should be configured to match the minimum precharge time ( $t_{PC}$ ). The bus turnaround delay is inserted between all consecutive transactions on the same bank (read/read, write/write, read/write and write/read), and the Chip select toggles between consecutive accesses.

$(BUSTURN + 1) \text{ fmc\_ker\_ck period} \geq t_{PCmin}$

0000: BUSTURN phase duration = 1 x *fmc\_ker\_ck* clock cycle added

...

1111: BUSTURN phase duration = 16 x *fmc\_ker\_ck* clock cycles added (default value after reset)

Bits 15:8 **DATAST[7:0]**: Data-phase duration.

These bits are written by software to define the data phase duration (refer to [Figure 160](#) to [Figure 161](#)) used in asynchronous SRAM, PSRAM and NOR Flash memory accesses:

0000 0000: Reserved.

0000 0001: DATAST phase duration = 1 x fmc\_ker\_ck clock cycles

0000 0010: DATAST phase duration = 2 x fmc\_ker\_ck clock cycles

...

1111 1111: DATAST phase duration = 255 x fmc\_ker\_ck clock cycles (default value after reset)

Bits 7:4 **ADDHLD[3:0]**: Address-hold phase duration.

These bits are written by software to define the duration of the address hold phase (refer to [Figure 158](#) to [Figure 159](#)) used in asynchronous multiplexed accesses:

0000: Reserved.

0001: ADDHLD phase duration = 1 x fmc\_ker\_ck clock cycle

0010: ADDHLD phase duration = 2 x fmc\_ker\_ck clock cycle

...

1111: ADDHLD phase duration = 15 x fmc\_ker\_ck clock cycles (default value after reset)

*Note: In synchronous NOR Flash accesses, this value is not used, and the address hold phase always lasts 1 Flash clock period.*

Bits 3:0 **ADDSET[3:0]**: Address setup phase duration.

These bits are written by software to define the duration of the address setup phase in fmc\_ker\_ck cycles (refer to [Figure 160](#) to [Figure 161](#)) used in asynchronous accesses:

0000: ADDSET phase duration = 0 x fmc\_ker\_ck clock cycle

...

1111: ADDSET phase duration = 15 x fmc\_ker\_ck clock cycles (default value after reset)

*Note: In synchronous accesses, this value is not used, and the address setup phase always lasts 1 Flash clock period. In muxed mode, the minimum ADDSET value is 1.*

**PSRAM Chip Select Counter Register (FMC\_PCSCNTR)**

Address offset: 0x20

Reset value: 0x0000 0000

This register contains the PSRAM chip select counter value for synchronous mode. The chip select counter is common to all banks and can be enabled separately on each bank. During PSRAM read or write accesses, this value is loaded into a timer which is decremented using the `fmc_ker_ck` while the NE signal is held low. When the timer reaches 0, the PSRAM controller splits the current access, toggles NE to allow PSRAM device refresh and restarts a new access. The programmed counter value guarantees a maximum NE pulse width ( $t_{CEM}$ ) as specified for PSRAM devices. The counter is reloaded and starts decrementing each time a new access is started by a transition of NE from high to low.

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **CNTB4EN**: Counter Bank4 enable

This bit enables the CS counter for PSRAM/NOR Bank4.

0: Counter disabled for Bank 4

1: Counter enabled for Bank 4

Bit 18 **CNTB3EN**: Counter Bank3 enable

This bit enables the CS counter for PSRAM/NOR Bank3.

0: Counter disabled for Bank 3.

1: Counter enabled for Bank 3

Bit 17 **CNTB2EN**: Counter Bank2 enable

This bit enables the CS counter for PSRAM/NOR Bank2.

0: Counter disabled for Bank 2

1: Counter enabled for Bank 2

Bit 16 **CNTB1EN**: Counter Bank1 enable

This bit enables the CS counter for PSRAM/NOR Bank1.

0: Counter disabled for Bank 1

1: Counter enabled for Bank 1

Bits 15:0 **CSCOUNT[15:0]**: Chip Select (CS) counter.

These bits are written by software to define the maximum chip select low pulse duration (in `fmc_ker_ck` cycles) for synchronous accesses.

The counter is disabled if the programmed value is 0.

The number of `fmc_ker_ck` clock cycles versus the programmed value is obtained by the below equation:

$$\text{number of fmc\_ker\_ck cycles} = (\text{CLKDIV} + 1) * \text{ROUNDUP}(\text{CSCOUNT}[15:0] / (\text{CLKDIV} + 1); 0)$$

## 26.9 NAND Flash controller

The FMC generates the appropriate signal timings to drive 8- and 16-bit NAND Flash memories

The NAND bank is configured through dedicated registers ([Section 26.9.9](#)). The programmable memory parameters include access timings (shown in [Table 165](#)) and ECC configuration.

The NAND controller supports the following features:

- Programmable page size of 256, 512, 1024, 2048, 4096 or 8192 bytes
- Programmable memory timings
- Programmable Error Correction Capability using BCH code or Hamming code
- Command sequencer: a hardware accelerator for read/write accesses within a page or within a block of configurable size.

This feature is useful when ECC computation is performed.

- Programmable address offset for ECC bytes programming using the command sequencer
- Interrupt generation on ECC error detection and page or sector transfer complete
- Support of multiple dice per package. Only one die can be selected at a time.

**Table 165. Programmable NAND Flash access parameters**

| Parameter             | Function                                                                                                                                                      | Access mode | Unit                         | Min. | Max. |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|------------------------------|------|------|
| Memory setup time     | Number of clock cycles (fmc_ker_ck) required to set up the address before the command assertion                                                               | Read/Write  | FMC clock cycle (fmc_ker_ck) | 1    | 256  |
| Memory wait           | Minimum duration (in fmc_ker_ck clock cycles) of the command assertion                                                                                        | Read/Write  | FMC clock cycle (fmc_ker_ck) | 1    | 256  |
| Memory hold           | Number of clock cycles (fmc_ker_ck) during which the address must be held (as well as the data if a write access is performed) after the command de-assertion | Read/Write  | FMC clock cycle (fmc_ker_ck) | 1    | 256  |
| Memory databus high-Z | Number of clock cycles (fmc_ker_ck) during which the data bus is kept in high-Z state after a write access has started                                        | Write       | FMC clock cycle (fmc_ker_ck) | 1    | 256  |
| Chip enable high      | Number of clock cycles (fmc_ker_ck) during which the NCE chip enable is kept high                                                                             | Write       | FMC clock cycle (fmc_ker_ck) | 1    | 16   |

### 26.9.1 External memory interface signals

The following tables list the typical signals that are used to interface NAND Flash memory.

*Note:* The “N” prefix identifies the signals which are active low.

#### 8-bit NAND Flash memory

**Table 166. 8-bit NAND Flash memory**

| FMC signal name  | I/O | Function                                             |
|------------------|-----|------------------------------------------------------|
| A[17]            | O   | NAND Flash address latch enable (ALE) signal         |
| A[16]            | O   | NAND Flash command latch enable (CLE) signal         |
| D[7:0]           | I/O | 8-bit multiplexed, bidirectional address/data bus    |
| NCE <sub>x</sub> | O   | Chip Select (x=1, 2)                                 |
| NOE(= NRE)       | O   | Output enable (memory signal name: read enable, NRE) |
| NWE              | O   | Write enable                                         |
| NWAIT            | I   | NAND Flash Ready/Busy (RNB) input signal to the FMC  |

*Note:* Theoretically, there is no capacity limitation as the FMC can manage as many address cycles as needed.

**16-bit NAND Flash memory****Table 167. 16-bit NAND Flash memory**

| FMC signal name  | I/O | Function                                             |
|------------------|-----|------------------------------------------------------|
| A[17]            | O   | NAND Flash address latch enable (ALE) signal         |
| A[16]            | O   | NAND Flash command latch enable (CLE) signal         |
| D[15:0]          | I/O | 16-bit multiplexed, bidirectional address/data bus   |
| NCE <sub>x</sub> | O   | Chip Select (x=1, 2)                                 |
| NOE(= NRE)       | O   | Output enable (memory signal name: read enable, NRE) |
| NWE              | O   | Write enable                                         |
| NWAIT            | I   | NAND Flash Ready/Busy (RNB) input signal to the FMC  |

*Note:* Theoretically, there is no capacity limitation as the FMC can manage as many address cycles as needed.

## 26.9.2 NAND Flash supported memories and transactions

*Table 168 shows the supported devices, access modes and transactions. Transactions not allowed (or not supported) by the NAND Flash controller are shown in gray.*

**Table 168. Supported memories and transactions**

| Device      | Mode         | R/W | AXI data size | Memory data size | Allowed/<br>not allowed | Comments                  |
|-------------|--------------|-----|---------------|------------------|-------------------------|---------------------------|
| NAND 8-bit  | Asynchronous | R   | 8             | 8                | Y                       |                           |
|             | Asynchronous | W   | 8             | 8                | Y                       |                           |
|             | Asynchronous | R   | 16            | 8                | Y                       | Split into 2 FMC accesses |
|             | Asynchronous | W   | 16            | 8                | Y                       | Split into 2 FMC accesses |
|             | Asynchronous | R   | 32            | 8                | Y                       | Split into 4 FMC accesses |
|             | Asynchronous | W   | 32            | 8                | Y                       | Split into 4 FMC accesses |
|             | Asynchronous | R   | 64            | 8                | Y                       | Split into 8 FMC accesses |
|             | Asynchronous | W   | 64            | 8                | Y                       | Split into 8 FMC accesses |
| NAND 16-bit | Asynchronous | R   | 8             | 16               | Y                       |                           |
|             | Asynchronous | W   | 8             | 16               | N                       |                           |
|             | Asynchronous | R   | 16            | 16               | Y                       |                           |
|             | Asynchronous | W   | 16            | 16               | Y                       |                           |
|             | Asynchronous | R   | 32            | 16               | Y                       | Split into 2 FMC accesses |
|             | Asynchronous | W   | 32            | 16               | Y                       | Split into 2 FMC accesses |
|             | Asynchronous | R   | 64            | 16               | Y                       | Split into 4 FMC accesses |
|             | Asynchronous | W   | 64            | 16               | Y                       | Split into 4 FMC accesses |

## 26.9.3 Timing diagrams for NAND Flash memory

The NAND Flash memory bank is managed through a set of registers:

- Control register: FMC\_PCR
- Interrupt status register: FMC\_SR
- ECC register: FMC\_HECCR
- Timing register for Common memory space: FMC\_PMEM
- Timing register for Attribute memory space: FMC\_PATT

Each timing configuration register contains three parameters used to define the number of `fmc_ker_ck` cycles for the different phases of any NAND Flash access, plus one parameter that defines the timing to start driving the data bus when a write access is performed.

*Figure 165* shows the timing parameter definitions for common memory accesses, knowing that Attribute memory space access timings are similar.

**Figure 165. NAND Flash controller waveforms for common memory access**

1. NOE remains high (inactive) during write accesses. NWE remains high (inactive) during read accesses.
2. The programmed values of MEMxSET + MEMxHOLD must be >1.

**Figure 166. NAND Flash controller waveforms for TCLR and TAR Timings**

1. NOE remains high (inactive) during write accesses. NWE remains high (inactive) during read accesses.

## 26.9.4 NAND Flash operations

The command latch enable (CLE) and address latch enable (ALE) signals of the NAND Flash memory device are driven by address signals from the FMC controller. This means that to send a command or an address to the NAND Flash memory, the CPU has to perform a write to a specific address in its memory space.

A typical page read operation from the NAND Flash device requires the following steps:

1. Program and enable the NAND memory bank by configuring the FMC\_PCR and FMC\_PMEM (and for some devices, FMC\_PATT, see [Section 26.9.5: NAND Flash prewait function](#)) registers according to the characteristics of the NAND Flash memory (PWID bits to configure NAND Flash data bus width, PWAITEN set to 0 or 1 as needed, see [Section 26.7.2: NAND Flash memory address mapping](#) for timing configuration).
2. The CPU performs a byte write to the common memory space, with a data byte value equal to one Flash command byte (for example 0x00 for Samsung NAND Flash devices). The NAND Flash CLE input is active during the write strobe (low pulse on NWE), so that the written byte is interpreted as a command by the NAND Flash memory. Once the command is latched by the memory device, it does not need to be written again for the following page read operations.
3. The CPU can send the start address for a read operation by writing a five-byte address to the common memory or the attribute space followed by the second read command. The NAND Flash ALE input is active during the write strobe (low pulse on NWE), so that the written bytes are interpreted as the start address for read operations. Using the attribute memory space allows to use a different FMC timing configuration, which can be used to implement the prewait function required for some NAND Flash memories (see details in [Section 26.9.5: NAND Flash prewait function](#)).
4. The controller waits till the NAND Flash memory is ready (RNB signal high), before starting a new access to the same bank or to another memory bank.
5. The CPU can then perform byte read operations from the common memory space to read the NAND Flash page (data field + Spare field) byte by byte.
6. No CPU command or address write operation is required to read the next NAND Flash page. This can be done in three different ways:
  - by simply performing the operation described in step 5,
  - a new random address can be accessed by restarting the operation at step 3,
  - a new command can be sent to the NAND Flash device by restarting at step 2.

*Note:* Non-‘CE don’t care’ NAND Flash memories are not supported.

### 26.9.5 NAND Flash prewait function

Some NAND Flash devices require that, after writing the last part of the address, the controller waits for the RNB signal to go low. (see [Figure 167](#)).

Figure 167. Access to NAND-Flash

1. CPU wrote byte 0x00 at address 0x8001 0000.
2. CPU wrote byte A7~A0 at address 0x8002 0000.
3. CPU wrote byte A16~A9 at address 0x8002 0000.
4. CPU wrote byte A24~A17 at address 0x8002 0000.
5. CPU wrote byte A25 at address 0x8002 0000: FMC performs a write access using FMC\_PATT2 timing definition, where  $ATTHOLD \geq 7$  (providing that  $(7+1) \times fmc\_ker\_ck = 112\text{ ns} > t_{WB\text{ max}}$ ). This guarantees that NCE remains low until RNB goes low and high again (only requested for NAND Flash memories where NCE is not don't care).

When this function is required, it can be performed by programming the MEMHOLD bits in FLASH\_PMEM register to meet the  $t_{WB}$  timing. However any CPU read or write access to the NAND Flash memory has a hold delay of  $(MEMHOLD + 1) \times fmc\_ker\_ck$  cycles inserted between the rising edge of the NWE signal and the next access.

To cope with this timing constraint, the attribute memory space can be used by programming ATTHOLD of FMC\_PATT register with a value that meets the  $t_{WB}$  timing, and by keeping the MEMHOLD value at its minimum value. The CPU must then use the common memory space for all NAND Flash read and write accesses, except when writing the last address byte to the NAND Flash device, in which case the CPU must write to the attribute memory space.

## 26.9.6 NAND ECC controller

NAND Flash memories include a spare memory area (or OOB) at the end of each page. This area is typically used to store some metadata (such as Bad Block Marker information to invalidate the whole page) or for error management functions.

The FMC controller supports on-the-fly error correction code (ECC) computation during data read/program from/to NAND Flash memory. This mechanism reduces the host CPU workload when processing the ECC by software.

The user can select one out of two algorithms:

- Hamming code algorithm for 1-bit error code correction and 2-bit error detection per 256, 512, 1024, 2048, 4096 or 8192 bytes.
- BCH (Bose, Chaudhuri and Hocquenghem) code for 4-bit error code correction and 8-bit error detection or 8-bit error code correction and 16-bit error detection per 512 bytes.

The principle of both ECC controllers is similar: the ECC modules monitor the NAND Flash data bus and read/write signals (NCE and NWE) each time the NAND Flash memory bank is active. The ECC controllers operate as follows:

- When accessing a NAND Flash memory bank, the data present on the D[7:0] or D[15:0] bus are latched and used for ECC computation.
- When accessing any other address in NAND Flash memory, the ECC logic is idle, and does not perform any operation. As a result, write operations to define commands or addresses to the NAND Flash memory are not taken into account for ECC computation.

Once the desired number of bytes has been read/written from/to the NAND Flash memory by the host CPU or DMA, the ECC result registers are updated.

### Hamming code

The Hamming code implemented can perform 1-bit error correction and 2-bit error detection per 256, 512, 1024, 2048, 4096 or 8192 bytes read or written from/to the NAND Flash memory. It consists in calculating the row and column parity. This algorithm is supported by 8-bit and 16-bit NAND Flash memories.

Page write and read sequences with Hamming code are described below.

To perform a page program with Hamming ECC computation:

1. Enable the ECCEN bit in the FMC\_PCR register.
2. Write data to the NAND Flash memory page. While the NAND page is written, the ECC controller computes the ECC value.
3. Wait until the ECC code is ready (NWRF is set in the FMC\_SR register).
4. Read the ECC value available in the FMC\_HECCR register and store it in NAND Flash spare area.
5. Clear the ECCEN bit and launch the page programming.

To perform a page read with Hamming ECC computation:

1. Enable the ECCEN bit in the FMC\_PCR register before reading the NAND page. While the NAND page is read, the ECC block computes the ECC value.
2. Wait until the ECC code is ready (NWRWF set in the FMC\_SR register).
3. Read the ECC value available in the spare area as well also the ECC value, processed by Hamming controller, available in FMC\_HECCR register.
4. If the two ECC values are identical, no correction is required. Otherwise an ECC error occurred, the software correction routine returns information on whether the error can be corrected or not, and corrects it when possible.

Depending on the spare area size, the page can be split into several sectors of identical size. This allows increasing the error correction capability for each page since 1 error can be corrected and 2 errors can be detected for each sector.

### Example

For a NAND Flash memory with 2 Kbytes + 64 bytes pages, each page can be split into 8 sectors of 256 bytes each. 3 bytes (22 bits) of ECC are required for each sector, which makes 24 bytes (8 x 3 bytes) to be stored in the spare area for the whole page. For the whole 2 Kbyte page, up to 8 errors can be corrected, respectively up to 16 errors detected, provided there is less than 1 error, respectively 2 errors, per sector.

### BCH (Bose, Chaudhuri and Hocquenghem) code

To increase the error correction capability, the FMC embeds a BCH (Bose, Chaudhuri and Hocquenghem) encoder and decoder.

It supports 4-bit error code correction and 8-bit error detection or 8-bit error code correction, and 16-bit error detection per sector. BCH encoder/decoder module handles sectors of fixed size, equal to 512 bytes. Each page must consequently be split into 512-byte sectors. The number of parity bytes generated for each sector is given in [Table 169](#). For 16-bit NAND Flash memories, a padding is added to align parity bytes to an even number (8 bytes and 14 bytes for 4-bit and 8-bit BCH code, respectively).

**Table 169. Number of ECC parity bytes per sector**

| Function               | BCH code |          |
|------------------------|----------|----------|
|                        | 4-bit    | 8-bit    |
| Error correction       |          |          |
| Number of parity bytes | 7 bytes  | 13 bytes |

The BCH module detects errors and returns the bit position for each sector. To correct the errors, the software needs to flip the error bits at the provided bit position stored in the FMC\_BCHPBRx register.

The BCH ECC controller supports 8-bit and 16-bit NAND Flash memories.

During a page program operation, the BCH encoder generates the ECC bytes (7 or 13 bytes) for each sector of 512 bytes that should be written in the NAND Flash spare area with a programmable offset. It should take into account some metadata at the beginning of the spare area. This operation should be executed for each sector. The BCH encoder does not process the spare area: metadata should have their own error protection mechanism.

The total number of ECC bytes (N) is given by the below equation:

$$N = \text{Number of ECC bytes /sector} \times \text{Number of sector/page}$$

**Example**

For an 8-bit NAND Flash with 4096-byte pages and an error correction capability of 4-bit per 512 bytes, the number of sector per page is 8 (4096 / 512). The total number of ECC bytes is consequently:

$$N = 7 \times 8 = 56 \text{ bytes}$$

The user application has to make sure that the spare area is large enough to store the metadata and parity bytes.

Page program and read sequences with BCH code are described below.

To perform a page program:

1. Enable write access by setting the WEN bit in the FMC\_PCR register.
2. Enable the ECC by setting the ECCEN bit in FMC\_PCR register.
3. Write 512 data bytes to the sector in the NAND Flash memory page. While the sector is written, the BCH encoder computes the ECC value.
4. Wait until the BCH code is ready.
5. Read the ECC value available in the FMC\_BCHPBRx registers and store it in the NAND Flash spare area.
6. Disable ECC by resetting the ECCEN bit in FMC\_PCR register.
7. Execute again step 2 to 6 for all sectors to be written in NAND Flash memory.
8. Launch the page programming.

To perform a page read:

1. Enable read access by resetting the WEN bit in the FMC\_PCR register.
2. Enable the ECC by setting the ECCEN bit in FMC\_PCR register.
3. Read the NAND page sector (512 bytes).
4. Read the corresponding ECC bytes (7 or 13 bytes) from the NAND Flash spare area.
5. During the read of data and parity bits, the syndrome is calculated. Then the error location search is launched.
6. Wait until the decoding error is ready (DERF bit set in the FMC\_BCHISR register), then read the decoding results (errors detected if any, correctable or not, number of errors, bit position) in FMC\_BCHDSR0 and FMC\_BCHDSRx registers.
7. Thanks to the decoding results, the software can correct the errors in the sector (when possible).
8. Disable ECC by resetting the ECCEN bit in FMC\_PCR register.
9. Execute again step 2 to 7 for all relevant sectors of the page.

### 26.9.7 FMC command sequencer

NAND Flash page programming and reading can be performed by the CPU as described in the above sections.

Data sector programming/reading as well as ECC byte programming/reading can also be managed automatically by the FMC command sequencer while using DMA for data transfer.

The purpose of the command sequencer is to ease the programming/reading of NAND Flash pages with ECC computation as well as free the CPU of sequencing tasks.

One DMA channel is required for write operations and two DMA channels for read operations.

A specific NAND Flash page layout should be respected when using the BCH algorithm. See [Figure 168](#) for an example of 2Kbyte page BCH layout.

**Figure 168. NAND Flash page (2 Kbytes) layout with BCH**

#### Page program sequence

1. A data buffer located in SRAM has to be initialized with the data to be written to the NAND Flash page.
2. The CPU configures the FMC command sequencer registers: page program command (0x80), address bytes, change write column command (0x85), ECC address offset, page size, sector size and sector number. It also selects the chip enable. It also selects the ECC algorithm (Hamming or BCH) and configures one DMA channel to transfer data from the buffer to the NAND Flash page.
3. The CPU then launches the sequencer by setting the CSQSTART bit in the FMC\_CSQCR register.
4. The command sequencer automatically generates the control and address cycles to the NAND Flash memory, following the programmed timings configured either in FMC\_PMEM or FMC\_PATT register.
5. A DMA request is issued to start data transfer from the data buffer to NAND Flash memory.
6. When the full sector is programmed, go to step 7 if ECC is enabled. Otherwise, jump to step 9.
7. The FMC command sequencer automatically issues a change write column command (0x85) followed by two address cycles. The command to be issued and the number of address cycles are programmed in FMC\_CSQCFGR2 register. The address is automatically generated from the programmed ECC address offset.
8. Once the parity bytes are available in ECC encoder (Hamming or BCH) module, they are automatically transferred to the NAND Flash spare area. The FMC command

- sequencer can generate a sector transfer complete interrupt if it has been previously enabled.
9. The sequencer then repeats step 4 (except that it performs only a change write column command instead of a page program command) to step 8 to program the following sectors and their corresponding ECC parity bytes. The ECC address offset is automatically incremented for each sector transfer. When ECC is disabled, the sequencer repeats step 5.
  10. The FMC command sequencer can generate a transfer complete interrupt or a transfer complete error interrupt by sector or when all sectors are written.
  11. The CPU can program any further metadata in the NAND Flash area, taking care not to overwrite parity bytes.
  12. The program command (0x10) can then be written to the command section to program the NAND Flash memory.
  13. An interrupt, if enabled, is generated on the rising edge of the Ready/Busy (RNB) signal to indicate that the page program operation is complete.

Refer to [Figure 169](#) for an overview of the page program sequence with BCH.

**Figure 169. 2 Kbyte page program sequence with BCH**

### Page read sequence

1. A data buffer is allocated in SRAM to store the NAND Flash page data. A decoding status buffer is also allocated to store result of ECC decoding.
2. The CPU programs the command sequencer registers: the page read first cycle command (0x00), address bytes, the page read second cycle command (0x30), change read column command (0x05), spare area offset, page size, sector size and sector number. It also selects the chip enable.  
It configures the ECC algorithm if required (Hamming or BCH), one DMA channel to handle data transfers from the NAND Flash page to the data buffer, and a second DMA channel to transfer ECC decoding results from ECC status registers to the RAM decoding status buffer.
3. The CPU then launches the FMC sequencer.
4. The FMC command sequencer issues the command and address cycles to the NAND Flash memory.
5. The command sequencer waits for a Ready/Busy (RNB) rising edge to start data transfer.
6. It sends a DMA request to launch the data transfer from the NAND Flash page to the data buffer.
7. When all sector data are read, go to step 8 if ECC is enabled, otherwise go to step 9. The FMC command sequencer can generate a sector transfer complete interrupt if it has been previously enabled.
8. When ECC status registers are empty (because the Hamming error code or the BCH error position bits of previous sector have already been read), the ECC command sequencer automatically issues a change read column command (0xE0) followed by two address cycles and by the 0xE0 command, to read ECC bytes from NAND Flash memory and store them in ECC registers. These commands as well as the number of address cycles are programmed in the FMC\_CSQCFGR2 register (see [Figure 170](#)).  
The address in spare area is extracted from the programmed ECC address offset.  
When the Hamming algorithm is used, a DMA request to the second DMA channel is sent to transfer ECC codes (FMC\_HPR and FMC\_HECCR registers) to the decoding status buffer.  
When BCH algorithm is used, once all the parity bytes have been read, the BCH decoder first processes the syndrome to detect errors and then searches for error positions if any.  
As the BCH decoder is pipelined, it is possible to start reading a sector even if the decoding of the previous sector is not complete.  
In parallel of the following steps, when BCH sector decoding is complete, the new error status is stored in the ECC status registers (FMC\_BCHDSR0) and a DMA request to the second DMA channel is sent to transfer data from the status registers to the decoding status buffer located in RAM.
9. The FMC command sequencer then repeats step 4 (except that a change read column command is issued instead of the page read first cycle command) to step 8 to read the other sectors and their corresponding ECC bytes. The addresses are issued and incremented following the page size, number of sectors, spare area address offset address and BCH code selection. When the read sequence is complete, the command

sequencer waits for  $t_{RHWL}$  before issuing a new command sequence (refer to [Figure 169](#)). When ECC is disabled, the sequencer repeats step 6.

10. Once all sectors within a page and the status registers (FMC\_BCHDSRx) are transferred by the command sequencer, the ECC controller can generate the transfer complete interrupt or transfer complete error (when enabled).
11. By reading the decoding status buffer, the CPU can start processing the errors corresponding to each sector. If no error has been detected, the page stored in RAM is validated. Otherwise the CPU corrects the error(s) before validating the page buffer in RAM. If there are too many errors, the CPU can detect the page cannot be corrected and invalidate the data buffer.

Following the selected BCH code, if the number of detected errors exceeds the number of correctable errors, this bit is not significant and the DUE bit is set. If the number of errors the detected by the BCH decoder exceeds the maximum number of detectable errors, DEN and DUE bits are not significant.

The DMA channels can also send interrupts each time a data transfer is complete. This allows the CPU to process error(s) in a sector as soon as it is available.

**Note:** *When using the sequencer and DMA channels, the CPU must not read the FMC\_BCHPBRx and FMC\_BCHDSRx registers before data of all sectors are transferred, that is when TCF flag is set in the FMC\_CSQISR register.*

**Figure 170. Change read command timings**

An example of 2 Kbyte page read sequence with BCH is described in [Figure 171](#). This example corresponds to four 512-byte sectors and 7 ECC bytes per data 512 bytes.

Figure 171. 2 Kbyte page read sequence with BCH

The BCH controller resets the ECC computation whenever a page read (0x00), a page program (0x80), a random read (0x05) or a random program command ((0x85) is issued.

When only part of a page is written/read using the BCH, the command sequencer issues a random read/write command sequence only for the number of sectors to be read/written. This is done by programming the number of sector to be processed.

**FMC command sequencer configuration**

1. Configure the FMC\_CSQCFGR1 register: program the command1 and the command 2 (in case of read access), the number of address cycles to be issued, configure the read or write sequence, and select the timings to be used.
2. Configure the address bytes in FMC\_CSQAR1 and FMC\_CSQAR2 register.
3. In the FMC\_CSQCFGR2 register, configure the change write or change read column commands and the timings to be used for ECC. Program the address offset for the random columns in the FMC\_CSQAR2 register. Enable the DMA if it is needed for ECC status register transfer.
4. Configure the number of sectors and the address cycle timings in the FMC\_CSQCFGR3 register.
5. Configure the ECC sector size, and select read or write access in the FMC\_PCR register.
6. Enable the SQSDTEN bit in the FMC\_CSQFCGR2 register. The ECCEN bit in the FMC\_PCR register kept at 0.
7. Transfer complete, and transfer error complete or sector transfer complete can be enabled through the FMC\_CSQIER register.

## 26.9.8 NAND Flash Controller interrupt

An interrupt can be generated on the following events:

- RNB rising edge: an interrupt is generated when a rising edge is detected on RNB NAND Flash signal
- RNB falling edge: an interrupt is generated when a falling edge is detected on RNB NAND Flash signal
- RNB high-level: an interrupt is generated when a high-level is detected on RNB NAND Flash signal.
- Transfer complete: an interrupt is generated when the FMC command sequencer has completed all data transfers for all sectors or when the command sequencer was aborted.
- Sector complete interrupt: an interrupt is generated when the FMC command sequencer has completed all data transfers for one sector.
- Sector error interrupt: an interrupt is generated when the FMC command sequencer has completed a sector transfer with at least one error detected.
- Sector uncorrectable error interrupt: an interrupt is generated when the FMC command sequencer has completed a sector transfer and detected an uncorrectable error.
- Command transfer complete: the command sequencer has completed the transfer of programmed commands and addresses.
- BCH encoder parity bits ready: an interrupt is generated when the BCH encoder has finished processing parity bits.
- BCH decoder syndrome ready: an interrupt is generated when the BCH decoder has finished processing the syndrome and knows if errors have been detected or not.
- BCH decoder error found: an interrupt is generated when the BCH decoder has detected an error.
- BCH decoder error ready: an interrupt is generated when the BCH decoder has finished processing errors, has identified error locations and can then correct them.
- BCH decoder uncorrectable error: an interrupt is generated when the BCH decoder has detected that the errors cannot be corrected (more than four or eight errors according to BCH error correction capability configuration).

The interrupt source can be enabled or disabled separately through the FMC\_IER, FMC\_CSQIER and FMC\_BCHIER registers.

**Table 170. FMC NAND controller Interrupt request**

| Interrupt event               | Event Flag           | Enable control bit    |
|-------------------------------|----------------------|-----------------------|
| Transfer complete             | TCF in FMC_CSQISR    | TCIE in FMC_CSQIER    |
| Sector complete               | SCF in FMC_CSQISR    | SCIE in FMC_CSQIER    |
| Sector error                  | SEF in FMC_CSQISR    | SEIE in FMC_CSQIER    |
| Sector uncorrectable error    | SUEF in FMC_CSQISR   | SUEIE in FMC_CSQIER   |
| Command transfer complete     | CMDTCF in FMC_CSQISR | CMDTCIE in FMC_CSQIER |
| BCH encoder parity bits ready | EPBRF in FMC_BCHISR  | EPBRIE in FMC_BCHIER  |
| BCH decoder syndrome ready    | DSRF in FMC_BCHISR   | DSRIE in FMC_BCHIER   |
| BCH decoder error found       | DEFF in FMC_BCHISR   | DEFIE in FMC_BCHIER   |

Table 170. FMC NAND controller Interrupt request (continued)

| Interrupt event                 | Event Flag         | Enable control bit  |
|---------------------------------|--------------------|---------------------|
| BCH decoder error ready         | DERF in FMC_BCHISR | DERIE in FMC_BCHIER |
| BCH decoder uncorrectable error | DUEF in FMC_BCHISR | DUEIE in FMC_BCHIER |

## 26.9.9 NAND Flash controller registers

### NAND Flash Programmable control register (FMC\_PCR)

Address offset: 0x80

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **WEN**: Write enable

This bit enables read or write access. It must be configured when using the FMC sequencer or when the ECC with BCH code is enabled. It can only be modified when ECCEN bit is reset.

0: Read access enabled  
1: Write access enabled

Bit 24 **BCHECC**: BCH error correction capability

0: 4-bit BCH (4-bit error correction and 8-bit error detection per 512 bytes)  
1: 8-bit BCH (8-bit error correction and 16-bit error detection per 512 bytes)

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:17 **ECCSS[2:0]**: ECC sector size (used to access spare area)

These bits define the sector size used for the ECC:

000: 256 bytes  
001: 512 bytes  
010: 1024 bytes  
011: 2048 bytes (default)  
100: 4096 bytes  
101: Reserved.  
11X: Reserved.

When the ECC is enabled with BCH code, the sector size must be programmed to 512 bytes.

Bits 16:13 **TAR[3:0]**: ALE to RE delay.

These bits define the time from ALE low to RE low in number of fmc\_ker\_ck clock cycles:

$$t_{ar} \leq (TAR + 1) \times t_{fmc\_ker\_ck}$$

where  $t_{fmc\_ker\_ck}$  is the FMC clock period and  $t_{ar}$  is the ALE to RE timing of NAND Flash memories.

0000: 1 x fmc\_ker\_ck cycle  
1111: 16 x fmc\_ker\_ck cycles (default)

Bits 12:9 **TCLR[3:0]**: CLE to RE delay.

These bits define the time from CLE low to RE low in number of `fmc_ker_ck` clock cycles:

$$t_{clr} \leq (TCLR + 1) \times t_{fmc\_ker\_ck}$$

where  $t_{fmc\_ker\_ck}$  is the FMC clock period and  $t_{clr}$  is the CLE to RE timing of NAND Flash memories.

0000: 1 x `fmc_ker_ck` cycle

1111: 16 x `fmc_ker_ck` cycles (default)

Bit 8 **ECCALG**: ECC algorithm

0: Hamming code is selected (default).

1: BCH code is selected.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **ECCEN**: ECC computation logic enable bit

0: ECC logic is disabled and reset (default after reset),

1: ECC logic is enabled.

This bit must be kept reset when using the FMC sequencer

Bits 5:4 **PWID[1:0]**: Data bus width

These bits define the external memory device width.

00: 8 bits (default after reset).

01: 16 bits

1X: Reserved.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **PBKEN**: NAND Flash memory bank enable bit

This bit enables the memory bank. Accessing a disabled memory bank causes an AXI bus error.

0: Corresponding memory bank is disabled (default after reset)

1: Corresponding memory bank is enabled

Bit 1 **PWAITEN**: Wait feature enable bit

This bit enables the Wait feature for the NAND Flash memory bank:

0: disabled (default)

1: enabled

Bit 0 Reserved, must be kept at reset value.

**FMC status register (FMC\_SR)**

Address offset: 0x84

Reset value: 0x0000 0040

This register contains information about the AXI interface isolation status and the NAND write requests status. The FMC has to be disabled before modifying some registers. As requests might be pending, it is necessary to wait till the AXI interface is stable and the core of the block is totally isolated from its AXI interface before reconfiguring the registers.

The PEF and PNWEF bits indicate the status of the pipe. If Hamming algorithm is used, the ECC is calculated while data are written to the memory. To read the correct ECC, the software must consequently wait until no write request to the NAND controller are pending, by polling PEF and NWRF bits.

| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17         | 16   |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------------|------|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.       | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |            |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1          | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | NWRF | Res. | PEF  | Res. | Res. | ISOST[1:0] |      |
|      |      |      |      |      |      |      |      |      | r    |      | r    |      |      | r          | r    |

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **NWRF**: NAND write request flag

This bit provides the status of the write request issued to the NAND Flash memory. When this bit is set, all write requests to the NAND controller are served.

0: NAND Flash write requests are pending

1: No NAND Flash write requests pending

Bit 5 Reserved, must be kept at reset value.

Bit 4 **PEF**: Pipe Empty Flag

This bit indicates if the pipe contains requests.

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **ISOST[1:0]**: FMC isolation state with respect to the AXI interface

00: FMC is not isolated; AXI transactions are treated by the FMC and its controllers.

01: FMC has been enabled (FMCEN=1) and waits for the end of pending AXI transactions (which will lead to error responses) before going to “non-isolated” state.

10: FMC has been disabled (FMCEN=0) and waits for the end of pending AXI transactions before going to isolation state.

11: FMC is isolated from its AXI interface. All AXI requests will lead to error responses.

**Common memory space timing register (FMC\_PMEM)**

Address offset: 0x88

Reset value: 0x0A0A 0A0A

The FMC\_PMEM read/write register contains NAND Flash memory bank timing information. This information is used to access the NAND Flash common memory space for command, address write accesses or data read/write accesses.

|              |    |    |    |    |    |    |    |              |    |    |    |    |    |    |    |
|--------------|----|----|----|----|----|----|----|--------------|----|----|----|----|----|----|----|
| 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| MEMHIZ[7:0]  |    |    |    |    |    |    |    | MEMHOLD[7:0] |    |    |    |    |    |    |    |
| rw           | rw | rw | rw | rw | rw | rw | rw | rw           | rw | rw | rw | rw | rw | rw | rw |
| 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| MEMWAIT[7:0] |    |    |    |    |    |    |    | MEMSET[7:0]  |    |    |    |    |    |    |    |
| rw           | rw | rw | rw | rw | rw | rw | rw | rw           | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 **MEMHIZ[7:0]**: Common memory data bus Hi-Z time

These bits define the number of fmc\_ker\_ck clock cycles (+1) during which the data bus is kept Hi-Z after starting a NAND Flash write access to the common memory space. This is only valid for write transactions:

0000 0000: 1 x fmc\_ker\_ck cycle  
 0000 0001: 2 x fmc\_ker\_ck cycles

.....

1111 1111: 256 x fmc\_ker\_ck cycles

Bits 23:16 **MEMHOLD[7:0]**: Common memory hold time

These bits define the number of fmc\_ker\_ck clock cycles (+1) during which the address is held (and data for write accesses) after the command is deasserted (NWE, NOE), during NAND Flash read or write accesses to the common memory space:

0000 0000: 1 x fmc\_ker\_ck cycle  
 0000 0001: 2 x fmc\_ker\_ck cycles

.....

1111 1111: 256 x fmc\_ker\_ck cycles

Bits 15:8 **MEMWAIT[7:0]**: Common memory wait time

These bits define the minimum number of fmc\_ker\_ck clock cycles (+1) to assert the command (NWE, NOE), during NAND Flash read or write accesses to the common memory space. The duration of command assertion is extended if the wait signal (NWAIT) is active (low) at the end of the programmed value of fmc\_ker\_ck:

0000 0000: 1 x fmc\_ker\_ck cycles (+ wait cycle introduced by deasserting NWAIT)  
 0000 0001: 2 x fmc\_ker\_ck cycles (+ wait cycle introduced by deasserting NWAIT)

.....

1111 1111: 256 x fmc\_ker\_ck cycles (+ wait cycle introduced by deasserting NWAIT)

Bits 7:0 **MEMSET[7:0]**: Common memory setup time

These bits define the number of fmc\_ker\_ck clock cycles (+1) to set up the address before the command assertion (NWE, NOE), during NAND Flash read or write accesses to the common memory space:

0000 0000: 1 x fmc\_ker\_ck cycles  
 0000 0001: 2 x fmc\_ker\_ck cycles

.....

1111 1111: 256 x fmc\_ker\_ck cycles

**Attribute memory space timing registers (FMC\_PATT)**

Address offset: 0x8C

Reset value: 0x0A0A 0A0A

The FMC\_PATT read/write register contains NAND Flash memory bank timing information. It is used for 8-bit accesses to the NAND Flash attribute memory space during the last address write access when the timing differs from previous accesses (for Ready/Busy management, refer to [Section 26.9.5: NAND Flash prewait function](#)).

|              |    |    |    |    |    |    |    |              |    |    |    |    |    |    |    |
|--------------|----|----|----|----|----|----|----|--------------|----|----|----|----|----|----|----|
| 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ATTHIZ[7:0]  |    |    |    |    |    |    |    | ATTHOLD[7:0] |    |    |    |    |    |    |    |
| rw           | rw | rw | rw | rw | rw | rw | rw | rw           | rw | rw | rw | rw | rw | rw | rw |
| 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ATTWAIT[7:0] |    |    |    |    |    |    |    | ATTSET[7:0]  |    |    |    |    |    |    |    |
| rw           | rw | rw | rw | rw | rw | rw | rw | rw           | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 **ATTHIZ[7:0]**: Attribute memory data bus Hi-Z time

These bits define the number of fmc\_ker\_ck clock cycles (+1) during which the data bus is kept in Hi-Z after starting a NAND Flash write access to the attribute memory space. These bits are only valid for write transactions:

0000 0000: 1 x fmc\_ker\_ck cycle

0000 0001: 2 x fmc\_ker\_ck cycle

.....

1111 1111: 256 x fmc\_ker\_ck cycles

Bits 23:16 **ATTHOLD[7:0]**: Attribute memory hold time

These bits define the number of fmc\_ker\_ck clock cycles (+1) during which the address is held (and data for write access) after the command deassertion (NWE, NOE), during NAND Flash read or write accesses to the attribute memory space:

0000 0000: 1 x fmc\_ker\_ck cycle

0000 0001: 2 x fmc\_ker\_ck cycle

.....

1111 1111: 256 x fmc\_ker\_ck cycles.

Bits 15:8 **ATTWAIT[7:0]**: Attribute memory wait time

These bits define the minimum number of x fmc\_ker\_ck (+1) clock cycles to assert the command (NWE, NOE), during NAND Flash read or write accesses to the attribute memory space. The duration of command assertion is extended if the wait signal (NWAIT) is active (low) at the end of the programmed value of fmc\_ker\_ck:

0000 0000: 1 x fmc\_ker\_ck cycle (+ wait cycle introduced by deassertion of NWAIT)

0000 0001: 2 x fmc\_ker\_ck cycles (+ wait cycle introduced by deassertion of NWAIT)

.....

1111 1111: 256 x fmc\_ker\_ck cycles (+ wait cycle introduced by deasserting NWAIT)

Bits 7:0 **ATTSET[7:0]**: Attribute memory setup time

These bits define the number of fmc\_ker\_ck clock cycles (+1) for address set up before the command assertion (NWE, NOE), during NAND Flash read or write accesses to the attribute memory space:

0000 0000: 1 x fmc\_ker\_ck cycle

0000 0001: 2 x fmc\_ker\_ck cycle

.....

1111 1111: 256 x fmc\_ker\_ck cycles.

**FMC Hamming parity result registers (FMC\_HPR)**

Address offset: 0x90

Reset value: 0x0000 0000

This register is used during read accesses in conjunction with the FMC sequencer. It contains the current error correction code value computed by the FMC NAND controller Hamming module. When the FMC sequencer reads data from a NAND Flash memory page at the correct address, the data read are automatically processed by the Hamming computation module. When X bytes have been read (according to the sector size ECCSS field in the FMC\_PCR register), the CPU must read the computed ECC value from the FMC\_HECCR register. It then verifies if these computed parity data are the same as the parity value recorded in the spare area and stored in the and the FMC\_HPR, to determine whether a page is valid, and to correct it otherwise. The FMC\_HPR register should be cleared after being read by setting the ECCEN bit to 0. To compute a new data block, the ECCEN bit must be set to 1.

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| HPR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| HPR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **HPR[31:0]**: Hamming parity result

This field contains the parity value computed by the Hamming ECC computation module.

[Table 171](#) describes the contents of these bitfields.**Table 171. HPR relevant bits**

| ECCSS[2:0] | Sector size in bytes | HPR bits  |
|------------|----------------------|-----------|
| 000        | 256                  | HPR[21:0] |

**FMC Hamming code ECC result register (FMC\_HECCR)**

Address offset: 0x94

Reset value: 0x0000 0000

This register contains the current error correction code value computed by the FMC NAND controller Hamming module. When the CPU reads/writes data from/to a NAND Flash memory page at the correct address (refer to [Section 26.9.6: NAND ECC controller](#)), the data read/written from/to the NAND Flash memory are automatically processed by the Hamming computation module. When X bytes have been read (according to the sector size ECCSS field in the FMC\_PCR register), the CPU must read the computed ECC value from the FMC\_HECCR register. It then verifies if these computed parity data are the same as the parity value recorded in the spare area, to determine whether a page is valid, and to correct it otherwise. The FMC\_HECCR register should be cleared after being read by setting the ECCEN bit to 0. To compute a new data block, the ECCEN bit must be set to 1.

**FMC NAND Interrupt Enable Register (FMC\_IER)**

Address offset: 0x180

Reset value: 0x0000 0000

This register configures the interrupt capability generation when the RNB signal is connected on FMC interrupt pin. An interrupt can be generated on the rising edge, falling edge or high level detected on the RNB signal.

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IFEF**: Interrupt falling edge flag

The flag is set by hardware and cleared by setting the CFEIF bit.

0: No interrupt falling edge occurred

1: Interrupt falling edge occurred

Bit 1 **IHLF**: Interrupt high-level flag

The flag is set by hardware and cleared by setting the CHLIF bit.

0: No Interrupt high-level occurred

1: Interrupt high-level occurred

Bit 0 **IREF**: Interrupt rising edge flag

The flag is set by hardware and cleared by setting the CREIF bit.

0: No interrupt rising edge occurred

1: Interrupt rising edge occurred

### FMC NAND Controller Interrupt Clear Register (FMC\_ICR)

Address offset: 0x188

Reset value: 0x0000 0000

Writing 1 in one of these bits will clear the corresponding flag in the interrupt status register (FMC\_ISR).

Bits 31:26 Reserved, must be kept at reset value.

- Bit 25 **CMD2T**: Command 2 Sequencer timings  
 This bit specifies if the Command 2 (CMD2) is issued to the NAND Flash memory with the timings defined in FMC\_PMEM or FMC\_PATT register.  
 0: CMD2 issued with the timings programmed in FMC\_PMEM  
 1: CMD2 issued with the timings programmed in FMC\_PATT
- Bit 24 **CMD1T**: Command 1 Sequencer timings  
 This bit specifies if the Command 1 (CMD1) is issued to the NAND Flash memory with the timings programmed in FMC\_PMEM or FMC\_PATT register.  
 0: CMD1 issued with the timings programmed in FMC\_PMEM  
 1: CMD1 issued with the timings programmed in FMC\_PATT

**Bits 23:16 CMD2[7:0]: Command 2 sequencer**

These bits specify if the Command 2 is issued by the command sequencer for the command second cycle during read operations. This command is only issued when the CMD2EN bit is set.

Example: CMD2[7:0] bits must be programmed to 0x30 to issue the read column command.

**Bits 15:8 CMD1[7:0]: Command 1 sequencer**

These bits specify if the Command 1 is issued by the command sequencer for the first cycle during read or write operations.

Bit 7 Reserved, must be kept at reset value.

**Bits 6:4 ACYNBR[2:0]: Address Cycle number**

These bits define the number of address cycles to be generated by the command sequencer when issuing the command programmed in the registers.

000: No address cycle.

001: 1 address cycle

010: 2 address cycles

011: 3 address cycles

100: 4 address cycles

101: 5 address cycles

Others: Reserved.

Bit 3 Reserved, must be kept at reset value.

**Bit 2 DMAEN: Command sequencer DMA request data enable**

When this bit is set, the command sequencer generates a DMA request to the first DMA channel, to transfer data from/to NAND Flash memory.

0: No DMA request transfer

1: A DMA request transfer

**Bit 1 CMD2EN: Command cycle 2 Enable**

This bit specifies that the command cycle 2 has to be generated by the command sequencer.

0: Command cycle 2 not issued.

1: Command cycle 2 (programmed CMD2[7:0]) sent by the command sequencer to the NAND Flash memory after the address cycles.

Bit 0 Reserved, must be kept at reset value.

## FMC NAND Command Sequencer Configuration Register 2 (FMC\_CSQCFGR2)

Address offset: 0x208

Reset value: 0x0000 0000

This register is used to configure the command sequencer to issue random read/ write commands to read/ write data by sector and automatically read/write data from NAND Flash memory at a programmable address offset. This is useful when performing a sector read/write operation followed by an ECC read/write operation in the NAND Flash spare area. The command sequencer generates the random commands until all the sectors are read/written.

| rw         | rw   | rw   | rw   | rw   | rw   | rw    | rw    |            |      |      |      |      | rw     | rw      | rw      |

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **RCMD2T**: Command 1 sequencer timings

This bit specifies if the CMD1 is issued to the NAND Flash memory with the timings programmed in FMC\_PMEM or FMC\_PATT register.

0: CMD1 issued with the timings programmed in FMC\_PMEM

1: CMD1 issued with the timings programmed in FMC\_PATT

Bit 24 **RCMD1T**: Command 1 sequencer timings

This bit specifies if the CMD1 is issued to the NAND Flash memory with the timings Flash memory in FMC\_PMEM or FMC\_PATT register.

0: CMD1 issued with the timings programmed in FMC\_PMEM

1: CMD1 issued with the timings programmed in FMC\_PATT

Bits 23:16 **RCMD2[7:0]**: Random Command 2 sequencer

These bits specify that the command 2 is issued by the command sequencer for the second cycle during read operations. This command is only issued when the RCMD2EN bit is set.

Example: the RCMD2 (0xE0) is required to issue the random read column command.

Bits 15:8 **RCMD1[7:0]**: Random Command 1 sequencer

These bits specify that the command 1 value is issued by the command sequencer for the first cycle during read or write accesses.

Bits 7:3 Reserved, must be kept at reset value.

Bit 2 **DMASEN**: Command sequencer DMA request decoding status enable

When this bit is set, the command sequencer generates a DMA request to the second DMA channel when valid bits are available in the ECC status register at the end of ECC processing (decoding).

0: No DMA request used for ECC status registers transfer

1: A DMA request used for ECC status registers transfer

**Bit 1 RCMD2EN:** Random Command 2 sequencer enable

This bit enables the command 2 to be issued by the command sequencer during read accesses. This command is issued only when the CMD2SQEN bit is set.

0: Command 2 not issued.

1: Command 2 (CMD2SQ[7:0]) issued by the command sequencer to NAND flash memory after the address cycle.

**Bit 0 SQSDTEN:** Sequencer spare data transfer enable

This bit enables the sequencer to access the spare data area after each sector transfer. It also enables the ECC when using the sequencer. ECCEN bit in FMC\_PCR register must be reset.

0: ECC disabled and spare data area not accessed by the sequencer

1: ECC enabled and spare data area read or programmed by the sequencer after each sector transfer

**FMC NAND sequencer configuration register 3 (FMC\_CSQCFGR3)**

Bits 31:24 Reserved, must be kept at reset value.

**Bit 23 RAC2T:** Random Address cycle 2 sequencer timings

This bit specifies if the random Address cycle 2 (ADDC2) is issued to the NAND Flash memory with the timings programmed in FMC\_PMEM or in FMC\_PATT register.

0: Random ADDC2 issued with the timings programmed in FMC\_PMEM

1: Random ADDC2 issued with the timings programmed in FMC\_PATT

**Bit 22 RAC1T:** Random Address cycle 1 sequencer timings

This bit specifies if the random Address cycle 1 (ADDC1) is issued to the NAND Flash memory with the timings programmed in FMC\_PMEM or in FMC\_PATT register.

0: Random ADDC1 issued with the timings programmed in FMC\_PMEM

1: Random ADDC1 issued with the timings programmed in FMC\_PATT

**Bit 21 SDT:** Spare data transfer sequencer timings

This bit specifies if the spare data transfer for read and write operations from/to the NAND Flash memory are performed with the timings programmed in FMC\_PMEM or FMC\_PATT register.

0: Spare data transfer issued with the timings programmed in FMC\_PMEM

1: Spare data transfer issued with the timings programmed in FMC\_PATT

- Bit 20 **AC5T**: Address cycle 5 sequencer timings  
 This bit defines if the Address cycle 5 (ADDC1) is issued to the NAND Flash memory with the timings programmed in FMC\_PMEM or FMC\_PATT register.  
 0: ADDC5 issued with the timings programmed in FMC\_PMEM  
 1: ADDC5 issued with the timings programmed in FMC\_PATT
- Bit 19 **AC4T**: Address cycle 4 sequencer timings  
 This bit defines if the Address cycle 4 (ADDC4) is issued to the NAND Flash memory with the timings programmed in FMC\_PMEM or FMC\_PATT register.  
 0: ADDC4 issued with the timings programmed in FMC\_PMEM  
 1: ADDC4 issued with the timings programmed in FMC\_PATT
- Bit 18 **AC3T**: Address cycle 3 sequencer timings  
 This bit defines if the Address cycle 3 (ADDC3) is issued to the NAND Flash memory with the timings programmed in FMC\_PMEM or FMC\_PATT register.  
 0: ADDC3 issued with the timings programmed in FMC\_PMEM  
 1: ADDC3 issued with the timings programmed in FMC\_PATT
- Bit 17 **AC2T**: Address cycle 2 sequencer timings  
 This bit defines if the Address cycle 2 (ADDC2) is issued to the NAND Flash memory with the timings programmed in FMC\_PMEM or FMC\_PATT register.  
 0: ADDC2 issued with the timings programmed in FMC\_PMEM  
 1: ADDC2 issued with the timings programmed in FMC\_PATT
- Bit 16 **AC1T**: Address cycle 1 sequencer timings  
 This bit defines if the Address cycle 1 (ADDC1) is issued to the NAND Flash memory with the timings programmed in FMC\_PMEM or FMC\_PATT register.  
 0: ADDC1 issued with the timings programmed in FMC\_PMEM  
 1: ADDC1 issued with the timings programmed in FMC\_PATT
- Bits 15:14 Reserved, must be kept at reset value.
- Bits 13:8 **SNBR[5:0]**: Number of sectors to be read/written  
 These bits define the number of sectors that will be processed by the sequencer.  
 They are used to read/write part of a page or to use the ECC (in particular with the BCH code which requires 512-byte sectors):  
 000000: 1 sector  
 000001: 2 sectors  
 ...  
 111111: 16 sectors  
 Others: Reserved.
- Bits 7:0 Reserved, must be kept at reset value.

**FMC NAND Command Sequencer Address Register 1 (FMC\_CSQAR1)**

Address offset: 0x210

Reset value: 0x0000 0000

This register is used to define the value of address cycles 1 to 4 to be issued by the command sequencer.

|            |    |    |    |    |    |    |    |            |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|

Bits 31:24 **ADDC4[7:0]**: Address Cycle 4

These bits define the value of address cycle 4 to be issued by the command sequencer during read or write accesses.

Bits 23:16 **ADDC3[7:0]**: Address Cycle 3

These bits define the value of address cycle 2 to be issued by the command sequencer during read or write accesses.

Bits 15:8 **ADDC2[7:0]**: Address Cycle 2

These bits define the value of address cycle 2 to be issued by the command sequencer during read or write accesses.

Bits 7:0 **ADDC1[7:0]**: Address Cycle 1

These bits define the value of address cycle 1 to be issued by the command sequencer during read or write accesses.

**FMC NAND Command Sequencer Address Register 2 (FMC\_CSQAR2)**

Address offset: 0x214

Reset value: 0x0002 0000

This register is used to program the fifth address cycle and the address offset in spare area. It also selects the chip enable.

|           |      |      |      |           |           |      |      |            |    |    |    |    |    |    |    |

Bits 31:16 **SAO[15:0]**: Spare Area Address Offset.

These bits define the offset of the first ECC byte in the spare area.

*Note: The minimum SAQ value is 2 since the first two bytes of the spare area are reserved for Bad block marking and metadata.*

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:10 **NANDCEN[1:0]**: NAND Flash chip enable number

These bits define the chip enable to be selected by the NAND Flash command sequencer.

00: NCE1 chip enable selected

01: NCE2 chip enable selected

Others: Reserved

Bits 9:8 Reserved, must be kept at reset value.

Bits 7:0 **ADDC5[7:0]**: Address Cycle 5

These bits define the value of address cycle 5 to be issued by the command sequencer during read or write accesses.

### FMC NAND Command Sequencer Interrupt Enable Register (FMC\_CSQIER)

|      |      |      |      |      |      |      |      |      |      |      | rw     | rw   | rw   | rw   | rw   |

Bits 31:5 Reserved, must be kept at reset value.

**Bit 4 CMDTCF:** Command Transfer Complete flag

This bit is set when the command sequencer has completed the transfer of programmed commands and addresses.

This bit is cleared by setting CCMDTCF bit. An interrupt can be generated if the CMDTCIE bit is set in the FMC\_CSQICR register.

**Bit 3 SUEF:** Sector Uncorrectable Error flag

This bit is set by hardware and cleared by writing 1 to the CSUEF bit in FMC\_CSQICR. When this bit is set, it indicates that the command sequencer detected an uncorrectable error when decoding a sector. An interrupt can be generated if the SUEIE bit is set in the FMC\_CSQICR register.

**Bit 2 SEF:** Sector Error flag

This bit is set by hardware and cleared by writing 1 to the CSEF bit in FMC\_CSQICR.

This bit is set when the command sequencer has completed the sector data transfer with at least one error detection. An interrupt can be generated if the SEIE bit is set in the FMC\_CSQICR register.

**Bit 1 SCF:** Sector Complete flag

This bit is set by hardware and cleared by writing 1 to the CSCF bit in FMC\_CSQICR.

This bit is set when the command sequencer has completed the sector data transfer. An interrupt can be generated if the SCIE bit is set in the FMC\_CSQICR register.

**Bit 0 TCF:** Transfer Complete flag

This bit is set by hardware and cleared by writing 1 to the CTCF bit in FMC\_CSQICR.

This bit is set when the command sequencer has transferred all the data for all sectors or when the command sequencer was aborted. An interrupt can be generated if the TCIE bit is set in the FMC\_CSQICR register.

**FMC NAND Command Sequencer Interrupt Clear Register (FMC\_CSQICR)**

Address offset: 0x228

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |         |       |      |      |      |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CCMDTCF**: Clear Command Transfer Complete flag

Writing one clears the CMTCF flag in the FMC\_CSQISR register

Bit 3 **CSUEF**: Clear Sector uncorrectable Error flag

Writing one clears the SUEF flag in the FMC\_CSQISR register

Bit 2 **CSEF**: Clear Sector Error flag

Writing one clears the SEF flag in the FMC\_CSQISR register

Bit 1 **CSCF**: Clear Sector Complete flag

Writing one clears the SCF flag in the FMC\_CSQISR register

Bit 0 **CTCF**: Clear Transfer Complete flag

Writing one clears the TCF flag in the FMC\_CSQISR register

**FMC Command Sequencer Error Mapping Status register (FMC\_CSQEMSR)**

Address offset: 0x230

Reset value: 0x0000 0000

This register holds a sector error mapping status when the whole transfer is complete.

|           |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **EPBRF**: Encoder Parity Bits Ready flag

This bit is set when the BCH encoder parity bits are available in FMC\_BCHPBR1..4.

Bit 3 **DSRF**: Decoder Syndrome Ready flag

This bit is set when the syndrome is ready and DEFF is a valid field.

Bit 2 **DEFF**: Decoder Error Found flag

This bit is set by hardware and cleared by writing 1 to CDEFF.

This bit indicates that at least one error has been detected in the sector.

Bit 1 **DERF**: Decoder Error Ready flag

This bit indicates that the decoder has finished searching errors and identifying their location.

The number of errors and their location are available in FMC\_BCHDSR0 and FMC\_BCHDSR1..4, respectively.

Bit 0 **DUEF**: Decoder Uncorrectable Errors flag

This field indicates that too many errors have been detected in the sector during the BCH decoding and that the sector is uncorrectable.

### FMC BCH Interrupt Clear Register (FMC\_BCHICR)

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CEPBRF**: Clear Encoder Parity Bits Ready flag

Writing 1 clears the EPBRF flag in FMC\_BCHISR.

Bit 3 **CDSRF**: Clear Decoder Syndrome Ready flag

Writing 1 clears the DSRF flag in FMC\_BCHISR.

Bit 2 **CDEFF**: Clear Decoder Error Found flag

Writing 1 clears the DEFF flag in FMC\_BCHISR.

Bit 1 **CDERF**: Clear Decoder Error ready flag

Writing 1 clears the DERF flag in FMC\_BCHISR.

Bit 0 **CDUEF**: Clear Decoder Uncorrectable Error flag

Writing 1 clears the DUEF flag in FMC\_BCHISR.

**FMC BCH Parity Bits Register 1 (FMC\_BCHPBR1)**

Address offset: 0x260

Reset value: 0x0000 0000

These registers contain the BCH parity bits (BCHPB). For the BCH 4-bit, only BCHPB[51:0] are significant and for the BCH 8-bit BCHPB[103:0] are significant.

Bits 7:0 **BCHPB[103:96]**: BCH parity bits

**FMC BCH Decoder Status register 0 (FMC\_BCHDSR0)**

Address offset: 0x27C

Reset value: 0x0000 0000

This register contains some fields already available in other registers but that require to be saved when error correction is performed on several sectors at a time (for example a whole NAND Flash page). This allows a DMA channel to transfer the content of FMC\_BCHDSR0..4 to a decoding status buffer.

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **DEN[3:0]**: Decoder error number

When DEF bit is set, this field indicates the number of errors detected by the BCH decoder.

Following the selected BCH code, if the number of detected errors exceeds the number of correctable errors, this bit is not significant and DUE bit is set.

If the BCH decoder detects a number of errors that exceeds the maximum number of detectable errors, DEN is not significant.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **DEF**: Decoder error found

This field indicates that the decoder has finished searching errors and identifying their location.

The number of errors and their location are available in FMC\_BCHDSR0 and FMC\_BCHDSR1..4, respectively.

Bit 0 **DUE**: Decoder uncorrectable error

This field indicates that too many errors have been detected in the sector during the BCH decoding and that the sector is uncorrectable.

If the BCH decoder detects a number of errors that exceeds the maximum number of detectable errors, DUE is not significant.

**FMC BCH Decoder Status register for bank 1 (FMC\_BCHDSR1)**

Address offset: 0x280

Reset value: 0x0000 0000

The maximum error correction capability of the BCH block embedded in the FMC is 8 errors. This register contains the positions of the 1st and 2nd error bits in EBP1 and EPB2 fields, respectively. If less than 8 errors are detected, the useless EPBx fields (x = 1 to 8) are “don’t care”.

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision

These bits return the FMC major revision

Bits 3:0 **MINREV[3:0]**: Minor revision

These bits return the FMC minor revision

**FMC Hardware configuration register 1 (FMC\_HWCFGR1)**

Address offset: 0x3F0

Reset value: 0x2232 B011

|                 |    |    |    |                 |      |      |           |                 |      |      |          |                 |      |      |          |

Bits 31:28 **RA\_LN2DPTH[3:0]**: AXI read address FIFO depthThese bits return the AXI read address FIFO depth. depth is  $2^{\text{RA\_LN2DPTH}}$ Bits 27:24 **WR\_LN2DPTH[3:0]**: AXI write response FIFO depthThese bits return the AXI write response FIFO depth. depth is  $2^{\text{WR\_LN2DPTH}}$ Bits 23:20 **WD\_LN2DPTH[3:0]**: AXI write data FIFO depthThese bits return the AXI write data FIFO depth. depth is  $2^{\text{WD\_LN2DPTH}}$ Bits 19:16 **WA\_LN2DPTH[3:0]**: AXI write address FIFO depthThese bits return the AXI write address FIFO depth. depth is  $2^{\text{WA\_LN2DPTH}}$ Bits 15:12 **ID\_SIZE[3:0]**: AXI ID signals width

0x0:

...

0xF

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **SDRAM\_SEL**: SDRAM controller selection

0x0: SDRAM controller not supported

0x1: SDRAM controller supported

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **NAND\_ECC**: NAND ECC

0x0: Hamming code

0x1: Hamming and BCH code

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **NAND\_SEL**: NAND Controller Selection

0x0: NAND Controller not supported

0x1: NAND Controller supported

**FMC Hardware configuration register 2 (FMC\_HWCFG2)**

Address offset: 0x3EC

Reset value: 0x00DC 8762

The base addresses are relevant only when the FMC includes the corresponding memory controller.

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:20 **SDRAM2\_BASE[3:0]**: SDRAM Bank2 base address

It returns bits [31:28] of SDRAM bank2 base address space when the SDRAM controller is supported. It is ignored otherwise.

Bits 19:16 **SDRAM1\_BASE[3:0]**: SDRAM Bank1 base address

It returns bits [31:28] of SDRAM bank1 base address space when the SDRAM controller is supported. It is ignored otherwise.

Bits 15:12 **NAND\_BASE[3:0]**: NAND base address

It returns bits [31:28] of NAND base address space

Bits 11:8 **SDRAM\_RBASE[3:0]**: SDRAM remap base address

it returns bits [31:28] of SDRAM remap base address space when the SDRAM controller is supported. It is ignored otherwise.

Bits 7:4 **NOR\_BASE[3:0]**: NOR base address

It returns bits [31:28] of NOR base address space

Bits 3:0 **RD\_LN2DPTH[3:0]**: AXI read data FIFO depth

These bits return the AXI read data FIFO depth. depth is  $2^{RD\_LN2DPTH}$

**26.9.10 FMC registers**

The following table summarizes the FMC registers.

**Table 173. FMC register map**

| Offset | Register    | 31    | 30   | 29   | 28   | 27   | 26   | 25   | 24 | 23          | 22 | 21   | 20     | 19       | 18  | 17          | 16         | 15     | 14     | 13   | 12      | 11   | 10      | 9       | 8    | 7      | 6    | 5   | 4    | 3     | 2     | 1   | 0 |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 27 Quad-SPI interface (QUADSPI)

### 27.1 Introduction

The QUADSPI is a specialized communication interface targeting single, dual or quad SPI Flash memories. It can operate in any of the three following modes:

- indirect mode: all the operations are performed using the QUADSPI registers
- status polling mode: the external Flash memory status register is periodically read and an interrupt can be generated in case of flag setting
- memory-mapped mode: the external Flash memory is mapped to the device address space and is seen by the system as if it was an internal memory

Both throughput and capacity can be increased two-fold using dual-flash mode, where two Quad-SPI Flash memories are accessed simultaneously.

### 27.2 QUADSPI main features

- Three functional modes: indirect, status-polling, and memory-mapped
- Dual-flash mode, where 8 bits can be sent/received simultaneously by accessing two Flash memories in parallel.
- SDR and DDR support
- Fully programmable opcode for both indirect and memory mapped mode
- Fully programmable frame format for both indirect and memory mapped mode
- Integrated FIFO for reception and transmission
- 8, 16, and 32-bit data accesses are allowed
- DMA channel for indirect mode operations
- Interrupt generation on FIFO threshold, timeout, operation complete, and access error

## 27.3.1 QUADSPI block diagram

Figure 172. QUADSPI block diagram

Figure 173. QUADSPI block diagram when dual-flash mode is enabled

### 27.3.2 QUADSPI pins and internal signals

[Table 174](#) lists the QUADSPI internal signals.

**Table 174. QUADSPI internal signals**

| Signal name    | Signal type    | Description                                |
|----------------|----------------|--------------------------------------------|
| quadspi_ker_ck | Digital input  | QUADSPI kernel clock                       |
| quadspi_hclk   | Digital input  | QUADSPI register interface clock           |
| quadspi_it     | Digital output | QUADSPI global interrupt                   |
| quadspi_ft_trg | Digital output | QUADSPI FIFO threshold trigger for MDMA    |
| quadspi_tc_trg | Digital output | QUADSPI transfer complete trigger for MDMA |

[Table 175](#) lists the QUADSPI pins, six for interfacing with a single Flash memory, or 10 to 11 for interfacing with two Flash memories (FLASH 1 and FLASH 2) in dual-flash mode.

**Table 175. QUADSPI pins**

| Signal name | Signal type          | Description                                                                                                      |
|-------------|----------------------|------------------------------------------------------------------------------------------------------------------|
| CLK         | Digital output       | Clock to FLASH 1 and FLASH 2                                                                                     |
| BK1_IO0/SO  | Digital input/output | Bidirectional IO in dual/quad modes or serial output in single mode, for FLASH 1                                 |
| BK1_IO1/SI  | Digital input/output | Bidirectional IO in dual/quad modes or serial input in single mode, for FLASH 1                                  |
| BK1_IO2     | Digital input/output | Bidirectional IO in quad mode, for FLASH 1                                                                       |
| BK1_IO3     | Digital input/output | Bidirectional IO in quad mode, for FLASH 1                                                                       |
| BK2_IO0/SO  | Digital input/output | Bidirectional IO in dual/quad modes or serial output in single mode, for FLASH 2                                 |
| BK2_IO1/SI  | Digital input/output | Bidirectional IO in dual/quad modes or serial input in single mode, for FLASH 2                                  |
| BK2_IO2     | Digital input/output | Bidirectional IO in quad mode, for FLASH 2                                                                       |
| BK2_IO3     | Digital input/output | Bidirectional IO in quad mode, for FLASH 2                                                                       |
| BK1_nCS     | Digital output       | Chip select (active low) for FLASH 1. Can also be used for FLASH 2 if QUADSPI is always used in dual-flash mode. |
| BK2_nCS     | Digital output       | Chip select (active low) for FLASH 2. Can also be used for FLASH 1 if QUADSPI is always used in dual-flash mode. |

### 27.3.3 QUADSPI command sequence

The QUADSPI communicates with the Flash memory using commands. Each command can include 5 phases: instruction, address, alternate byte, dummy, data. Any of these phases can be configured to be skipped, but at least one of the instruction, address, alternate byte, or data phase must be present.

nCS falls before the start of each command and rises again after each command finishes.

Figure 174. An example of a read command in quad mode

### Instruction phase

During this phase, an 8-bit instruction, configured in INSTRUCTION field of QUADSPI\_CCR[7:0] register, is sent to the Flash memory, specifying the type of operation to be performed.

Though most Flash memories can receive instructions only one bit at a time from the IO0/SO signal (single SPI mode), the instruction phase can optionally send 2 bits at a time (over IO0/IO1 in dual SPI mode) or 4 bits at a time (over IO0/IO1/IO2/IO3 in quad SPI mode). This can be configured using the IMODE[1:0] field of QUADSPI\_CCR[9:8] register.

When IMODE = 00, the instruction phase is skipped, and the command sequence starts with the address phase, if present.

### Address phase

In the address phase, 1-4 bytes are sent to the Flash memory to indicate the address of the operation. The number of address bytes to be sent is configured in the ADSIZE[1:0] field of QUADSPI\_CCR[13:12] register. In indirect and automatic-polling modes, the address bytes to be sent are specified in the ADDRESS[31:0] field of QUADSPI\_AR register, while in memory-mapped mode the address is given directly via the AHB (from the Cortex® or from a DMA).

The address phase can send 1 bit at a time (over SO in single SPI mode), 2 bits at a time (over IO0/IO1 in dual SPI mode), or 4 bits at a time (over IO0/IO1/IO2/IO3 in quad SPI mode). This can be configured using the ADMODE[1:0] field of QUADSPI\_CCR[11:10] register.

When ADMODE = 00, the address phase is skipped, and the command sequence proceeds directly to the next phase, if any.

### Alternate-bytes phase

In the alternate-bytes phase, 1-4 bytes are sent to the Flash memory, generally to control the mode of operation. The number of alternate bytes to be sent is configured in the ABSIZE[1:0] field of QUADSPI\_CCR[17:16] register. The bytes to be sent are specified in the QUADSPI\_ABR register.

The alternate-bytes phase can send 1 bit at a time (over SO in single SPI mode), 2 bits at a time (over IO0/IO1 in dual SPI mode), or 4 bits at a time (over IO0/IO1/IO2/IO3 in quad SPI mode). This can be configured using the ABMODE[1:0] field of QUADSPI\_CCR[15:14] register.

When `ABMODE = 00`, the alternate-bytes phase is skipped, and the command sequence proceeds directly to the next phase, if any.

There may be times when only a single nibble needs to be sent during the alternate-byte phase rather than a full byte, such as when dual-mode is used and only two cycles are used for the alternate bytes. In this case, firmware can use quad-mode (`ABMODE = 11`) and send a byte with bits 7 and 3 of `ALTERNATE` set to '1' (keeping the `IO3` line high), and bits 6 and 2 set to '0' (keeping the `IO2` line low). In this case the upper two bits of the nibble to be sent are placed in bits 4:3 of `ALTERNATE` while the lower two bits are placed in bits 1 and 0. For example, if the nibble 2 (0010) is to be sent over `IO0/IO1`, then `ALTERNATE` should be set to 0x8A (1000\_1010).

### Dummy-cycles phase

In the dummy-cycles phase, 1-31 cycles are given without any data being sent or received, in order to allow the Flash memory the time to prepare for the data phase when higher clock frequencies are used. The number of cycles given during this phase is specified in the `DCYC[4:0]` field of `QUADSPI_CCR[22:18]` register. In both SDR and DDR modes, the duration is specified as a number of full CLK cycles.

When `DCYC` is zero, the dummy-cycles phase is skipped, and the command sequence proceeds directly to the data phase, if present.

The operating mode of the dummy-cycles phase is determined by `DMODE`.

In order to assure enough "turn-around" time for changing the data signals from output mode to input mode, there must be at least one dummy cycle when using dual or quad mode to receive data from the Flash memory.

### Data phase

During the data phase, any number of bytes can be sent to, or received from the Flash memory.

In indirect and automatic-polling modes, the number of bytes to be sent/received is specified in the `QUADSPI_DLR` register.

In indirect write mode the data to be sent to the Flash memory must be written to the `QUADSPI_DR` register, while in indirect read mode the data received from the Flash memory is obtained by reading from the `QUADSPI_DR` register.

In memory-mapped mode, the data which is read is sent back directly over the AHB to the Cortex or to a DMA.

The data phase can send/receive 1 bit at a time (over `SO/SI` in single SPI mode), 2 bits at a time (over `IO0/IO1` in dual SPI mode), or 4 bits at a time (over `IO0/IO1/IO2/IO3` in quad SPI mode). This can be configured using the `ABMODE[1:0]` field of `QUADSPI_CCR[15:14]` register.

When `DMODE = 00`, the data phase is skipped, and the command sequence finishes immediately by raising `nCS`. This configuration must only be used in only indirect write mode.

## 27.3.4 QUADSPI signal interface protocol modes

### Single SPI mode

Legacy SPI mode allows just a single bit to be sent/received serially. In this mode, data is sent to the Flash memory over the SO signal (whose I/O shared with IO0). Data received from the Flash memory arrives via SI (whose I/O shared with IO1).

The different phases can each be configured separately to use this single bit mode by setting the IMODE/ADMODE/ABMODE/DMODE fields (in QUADSPI\_CCR) to 01.

In each phase which is configured in single mode:

- IO0 (SO) is in output mode
- IO1 (SI) is in input mode (high impedance)
- IO2 is in output mode and forced to '0'
- IO3 is in output mode and forced to '1' (to deactivate the "hold" function)

This is the case even for the dummy phase if DMODE = 01.

### Dual SPI mode

In dual SPI mode, two bits are sent/received simultaneously over the IO0/IO1 signals.

The different phases can each be configured separately to use dual SPI mode by setting the IMODE/ADMODE/ABMODE/DMODE fields of QUADSPI\_CCR register to 10.

In each phase which is configured in dual mode:

- IO0/IO1 are at high-impedance (input) during the data phase for read operations, and outputs in all other cases
- IO2 is in output mode and forced to '0'
- IO3 is in output mode and forced to '1'

In the dummy phase when DMODE = 01, IO0/IO1 are always high-impedance.

### Quad SPI mode

In quad SPI mode, four bits are sent/received simultaneously over the IO0/IO1/IO2/IO3 signals.

The different phases can each be configured separately to use quad SPI mode by setting the IMODE/ADMODE/ABMODE/DMODE fields of QUADSPI\_CCR register to 11.

In each phase which is configured in quad mode, IO0/IO1/IO2/IO3 are all at high-impedance (input) during the data phase for read operations, and outputs in all other cases.

In the dummy phase when DMODE = 11, IO0/IO1/IO2/IO3 are all high-impedance.

IO2 and IO3 are used only in Quad SPI mode. If none of the phases are configured to use Quad SPI mode, then the pins corresponding to IO2 and IO3 can be used for other functions even while QUADSPI is active.

### SDR mode

By default, the DDRM bit (QUADSPI\_CCR[31]) is 0 and the QUADSPI operates in single data rate (SDR) mode.

In SDR mode, when the QUADSPI is driving the IO0/SO, IO1, IO2, IO3 signals, these signals transition only with the falling edge of CLK.

When receiving data in SDR mode, the QUADSPI assumes that the Flash memories also send the data using CLK's falling edge. By default (when SSHIFT = 0), the signals are sampled using the following (rising) edge of CLK.

### DDR mode

When the DDRM bit (QUADSPI\_CCR[31]) is set to 1, the QUADSPI operates in double data rate (DDR) mode.

In DDR mode, when the QUADSPI is driving the IO0/SO, IO1, IO2, IO3 signals in the address/alternate-byte/data phases, a bit is sent on each of the falling and rising edges of CLK.

The instruction phase is not affected by DDRM. The instruction is always sent using CLK's falling edge.

When receiving data in DDR mode, the QUADSPI assumes that the Flash memories also send the data using both rising and falling CLK edges. When DDRM = 1, firmware must clear SSHIFT bit (bit 4 of QUADSPI\_CR). Thus, the signals are sampled one half of a CLK cycle later (on the following, opposite edge).

**Figure 175. An example of a DDR command in quad mode**

### Dual-flash mode

When the DFM bit (bit 6 of QUADSPI\_CR) is 1, the QUADSPI is in dual-flash mode, where two external quad SPI Flash memories (FLASH 1 and FLASH 2) are used in order to send/receive 8 bits (or 16 bits in DDR mode) every cycle, effectively doubling the throughput as well as the capacity.

Each of the Flash memories use the same CLK and optionally the same nCS signals, but each have separate IO0, IO1, IO2, and IO3 signals.

Dual-flash mode can be used in conjunction with single-bit, dual-bit, and quad-bit modes, as well as with either SDR or DDR mode.

The Flash memory size, as specified in FSIZE[4:0] (QUADSPI\_DCR[20:16]), should reflect the total Flash memory capacity, which is double the size of one individual component.

If address X is even, then the byte which the QUADSPI gives for address X is the byte at the address X/2 of FLASH 1, and the byte which the QUADSPI gives for address X+1 is the byte at the address X/2 of FLASH 2. In other words, bytes at even addresses are all stored in FLASH 1 and bytes at odd addresses are all stored in FLASH 2.

When reading the Flash memories status registers in dual-flash mode, twice as many bytes should be read compared to doing the same read in single-flash mode. This means that if each Flash memory gives 8 valid bits after the instruction for fetching the status register, then the QUADSPI must be configured with a data length of 2 bytes (16 bits), and the QUADSPI will receive one byte from each Flash memory. If each Flash memory gives a status of 16 bits, then the QUADSPI must be configured to read 4 bytes to get all the status bits of both Flash memories in dual-flash mode. The least-significant byte of the result (in the data register) is the least-significant byte of FLASH 1 status register, while the next byte is the least-significant byte of FLASH 2 status register. Then, the third byte of the data register is FLASH 1 second byte, while the forth byte is FLASH 2 second byte (in the case that the Flash memories have 16-bit status registers).

An even number of bytes must always be accessed in dual-flash mode. For this reason, bit 0 of the data length field (QUADSPI\_DLR[0]) is stuck at 1 when DRM = 1.

In dual-flash mode, the behavior of FLASH 1 interface signals are basically the same as in normal mode. FLASH 2 interface signals have exactly the same waveforms as FLASH 1 during the instruction, address, alternate-byte, and dummy-cycles phases. In other words, each Flash memory always receives the same instruction and the same address. Then, during the data phase, the BK1\_IOx and BK2\_IOx buses are both transferring data in parallel, but the data that are sent to (or received from) FLASH 1 are distinct from those of FLASH 2.

### 27.3.5 QUADSPI indirect mode

When in indirect mode, commands are started by writing to QUADSPI registers and data is transferred by writing or reading the data register, in the same way as for other communication peripherals.

When FMODE = 00 (QUADSPI\_CCR[27:26]), the QUADSPI is in indirect write mode, where bytes are sent to the Flash memory during the data phase. Data are provided by writing to the data register (QUADSPI\_DR).

When FMODE = 01, the QUADSPI is in indirect read mode, where bytes are received from the Flash memory during the data phase. Data are recovered by reading QUADSPI\_DR.

The number of bytes to be read/written is specified in the data length register (QUADSPI\_DLR). If QUADSPI\_DLR = 0xFFFF\_FFFF (all 1's), then the data length is considered undefined and the QUADSPI simply continues to transfer data until the end of Flash memory (as defined by FSIZE) is reached. If no bytes are to be transferred, DMODE (QUADSPI\_CCR[25:24]) should be set to 00.

If QUADSPI\_DLR = 0xFFFF\_FFFF and FSIZE = 0x1F (max value indicating a 4GB Flash memory), then in this special case the transfers continue indefinitely, stopping only after an abort request or after the QUADSPI is disabled. After the last memory address is read (at address 0xFFFF\_FFFF), reading continues with address = 0x0000\_0000.

When the programmed number of bytes to be transmitted or received is reached, TCF is set and an interrupt is generated if TCIE = 1. In the case of undefined number of data, the TCF is set when the limit of the external SPI memory is reached according to the Flash memory size defined in the QUADSPI\_CR.

### Triggering the start of a command

Essentially, a command starts as soon as firmware gives the last information that is necessary for this command. Depending on the QUADSPI configuration, there are three different ways to trigger the start of a command in indirect mode. The commands starts immediately after:

1. a write is performed to INSTRUCTION[7:0] (QUADSPI\_CCR), if no address is necessary (when ADMODE = 00) and if no data needs to be provided by the firmware (when FMODE = 01 or DMODE = 00)
2. a write is performed to ADDRESS[31:0] (QUADSPI\_AR), if an address is necessary (when ADMODE != 00) and if no data needs to be provided by the firmware (when FMODE = 01 or DMODE = 00)
3. a write is performed to DATA[31:0] (QUADSPI\_DR), if an address is necessary (when ADMODE != 00) and if data needs to be provided by the firmware (when FMODE = 00 and DMODE != 00)

Writes to the alternate byte register (QUADSPI\_ABR) never trigger the communication start. If alternate bytes are required, they must be programmed before.

As soon as a command is started, the BUSY bit (bit 5 of QUADSPI\_SR) is automatically set.

### FIFO and data management

In indirect mode, data go through a 16-byte FIFO which is internal to the QUADSPI. FLEVEL[4:0] (QUADSPI\_SR[12:8]) indicates how many bytes are currently being held in the FIFO.

In indirect write mode (FMODE = 00), firmware adds data to the FIFO when it writes QUADSPI\_DR. Word writes add 4 bytes to the FIFO, halfword writes add 2 bytes, and byte writes add only 1 byte. If firmware adds too many bytes to the FIFO (more than is indicated by DL[31:0]), the extra bytes are flushed from the FIFO at the end of the write operation (when TCF is set).

Byte/halfword accesses to QUADSPI\_DR must be done only to the least significant byte/halfword of the 32-bit register.

FTHRES[3:0] is used to define a FIFO threshold. When the threshold is reached, the FTF (FIFO threshold flag) is set. In indirect read mode, FTF is set when the number of valid bytes to be read from the FIFO is above the threshold. FTF is also set if there are data in the FIFO after the last byte is read from the Flash memory, regardless of the FTHRES setting. In indirect write mode, FTF is set when the number of empty bytes in the FIFO is above the threshold.

If FTIE = 1, there is an interrupt when FTF is set. If DMAEN = 1, a DMA transfer is initiated when FTF is set. FTF is cleared by HW as soon as the threshold condition is no longer true (after enough data has been transferred by the CPU or DMA).

In indirect read mode when the FIFO becomes full, the QUADSPI temporarily stops reading bytes from the Flash memory to avoid an overrun. Note that the reading of the Flash memory does not restart until 4 bytes become vacant in the FIFO (when FLEVEL ≤ 11). Thus, when FTHRES ≥ 13, the application must take care to read enough bytes to assure that the QUADSPI starts retrieving data from the Flash memory again. Otherwise, the FTF flag stays at '0' as long as 11 < FLEVEL < FTHRES.

### 27.3.6 QUADSPI status flag polling mode

In automatic-polling mode, the QUADSPI periodically starts a command to read a defined number of status bytes (up to 4). The received bytes can be masked to isolate some status bits and an interrupt can be generated when the selected bits have a defined value.

The accesses to the Flash memory begin in the same way as in indirect read mode: if no address is required (AMODE = 00), accesses begin as soon as the QUADSPI\_CCR is written. Otherwise, if an address is required, the first access begins when QUADSPI\_AR is written. BUSY goes high at this point and stays high even between the periodic accesses.

The contents of MASK[31:0] (QUADSPI\_PSMAR) are used to mask the data from the Flash memory in automatic-polling mode. If the MASK[n] = 0, then bit n of the result is masked and not considered. If MASK[n] = 1, and the content of bit[n] is the same as MATCH[n] (QUADSPI\_PSMAR), then there is a match for bit n.

If the polling match mode bit (PMM, bit 23 of QUADSPI\_CR) is 0, then “AND” match mode is activated. This means status match flag (SMF) is set only when there is a match on all of the unmasked bits.

If PMM = 1, then “OR” match mode is activated. This means SMF is set if there is a match on any of the unmasked bits.

An interrupt is called when SMF is set if SMIE = 1.

If the automatic-polling-mode-stop (APMS) bit is set, operation stops and BUSY goes to 0 as soon as a match is detected. Otherwise, BUSY stays at ‘1’ and the periodic accesses continue until there is an abort or the QUADSPI is disabled (EN = 0).

The data register (QUADSPI\_DR) contains the latest received status bytes (the FIFO is deactivated). The content of the data register is not affected by the masking used in the matching logic. The FTF status bit is set as soon as a new reading of the status is complete, and FTF is cleared as soon as the data is read.

### 27.3.7 QUADSPI memory-mapped mode

When configured in memory-mapped mode, the external SPI device is seen as an internal memory.

It is forbidden to access QUADSPI Flash bank area before having properly configured and enabled the QUADSPI peripheral.

No more than 256MB can be addressed even if the Flash memory capacity is larger.

If an access is made to an address outside of the range defined by FSIZE but still within the 256MB range, then a bus error is given. The effect of this error depends on the bus master that attempted the access:

- If it is the Cortex<sup>®</sup> CPU, bus fault exception is generated when enabled (or a hard fault exception when bus fault is disabled)
- If it is a DMA, a DMA transfer error is generated and the corresponding DMA channel is automatically disabled.

Byte, halfword, and word access types are all supported.

Support for execute in place (XIP) operation is implemented, where the QUADSPI anticipates the next access and loads in advance the byte at the following address. If the subsequent access is indeed made at a continuous address, the access will be completed faster since the value is already prefetched.

By default, the QUADSPI never stops its prefetch operation, keeping the previous read operation active with nCS maintained low, even if no access to the Flash memory occurs for a long time. Since Flash memories tend to consume more when nCS is held low, the application might want to activate the timeout counter (TCEN = 1, bit 3 of QUADSPI\_CR) so that nCS is released after a period of TIMEOUT[15:0] (QUADSPI\_LPTR) cycles have elapsed without any access since when the FIFO becomes full with prefetch data.

BUSY goes high as soon as the first memory-mapped access occurs. Because of the prefetch operations, BUSY does not fall until there is a timeout, there is an abort, or the peripheral is disabled.

### 27.3.8 QUADSPI Free running clock mode

When configured in Free running clock mode, the QUADSPI peripheral continuously outputs the clock for test and calibration purposes.

Free running clock mode is entered as soon as the Free running clock mode bit (FRCM) is set in the QUADSPI communication configuration register (QUADSPI\_CCR). It is exited by setting the ABORT bit of the QUADSPI control register (QUADSPI\_CR).

When the QUADSPI operates in Free running clock mode:

- the clock is running continuously,
- nCS stays High (external device deselected),
- data lines are released (High-Z),
- the BUSY flag of the QUADSPI status register (QUADSPI\_SR) is set.

### 27.3.9 QUADSPI Flash memory configuration

The device configuration register (QUADSPI\_DCR) can be used to specify the characteristics of the external SPI Flash memory.

The FSIZE[4:0] field defines the size of external memory using the following formula:

$$\text{Number of bytes in Flash memory} = 2^{[FSIZE+1]}$$

FSIZE+1 is effectively the number of address bits required to address the Flash memory. The Flash memory capacity can be up to 4GB (addressed using 32 bits) in indirect mode, but the addressable space in memory-mapped mode is limited to 256MB.

If DFM = 1, FSIZE indicates the total capacity of the two Flash memories together.

When the QUADSPI executes two commands, one immediately after the other, it raises the chip select signal (nCS) high between the two commands for only one CLK cycle by default. If the Flash memory requires more time between commands, the chip select high time (CSHT) field can be used to specify the minimum number of CLK cycles (up to 8) that nCS must remain high.

The clock mode (CKMODE) bit indicates the CLK signal logic level in between commands (when nCS = 1).

### 27.3.10 QUADSPI delayed data sampling

By default, the QUADSPI samples the data driven by the Flash memory one half of a CLK cycle after the Flash memory drives the signal.

In case of external signal delays, it may be beneficial to sample the data later. Using the SSHIFT bit (bit 4 of QUADSPI\_CR), the sampling of the data can be shifted by half of a CLK cycle.

Clock shifting is not supported in DDR mode: the SSHIFT bit must be clear when DDRM bit is set.

### 27.3.11 QUADSPI configuration

The QUADSPI configuration is done in two phases:

- QUADSPI IP configuration
- QUADSPI Flash memory configuration

Once configured and enabled, the QUADSPI can be used in one of its three operating modes: indirect mode, status-polling mode, or memory-mapped mode.

#### QUADSPI IP configuration

The QUADSPI IP is configured using the QUADSPI\_CR. The user shall configure the clock prescaler division factor and the sample shifting settings for the incoming data.

DDR mode can be set through the DDRM bit. When setting QUADSPI interface in DDR mode, the internal divider of kernel clock must be set with a division ratio of 2 or more. Once enabled, the address and the alternate bytes are sent on both clock edges and the data are sent/received on both clock edges. Regardless of the DDRM bit setting, instructions are always sent in SDR mode.

The DMA requests are enabled setting the DMAEN bit. In case of interrupt usage, their respective enable bit can be also set during this phase.

FIFO level for either DMA request generation or interrupt generation is programmed in the FTHRES bits.

If timeout counter is needed, the TCEN bit can be set and the timeout value programmed in the QUADSPI\_LPTR register.

Dual-flash mode can be activated by setting DFM to 1.

#### QUADSPI Flash memory configuration

The parameters related to the targeted external Flash memory are configured through the QUADSPI\_DCR register. The user shall program the Flash memory size in the FSIZE bits, the Chip Select minimum high time in the CSHT bits, and the functional mode (Mode 0 or Mode 3) in the MODE bit.

### 27.3.12 QUADSPI usage

The operating mode is selected using FMODE[1:0] (QUADSPI\_CCR[27:26]).

#### Indirect mode procedure

When FMODE is programmed to 00, indirect write mode is selected and data can be sent to the Flash memory. With FMODE = 01, indirect read mode is selected where data can be read from the Flash memory.

When the QUADSPI is used in indirect mode, the frames are constructed in the following way:

1. Specify a number of data bytes to read or write in the QUADSPI\_DLR.
2. Specify the frame format, mode and instruction code in the QUADSPI\_CCR.
3. Specify optional alternate byte to be sent right after the address phase in the QUADSPI\_ABR.
4. Specify the operating mode in the QUADSPI\_CR. If FMODE = 00 (indirect write mode) and DMAEN = 1, then QUADSPI\_AR should be specified before QUADSPI\_CR, because otherwise QUADSPI\_DR might be written by the DMA before QUADSPI\_AR is updated (if the DMA controller has already been enabled).
5. Specify the targeted address in the QUADSPI\_AR.
6. Read/Write the data from/to the FIFO through the QUADSPI\_DR.

When writing the control register (QUADSPI\_CR) the user specifies the following settings:

- The enable bit (EN) set to '1'
- The DMA enable bit (DMAEN) for transferring data to/from RAM
- Timeout counter enable bit (TCEN)
- Sample shift setting (SSHIFT)
- FIFO threshold level (FTRHES) to indicate when the FTF flag should be set
- Interrupt enables
- Automatic polling mode parameters: match mode and stop mode (valid when FMODE = 11)
- Clock prescaler

When writing the communication configuration register (QUADSPI\_CCR) the user specifies the following parameters:

- The instruction byte through the INSTRUCTION bits
- The way the instruction has to be sent through the IMODE bits (1/2/4 lines)
- The way the address has to be sent through the ADMODE bits (None/1/2/4 lines)
- The address size (8/16/24/32-bit) through the ADSIZE bits
- The way the alternate bytes have to be sent through the ABMODE (None/1/2/4 lines)
- The alternate bytes number (1/2/3/4) through the ABSIZE bits
- The presence or not of dummy bytes through the DBMODE bit
- The number of dummy bytes through the DCYC bits
- The way the data have to be sent/received (None/1/2/4 lines) through the DMODE bits

If neither the address register (QUADSPI\_AR) nor the data register (QUADSPI\_DR) need to be updated for a particular command, then the command sequence starts as soon as QUADSPI\_CCR is written. This is the case when both ADMODE and DMODE are 00, or if just ADMODE = 00 when in indirect read mode (FMODE = 01).

When an address is required (ADMODE is not 00) and the data register does not need to be written (when FMODE = 01 or DMODE = 00), the command sequence starts as soon as the address is updated with a write to QUADSPI\_AR.

In case of data transmission (FMODE = 00 and DMODE! = 00), the communication start is triggered by a write in the FIFO through QUADSPI\_DR.

### Status flag polling mode

The status flag polling mode is enabled setting the FMODE field (QUADSPI\_CCR[27:26]) to 10. In this mode, the programmed frame will be sent and the data retrieved periodically.

The maximum amount of data read in each frame is 4 bytes. If more data is requested in QUADSPI\_DLR, it will be ignored and only 4 bytes will be read.

The periodicity is specified in the QUADSPI\_PISR register.

Once the status data has been retrieved, it can internally be processed in order to:

- set the status match flag and generate an interrupt if enabled
- stop automatically the periodic retrieving of the status bytes

The received value can be masked with the value stored in the QUADSPI\_PSMKR and ORed or ANDed with the value stored in the QUADSPI\_PSMAR.

In case of match, the status match flag is set and an interrupt is generated if enabled, and the QUADSPI can be automatically stopped if the AMPS bit is set.

In any case, the latest retrieved value is available in the QUADSPI\_DR.

### Memory-mapped mode

In memory-mapped mode, the external Flash memory is seen as internal memory but with some latency during accesses. Only read operations are allowed to the external Flash memory in this mode.

Memory-mapped mode is entered by setting the FMODE to 11 in the QUADSPI\_CCR register.

The programmed instruction and frame is sent when a master is accessing the memory mapped space.

The FIFO is used as a prefetch buffer to anticipate linear reads. Any access to QUADSPI\_DR in this mode returns zero.

The data length register (QUADSPI\_DLR) has no meaning in memory-mapped mode.

## 27.3.13 Sending the instruction only once

Some Flash memories (e.g. Winbound) might provide a mode where an instruction must be sent only with the first command sequence, while subsequent commands start directly with the address. One can take advantage of such a feature using the SIOO bit (QUADSPI\_CCR[28]).

SIOO is valid for all functional modes (indirect, automatic polling, and memory-mapped). If the SIOO bit is set, the instruction is sent only for the first command following a write to QUADSPI\_CCR. Subsequent command sequences skip the instruction phase, until there is a write to QUADSPI\_CCR.

SIOO has no effect when IMODE = 00 (no instruction).

### 27.3.14 QUADSPI error management

An error can be generated in the following case:

- In indirect mode or status flag polling mode when a wrong address has been programmed in the QUADSPI\_AR (according to the Flash memory size defined by FSIZE[4:0] in the QUADSPI\_DCR): this will set the TEF and an interrupt is generated if enabled.
- Also in indirect mode, if the address plus the data length exceeds the Flash memory size, TEF will be set as soon as the access is triggered.
- In memory-mapped mode, when an out of range access is done by a master or when the QUADSPI is disabled: this will generate a bus error as a response to the faulty bus master request.
- When a master is accessing the memory mapped space while the memory mapped mode is disabled: this will generate a bus error as a response to the faulty bus master request.

### 27.3.15 QUADSPI busy bit and abort functionality

Once the QUADSPI starts an operation with the Flash memory, the BUSY bit is automatically set in the QUADSPI\_SR.

In indirect mode, the BUSY bit is reset once the QUADSPI has completed the requested command sequence and the FIFO is empty.

In automatic-polling mode, BUSY goes low only after the last periodic access is complete, due to a match when APMS = 1, or due to an abort.

After the first access in memory-mapped mode, BUSY goes low only on a timeout event or on an abort.

Any operation can be aborted by setting the ABORT bit in the QUADSPI\_CR. Once the abort is completed, the BUSY bit and the ABORT bit are automatically reset, and the FIFO is flushed.

*Note:* Some Flash memories might misbehave if a write operation to a status registers is aborted.

### 27.3.16 nCS behavior

By default, nCS is high, deselecting the external Flash memory. nCS falls before an operation begins and rises as soon as it finishes.

When CKMODE = 0 ("mode0", where CLK stays low when no operation is in progress) nCS falls one CLK cycle before an operation first rising CLK edge, and nCS rises one CLK cycle after the operation final rising CLK edge, as shown in [Figure 176](#).

**Figure 176. nCS when CKMODE = 0 (T = CLK period)**

When CKMODE=1 ("mode3", where CLK goes high when no operation is in progress) and DDRM=0 (SDR mode), nCS still falls one CLK cycle before an operation first rising CLK edge, and nCS rises one CLK cycle after the operation final rising CLK edge, as shown in [Figure 177](#).

**Figure 177. nCS when CKMODE = 1 in SDR mode ( $T = \text{CLK period}$ )**

When CKMODE = 1 ("mode3") and DDRM = 1 (DDR mode), nCS falls one CLK cycle before an operation first rising CLK edge, and nCS rises one CLK cycle after the operation final active rising CLK edge, as shown in [Figure 178](#). Because DDR operations must finish with a falling edge, CLK is low when nCS rises, and CLK rises back up one half of a CLK cycle afterwards.

**Figure 178. nCS when CKMODE = 1 in DDR mode ( $T = \text{CLK period}$ )**

When the FIFO stays full in a read operation or if the FIFO stays empty in a write operation, the operation stalls and CLK stays low until firmware services the FIFO. If an abort occurs when an operation is stalled, nCS rises just after the abort is requested and then CLK rises one half of a CLK cycle later, as shown in [Figure 179](#).

**Figure 179. nCS when CKMODE = 1 with an abort ( $T = \text{CLK period}$ )**

When not in dual-flash mode (DFM = 0) and FSEL = 0 (default value), only FLASH 1 is accessed and thus BK2\_nCS stays high, if FSEL = 1, only FLASH 2 is accessed and BK1\_nCS stays high. In dual-flash mode, BK2\_nCS behaves exactly the same as BK1\_nCS. Thus, if there is a FLASH 2 and if the application is dual-flash mode only, then BK1\_nCS signal can be used for FLASH 2 as well, and the pin devoted to BK2\_nCS can be used for other functions.

## 27.4 QUADSPI interrupts

An interrupt can be produced on the following events:

- Timeout
- Status match
- FIFO threshold
- Transfer complete
- Transfer error

Separate interrupt enable bits are available for flexibility.

**Table 176. QUADSPI interrupt requests**

| Interrupt event   | Event flag | Enable control bit |
|-------------------|------------|--------------------|
| Timeout           | TOF        | TOIE               |
| Status match      | SMF        | SMIE               |
| FIFO threshold    | FTF        | FTIE               |
| Transfer complete | TCF        | TCIE               |
| Transfer error    | TEF        | TEIE               |

## 27.5 QUADSPI registers

### 27.5.1 QUADSPI control register (QUADSPI\_CR)

Address offset: 0x0000

Reset value: 0x0000 0000

|                |      |      |      |             |     |     |     |      |      |      |        |      |       |       |      |
|----------------|------|------|------|-------------|-----|-----|-----|------|------|------|--------|------|-------|-------|------|
| 31             | 30   | 29   | 28   | 27          | 26  | 25  | 24  | 23   | 22   | 21   | 20     | 19   | 18    | 17    | 16   |
| PRESCALER[7:0] |      |      |      |             |     |     |     | PMM  | APMS | Res. | TOIE   | SMIE | FTIE  | TCIE  | TEIE |
| r/w            | r/w  | r/w  | r/w  | r/w         | r/w | r/w | r/w | r/w  | r/w  |      | r/w    | r/w  | r/w   | r/w   | r/w  |
| 15             | 14   | 13   | 12   | 11          | 10  | 9   | 8   | 7    | 6    | 5    | 4      | 3    | 2     | 1     | 0    |
| Res.           | Res. | Res. | Res. | FTHRES[3:0] |     |     |     | FSEL | DFM  | Res. | SSHIFT | TCEN | DMAEN | ABORT | EN   |
|                |      |      |      | r/w         | r/w | r/w | r/w | r/w  | r/w  |      | r/w    | r/w  | r/w   | r/w   | r/w  |

Bits 31:24 **PRESCALER[7:0]**: Clock prescaler

This field defines the scaler factor for generating CLK based on the quadspi\_ker\_ck clock (value+1).

0:  $F_{CLK} = F_{quadspi\_ker\_ck}$ , quadspi\_ker\_ck clock used directly as QUADSPI CLK (prescaler bypassed)

1:  $F_{CLK} = F_{quadspi\_ker\_ck}/2$

2:  $F_{CLK} = F_{quadspi\_ker\_ck}/3$

...

255:  $F_{CLK} = F_{quadspi\_ker\_ck}/256$

For odd clock division factors, CLK's duty cycle is not 50%. The clock signal remains low one cycle longer than it stays high.

This field can be modified only when BUSY = 0.

When setting QUADSPI interface in DDR mode, the prescaler must be set with a division ratio of 2 or more.

Bit 23 **PMM**: Polling match mode

This bit indicates which method should be used for determining a "match" during automatic polling mode.

0: AND match mode. SMF is set if all the unmasked bits received from the Flash memory match the corresponding bits in the match register.

1: OR match mode. SMF is set if any one of the unmasked bits received from the Flash memory matches its corresponding bit in the match register.

This bit can be modified only when BUSY = 0.

Bit 22 **APMS**: Automatic poll mode stop

This bit determines if automatic polling is stopped after a match.

0: Automatic polling mode is stopped only by abort or by disabling the QUADSPI.

1: Automatic polling mode stops as soon as there is a match.

This bit can be modified only when BUSY = 0.

Bit 21 Reserved, must be kept at reset value.

Bit 20 **TOIE**: TimeOut interrupt enable

This bit enables the TimeOut interrupt.

0: Interrupt disable

1: Interrupt enabled

Bit 19 **SMIE**: Status match interrupt enable

This bit enables the status match interrupt.

0: Interrupt disable

1: Interrupt enabled

Bit 18 **FTIE**: FIFO threshold interrupt enable

This bit enables the FIFO threshold interrupt.

0: Interrupt disabled

1: Interrupt enabled

Bit 17 **TCIE**: Transfer complete interrupt enable

This bit enables the transfer complete interrupt.

0: Interrupt disabled

1: Interrupt enabled

Bit 16 **TEIE**: Transfer error interrupt enable

This bit enables the transfer error interrupt.

0: Interrupt disable

1: Interrupt enabled

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **FTHRES[3:0]**: FIFO threshold level

Defines, in indirect mode, the threshold number of bytes in the FIFO that will cause the FIFO threshold flag (bit FTF in register QUADSPI\_SR) to be set.

0: In indirect write mode (FMODE = 00) FTF is set if there are 1 or more free bytes location left in the FIFO or indirect read mode (FMODE = 01) FTF is set if there are 1 or more valid bytes that can be read from the FIFO

1: In indirect write mode (FMODE = 00) FTF is set if there are 2 or more free bytes location left in the FIFO or indirect read mode (FMODE = 01) FTF is set if there are 2 or more valid bytes that can be read from the FIFO

...

15: In indirect write mode (FMODE = 00) FTF is set if there are 16 free bytes location left in the FIFO or indirect read mode (FMODE = 01) FTF is set if there are 16 valid bytes that can be read from the FIFO

If DMAEN = 1, then the DMA controller for the corresponding channel must be disabled before changing the FTHRES value.

Bit 7 **FSEL**: Flash memory selection

This bit selects the Flash memory to be addressed in single flash mode (when DFM = 0).

0: FLASH 1 selected

1: FLASH 2 selected

This bit can be modified only when BUSY = 0.

This bit is ignored when DFM = 1.

Bit 6 **DFM**: Dual-flash mode

This bit activates dual-flash mode, where two external Flash memories are used simultaneously to double throughput and capacity.

0: Dual-flash mode disabled

1: Dual-flash mode enabled

This bit can be modified only when BUSY = 0.

Bit 5 Reserved, must be kept at reset value.

**Bit 4 SSHIFT:** Sample shift

By default, the QUADSPI samples data 1/2 of a CLK cycle after the data is driven by the Flash memory. This bit allows the data is to be sampled later in order to account for external signal delays.

0: No shift

1: 1/2 cycle shift

Firmware must assure that SSHIFT = 0 when in DDR mode (when DDRM = 1).

This field can be modified only when BUSY = 0.

**Bit 3 TCEN:** Timeout counter enable

This bit is valid only when memory-mapped mode (FMODE = 11) is selected. Activating this bit causes the chip select (nCS) to be released (and thus reduces consumption) if there has not been an access after a certain amount of time, where this time is defined by TIMEOUT[15:0] (QUADSPI\_LPTR).

Enable the timeout counter.

By default, the QUADSPI never stops its prefetch operation, keeping the previous read operation active with nCS maintained low, even if no access to the Flash memory occurs for a long time. Since Flash memories tend to consume more when nCS is held low, the application might want to activate the timeout counter (TCEN = 1, bit 3 of QUADSPI\_CR) so that nCS is released after a period of TIMEOUT[15:0] (QUADSPI\_LPTR) cycles have elapsed without an access since when the FIFO becomes full with prefetch data.

0: Timeout counter is disabled, and thus the chip select (nCS) remains active indefinitely after an access in memory-mapped mode.

1: Timeout counter is enabled, and thus the chip select is released in memory-mapped mode after TIMEOUT[15:0] cycles of Flash memory inactivity.

This bit can be modified only when BUSY = 0.

**Bit 2 DMAEN:** DMA enable

In indirect mode, DMA can be used to input or output data via the QUADSPI\_DR register. DMA transfers are initiated when the FIFO threshold flag, FTF, is set.

0: DMA is disabled for indirect mode

1: DMA is enabled for indirect mode

**Bit 1 ABORT:** Abort request

This bit aborts the on-going command sequence. It is automatically reset once the abort is complete.

This bit stops the current transfer.

In polling mode or memory-mapped mode, this bit also reset the APM bit or the DM bit.

0: No abort requested

1: Abort requested

**Bit 0 EN:** Enable

Enable the QUADSPI.

0: QUADSPI is disabled

1: QUADSPI is enabled

## 27.5.2 QUADSPI device configuration register (QUADSPI\_DCR)

Address offset: 0x0004

Reset value: 0x0000 0000

| 31   | 30   | 29   | 28   | 27   | 26        | 25   | 24   | 23   | 22   | 21   | 20         | 19   | 18   | 17   | 16      |
|------|------|------|------|------|-----------|------|------|------|------|------|------------|------|------|------|---------|
| Res. | Res. | Res. | Res. | Res. | Res.      | Res. | Res. | Res. | Res. | Res. | FSIZE[4:0] |      |      |      |         |
|      |      |      |      |      |           |      |      |      |      |      | rw         | rw   | rw   | rw   | rw      |
| 15   | 14   | 13   | 12   | 11   | 10        | 9    | 8    | 7    | 6    | 5    | 4          | 3    | 2    | 1    | 0       |

|      |      |      |      |      | rw        | rw   | rw   |      |      |      |            |      |      |      | rw      |

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **FSIZE[4:0]**: Flash memory size

This field defines the size of external memory using the following formula:

Number of bytes in Flash memory =  $2^{[FSIZE+1]}$

FSIZE+1 is effectively the number of address bits required to address the Flash memory. The Flash memory capacity can be up to 4GB (addressed using 32 bits) in indirect mode, but the addressable space in memory-mapped mode is limited to 256MB.

If DFM = 1, FSIZE indicates the total capacity of the two Flash memories together.

This field can be modified only when BUSY = 0.

Bits 15:11 Reserved, must be kept at reset value.

Bits 10:8 **CSHT[2:0]**: Chip select high time

CSHT+1 defines the minimum number of CLK cycles which the chip select (nCS) must remain high between commands issued to the Flash memory.

0: nCS stays high for at least 1 cycle between Flash memory commands

1: nCS stays high for at least 2 cycles between Flash memory commands

...

7: nCS stays high for at least 8 cycles between Flash memory commands

This field can be modified only when BUSY = 0.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **CKMODE**: Mode 0 / mode 3

This bit indicates the level that CLK takes between commands (when nCS = 1).

0: CLK must stay low while nCS is high (chip select released). This is referred to as mode 0.

1: CLK must stay high while nCS is high (chip select released). This is referred to as mode 3.

This field can be modified only when BUSY = 0.

### 27.5.3 QUADSPI status register (QUADSPI\_SR)

Address offset: 0x0008

Reset value: 0x0000 0000

|      |      |      |             |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|-------------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28          | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res.        | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |             |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12          | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | FLEVEL[4:0] |      |      |      |      | Res. | Res. | BUSY | TOF  | SMF  | FTF  | TCF  | TEF  |
|      |      |      | r           | r    | r    | r    | r    |      |      | r    | r    | r    | r    | r    | r    |

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:8 **FLEVEL[4:0]**: FIFO level

This field gives the number of valid bytes which are being held in the FIFO. FLEVEL = 0 when the FIFO is empty, and 16 when it is full. In memory-mapped mode and in automatic status polling mode, FLEVEL is zero.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **BUSY**: Busy

This bit is set when an operation is on going. This bit clears automatically when the operation with the Flash memory is finished and the FIFO is empty.

Bit 4 **TOF**: Timeout flag

This bit is set when timeout occurs. It is cleared by writing 1 to CTOF.

Bit 3 **SMF**: Status match flag

This bit is set in automatic polling mode when the unmasked received data matches the corresponding bits in the match register (QUADSPI\_PSMAR). It is cleared by writing 1 to CSMF.

Bit 2 **FTF**: FIFO threshold flag

In indirect mode, this bit is set when the FIFO threshold has been reached, or if there is any data left in the FIFO after reads from the Flash memory are complete. It is cleared automatically as soon as threshold condition is no longer true.

In automatic polling mode this bit is set every time the status register is read, and the bit is cleared when the data register is read.

Bit 1 **TCF**: Transfer complete flag

This bit is set in indirect mode when the programmed number of data has been transferred or in any mode when the transfer has been aborted. It is cleared by writing 1 to CTCF.

Bit 0 **TEF**: Transfer error flag

This bit is set in indirect mode when an invalid address is being accessed in indirect mode. It is cleared by writing 1 to CTEF.

### 27.5.4 QUADSPI flag clear register (QUADSPI\_FCR)

Address offset: 0x000C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CTOF | CSMF | Res. | CTCF | CTEF |
|      |      |      |      |      |      |      |      |      |      |      | w    | w    |      | w    | w    |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CTOF**: Clear timeout flag

Writing 1 clears the TOF flag in the QUADSPI\_SR register

Bit 3 **CSMF**: Clear status match flag

Writing 1 clears the SMF flag in the QUADSPI\_SR register

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CTCF**: Clear transfer complete flag

Writing 1 clears the TCF flag in the QUADSPI\_SR register

Bit 0 **CTEF**: Clear transfer error flag

Writing 1 clears the TEF flag in the QUADSPI\_SR register

### 27.5.5 QUADSPI data length register (QUADSPI\_DLR)

Address offset: 0x0010

Reset value: 0x0000 0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DL[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW        | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| DL[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW        | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 31:0 **DL[31:0]**: Data length

Number of data to be retrieved (value+1) in indirect and status-polling modes. A value no greater than 3 (indicating 4 bytes) should be used for status-polling mode.

All 1s in indirect mode means undefined length, where QUADSPI will continue until the end of memory, as defined by FSIZE.

0x0000\_0000: 1 byte is to be transferred

0x0000\_0001: 2 bytes are to be transferred

0x0000\_0002: 3 bytes are to be transferred

0x0000\_0003: 4 bytes are to be transferred

...

0xFFFF\_FFFD: 4,294,967,294 (4G-2) bytes are to be transferred

0xFFFF\_FFFE: 4,294,967,295 (4G-1) bytes are to be transferred

0xFFFF\_FFFF: undefined length -- all bytes until the end of Flash memory (as defined by FSIZE) are to be transferred. Continue reading indefinitely if FSIZE = 0x1F.

DL[0] is stuck at '1' in dual-flash mode (DFM = 1) even when '0' is written to this bit, thus assuring that each access transfers an even number of bytes.

This field has no effect when in memory-mapped mode (FMODE = 10).

This field can be written only when BUSY = 0.

## 27.5.6 QUADSPI communication configuration register (QUADSPI\_CCR)

Address offset: 0x0014

Reset value: 0x0000 0000

|             |      |             |      |             |    |            |    |                  |           |    |    |    |    |             |    |
|-------------|------|-------------|------|-------------|----|------------|----|------------------|-----------|----|----|----|----|-------------|----|
| 31          | 30   | 29          | 28   | 27          | 26 | 25         | 24 | 23               | 22        | 21 | 20 | 19 | 18 | 17          | 16 |
| DDRM        | DHHC | FRCM        | SIOO | FMODE[1:0]  |    | DMODE[1:0] |    | Res.             | DCYC[4:0] |    |    |    |    | ABSIZE[1:0] |    |
| rw          | rw   | rw          | rw   | rw          | rw | rw         | rw |                  | rw        | rw | rw | rw | rw | rw          | rw |
| 15          | 14   | 13          | 12   | 11          | 10 | 9          | 8  | 7                | 6         | 5  | 4  | 3  | 2  | 1           | 0  |
| ABMODE[1:0] |      | ADSIZE[1:0] |      | ADMODE[1:0] |    | IMODE[1:0] |    | INSTRUCTION[7:0] |           |    |    |    |    |             |    |
| rw          | rw   | rw          | rw   | rw          | rw | rw         | rw | rw               | rw        | rw | rw | rw | rw | rw          | rw |

Bit 31 **DDRM**: Double data rate mode

This bit sets the DDR mode for the address, alternate byte and data phase:

0: DDR Mode disabled

1: DDR Mode enabled

This field can be written only when BUSY = 0.

Bit 30 **DHHC**: DDR hold

Delay the data output by 1/4 of the QUADSPI output clock cycle in DDR mode:

0: Delay the data output using analog delay

1: Delay the data output by 1/4 of a QUADSPI output clock cycle.

This feature is only active in DDR mode.

This field can be written only when BUSY = 0.

*Note: PRESCALER > 0 is mandatory when DHHC = 1.*

Bit 29 **FRCM**: Free running clock mode

When this bit is set, the QUADSPI peripheral enters Free running clock mode regardless of the FMODE bits.

0: Normal mode

1: Free running clock mode

This bit can be written only when BUSY = 0.

Bit 28 **SIOO**: Send instruction only once mode

See [Section 27.3.13: Sending the instruction only once on page 1473](#). This bit has no effect when IMODE = 00.

0: Send instruction on every transaction

1: Send instruction only for the first command

This field can be written only when BUSY = 0.

Bits 27:26 **FMODE[1:0]**: Functional mode

This field defines the QUADSPI functional mode of operation.

00: Indirect write mode

01: Indirect read mode

10: Automatic polling mode

11: Memory-mapped mode

If DMAEN = 1 already, then the DMA controller for the corresponding channel must be disabled before changing the FMODE value.

This field can be written only when BUSY = 0.

Bits 25:24 **DMODE[1:0]**: Data mode

This field defines the data phase's mode of operation:

00: No data

01: Data on a single line

10: Data on two lines

11: Data on four lines

This field also determines the dummy phase mode of operation.

This field can be written only when BUSY = 0.

## Bit 23 Reserved, must be kept at reset value.

Bits 22:18 **DCYC[4:0]**: Number of dummy cycles

This field defines the duration of the dummy phase. In both SDR and DDR modes, it specifies a number of CLK cycles (0-31).

This field can be written only when BUSY = 0.

- Bits 17:16 **ABSIZE[1:0]**: Alternate bytes size  
This bit defines alternate bytes size:  
00: 8-bit alternate byte  
01: 16-bit alternate bytes  
10: 24-bit alternate bytes  
11: 32-bit alternate bytes  
This field can be written only when BUSY = 0.
- Bits 15:14 **ABMODE[1:0]**: Alternate bytes mode  
This field defines the alternate-bytes phase mode of operation:  
00: No alternate bytes  
01: Alternate bytes on a single line  
10: Alternate bytes on two lines  
11: Alternate bytes on four lines  
This field can be written only when BUSY = 0.
- Bits 13:12 **ADSIZE[1:0]**: Address size  
This bit defines address size:  
00: 8-bit address  
01: 16-bit address  
10: 24-bit address  
11: 32-bit address  
This field can be written only when BUSY = 0.
- Bits 11:10 **ADMODE[1:0]**: Address mode  
This field defines the address phase mode of operation:  
00: No address  
01: Address on a single line  
10: Address on two lines  
11: Address on four lines  
This field can be written only when BUSY = 0.
- Bits 9:8 **IMODE[1:0]**: Instruction mode  
This field defines the instruction phase mode of operation:  
00: No instruction  
01: Instruction on a single line  
10: Instruction on two lines  
11: Instruction on four lines  
This field can be written only when BUSY = 0.
- Bits 7:0 **INSTRUCTION[7:0]**: Instruction  
Instruction to be send to the external SPI device.  
This field can be written only when BUSY = 0.

### 27.5.7 QUADSPI address register (QUADSPI\_AR)

Address offset: 0x0018

Reset value: 0x0000 0000

|                |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31             | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ADDRESS[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw             | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15             | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ADDRESS[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw             | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **ADDRESS[31:0]**: Address

Address to be send to the external Flash memory

Writes to this field are ignored when BUSY = 1 or when FMODE = 11 (memory-mapped mode).

In dual flash mode, ADDRESS[0] is automatically stuck to '0' as the address should always be even

## 27.5.8 QUADSPI alternate bytes registers (QUADSPI\_ABR)

Address offset: 0x001C

Reset value: 0x0000 0000

|                  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31               | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ALTERNATE[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw               | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15               | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ALTERNATE[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw               | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **ALTERNATE[31:0]**: Alternate Bytes

Optional data to be send to the external SPI device right after the address.

This field can be written only when BUSY = 0.

## 27.5.9 QUADSPI data register (QUADSPI\_DR)

Address offset: 0x0020

Reset value: 0x0000 0000

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DATA[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| DATA[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DATA[31:0]**: Data

Data to be sent/received to/from the external SPI device.

In indirect write mode, data written to this register is stored on the FIFO before it is sent to the Flash memory during the data phase. If the FIFO is too full, a write operation is stalled until the FIFO has enough space to accept the amount of data being written.

In indirect read mode, reading this register gives (via the FIFO) the data which was received from the Flash memory. If the FIFO does not have as many bytes as requested by the read operation and if BUSY=1, the read operation is stalled until enough data is present or until the transfer is complete, whichever happens first.

In automatic polling mode, this register contains the last data read from the Flash memory (without masking).

Word, halfword, and byte accesses to this register are supported. In indirect write mode, a byte write adds 1 byte to the FIFO, a halfword write 2, and a word write 4. Similarly, in indirect read mode, a byte read removes 1 byte from the FIFO, a halfword read 2, and a word read 4. Accesses in indirect mode must be aligned to the bottom of this register: a byte read must read DATA[7:0] and a halfword read must read DATA[15:0].

### 27.5.10 QUADSPI polling status mask register (QUADSPI\_PSMKR)

Address offset: 0x0024

Reset value: 0x0000 0000

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| MASK[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| MASK[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **MASK[31:0]**: Status mask

Mask to be applied to the status bytes received in polling mode.

For bit n:

0: Bit n of the data received in automatic polling mode is masked and its value is not considered in the matching logic

1: Bit n of the data received in automatic polling mode is unmasked and its value is considered in the matching logic

This field can be written only when BUSY = 0.

### 27.5.11 QUADSPI polling status match register (QUADSPI\_PSMAR)

Address offset: 0x0028

Reset value: 0x0000 0000

|              |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| MATCH[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw           | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **MATCH[31:0]**: Status match

Value to be compared with the masked status register to get a match.

This field can be written only when BUSY = 0.

### 27.5.12 QUADSPI polling interval register (QUADSPI\_PIR)

Address offset: 0x002C

Reset value: 0x0000 0000

|                |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|----------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31             | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.           | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|                |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15             | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| INTERVAL[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| rw             | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **INTERVAL[15:0]**: Polling interval

Number of CLK cycles between to read during automatic polling phases.

This field can be written only when BUSY = 0.

### 27.5.13 QUADSPI low-power timeout register (QUADSPI\_LPTR)

Address offset: 0x0030

Reset value: 0x0000 0000

|               |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|---------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31            | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.          | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|               |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15            | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| TIMEOUT[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| rw            | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **TIMEOUT[15:0]**: Timeout period

After each access in memory-mapped mode, the QUADSPI prefetches the subsequent bytes and holds these bytes in the FIFO. This field indicates how many CLK cycles the QUADSPI waits after the FIFO becomes full until it raises nCS, putting the Flash memory in a lower-consumption state.  
This field can be written only when BUSY = 0.

### 27.5.14 QUADSPI HW configuration register (QUADSPI\_HWCFGR)

Address offset: 0x03F0

Reset value: 0x0000 B058

|               |      |      |      |               |      |      |      |              |      |      |      |               |      |      |      |

|               |      |      |      |               |      |      |      |              |      |      |      |               |      |      |      |
| 15            | 14   | 13   | 12   | 11            | 10   | 9    | 8    | 7            | 6    | 5    | 4    | 3             | 2    | 1    | 0    |
| IDLENGTH[3:0] |      |      |      | PRESCVAL[3:0] |      |      |      | FIFOPTR[3:0] |      |      |      | FIFOSIZE[3:0] |      |      |      |
| r             | r    | r    | r    | r             | r    | r    | r    | r            | r    | r    | r    | r             | r    | r    | r    |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IDLENGTH[3:0]**: ID length

This field returns the length of the AXI IDs.

Bits 11:8 **PRESCVAL[3:0]**: Prescaler reset value

This field returns the reset value of the prescaler.

Bits 7:4 **FIFOPTR[3:0]**: FIFO pointer size

This field returns the size in bit of the FIFO pointer.

Bits 3:0 **FIFOSIZE[3:0]**: FIFO size

This field returns the size of FIFO in words.

### 27.5.15 QUADSPI version register (QUADSPI\_VERR)

Address offset: 0x03F4

Reset value: 0x0000 0041

|      |      |      |      |      |      |      |      |             |      |      |      |             |      |      |      |
|------|------|------|------|------|------|------|------|-------------|------|------|------|-------------|------|------|------|

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7           | 6    | 5    | 4    | 3           | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MAJREV[3:0] |      |      |      | MINREV[3:0] |      |      |      |
|      |      |      |      |      |      |      |      | r           | r    | r    | r    | r           | r    | r    | r    |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: major revision

This field returns major revision of the QUADSPI.

Bits 3:0 **MINREV[3:0]**: minor revision

This field returns the minor revision of the QUADSPI.

### 27.5.16 QUADSPI identification register (QUADSPI\_IPIDR)

Address offset: 0x03F8

Reset value: 0x0014 0031

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ID[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ID[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **ID[31:0]**: identification code

This field returns the identification code of the QUADSPI.

### 27.5.17 QUADSPI size identification register (QUADSPI\_SIDR)

Address offset: 0x03FC

Reset value: 0xA3C5 DD01

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SID[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| SID[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **SID[31:0]**: size and ID

This field returns the size and ID of the QUADSPI.

## 27.5.18 QUADSPI register map

Table 177. QUADSPI register map and reset values

| Offset | Register name   | 31              | 30   | 29   | 28   | 27         | 26   | 25         | 24   | 23   | 22        | 21   | 20         | 19   | 18          | 17   | 16          | 15             | 14          | 13   | 12            | 11          | 10         | 9            | 8                | 7    | 6             | 5      | 4    | 3     | 2     | 1    | 0      |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 28 Delay block (DLYB)

### 28.1 Introduction

The delay block (DLYB) is used to generate an output clock which is dephased from the input clock. The phase of the output clock must be programmed by the user application. The output clock is then used to clock the data received by another peripheral such as an SDMMC or Quad-SPI interface.

The delay is voltage- and temperature-dependent, which may require the application to re-configure and recenter the output clock phase with the receive data.

### 28.2 DLYB main features

The delay block has the following features:

- Input clock frequency ranging from 25 to 208 MHz
- Up to 12 oversampling phases.

### 28.3 DLYB functional description

#### 28.3.1 DLYB diagram

The delay block includes of the following sub-blocks:

- Register interface block providing AHB access to the Delay Block registers.
- Delay line supporting the unit delays.
- Delay line length sampling
- Output clock selection multiplexer

Figure 180. DLYB block diagram

MSv37830V2

### 28.3.2 DLYB pins and internal signals

[Table 178](#) lists the DLYB internal signals.

**Table 178. DLYB internal input/output signals**

| Signal name | Signal type    | Description                          |
|-------------|----------------|--------------------------------------|
| dlyb_hclk   | Digital input  | Delay block register interface clock |
| dlyb_in_ck  | Digital input  | Delay block input clock              |
| dlyb_out_ck | Digital output | Delay block output clock             |

### 28.3.3 General description

The delay block is enabled by setting the DEN bit in the DLYB\_CR register (see [Section 28.4.1: DLYB control register \(DLYB\\_CR\)](#)). The length sampler is enabled through the SEN bit in DLYB\_CR register.

When the delay block is enabled, the delay added by a unit delay is defined by the UNIT bits in DLYB\_CFGR register (see [Section 28.4.2: DLYB configuration register \(DLYB\\_CFGR\)](#)). Note that the UNIT bits can be programmed only when the output clock is disabled (SEN = '1').

When the delay block is enabled, the output clock phase is selected through the SEL bit in DLYB\_CFGR register. Note that SEL can be programmed only when the output clock is disabled (SEN = '1').

Before dephasing the output clock, the delay line length shall be configured to one input clock period. The delay line length can be configured by enabling the length sampler through the SEN bit, which gives access to the delay line length (LNG bits) and Length valid flag (LNGF) in DLYB\_CFGR.

Once the delay line length has been configured, a dephased output clock can be selected by the output clock multiplexer. This is done through SEL bits. The output clock is only available on the selected phase when SEN is set to '0'.

[Table 179](#) gives a summary of the delay block control.

**Table 179. Delay block control**

| DEN | SEN | UNIT                      | SEL                               | LNG        | LNGF        | Output clock               |
|-----|-----|---------------------------|-----------------------------------|------------|-------------|----------------------------|
| 0   | 0   | Don't care                | Don't care                        | Don't care | Don't care  | Enabled (= Input clock)    |
| x   | 1   | Unit delay                | Output clock phase                | Length     | Length flag | Disabled                   |
| 1   | 0   | Unit delay <sup>(1)</sup> | Output clock phase <sup>(2)</sup> | Don't care | Don't care  | Enabled (= selected phase) |

1. The unit delay can only be changed when SEN = '1'.

2. The output clock phase can only be changed when SEN = '1'.

### 28.3.4 Delay line length configuration procedure

LNG bits are used to determine the delay line length with respect to the input clock period. The length shall be configured so that one full input clock period is covered by the delay line length.

To configure the delay line length to one period of the Input clock, follow the sequence below:

1. Enable the delay block by setting DEN bit to '1'.
2. Enable the length sampling by setting SEN bit to '1'.
3. Enable all delay cells by setting SEL bits to 12.
4. For UNIT = 0 to 127 (this step must be repeated until the delay line length is configured):
  - a) Update the UNIT value and wait till the length flag LNGF is set to '1'.
  - b) Read LNG bits.If (LNG[10:0] > 0) and (LNG[11] or LNG[10] = 0), the delay line length is configured to one input clock period.
5. Determine how many unit delays (N) span one input clock period.
  - For N = 10 to 0:
    - If LNG[N] = '1', the number of unit delays spanning the input clock period = N.
6. Disable the length sampling by clearing SEN to '0'.

### 28.3.5 Output clock phase configuration procedure

When the delay line length is configured to one input clock period, the output clock phase can be selected between the unit delays spanning one Input clock period.

Follow the steps below to select the output clock phase:

1. Disable the output clock and enable the access to the phase selection SEL bits by setting SEN bit to '1'.
2. Program SEL bits with the desired output clock phase value.
3. Enable the output clock on the selected phase by clearing SEN to '0'.

## 28.4 DLYB registers

All registers can be accessed in word, half-word and byte access.

### 28.4.1 DLYB control register (DLYB\_CR)

Address offset: 0x000

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SEN  | DEN  |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      | rw   | rw   |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **SEN**: Sampler length enable bit

0: Sampler length and register access to UNIT and SEL disabled, output clock enabled.

1: Sampler length and register access to UNIT and SEL enabled, output clock disabled.

Bit 0 **DEN**: Delay block enable bit

0: Delay block disabled.

1: Delay block enabled.

### 28.4.2 DLYB configuration register (DLYB\_CFGR)

Address offset: 0x004

Reset value: 0x0000 0000

|      |           |      |      |           |    |    |    |      |      |      |      |          |    |    |    |
|------|-----------|------|------|-----------|----|----|----|------|------|------|------|----------|----|----|----|
| 31   | 30        | 29   | 28   | 27        | 26 | 25 | 24 | 23   | 22   | 21   | 20   | 19       | 18 | 17 | 16 |
| LNGF | Res.      | Res. | Res. | LNG[11:0] |    |    |    |      |      |      |      |          |    |    |    |
| r    |           |      |      | r         | r  | r  | r  | r    | r    | r    | r    | r        | r  | r  | r  |
| 15   | 14        | 13   | 12   | 11        | 10 | 9  | 8  | 7    | 6    | 5    | 4    | 3        | 2  | 1  | 0  |
| Res. | UNIT[6:0] |      |      |           |    |    |    | Res. | Res. | Res. | Res. | SEL[3:0] |    |    |    |
|      | rw        | rw   | rw   | rw        | rw | rw | rw |      |      |      |      | rw       | rw | rw | rw |

Bit 31 **LNGF**: Length valid flag

This flag indicates when the delay line length value contained in LNG bits is valid after UNIT bits changed.

0: Length value in LNG is not valid.

1: Length value in LNG is valid.

Bits 30:28 Reserved, must be kept at reset value.

Bits 27:16 **LNG[11:0]**: Delay line length value

These bits reflect the 12 unit delay values sampled at the rising edge of the input clock.

The value is only valid when LNGF = '1'.

Bit 15 Reserved, must be kept at reset value.

Bits 14:8 **UNIT[6:0]**: Delay Defines the delay of a Unit delay cell.

These bits can only be written when SEN = '1'.

Unit delay = Initial delay + UNIT x delay step

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **SEL[3:0]**: Select the phase for the Output clock.

These bits can only be written when SEN = '1'.

Output clock phase = Input clock + SEL x Unit delay

### 28.4.3 DLYB register map

Table 180. DLYB register map and reset values

| Offset | Register name | 31   | 30  | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19  | 18  | 17  | 16   | 15  | 14  | 13  | 12  | 11  | 10  | 9   | 8   | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 29 Analog-to-digital converters (ADC)

### 29.1 Introduction

This section describes the ADC implementation:

- ADC1 and ADC2 are tightly coupled and can operate in dual mode (ADC1 is master).

Each ADC consists of a 16-bit successive approximation analog-to-digital converter.

Each ADC has up to 20 multiplexed channels. A/D conversion of the various channels can be performed in single, continuous, scan or discontinuous mode. The result of the ADC is stored in a left-aligned or right-aligned 32-bit data register.

The ADCs are mapped on the AHB bus to allow fast data handling.

The analog watchdog features allow the application to detect if the input voltage goes outside the user-defined high or low thresholds.

A built-in hardware oversampler allows to improve analog performances while off-loading the related computational burden from the CPU.

An efficient low-power mode is implemented to allow very low consumption at low frequency.

## 29.2 ADC main features

- High-performance features
  - Up to 2x ADCs which can operate in dual mode
  - 16, 14, 12, 10 or 8-bit configurable resolution
  - ADC conversion time is independent from the AHB bus clock frequency
  - Faster conversion time by lowering resolution
  - Can manage Single-ended or differential inputs (programmable per channels)
  - AHB slave bus interface to allow fast data handling
  - Self-calibration (both offset and linearity)
  - Channel-wise programmable sampling time
  - Up to four injected channels (analog inputs assignment to regular or injected channels is fully configurable)
  - Hardware assistant to prepare the context of the injected channels to allow fast context switching
  - Data alignment with in-built data coherency
  - Data can be managed by GP-DMA for regular channel conversions with FIFO
  - Data can be routed to DFSDM for post processing
  - 4 dedicated data registers for the injected channels
- Oversampler
  - 32-bit data register
  - Oversampling ratio adjustable from 2 to 1024x
  - Programmable data right and left shift
- Low-power features
  - Speed adaptive low-power mode to reduce ADC consumption when operating at low frequency
  - Allows slow bus frequency application while keeping optimum ADC performance
  - Provides automatic control to avoid ADC overrun in low AHB bus clock frequency application (auto-delayed mode)
- Each ADC features an external analog input channel
  - Up to 6 fast channels from dedicated GPIO pads
  - Up to 14 slow channels from dedicated GPIO pads
- In addition, there are 6 internal dedicated channels
  - Internal reference voltage ( $V_{REFINT}$ )
  - Internal temperature sensor ( $V_{SENSE}$ )
  - $V_{BAT}$  monitoring channel ( $V_{BAT}/4$ )
  - Connection to DAC internal channels
  - $V_{DDCORE}$  monitoring channel
- Start-of-conversion can be initiated:
  - by software for both regular and injected conversions
  - by hardware triggers with configurable polarity (internal timers events or GPIO input events) for both regular and injected conversions
- Conversion modes

- Each ADC can convert a single channel or can scan a sequence of channels
- Single mode converts selected inputs once per trigger
- Continuous mode converts selected inputs continuously
- Discontinuous mode
- Dual ADC mode
- Interrupt generation at ADC ready, the end of sampling, the end of conversion (regular or injected), end of sequence conversion (regular or injected), analog watchdog 1, 2 or 3 or overrun events
- 3 analog watchdogs per ADC
- ADC input range:  $V_{REF-} \leq V_{IN} \leq V_{REF+}$

*Figure 181* shows the block diagram of one ADC.

## 29.3 ADC implementation

**Table 181. ADC features**

| ADC modes/features                            | ADC1                 | ADC2 |
|-----------------------------------------------|----------------------|------|
| Dual mode                                     | X (coupled together) |      |
| DFSDM interface                               | X                    | X    |
| Extended sample time option (SMPPLUS control) | -                    | -    |
| LDO voltage regulator status                  | X                    | X    |

## 29.4 ADC functional description

### 29.4.1 ADC block diagram

Figure 181 shows the ADC block diagram and Table 182 gives the ADC pin description.

Figure 181. ADC block diagram

## 29.4.2 ADC pins and internal signals

**Table 182. ADC input/output pins**

| Name      | Signal type                      | Description                                                                                                                 |
|-----------|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| VREF+     | Input, analog reference positive | The higher/positive reference voltage for the ADC.                                                                          |
| VDDA      | Input, analog supply             | Analog power supply equal $V_{DDA}$ :<br>$1.62\text{ V} \leq V_{DDA} \leq 3.6\text{ V}$                                     |
| VREF-     | Input, analog reference negative | The lower/negative reference voltage for the ADC.                                                                           |
| VSSA      | Input, analog supply ground      | Ground for analog power supply equal to $V_{SS}$                                                                            |
| ADCx_INPy | External analog inputs           | Up to 20 analog input channels (x = ADC number= 1 to 2):<br>– ADCx_INP[0:5] fast channels<br>– ADCx_INP[6:19] slow channels |
| ADCx_INNy |                                  | Up to 20 analog input channels (x = ADC number= 1 to 2):<br>– ADCx_INN[0:5] fast channels<br>– ADCx_INN[6:19] slow channels |

**Table 183. ADC internal input/output signals**

| Internal signal name             | Signal type   | Description                                                                                                                                                           |
|----------------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $V_{INP}[y]$                     | Analog inputs | Positive input analog channels for each ADC, connected either to ADCx_INPi external channels or to internal channels.                                                 |
| $V_{INN}[y]$                     | Analog inputs | Negative input analog channels for each ADC, connected either to VREF- or to ADCx_INNi external channels                                                              |
| adc_ext_trgy                     | Inputs        | Up to 21 external trigger inputs for the regular conversions (can be connected to on-chip timers). These inputs are shared between the ADC master and the ADC slave.  |
| adc_jext_trgy                    | Inputs        | Up to 21 external trigger inputs for the injected conversions (can be connected to on-chip timers). These inputs are shared between the ADC master and the ADC slave. |
| adc_awd1<br>adc_awd2<br>adc_awd3 | Outputs       | Internal analog watchdog output signal connected to on-chip timers. (x = Analog watchdog number 1,2,3)                                                                |
| adc_it                           | Output        | ADC interrupt                                                                                                                                                         |
| adc_hclk                         | Input         | AHB clock                                                                                                                                                             |
| adc_ker_ck_input                 | Input         | ADC kernel clock input from RCC                                                                                                                                       |

### 29.4.3 ADC clocks

#### Dual clock domain architecture

The dual clock-domain architecture means that the ADC clock is independent from the AHB bus clock.

The input clock is the same for the all ADCs and can be selected between two different clock sources (see [Figure 182: ADC clock scheme](#)):

1. The ADC clock can be a specific clock source, named `adc_ker_ck` which is independent and asynchronous with the AHB clock.  
It can be configured in the RCC (refer to RCC Section for more information on how to generate the ADC clock (`adc_ker_ck`) dedicated clock).  
To select this scheme, `CKMODE[1:0]` bits of the `ADCx_CCR` register must be reset.
2. The ADC clock can be derived from the AHB clock of the ADC bus interface, divided by a programmable factor (1, 2 or 4). In this mode, a programmable divider factor can be selected (/1, 2 or 4 according to bits `CKMODE[1:0]`).  
To select this scheme, `CKMODE[1:0]` bits of the `ADCx_CCR` register must be different from "00".

**Note:** For option 2), a prescaling factor of 1 (`CKMODE[1:0]=01`) can be used only if the AHB prescaler is set to 1 (`HPRE[3:0] = 0XXX` in `RCC_CFGR` register, corresponding to a clock duty cycle of 50 %).

Option 1) has the advantage of reaching the maximum ADC clock frequency whatever the AHB clock scheme selected. The ADC clock can eventually be divided by the following ratio: 1, 2, 4, 6, 8, 10, 12, 16, 32, 64, 128, 256; using the prescaler configured with bits `PRESC[3:0]` in the `ADCx_CCR` register.

Option 2) has the advantage of bypassing the clock domain resynchronizations. This can be useful when the ADC is triggered by a timer and if the application requires that the ADC is precisely triggered without any uncertainty (otherwise, an uncertainty of the trigger instant is added by the resynchronizations between the two clock domains).

The clock configured through `CKMODE[1:0]` bits must be compliant with the operating frequency specified in the product datasheet.

Figure 182. ADC clock scheme

1. Refer to the RCC section to see how `adc_hclk` and `adc_ker_ck` can be generated.

### Clock ratio constraint between ADC clock and AHB clock

There are generally no constraints to be respected for the ratio between the ADC clock and the AHB clock except if some injected channels are programmed. In this case, it is mandatory to respect the following ratio:

- $F_{\text{adc\_hclk}} \geq F_{\text{adc\_ker\_ck}} / 4$  if the resolution of all channels are 16-bit, 14-bit, 12-bit or 10-bit
- $F_{\text{adc\_hclk}} \geq F_{\text{adc\_ker\_ck}} / 3$  if there are some channels with resolutions equal to 8-bit (and none with lower resolutions)

### BOOST control

The ADC Boost mode can be controlled through the `BOOST` in the `ADC_CR` register.

This must be set according to the ADC clock setting. Refer to the `ADC_CR` register description.

### 29.4.4 ADC1/2 connectivity

ADC1 and ADC2 are tightly coupled and share some external channels as described in the following figures.

Figure 183. ADC1 connectivity

1. ADCx\_INNy signal can only be used when the corresponding ADC input channel is configured as differential mode.

Figure 184. ADC2 connectivity

1. ADCx\_INNy signal can only be used when the corresponding ADC input channel is configured as differential mode.

### 29.4.5 Slave AHB interface

The ADCs implement an AHB slave port for control/status register and data access. The features of the AHB interface are listed below:

- Word (32-bit) accesses
- Single cycle response
- Response to all read/write accesses to the registers with zero wait states.

The AHB slave interface does not support split/retry requests, and never generates AHB errors.

### 29.4.6 ADC deep-power-down mode (DEEPPWD) and ADC voltage regulator (ADVREGEN)

By default, the ADC is in deep-power-down mode where its supply is internally switched off to reduce the leakage currents (the reset state of bit DEEPPWD is 1 in the ADC\_CR register).

To start ADC operations, it is first needed to exit deep-power-down mode by clearing bit DEEPPWD=0.

Then, it is mandatory to enable the ADC internal voltage regulator by setting the bit ADVREGEN=1 into ADC\_CR register. The software must wait for the startup time of the ADC voltage regulator ( $T_{\text{ADCVREG\_STUP}}$ ) before launching a calibration or enabling the ADC. This delay must be implemented by software.

The LDO status can be verified by checking the LDORDY bit in ADC\_ISR register (refer to [Section 29.3: ADC implementation](#) for the availability of the LDO regulator status).

For the startup time of the ADC voltage regulator, refer to device datasheet for  $T_{\text{ADCVREG\_STUP}}$  parameter.

After ADC operations are complete, the ADC can be disabled (ADEN=0). It is possible to save power by also disabling the ADC voltage regulator. This is done by writing bit ADVREGEN=0.

Then, to save more power by reducing the leakage currents, it is also possible to re-enter in ADC deep-power-down mode by setting bit DEEPPWD=1 into ADC\_CR register. This is particularly interesting before entering Stop mode.

*Note: Writing DEEPPWD=1 automatically disables the ADC voltage regulator and bit ADVREGEN is automatically cleared.*

*Note: When the internal voltage regulator is disabled (ADVREGEN=0), the internal analog calibration is kept.*

In ADC deep-power-down mode (DEEPPWD=1), the internal analog calibration is lost and it is necessary to either relaunch a calibration or apply again the calibration factor which was previously saved (refer to [Section 29.4.8: Calibration \(ADCAL, ADCALDIF, ADCALLIN, ADC\\_CALFACT\)](#)).

### 29.4.7 Single-ended and differential input channels

Channels can be configured to be either single-ended input or differential input by writing into bits DIFSEL[19:0] in the ADC\_DIFSEL register. This configuration must be written while the ADC is disabled (ADEN=0).

In single-ended input mode, the analog voltage to be converted for channel “i” is the difference between the external voltage  $V_{INP[i]}$  (positive input) and  $V_{REF-}$  (negative input).

In differential input mode, the analog voltage to be converted for channel “i” is the difference between the external voltage  $V_{INP[i]}$  (positive input) and  $V_{INN[i]}$  (negative input).

The output data for the differential mode is an unsigned data. When  $V_{INP[i]}$  equals  $V_{REF-}$ ,  $V_{INN[i]}$  equals  $V_{REF+}$  and the output data is 0x0000 (16-bit resolution mode). When  $V_{INP[i]}$  equals  $V_{REF+}$ ,  $V_{INN[i]}$  equals  $V_{REF-}$  and the output data is 0xFFFF.

$$\text{Converted value} = \frac{\text{ADC\_Full\_Scale}}{2} \times \left[ 1 + \frac{V_{INP} - V_{INN}}{V_{REF+}} \right]$$

When ADC is configured as differential mode, both input should be biased at  $V_{REF+} / 2$  voltage.

The input signal are supposed to be differential (common mode voltage should be fixed).

For a complete description of how the input channels are connected for each ADC, refer to [Section 29.4.4: ADC1/2 connectivity](#).

**Caution:** When configuring the channel “i” in differential input mode, its negative input voltage is connected to  $V_{INN[i]}$ . As a consequence, channel “i+n”, which is connected to  $V_{INN[i]}$ , should not be converted at same time by different ADCs. Some channels are shared between ADC1/ADC2: this can make the channel on the other ADC unusable.

### 29.4.8 Calibration (ADCAL, ADCALDIF, ADCALLIN, ADC\_CALFACT)

Each ADC provides an automatic calibration procedure which drives all the calibration sequence including the power-on/off sequence of the ADC. During the procedure, the ADC calculates a calibration factor which is 11-bits of offset or 160-bits of linearity and which is applied internally to the ADC until the next ADC power-off. During the calibration procedure, the application must not use the ADC and must wait until calibration is complete.

The calibration is preliminary to any ADC operation. It removes the systematic errors which may vary from chip to chip and allows to compensate offset and linearity deviation.

The calibration factor for the offset to be applied for single-ended input conversions is different from the factor to be applied for differential input conversions:

- Write ADCALDIF=0 before launching a calibration which will be applied for single-ended input conversions.
- Write ADCALDIF=1 before launching a calibration which will be applied for differential input conversions.

The linearity correction must be done once only, regardless of single / differential configuration.

- Write ADCALLIN=1 before launching a calibration which will run the linearity calibration same time as the offset calibration.
- Write ADCALLIN=0 before launching a calibration which will not run the linearity calibration but only the offset calibration.

The calibration is then initiated by software by setting bit ADCAL=1. It can be initiated only when the ADC is disabled (when ADEN=0). ADCAL bit stays at 1 during all the calibration sequence. It is then cleared by hardware as soon the calibration completes. At this time, the associated calibration factor is stored internally in the analog ADC and also in the bits CALFACT\_S[10:0] or CALFACT\_D[10:0] of ADC\_CALFACT register (depending on single-ended or differential input calibration). The 160-bit linearity calibration factor can be accessed using the ADC\_CALFACT2 register with ADEN set to 1.

The internal analog calibration is kept if the ADC is disabled (ADEN=0). However, if the ADC is disabled for extended periods, it is recommended that a new offset calibration cycle is run before enabling again the ADC.

The internal analog calibration is lost each time the power of the ADC is removed (example, when the product enters in STANDBY or VBAT mode). In this case, to avoid spending time recalibrating the ADC, it is possible to re-write the calibration factor into the ADC\_CALFACT and ADC\_CALFACT2 register without recalibrating, supposing that the software has previously saved the calibration factor delivered during the previous calibration.

The calibration factor can be written if the ADC is enabled but not converting (ADEN=1 and ADSTART=0 and JADSTART=0). Then, at the next start of conversion, the calibration factor will automatically be injected into the analog ADC. This loading is transparent and does not add any cycle latency to the start of the conversion. It is recommended to recalibrate when  $V_{REF+}$  voltage changed more than 10%.

Refer to the datasheets for the clock cycle requirement for both linear and offset calibration.

### Software procedure to calibrate the ADC

1. Ensure DEEPPWD=0, ADVREGEN=1 and verify that the ADC voltage regulator startup time has elapsed by checking the LDORDY bit in ADC\_ISR (refer to [Section 29.3: ADC implementation](#) for the availability of the LDO regulator status).
2. Ensure that ADEN=0.
3. Select the input mode for this calibration by setting ADCALDIF=0 (Single-ended input) or ADCALDIF=1 (Differential input). Select if Linearity calibration enable or not by ADCALLIN=1(enabled) or ADCALLIN=0(disabled).
4. Set ADCAL=1.
5. Wait until ADCAL=0.
6. The offset calibration factor can be read from ADC\_CALFACT register.
7. The linearity calibration factor can be read from ADC\_CALFACT2 register, following the procedure described in [Section : Linearity calibration reading procedure](#) (ADEN must be set to 1 prior to accessing ADC\_CALFACT2 register).

Figure 185. ADC calibration

Software procedure to re-inject a calibration factor into the ADC

1. Ensure ADEN=1 and ADSTART=0 and JADSTART=0 (ADC enabled and no conversion is ongoing).
2. Write CALFACT\_S and CALFACT\_D with the new offset calibration factors.
3. Write LINCALFACT bits with the new linearity calibration factors, following the procedure described in [Section : Linearity calibration writing procedure](#).
4. When a conversion is launched, the calibration factor will be injected into the analog ADC only if the internal analog calibration factor differs from the one stored in bits CALFACT\_S for single-ended input channel or bits CALFACT\_D for differential input channel.

Figure 186. Updating the ADC offset calibration factor

### Calibrating single-ended and differential analog inputs with a single ADC

If the ADC is supposed to convert both differential and single-ended inputs, two calibrations must be performed, one with ADCALDIF=0 and one with ADCALDIF=1. The procedure is the following:

1. Disable the ADC.
2. Calibrate the ADC in single-ended input mode (with ADCALDIF=0) and Linearity calibration enable (with ADCALLIN=1). This updates the registers CALFACT\_S[10:0] and LINCALFACT[159:0].
3. Calibrate the ADC in Differential input modes (with ADCALDIF=1) and Linearity calibration disable (with ADCALLIN=0). This updates the register CALFACT\_D[10:0].
4. Enable the ADC, configure the channels and launch the conversions. Each time there is a switch from a single-ended to a differential inputs channel (and vice-versa), the calibration will automatically be injected into the analog ADC.

**Figure 187. Mixing single-ended and differential channels**

### Linearity calibration reading procedure

Once the calibration is done (ADCAL bit cleared by hardware) with ADCALLIN=1, the 160-bit linearity correction factor can be read using the ADC\_CALFACT2 30-bit registers (6 read accesses are necessary).

The six LINCALRDYW1..6 control/status bits in ADC\_CR are set when the calibration is complete. When ADEN is set to 1, clearing one of these bits launches the transfer of part of the linearity factor into the LINCALFACT[29:0] of the ADC\_CALFACT2 register. The bit will be reset by hardware when the ADC\_CALFACT2 register can be read (software must poll the bit until it is cleared). The complete procedure is as following:

1. Ensure DEEPPWD=0, ADVREGEN=1 and that the ADC voltage regulator startup time has elapsed by checking the LDORDY bit in ADC\_ISR (refer to [Section 29.3: ADC implementation](#) for the availability of the LDO regulator status).
2. Set ADEN = 1 and wait until ADRDY=1.
3. Clear LINCALRDYW6 bit (Linearity calibration ready Word 6).
4. Poll LINCALRDYW6 bit until returned value is zero, indicating linearity correction bits[159:150] are available in ADC\_CALFACT2[29:0].
5. Read ADC\_CALFACT2[29:0].
6. Clear LINCALRDYW5 bit.
7. Poll LINCALRDYW5 bit until returned value is zero, indicating linearity correction bits[149:120] are available in ADC\_CALFACT2[29:0].
8. Read ADC\_CALFACT2[29:0].
9. Clear LINCALRDYW4 bit.
10. Poll LINCALRDYW4 bit until returned value is zero, indicating linearity correction bits[119:90] are available in ADC\_CALFACT2[29:0].
11. Read ADC\_CALFACT2[29:0].
12. Clear LINCALRDYW3 bit.
13. Poll LINCALRDYW3 bit until returned value is zero, indicating linearity correction bits[89:60] are available in ADC\_CALFACT2[29:0].
14. Read ADC\_CALFACT2[29:0].
15. Clear LINCALRDYW2 bit.
16. Poll LINCALRDYW2 bit until returned value is zero, indicating linearity correction bits[59:30] are available in ADC\_CALFACT2[29:0].
17. Read ADC\_CALFACT2[29:0].
18. Clear LINCALRDYW1 bit.
19. Poll LINCALRDYW1 bit until returned value is zero, indicating linearity correction bits[29:0] are available in ADC\_CALFACT2[29:0].
20. Read ADC\_CALFACT2[29:0].

**Note:** *The software is allowed to toggle a single LINCALRDYWx bit at once (other bits left unchanged), otherwise causing unexpected behavior.*

*The software can access the linearity calibration factor by writing LINCALRDYW1..6 bits only when ADEN=1 and ADSTART=0 and JADSTART=0 (ADC enabled and no conversion is ongoing).*

### Linearity calibration writing procedure

The six LINCALRDYW1..6 control/status bits in ADC\_CR are reset when the calibration has not yet been done or a new linearity calibration factor have been rewritten. It is possible to force directly a linearity calibration factor or re-inject it using the following procedure:

1. Ensure DEEPPWD=0, ADVREGEN=1 and that ADC voltage regulator startup time has elapsed by checking the LDORDY bit in ADC\_ISR (refer to [Section 29.3: ADC implementation](#) for the availability of the LDO regulator status).
2. Set ADEN = 1 and wait until ADRDY=1.
3. Write ADC\_CALFACT2[9:0] with previously saved linearity correction factor bits[159:150].
4. Set LINCALRDYW6 bit.
5. Poll LINCALRDYW6 bit until returned value is one, indicating linearity correction bits[159:150] have been effectively written.
6. Write ADC\_CALFACT2[29:0] with previously saved linearity correction factor bits[149:120].
7. Set LINCALRDYW5 bit.
8. Poll LINCALRDYW5 bit until returned value is one, indicating linearity correction bits[149:120] have been effectively written.
9. Write ADC\_CALFACT2[29:0] with previously saved linearity correction factor bits[119:90].
10. Set LINCALRDYW4 bit.
11. Poll LINCALRDYW4 bit until returned value is one, indicating linearity correction bits[119:90] have been effectively written.
12. Write ADC\_CALFACT2[29:0] with previously saved linearity correction factor bits[89:60].
13. Set LINCALRDYW3 bit.
14. Poll LINCALRDYW3 bit until returned value is one, indicating linearity correction bits[89:60] have been effectively written.
15. Write ADC\_CALFACT2[29:0] with previously saved linearity correction factor bits[59:30].
16. Set LINCALRDYW2 bit.
17. Poll LINCALRDYW2 bit until returned value is one, indicating linearity correction bits[59:30] have been effectively written.
18. Write ADC\_CALFACT2[29:0] with previously saved linearity correction factor bits[29:0].
19. Set LINCALRDYW1 bit.
20. Poll LINCALRDYW1 bit until returned value is one, indicating linearity correction bits[29:0] have been effectively written.

**Note:** *The software is allowed to toggle a single LINCALRDYWx bit at once (other bits left unchanged), otherwise causing unexpected behavior.*

*The software is allowed to update the linearity calibration factor by writing LINCALRDYW1..6 bits only when ADEN=1 and ADSTART=0 and JADSTART=0 (ADC enabled and no conversion is ongoing).*

### 29.4.9 ADC on-off control (ADEN, ADDIS, ADRDY)

First of all, follow the procedure explained in [Section 29.4.6: ADC deep-power-down mode \(DEEPPWD\) and ADC voltage regulator \(ADVREGEN\)](#).

Once DEEPPWD = 0 and ADVREGEN = 1, the ADC can be enabled and the ADC needs a stabilization time of  $t_{STAB}$  before it starts converting accurately, as shown in [Figure 188](#). Two control bits enable or disable the ADC:

- ADEN=1 enables the ADC. The flag ADRDY will be set once the ADC is ready for operation.
- ADDIS=1 disables the ADC. ADEN and ADDIS are then automatically cleared by hardware as soon as the analog ADC is effectively disabled.

Regular conversion can then start either by setting ADSTART=1 (refer to [Section 29.4.19: Conversion on external trigger and trigger polarity \(EXTSEL, EXTEN, JEXTSEL, JEXTEN\)](#)) or when an external trigger event occurs, if triggers are enabled.

Injected conversions start by setting JADSTART=1 or when an external injected trigger event occurs, if injected triggers are enabled.

#### Software procedure to enable the ADC

1. Clear the ADRDY bit in the ADC\_ISR register by writing '1'.
2. Set ADEN=1.
3. Wait until ADRDY=1 (ADRDY is set after the ADC startup time). This can be done using the associated interrupt (setting ADRDYIE=1).
4. Clear the ADRDY bit in the ADC\_ISR register by writing '1' (optional).

#### Software procedure to disable the ADC

1. Check that both ADSTART=0 and JADSTART=0 to ensure that no conversion is ongoing. If required, stop any regular and injected conversion ongoing by setting ADSTP=1 and JADSTP=1 and then wait until ADSTP=0 and JADSTP=0.
2. Set ADDIS=1.
3. If required by the application, wait until ADEN=0, until the analog ADC is effectively disabled (ADDIS will automatically be reset once ADEN=0).

**Figure 188. Enabling / Disabling the ADC**

### 29.4.10 Constraints when writing the ADC control bits

The software can write the RCC control bits to configure and enable the ADC clock (refer to RCC Section), the control bits DIFSEL in the ADC\_DIFSEL register, ADC\_CCR register and the control bits ADCAL and ADEN in the ADC\_CR register, only if the ADC is disabled (ADEN must be equal to 0).

The software is then allowed to write the control bits ADSTART, JADSTART and ADDIS of the ADC\_CR register only if the ADC is enabled and there is no pending request to disable the ADC (ADEN must be equal to 1 and ADDIS to 0).

For all the other control bits of the ADC\_CFGR, ADC\_SMPRy, ADC\_TRy, ADC\_SQRy, ADC\_JDRy, ADC\_OFRy and ADC\_IER registers:

- For control bits related to configuration of regular conversions, the software is allowed to write them only if the ADC is enabled (ADEN=1) and if there is no regular conversion ongoing (ADSTART must be equal to 0).
- For control bits related to configuration of injected conversions, the software is allowed to write them only if the ADC is enabled (ADEN=1) and if there is no injected conversion ongoing (JADSTART must be equal to 0).

The software can write ADSTP or JADSTP control bits in the ADC\_CR register only if the ADC is enabled and eventually converting and if there is no pending request to disable the ADC (ADSTART or JADSTART must be equal to 1 and ADDIS to 0).

The software can write the register ADC\_JSQR at any time, when the ADC is enabled (ADEN=1).

The software is allowed to write the ADC\_JSQR register only when JADSTART is cleared to 0 (no injected conversion is ongoing) unless the context queue is enabled (JQDIS=0 in ADC\_CFGR register).

*Note: There is no hardware protection to prevent these forbidden write accesses and ADC behavior may become in an unknown state. To recover from this situation, the ADC must be disabled (clear ADEN=0 as well as all the bits of ADC\_CR register).*

### 29.4.11 Channel selection (SQRx, JSQRx)

There are up to 20 multiplexed channels per ADC:

- 6 fast analog inputs coming from Analog PADs and GPIO pads (ADCx\_INP/INN[0..5])
- Up to 14 slow analog inputs coming from GPIO pads (ADCx\_INP/INN[6..19]).
- The ADCs are connected to 6 internal analog inputs:
  - the internal temperature sensor ( $V_{\text{SENSE}}$ )
  - the internal reference voltage ( $V_{\text{REFINT}}$ )
  - the  $V_{\text{DDCORE}}$  monitoring channel
  - the  $V_{\text{BAT}}$  monitoring channel ( $V_{\text{BAT}}/4$ )
  - DAC internal channels

Refer to *Table ADC interconnection* in [Section 29.4.2: ADC pins and internal signals](#) for the connection of the above internal analog inputs to external ADC pins or internal signals.

It is possible to organize the conversions in two groups: regular and injected. A group consists of a sequence of conversions that can be done on any channel and in any order. For instance, it is possible to implement the conversion sequence in the following order:

ADCx\_INP/INN3, ADCx\_INP/INN8, ADCx\_INP/INN2, ADCx\_INP/INN2, ADCx\_INP/INN0, ADCx\_INP/INN2, ADCx\_INP/INN2, ADCx\_INP/INN15.

- A **regular group** is composed of up to 16 conversions. The regular channels and their order in the conversion sequence must be selected in the ADC\_SQRy registers. The total number of conversions in the regular group must be written in the L[3:0] bits in the ADC\_SQR1 register.
- An **injected group** is composed of up to 4 conversions. The injected channels and their order in the conversion sequence must be selected in the ADC\_JSQR register. The total number of conversions in the injected group must be written in the L[1:0] bits in the ADC\_JSQR register.

ADC\_SQRy registers must not be modified while regular conversions can occur. For this, the ADC regular conversions must be first stopped by writing ADSTP=1 (refer to [Section 29.4.18: Stopping an ongoing conversion \(ADSTP, JADSTP\)](#)).

The software is allowed to modify on-the-fly the ADC\_JSQR register when JADSTART is set to 1 only when the context queue is enabled (JQDIS=0 in ADC\_CFGR register).

### Temperature sensor, $V_{REFINT}$ , $V_{DDCORE}$ and $V_{BAT}$ internal channels

The internal reference voltage ( $V_{REFINT}$ ), the temperature sensor ( $V_{SENSE}$ ),  $V_{DDCORE}$  monitoring channel, and the  $V_{BAT}$  channel are connected to ADC internal channels. Refer to [Table ADC interconnection](#) in [Section 29.4.2: ADC pins and internal signals](#) for details.

*Note:* To convert one of the internal analog channels, enable the corresponding analog sources by programming VREFEN, TSEN and VBATEN bits in the ADC\_CCR registers, or VDDCOREEN bit in the ADC2\_OR register.

### 29.4.12 Channel preselection register (ADC\_PCSEL)

For each channel selected through SQRx or JSQRx, the corresponding ADC\_PCSEL bit must be previously configured.

This ADC\_PCSEL bit controls the analog switch integrated in the I/O level. The ADC input MUX selects the ADC input according to the SQRx and JSQRx with very high speed, the analog switch integrated in the IO cannot react as fast as ADC mux does. To avoid the delay on analog switch control on IO, it is necessary to pre select the input channels which will be selected in the SQRx, JSQRx.

The selection is based on the  $V_{INP[i]}$  of each ADC input. If ADC1 converts the ADC1\_INP2( $V_{INP[2]}$ ) as differential mode, ADC1\_INP6( $V_{INN[2]}$ ) also needs to be selected in ADC\_PCSEL.

Some I/Os are connected to several  $V_{INP[i]}$  of the ADCx. The control inputs of the analog switch are ORed with the corresponding ADC\_PCSEL register bits.

### 29.4.13 Channel-wise programmable sampling time (SMPR1, SMPR2)

Before starting a conversion, the ADC must establish a direct connection between the voltage source under measurement and the embedded sampling capacitor of the ADC. This sampling time must be enough for the input voltage source to charge the embedded capacitor to the input voltage level.

Each channel can be sampled with a different sampling time which is programmable using the SMP[2:0] bits in the ADC\_SMPR1 and ADC\_SMPR2 registers. It is therefore possible to select among the following sampling time values:

- SMP = 000: 1.5 ADC clock cycles
- SMP = 001: 2.5 ADC clock cycles
- SMP = 010: 8.5 ADC clock cycles
- SMP = 011: 16.5 ADC clock cycles
- SMP = 100: 32.5 ADC clock cycles
- SMP = 101: 64.5 ADC clock cycles
- SMP = 110: 387.5 ADC clock cycles
- SMP = 111: 810.5 ADC clock cycles

The total conversion time is calculated as follows:

$$T_{\text{CONV}} = \text{Sampling time} + 7.5 \text{ ADC clock cycles}$$

Example:

With  $F_{\text{adc\_ker\_ck}} = 24 \text{ MHz}$  and a sampling time of 1.5 ADC clock cycles (14-bit mode):

$$T_{\text{CONV}} = (1.5 + 7.5) \text{ ADC clock cycles} = 9 \text{ ADC clock cycles} = 0.375 \mu\text{s} \text{ (14 bit mode for fast channels)}$$

The ADC notifies the end of the sampling phase by setting the status bit EOSMP (only for regular conversion).

#### Constraints on the sampling time for fast and slow channels

For each channel, SMP[2:0] bits must be programmed to respect a minimum sampling time as specified in the ADC characteristics section of the datasheets.

#### I/O analog switches voltage booster

The I/O analog switches resistance increases when the  $V_{\text{DDA}}$  voltage is too low. This requires to have the sampling time adapted accordingly (refer to the datasheet for electrical characteristics). This resistance can be minimized at low  $V_{\text{DDA}}$  by enabling an internal voltage booster with EN\_BOOSTER bit in the SYSCFG\_PMCR register.

### 29.4.14 Single conversion mode (CONT=0)

In Single conversion mode, the ADC performs once all the conversions of the channels. This mode is started with the CONT bit at 0 by either:

- Setting the ADSTART bit in the ADC\_CR register (for a regular channel, with software trigger selected)
  - Setting the JADSTART bit in the ADC\_CR register (for an injected channel, with software trigger selected)
  - External hardware trigger event (for a regular or injected channel)
- ADSTART bit or JADSTART bit must be set before triggering an external event.

Inside the regular sequence, after each conversion is complete:

- The converted data are stored into the 32-bit ADC\_DR register
- The EOC (end of regular conversion) flag is set
- An interrupt is generated if the EOCIE bit is set

Inside the injected sequence, after each conversion is complete:

- The converted data are stored into one of the four 32-bit ADC\_JDRy registers
- The JEOC (end of injected conversion) flag is set
- An interrupt is generated if the JEOCIE bit is set

After the regular sequence is complete:

- The EOS (end of regular sequence) flag is set
- An interrupt is generated if the EOSIE bit is set

After the injected sequence is complete:

- The JEOS (end of injected sequence) flag is set
- An interrupt is generated if the JEOSIE bit is set

Then the ADC stops until a new external regular or injected trigger occurs or until bit ADSTART or JADSTART is set again.

*Note:* To convert a single channel, program a sequence with a length of 1.

#### 29.4.15 Continuous conversion mode (CONT=1)

This mode applies to regular channels only.

In continuous conversion mode, when a software or hardware regular trigger event occurs, the ADC performs once all the regular conversions of the channels and then automatically re-starts and continuously converts each conversions of the sequence. This mode is started with the CONT bit at 1 either by external trigger or by setting the ADSTART bit in the ADC\_CR register.

Inside the regular sequence, after each conversion is complete:

- The converted data are stored into the 32-bit ADC\_DR register
- The EOC (end of conversion) flag is set
- An interrupt is generated if the EOCIE bit is set

After the sequence of conversions is complete:

- The EOS (end of sequence) flag is set
- An interrupt is generated if the EOSIE bit is set

Then, a new sequence restarts immediately and the ADC continuously repeats the conversion sequence.

*Note:* To convert a single channel, program a sequence with a length of 1.

*It is not possible to have both discontinuous mode and continuous mode enabled: it is forbidden to set both DISCEN=1 and CONT=1.*

*Injected channels cannot be converted continuously. The only exception is when an injected channel is configured to be converted automatically after regular channels in continuous mode (using JAUTO bit), refer to [Auto-injection mode](#) section).*

### 29.4.16 Starting conversions (ADSTART, JADSTART)

Software starts ADC regular conversions by setting ADSTART=1.

When ADSTART is set, the conversion starts:

- Immediately: if EXTEN = 0x0 (software trigger)
- At the next active edge of the selected regular hardware trigger: if EXTEN != 0x0

Software starts ADC injected conversions by setting JADSTART=1.

When JADSTART is set, the conversion starts:

- Immediately, if JEXTEN = 0x0 (software trigger)
- At the next active edge of the selected injected hardware trigger: if JEXTEN != 0x0

**Note:** *In auto-injection mode (JAUTO=1), use ADSTART bit to start the regular conversions followed by the auto-injected conversions (JADSTART must be kept cleared).*

ADSTART and JADSTART also provide information on whether any ADC operation is currently ongoing. It is possible to re-configure the ADC while ADSTART=0 and JADSTART=0 are both true, indicating that the ADC is idle.

ADSTART is cleared by hardware:

- In single mode with software trigger (CONT=0, EXTEN=0x0)
  - at any end of conversion sequence (EOS =1)
- In discontinuous mode with software trigger (CONT=0, DISCEN=1, EXTEN=0x0)
  - at end of conversion (EOC=1)
- In all other cases (CONT=x, EXTEN=x)
  - after execution of the ADSTP procedure asserted by the software.

**Note:** *In continuous mode (CONT=1), ADSTART is not cleared by hardware with the assertion of EOS because the sequence is automatically relaunched.*

*When a hardware trigger is selected in single mode (CONT=0 and EXTEN !=0x00), ADSTART is not cleared by hardware with the assertion of EOS to help the software which does not need to reset ADSTART again for the next hardware trigger event. This ensures that no further hardware triggers are missed.*

JADSTART is cleared by hardware:

- in single mode with software injected trigger (JEXTEN=0x0)
  - at any end of injected conversion sequence (JEOS assertion) or at any end of sub-group processing if JDISCEN=1
- in all cases (JEXTEN=x)
  - after execution of the JADSTP procedure asserted by the software.

**Note:** *When the software trigger is selected, ADSTART bit should not be set if the EOC flag is still high.*

## 29.4.17 Timing

The elapsed time between the start of a conversion and the end of conversion is the sum of the configured sampling time plus the successive approximation time depending on data resolution:

$$T_{\text{CONV}} = T_{\text{SMPL}} + T_{\text{SAR}} = [1.5_{\text{min}} + 7.5_{\text{14bit}}] \times T_{\text{adc\_ker\_ck}}$$

$$T_{\text{CONV}} = T_{\text{SMPL}} + T_{\text{SAR}} = 62.5 \text{ ns}_{\text{min}} + 312.5 \text{ ns}_{\text{14bit}} = 375.0 \text{ ns (for } F_{\text{adc\_ker\_ck}} = 24 \text{ MHz)}$$

**Figure 189. Analog to digital conversion time**

1.  $T_{\text{SMPL}}$  depends on SMP[2:0]
2.  $T_{\text{SAR}}$  depends on RES[2:0]

## 29.4.18 Stopping an ongoing conversion (ADSTP, JADSTP)

The software can decide to stop regular conversions ongoing by setting ADSTP=1 and injected conversions ongoing by setting JADSTP=1.

Stopping conversions will reset the ongoing ADC operation. Then the ADC can be reconfigured (ex: changing the channel selection or the trigger) ready for a new operation.

Note that it is possible to stop injected conversions while regular conversions are still operating and vice-versa. This allows, for instance, re-configuration of the injected conversion sequence and triggers while regular conversions are still operating (and vice-versa).

When the ADSTP bit is set by software, any ongoing regular conversion is aborted with partial result discarded (ADC\_DR register is not updated with the current conversion).

When the JADSTP bit is set by software, any ongoing injected conversion is aborted with partial result discarded (ADC\_JDRy register is not updated with the current conversion). The scan sequence is also aborted and reset (meaning that relaunching the ADC would restart a new sequence).

Once this procedure is complete, bits ADSTP/ADSTART (in case of regular conversion), or JADSTP/JADSTART (in case of injected conversion) are cleared by hardware and the software must poll ADSTART (or JADSTART) until the bit is reset before assuming the ADC is completely stopped.

**Note:** In auto-injection mode (JAUTO=1), setting ADSTP bit aborts both regular and injected conversions (JADSTP must not be used).

**Figure 190. Stopping ongoing regular conversions**

**Figure 191. Stopping ongoing regular and injected conversions**

## 29.4.19 Conversion on external trigger and trigger polarity (EXTSEL, EXTEN, JEXTSEL, JEXTEN)

A conversion or a sequence of conversions can be triggered either by software or by an external event (e.g. timer capture, input pins). If the EXTEN[1:0] control bits (for a regular conversion) or JEXTEN[1:0] bits (for an injected conversion) are different from 0b00, then external events are able to trigger a conversion with the selected polarity.

When the Injected Queue is enabled (bit JQDIS=0), injected software triggers are not possible.

The regular trigger selection is effective once software has set bit ADSTART=1 and the injected trigger selection is effective once software has set bit JADSTART=1.

Any hardware triggers which occur while a conversion is ongoing are ignored.

- If bit ADSTART=0, any regular hardware triggers which occur are ignored.
- If bit JADSTART=0, any injected hardware triggers which occur are ignored.

[Table 185](#) provides the correspondence between the EXTEN[1:0] and JEXTEN[1:0] values and the trigger polarity.

**Table 185. Configuring the trigger polarity for regular external triggers**

| EXTEN[1:0] | Source                                                                  |
|------------|-------------------------------------------------------------------------|
| 00         | Hardware Trigger detection disabled, software trigger detection enabled |
| 01         | Hardware Trigger with detection on the rising edge                      |
| 10         | Hardware Trigger with detection on the falling edge                     |
| 11         | Hardware Trigger with detection on both the rising and falling edges    |

*Note:* The polarity of the regular trigger cannot be changed on-the-fly.

**Table 186. Configuring the trigger polarity for injected external triggers**

| JEXTEN[1:0] | Source                                                                                                                                                                                                                                           |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 00          | <ul style="list-style-type: none"> <li>– If JQDIS=1 (Queue disabled): Hardware trigger detection disabled, software trigger detection enabled</li> <li>– If JQDIS=0 (Queue enabled), Hardware and software trigger detection disabled</li> </ul> |
| 01          | Hardware Trigger with detection on the rising edge                                                                                                                                                                                               |
| 10          | Hardware Trigger with detection on the falling edge                                                                                                                                                                                              |
| 11          | Hardware Trigger with detection on both the rising and falling edges                                                                                                                                                                             |

*Note:* The polarity of the injected trigger can be anticipated and changed on-the-fly when the queue is enabled (JQDIS=0). Refer to [Section 29.4.22: Queue of context for injected conversions](#).

The EXTSEL[4:0] and JEXTSEL[4:0] control bits select which out of 21 possible events can trigger conversion for the regular and injected groups.

A regular group conversion can be interrupted by an injected trigger.

**Note:** The regular trigger selection cannot be changed on-the-fly.  
The injected trigger selection can be anticipated and changed on-the-fly. Refer to [Section 29.4.22: Queue of context for injected conversions on page 1528](#)

Each ADC master shares the same input triggers with its ADC slave as described in [Figure 192](#).

**Figure 192. Triggers are shared between ADC master and ADC slave**

[Table 187](#) and [Table 188](#) give all the possible external triggers of the three ADCs for regular and injected conversion.

**Table 187. ADC1, ADC2 - External triggers for regular channels**

| Name         | Source     | Type                                | EXTSEL[4:0] |

## 29.4.20 Injected channel management

### Triggered injection mode

To use triggered injection, the JAUTO bit in the ADC\_CFGR register must be cleared.

1. Start the conversion of a group of regular channels either by an external trigger or by setting the ADSTART bit in the ADC\_CR register.
2. If an external injected trigger occurs, or if the JADSTART bit in the ADC\_CR register is set during the conversion of a regular group of channels, the current conversion is

- reset and the injected channel sequence switches are launched (all the injected channels are converted once).
3. Then, the regular conversion of the regular group of channels is resumed from the last interrupted regular conversion.
  4. If a regular event occurs during an injected conversion, the injected conversion is not interrupted but the regular sequence is executed at the end of the injected sequence. [Figure 193](#) shows the corresponding timing diagram.

**Note:** *When using triggered injection, one must ensure that the interval between trigger events is longer than the injection sequence. For instance, if the sequence length is 20 ADC clock cycles (that is two conversions with a sampling time of 1.5 clock periods), the minimum interval between triggers must be 21 ADC clock cycles.*

### Auto-injection mode

If the JAUTO bit in the ADC\_CFGR register is set, then the channels in the injected group are automatically converted after the regular group of channels. This can be used to convert a sequence of up to 20 conversions programmed in the ADC\_SQRy and ADC\_JSQR registers.

In this mode, the ADSTART bit in the ADC\_CR register must be set to start regular conversions, followed by injected conversions (JADSTART must be kept cleared). Setting the ADSTP bit aborts both regular and injected conversions (JADSTP bit must not be used).

In this mode, external trigger on injected channels must be disabled.

If the CONT bit is also set in addition to the JAUTO bit, regular channels followed by injected channels are continuously converted.

**Note:** *It is not possible to use both the auto-injected and discontinuous modes simultaneously. When the DMA is used for exporting regular sequencer's data in JAUTO mode, it is necessary to program it in circular mode (CIRC bit set in DMA\_CCRx register). If the CIRC bit is reset (single-shot mode), the JAUTO sequence will be stopped upon DMA Transfer Complete event.*

Figure 193. Injected conversion latency

1. The maximum latency value can be found in the electrical characteristics of the device datasheet.

## 29.4.21 Discontinuous mode (DISCEN, DISCNUM, JDISCEN)

### Regular group mode

This mode is enabled by setting the DISCEN bit in the ADC\_CFGR register.

It is used to convert a short sequence (sub-group) of  $n$  conversions ( $n \leq 8$ ) that is part of the sequence of conversions selected in the ADC\_SQRy registers. The value of  $n$  is specified by writing to the DISCNUM[2:0] bits in the ADC\_CFGR register.

When an external trigger occurs, it starts the next  $n$  conversions selected in the ADC\_SQR registers until all the conversions in the sequence are done. The total sequence length is defined by the L[3:0] bits in the ADC\_SQR1 register.

Example:

- DISCEN=1,  $n=3$ , channels to be converted = 1, 2, 3, 6, 7, 8, 9, 10, 11
  - 1st trigger: channels converted are 1, 2, 3 (an EOC event is generated at each conversion).
  - 2nd trigger: channels converted are 6, 7, 8 (an EOC event is generated at each conversion).
  - 3rd trigger: channels converted are 9, 10, 11 (an EOC event is generated at each conversion) and an EOS event is generated after the conversion of channel 11.
  - 4th trigger: channels converted are 1, 2, 3 (an EOC event is generated at each conversion).
  - ...
- DISCEN=0, channels to be converted = 1, 2, 3, 6, 7, 8, 9, 10, 11
  - 1st trigger: the complete sequence is converted: channel 1, then 2, 3, 6, 7, 8, 9, 10 and 11. Each conversion generates an EOC event and the last one also generates an EOS event.
  - all the next trigger events will relaunch the complete sequence.

**Note:** *When a regular group is converted in discontinuous mode, no rollover occurs (the last subgroup of the sequence can have less than n conversions).*

*When all subgroups are converted, the next trigger starts the conversion of the first subgroup. In the example above, the 4th trigger reconverts the channels 1, 2 and 3 in the 1st subgroup.*

*It is not possible to have both discontinuous mode and continuous mode enabled. In this case (if DISCEN=1, CONT=1), the ADC behaves as if continuous mode was disabled.*

### Injected group mode

This mode is enabled by setting the JDISCEN bit in the ADC\_CFGR register. It converts the sequence selected in the ADC\_JSQR register, channel by channel, after an external injected trigger event. This is equivalent to discontinuous mode for regular channels where 'n' is fixed to 1.

When an external trigger occurs, it starts the next channel conversions selected in the ADC\_JSQR registers until all the conversions in the sequence are done. The total sequence length is defined by the JL[1:0] bits in the ADC\_JSQR register.

Example:

- JDISCEN=1, channels to be converted = 1, 2, 3
  - 1st trigger: channel 1 converted (a JEOC event is generated)
  - 2nd trigger: channel 2 converted (a JEOC event is generated)
  - 3rd trigger: channel 3 converted and a JEOC event + a JEOS event are generated
  - ...

**Note:** *When all injected channels have been converted, the next trigger starts the conversion of the first injected channel. In the example above, the 4th trigger reconverts the 1st injected channel 1.*

*It is not possible to use both auto-injected mode and discontinuous mode simultaneously: the bits DISCEN and JDISCEN must be kept cleared by software when JAUTO is set.*

## 29.4.22 Queue of context for injected conversions

A queue of context is implemented to anticipate up to 2 contexts for the next injected sequence of conversions. JQDIS bit of ADC\_CFGR register must be reset to enable this feature. Only hardware-triggered conversions are possible when the context queue is enabled.

This context consists of:

- Configuration of the injected triggers (bits JEXTEN[1:0] and JEXTSEL[4:0] in ADC\_JSQR register)
- Definition of the injected sequence (bits JSQx[4:0] and JL[1:0] in ADC\_JSQR register)

All the parameters of the context are defined into a single register ADC\_JSQR and this register implements a queue of 2 buffers, allowing the bufferization of up to 2 sets of parameters:

- The ADC\_JSQR register can be written at any moment even when injected conversions are ongoing.
- Each data written into the JSQR register is stored into the Queue of context.
- At the beginning, the Queue is empty and the first write access into the JSQR register immediately changes the context and the ADC is ready to receive injected triggers.
- Once an injected sequence is complete, the Queue is consumed and the context changes according to the next JSQR parameters stored in the Queue. This new context is applied for the next injected sequence of conversions.
- A Queue overflow occurs when writing into register JSQR while the Queue is full. This overflow is signaled by the assertion of the flag JQOVF. When an overflow occurs, the write access of JSQR register which has created the overflow is ignored and the queue of context is unchanged. An interrupt can be generated if bit JQOVFIE is set.
- Two possible behaviors are possible when the Queue becomes empty, depending on the value of the control bit JQM of register ADC\_CFGR:
  - If JQM=0, the Queue is empty just after enabling the ADC, but then it can never be empty during run operations: the Queue always maintains the last active context and any further valid start of injected sequence will be served according to the last active context.
  - If JQM=1, the Queue can be empty after the end of an injected sequence or if the Queue is flushed. When this occurs, there is no more context in the queue and hardware triggers are disabled. Therefore, any further hardware injected triggers are ignored until the software re-writes a new injected context into JSQR register.
- Reading JSQR register returns the current JSQR context which is active at that moment. When the JSQR context is empty, JSQR is read as 0x0000.
- The Queue is flushed when stopping injected conversions by setting JADSTP=1 or when disabling the ADC by setting ADDIS=1:
  - If JQM=0, the Queue is maintained with the last active context.
  - If JQM=1, the Queue becomes empty and triggers are ignored.

**Note:** *When configured in discontinuous mode (bit JDISCEN=1), only the last trigger of the injected sequence changes the context and consumes the Queue. The 1<sup>st</sup> trigger only consumes the queue but others are still valid triggers as shown by the discontinuous mode example below (length = 3 for both contexts):*

- *1<sup>st</sup> trigger, discontinuous. Sequence 1: context 1 consumed, 1<sup>st</sup> conversion carried out*
- *2<sup>nd</sup> trigger, disc. Sequence 1: 2<sup>nd</sup> conversion.*
- *3<sup>rd</sup> trigger, discontinuous. Sequence 1: 3<sup>rd</sup> conversion.*
- *4<sup>th</sup> trigger, discontinuous. Sequence 2: context 2 consumed, 1<sup>st</sup> conversion carried out.*
- *5<sup>th</sup> trigger, discontinuous. Sequence 2: 2<sup>nd</sup> conversion.*
- *6<sup>th</sup> trigger, discontinuous. Sequence 2: 3<sup>rd</sup> conversion.*

**Note:** *When queue of context enabled (bit JQDIS=0), only hardware trigger can be used.*

Behavior when changing the trigger or sequence context

The [Figure 194](#) and [Figure 195](#) show the behavior of the context Queue when changing the sequence or the triggers.

Figure 194. Example of JSQR queue of context (sequence change)

1. Parameters:
- P1: sequence of 3 conversions, hardware trigger 1
  - P2: sequence of 1 conversion, hardware trigger 1
  - P3: sequence of 4 conversions, hardware trigger 1

Figure 195. Example of JSQR queue of context (trigger change)

1. Parameters:
- P1: sequence of 2 conversions, hardware trigger 1
  - P2: sequence of 1 conversion, hardware trigger 2
  - P3: sequence of 4 conversions, hardware trigger 1

### Queue of context: Behavior when a queue overflow occurs

The [Figure 196](#) and [Figure 197](#) show the behavior of the context Queue if an overflow occurs before or during a conversion.

**Figure 196. Example of JSQR queue of context with overflow before conversion**

- Parameters:
  - P1: sequence of 2 conversions, hardware trigger 1
  - P2: sequence of 1 conversion, hardware trigger 2
  - P3: sequence of 3 conversions, hardware trigger 1
  - P4: sequence of 4 conversions, hardware trigger 1

**Figure 197. Example of JSQR queue of context with overflow during conversion**

- Parameters:
  - P1: sequence of 2 conversions, hardware trigger 1
  - P2: sequence of 1 conversion, hardware trigger 2
  - P3: sequence of 3 conversions, hardware trigger 1
  - P4: sequence of 4 conversions, hardware trigger 1

It is recommended to manage the queue overflows as described below:

- After each P context write into JSQR register, flag JQOVF shows if the write has been ignored or not (an interrupt can be generated).
- Avoid Queue overflows by writing the third context (P3) only once the flag JEOS of the previous context P2 has been set. This ensures that the previous context has been consumed and that the queue is not full.

### Queue of context: Behavior when the queue becomes empty

Figure 198 and Figure 199 show the behavior of the context Queue when the Queue becomes empty in both cases JQM=0 or 1.

**Figure 198. Example of JSQR queue of context with empty queue (case JQM=0)**

1. Parameters:

- P1: sequence of 1 conversion, hardware trigger 1
- P2: sequence of 1 conversion, hardware trigger 1
- P3: sequence of 1 conversion, hardware trigger 1

**Note:** When writing P3, the context changes immediately. However, because of internal resynchronization, there is a latency and if a trigger occurs just after or before writing P3, it can happen that the conversion is launched considering the context P2. To avoid this situation, the user must ensure that there is no ADC trigger happening when writing a new context that applies immediately.

**Figure 199. Example of JSQR queue of context with empty queue (case JQM=1)**

1. Parameters:  
 P1: sequence of 1 conversion, hardware trigger 1  
 P2: sequence of 1 conversion, hardware trigger 1  
 P3: sequence of 1 conversion, hardware trigger 1

### Flushing the queue of context

The figures below show the behavior of the context Queue in various situations when the queue is flushed.

**Figure 200. Flushing JSQR queue of context by setting JADSTP=1 (JQM=0).  
 Case when JADSTP occurs during an ongoing conversion.**

1. Parameters:  
 P1: sequence of 1 conversion, hardware trigger 1  
 P2: sequence of 1 conversion, hardware trigger 1  
 P3: sequence of 1 conversion, hardware trigger 1

**Figure 201. Flushing JSQR queue of context by setting JADSTP=1 (JQM=0).  
Case when JADSTP occurs during an ongoing conversion and a new trigger occurs.**

- Parameters:  
 P1: sequence of 1 conversion, hardware trigger 1  
 P2: sequence of 1 conversion, hardware trigger 1  
 P3: sequence of 1 conversion, hardware trigger 1

**Figure 202. Flushing JSQR queue of context by setting JADSTP=1 (JQM=0).  
Case when JADSTP occurs outside an ongoing conversion**

- Parameters:  
 P1: sequence of 1 conversion, hardware trigger 1  
 P2: sequence of 1 conversion, hardware trigger 1  
 P3: sequence of 1 conversion, hardware trigger 1

**Figure 203. Flushing JSQR queue of context by setting JADSTP=1 (JQM=1)**

- Parameters:  
 P1: sequence of 1 conversion, hardware trigger 1  
 P2: sequence of 1 conversion, hardware trigger 1  
 P3: sequence of 1 conversion, hardware trigger 1

**Figure 204. Flushing JSQR queue of context by setting ADDIS=1 (JQM=0)**

- Parameters:  
 P1: sequence of 1 conversion, hardware trigger 1  
 P2: sequence of 1 conversion, hardware trigger 1  
 P3: sequence of 1 conversion, hardware trigger 1

**Figure 205. Flushing JSQR queue of context by setting ADDIS=1 (JQM=1)**

1. Parameters:
  - P1: sequence of 1 conversion, hardware trigger 1
  - P2: sequence of 1 conversion, hardware trigger 1
  - P3: sequence of 1 conversion, hardware trigger 1

### Queue of context: Starting the ADC with an empty queue

The following procedure must be followed to start ADC operation with an empty queue, in case the first context is not known at the time the ADC is initialized. This procedure is only applicable when JQM bit is reset:

5. Write a dummy JSQR with JEXTEN not equal to 0 (otherwise triggering a software conversion)
6. Set JADSTART
7. Set JADSTP
8. Wait until JADSTART is reset
9. Set JADSTART.

### Disabling the queue

It is possible to disable the queue by setting bit JQDIS=1 into the ADC\_CFGR register.

### Queue of context: Programming of the register ADC\_JSQR

When the injected conversion queue of context is enabled (JQDIS=0), the ADC\_JSQR must be programmed at one register write access. As JL[1:0] register define the number of the injected sequence, corresponding JSQ1 to JSQ4 must be written at same time. If ADC\_JSQR is reprogrammed before the injected conversion start, reprogrammed data is put on the queue. When queue of context is empty, ADC\_JSQR read back as 0x0000. Register access should not use the 'read modify write' sequence.

When ADC\_JSQR is programmed when already 2 contexts are queued, it will raise JQOVF flag and generate the interrupt.

### 29.4.23 Programmable resolution (RES) - fast conversion mode

It is possible to perform faster conversion by reducing the ADC resolution.

The resolution can be configured to be either 16, 14, 12, 10, 8 bits by programming the control bits RES[1:0]. [Figure 210](#), [Figure 211](#), [Figure 212](#) and [Figure 213](#) show the conversion result format with respect to the resolution as well as to the data alignment.

Lower resolution allows faster conversion time for applications where high-data precision is not required. It reduces the conversion time spent by the successive approximation steps according to [Table 189](#).

**Table 189. T<sub>SAR</sub> timings depending on resolution**

| RES<br>[2:0] | T <sub>SAR</sub><br>(ADC clock cycles) | T <sub>SAR</sub> (ns) at<br>F <sub>adc_ker_ck</sub> =24<br>MHz | T <sub>adc_ker_ck</sub> (ADC clock<br>cycles)<br>(with Sampling Time=<br>1.5 ADC clock cycles) | T <sub>adc_ker_ck</sub> (ns)<br>at<br>F <sub>adc_ker_ck</sub> =24<br>MHz |
|--------------|----------------------------------------|----------------------------------------------------------------|------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| 16 bits      | 8.5 ADC clock cycles                   | 354.2                                                          | 10 ADC clock cycles                                                                            | 416.7                                                                    |
| 14 bits      | 7.5 ADC clock cycles                   | 312.5                                                          | 9 ADC clock cycles                                                                             | 375                                                                      |
| 12 bits      | 6.5 ADC clock cycles                   | 270.8                                                          | 8 ADC clock cycles                                                                             | 333.3                                                                    |
| 10 bits      | 5.5 ADC clock cycles                   | 229.2                                                          | 7 ADC clock cycles                                                                             | 291.7                                                                    |
| 8 bits       | 4.5 ADC clock cycles                   | 187.5                                                          | 6 ADC clock cycles                                                                             | 250.0                                                                    |

### 29.4.24 End of conversion, end of sampling phase (EOC, JEOC, EOSMP)

The ADC notifies the application for each end of regular conversion (EOC) event and each injected conversion (JEOC) event.

The ADC sets the EOC flag as soon as a new regular conversion data is available in the ADC\_DR register. An interrupt can be generated if bit EOCIE is set. EOC flag is cleared by the software either by writing 1 to it or by reading ADC\_DR.

The ADC sets the JEOC flag as soon as a new injected conversion data is available in one of the ADC\_JDRy register. An interrupt can be generated if bit JEOCIE is set. JEOC flag is cleared by the software either by writing 1 to it or by reading the corresponding ADC\_JDRy register.

The ADC also notifies the end of Sampling phase by setting the status bit EOSMP (for regular conversions only). EOSMP flag is cleared by software by writing 1 to it. An interrupt can be generated if bit EOSMPIE is set.

### 29.4.25 End of conversion sequence (EOS, JEOS)

The ADC notifies the application for each end of regular sequence (EOS) and for each end of injected sequence (JEOS) event.

The ADC sets the EOS flag as soon as the last data of the regular conversion sequence is available in the ADC\_DR register. An interrupt can be generated if bit EOSIE is set. EOS flag is cleared by the software either by writing 1 to it.

The ADC sets the JEOS flag as soon as the last data of the injected conversion sequence is complete. An interrupt can be generated if bit JEOSIE is set. JEOS flag is cleared by the software either by writing 1 to it.

### 29.4.26 Timing diagrams example (single/continuous modes, hardware/software triggers)

**Figure 206. Single conversions of a sequence, software trigger**

1. EXTEN=0x0, CONT=0
2. Channels selected = 1,9, 10, 17; AUTDLY=0.

**Figure 207. Continuous conversion of a sequence, software trigger**

1. EXTEN=0x0, CONT=1
2. Channels selected = 1,9, 10, 17; AUTDLY=0.

**Figure 208. Single conversions of a sequence, hardware trigger**

1. TRGX (over-frequency) is selected as trigger source, EXTEN = 01, CONT = 0
2. Channels selected = 1, 2, 3, 4; AUTDLY=0.

**Figure 209. Continuous conversions of a sequence, hardware trigger**

1. TRGX is selected as trigger source, EXTEN = 10, CONT = 1
2. Channels selected = 1, 2, 3, 4; AUTDLY=0.

### 29.4.27 Data management

#### Data register, data alignment and offset (ADC\_DR, ADC\_JDRy, OFFSETy, OFFSETy\_CH, OVSS, LSHIFT, RSHIFT, SSATE)

##### Data and alignment

At the end of each regular conversion channel (when EOC event occurs), the result of the converted data is stored into the ADC\_DR data register which is 32 bits wide.

At the end of each injected conversion channel (when JEOC event occurs), the result of the converted data is stored into the corresponding ADC\_JDRy data register which is 32 bits wide.

The OVSS[3:0] and LSHIFT[3:0] bitfields in the ADC\_CFGR2 register selects the alignment of the data stored after conversion. Data can be right- or left-aligned as shown in [Figure 210](#), [Figure 211](#), [Figure 212](#) and [Figure 213](#).

**Note:** The data can be re-aligned in normal and in oversampling mode.

## Offset

An offset  $y$  ( $y=1, 2, 3, 4$ ) can be applied to a channel by programming a value different from 0 in OFFSETy[25:0] bitfield into ADC\_OFRy register. The channel to which the offset will be applied is programmed into the bits OFFSETy\_CH[4:0] of ADC\_OFRy register. In this case, the converted value is decreased by the user-defined offset written in the bits OFFSETy[25:0]. The result may be a negative value so the read data is signed and the SEXT bit represents the extended sign value.

The offset value should be lower than the max conversion value (ex. 16bit mode, offset value max is 0xFFFF).

The offset correction is also supported in oversampling mode. For the oversampling mode, offset is subtracted before OVSS right shift applied.

Table 190 describes how the comparison is performed for all the possible resolutions for analog watchdog 1, 2, 3.

**Table 190. Offset computation versus data resolution**

| Resolution<br>(bits<br>RES[2:0]) | Subtraction between raw<br>converted data and offset: |              | Result                | Comments                                           |
|----------------------------------|-------------------------------------------------------|--------------|-----------------------|----------------------------------------------------|
|                                  | Raw<br>converted<br>Data, left<br>aligned             | Offset       |                       |                                                    |
| 16 bits                          | DATA[15:0]                                            | OFFSET[25:0] | signed 27-bit<br>data | -                                                  |
| 14 bits                          | DATA[15:2],00                                         | OFFSET[25:0] | signed 27-bit<br>data | The user must configure OFFSET[1:0]<br>to 00       |
| 12 bits                          | DATA[15:4],00<br>00                                   | OFFSET[25:0] | signed 27-bit<br>data | The user must configure OFFSET[3:0]<br>to 0000     |
| 10 bits                          | DATA[15:6],00<br>0000                                 | OFFSET[25:0] | signed 27-bit<br>data | The user must configure OFFSET[5:0]<br>to 000000   |
| 8 bits                           | DATA[15:8],00<br>0000                                 | OFFSET[25:0] | signed 27-bit<br>data | The user must configure OFFSET[7:0]<br>to 00000000 |

When reading data from ADC\_DR (regular channel) or from ADC\_JDRy (injected channel,  $y=1,2,3,4$ ) corresponding to channel  $i$ :

- If one of the offsets is enabled (bit OFFSETy\_EN=1) for the corresponding channel, the read data is signed.
- If none of the four offsets is enabled for this channel, the read data is not signed.

Figure 210, Figure 211, Figure 212 and Figure 213 show alignments for signed and unsigned data together with corresponding OVSS and LSHIFT values.

**Figure 210. Right alignment (offset disabled, unsigned value)****Figure 211. Right alignment (offset enabled, signed value)**

Figure 212. Left alignment (offset disabled, unsigned value)

Figure 213. Left alignment (offset enabled, signed value)

**16-bit and 8-bit signed format management: RSHIFTx,SSATE**

The offset correction sign-extends the data format, resulting in an unsigned 16-bit conversion being extended to 17-bit signed format, for instance.

Three options are offered for formatting 8-bit and 16-bit conversion results.

For each offset correction channel 1 to 4, a RSHIFT1..4 bit in the ADC\_CFGR2 register allows to have the result right-shifted 1-bit and have it fitting a standard 8 or 16-bit format.

Another option is to have the result saturated to the 16-bit and 8-bit signed formats, for the following cases only: RES[2:0] = 000 (16-bit format) and RES[2:0] = 100 (8-bit format).

This mode is enabled with the SSATE bit in the ADC\_OFRy register.

The table below summarizes the 3 available use case for 16-bit format.

**Table 191. 16-bit data formats**

| SSATE | RSHIFTx | Format                                                                        | Data range<br>(offset = 0x8000) |
|-------|---------|-------------------------------------------------------------------------------|---------------------------------|
| 0     | 0       | Sign-extended 17-bit significant data<br>SEXT[31:16] DATA[15:0]               | 0x00007FFF - 0x FFFF8000        |
| 0     | 1       | Sign-extended right-shifted 16-bit significant data<br>SEXT[31:15] DATA[14:0] | 0x3FFF - 0xC000                 |
| 1     | 0       | Sign-extended saturated 16-bit significant data<br>SEXT[31:15] DATA[14:0]     | 7FFF - 0x8000                   |
| 1     | 1       | Reserved                                                                      | -                               |

Numerical examples are given in [Table 192](#) with 3 different offset values.

**Table 192. Numerical examples for 16-bit format (bold indicates saturation)**

| Raw conversion result | Offset value | Result<br>SSATE = 0<br>RSHIFT = 0 | Result<br>SSATE = 0<br>RSHIFT = 1 | Result<br>SSATE = 1<br>RSHIFT = 0 |
|-----------------------|--------------|-----------------------------------|-----------------------------------|-----------------------------------|
| 0xFFFF                | 0x8000       | 0x0000 7FFF                       | 3FFF                              | 7FFF                              |
| 0x8000                |              | 0x0000 0000                       | 0                                 | 0                                 |
| 0x0000                |              | 0xFFFF 8000                       | C000                              | 8000                              |
| 0xFFFF                | 0x8020       | 0x0000 7FDF                       | 3FEF                              | 7FDF                              |
| 0x8000                |              | 0xFFFF FFE0                       | FFF0                              | FFE0                              |
| 0x0000                |              | 0xFFFF 7FE0                       | BFF0                              | 8000                              |
| 0xFFFF                | 0x7FF0       | 0x0000 800F                       | 4007                              | 7FFF                              |
| 0x8000                |              | 0x0000 0010                       | 8                                 | 0010                              |
| 0x0000                |              | 0xFFFF 8010                       | C008                              | 8010                              |

When oversampling mode is active, the SSATE and RSHIFT1..4 bits are not supported.

### ADC overrun (OVR, OVRMOD)

The overrun flag (OVR) notifies of a buffer overrun event when the regular converted data has not been read (by the CPU or the DMA) before ADC\_DR FIFO (eight stages) is overflowed.

The OVR flag is set when a new conversion completes while ADC\_CR register FIFO was full. An interrupt is generated if OVRIE bit is set to 1.

When an overrun condition occurs, the ADC is still operating and can continue to convert unless the software decides to stop and reset the sequence by setting ADSTP to 1.

OVR flag is cleared by software by writing 1 to it.

Data can be configured to be preserved or overwritten when an overrun event occurs by programming the OVRMOD control bit of the ADC\_CFGR register:

- **OVRMOD = 0**

The overrun event preserves the data register from being overwritten: the old data is maintained up to ADC\_DR FIFO depth (8 data) and the new conversion is discarded and lost. If OVR remains at 1, any further conversion is performed but the resulting data is also discarded.

- **OVRMOD = 1**

The data register is overwritten with the last conversion result and the previous unread data is lost. In this mode, ADC\_DR FIFO is disabled. If OVR remains at 1, any further conversion is performed normally and the ADC\_DR register always contains the latest converted data.

**Figure 214. Example of overrun (OVRMOD = 0)**

Figure 215. Example of overrun (OVRMOD = 1)

**Note:** There is no overrun detection on the injected channels since there is a dedicated data register for each of the four injected channels.

### Managing a sequence of conversion without using the DMA

If the conversions are slow enough, the conversion sequence can be handled by the software. In this case the software must use the EOC flag and its associated interrupt to handle each data. Each time a conversion is complete, EOC is set and the ADC\_DR register can be read. OVRMOD should be configured to 0 to manage overrun events or FIFO overflows as errors.

### Managing conversions without using the DMA and without overrun

It may be useful to let the ADC convert one or more channels without reading the data each time (if there is an analog watchdog for instance). In this case, the OVRMOD bit must be configured to 1 and OVR flag should be ignored by the software. An overrun event will not prevent the ADC from continuing to convert and the ADC\_DR register will always contain the latest conversion.

### Managing conversions using the DMA

Since converted channel values are stored into a unique data register, it is useful to use DMA for conversion of more than one channel. This avoids the loss of the data already stored in the ADC\_DR register.

When the DMA mode is enabled (DMNGT bit = 01 or 11 in the ADC\_CFGR register in single ADC mode or MDMA different from 0b00 in dual ADC mode), a DMA request is generated after each conversion of a channel. This allows the transfer of the converted data from the ADC\_DR register to the destination location selected by the software.

Despite this, if an overrun occurs (OVR=1) because the DMA could not serve the DMA transfer request in time, the ADC stops generating DMA requests and the data

corresponding to the new conversion is not transferred by the DMA. Which means that all the data transferred to the RAM can be considered as valid.

Depending on the configuration of OVRMOD bit, the data is either preserved or overwritten (refer to [Section : ADC overrun \(OVR, OVRMOD\)](#)).

The DMA transfer requests are blocked until the software clears the OVR bit.

Two different DMA modes are proposed depending on the application use and are configured with bit DMNGT of the ADC\_CFGR register in single ADC mode, or with bit DAMDF of the ADC\_CCR register in dual ADC mode:

- DMA one shot mode (DMNGT bit = 01).  
This mode is suitable when the DMA is programmed to transfer a fixed number of data.
- DMA circular mode (DMNGT bit = 11)  
This mode is suitable when programming the DMA in circular mode.

#### **DMA one shot mode (DMNGT=01)**

In this mode, the ADC generates a DMA transfer request each time a new conversion data is available and stops generating DMA requests once the DMA has reached the last DMA transfer (when DMA\_EOT interrupt occurs - refer to DMA paragraph) even if a conversion has been started again.

When the DMA transfer is complete (all the transfers configured in the DMA controller have been done):

- The content of the ADC data register is frozen.
- Any ongoing conversion is aborted with partial result discarded.
- No new DMA request is issued to the DMA controller. This avoids generating an overrun error if there are still conversions which are started.
- Scan sequence is stopped and reset.
- The DMA is stopped.

#### **DMA circular mode (DMNGT=11)**

In this mode, the ADC generates a DMA transfer request each time a new conversion data is available in the data register, even if the DMA has reached the last DMA transfer. This allows configuring the DMA in circular mode to handle a continuous analog input data stream.

#### **DMA with FIFO**

The output data register has eight-stage FIFO. Two different DMA requests are generated parallel. When a data is available, "SREQ single request" generated, when 4 data are available, "BREQ burst request" generated. DMA2 can be programmed either single transfer mode or incremental burst mode(4 beats), according to this mode, correct request line is selected by the DMA2. Please refer to the DMA2 chapter for further information.

### **29.4.28 Managing conversions using the DFSDM**

The ADC conversion results can be transferred directly to the Digital Filter for Sigma Delta Modulators (DFSDM).

In this case, the DMNGT[1:0] bits must be set to 10.

The ADC transfers 16 least significant bits of the regular data register data to the DFSDM, which in turns will reset the EOC flag once the transfer is effective.

The data format must be 16-bit signed:

ADC\_DR[31:16] = don't care

ADC\_DR[15] = sign

ADC\_DR[14:0] = data

Any value above 16-bit signed format will be truncated.

## 29.4.29 Dynamic low-power features

### Auto-delayed conversion mode (AUTDLY)

The ADC implements an auto-delayed conversion mode controlled by the AUTDLY configuration bit. Auto-delayed conversions are useful to simplify the software as well as to optimize performance of an application clocked at low frequency where there would be risk of encountering an ADC overrun.

When AUTDLY=1, a new conversion can start only if all the previous data of the same group has been treated:

- For a regular conversion: once the ADC\_DR register has been read or if the EOC bit has been cleared (see [Figure 216](#)).
- For an injected conversion: when the JEOS bit has been cleared (see [Figure 217](#)).

This is a way to automatically adapt the speed of the ADC to the speed of the system which will read the data.

The delay is inserted after each regular conversion (whatever DISCEN=0 or 1) and after each sequence of injected conversions (whatever JDISCEN=0 or 1).

*Note: There is no delay inserted between each conversions of the injected sequence, except after the last one.*

During a conversion, a hardware trigger event (for the same group of conversions) occurring during this delay is ignored.

*Note: This is not true for software triggers where it remains possible during this delay to set the bits ADSTART or JADSTART to re-start a conversion: it is up to the software to read the data before launching a new conversion.*

No delay is inserted between conversions of different groups (a regular conversion followed by an injected conversion or conversely):

- If an injected trigger occurs during the automatic delay of a regular conversion, the injected conversion starts immediately (see [Figure 217](#)).
- Once the injected sequence is complete, the ADC waits for the delay (if not ended) of the previous regular conversion before launching a new regular conversion (see [Figure 219](#)).

The behavior is slightly different in auto-injected mode (JAUTO=1) where a new regular conversion can start only when the automatic delay of the previous injected sequence of conversion has ended (when JEOS has been cleared). This is to ensure that the software can read all the data of a given sequence before starting a new sequence (see [Figure 220](#)).

To stop a conversion in continuous auto-injection mode combined with autodelay mode (JAUTO=1, CONT=1 and AUTDLY=1), follow the following procedure:

1. Wait until JEOS=1 (no more conversions are restarted)
2. Clear JEOS,
3. Set ADSTP=1
4. Read the regular data.

If this procedure is not respected, a new regular sequence can re-start if JEOS is cleared after ADSTP has been set.

In AUTDLY mode, a hardware regular trigger event is ignored if it occurs during an already ongoing regular sequence or during the delay that follows the last regular conversion of the sequence. It is however considered pending if it occurs after this delay, even if it occurs during an injected sequence or the delay that follows it. The conversion then starts at the end of the delay of the injected sequence.

In AUTDLY mode, a hardware injected trigger event is ignored if it occurs during an already ongoing injected sequence or during the delay that follows the last injected conversion of the sequence.

### 29.4.30 Analog window watchdog (AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWD2CH, AWD3CH, AWD\_HTRy, AWD\_LTRy, AWDy)

The three AWD analog watchdogs monitor whether some channels remain within a configured voltage range (window).

**Figure 221. Analog watchdog guarded area**

ai16048

#### AWDx flag and interrupt

An interrupt can be enabled for each of the 3 analog watchdogs by setting AWDyIE in the ADC\_IER register (x=1,2,3).

AWDy (y=1,2,3) flag is cleared by software by writing 1 to it.

The ADC conversion result is compared to the lower and higher thresholds before alignment.

#### Description of analog watchdog 1

The AWD analog watchdog 1 is enabled by setting the AWD1EN bit in the ADC\_CFGR register. This watchdog monitors whether either one selected channel or all enabled channels<sup>(1)</sup> remain within a configured voltage range (window).

[Table 193](#) shows how the ADC\_CFGRy registers should be configured to enable the analog watchdog on one or more channels.

**Table 193. Analog watchdog channel selection**

| Channels guarded by the analog watchdog           | AWD1SGL bit | AWD1EN bit | JAWD1EN bit |
|---------------------------------------------------|-------------|------------|-------------|
| None                                              | x           | 0          | 0           |
| All injected channels                             | 0           | 0          | 1           |
| All regular channels                              | 0           | 1          | 0           |
| All regular and injected channels                 | 0           | 1          | 1           |
| Single <sup>(1)</sup> injected channel            | 1           | 0          | 1           |
| Single <sup>(1)</sup> regular channel             | 1           | 1          | 0           |
| Single <sup>(1)</sup> regular or injected channel | 1           | 1          | 1           |

1. Selected by the AWDyCH[4:0] bits. The channels must also be programmed to be converted in the appropriate regular or injected sequence.

The AWD1 analog watchdog status bit is set if the analog voltage converted by the ADC is below a lower threshold or above a higher threshold.

These thresholds are programmed in bits HTR1[25:0] of the ADC\_HTR1 register and LTR1[25:0] of the ADC\_LTR1 register for the analog watchdog 1.

The threshold can be up to 26-bits (16-bit resolution with oversampling, OSVR[9:0]=1024).

When converting data with a resolution of less than 16 bits (according to bits RES[2:0]), the LSBs of the programmed thresholds must be kept cleared, the internal comparison being performed on the full 16-bit converted data (left aligned to the half-word boundary).

[Table 194](#) describes how the comparison is performed for all the possible resolutions for analog watchdog 1,2,3.

**Table 194. Analog watchdog 1,2,3 comparison**

| Resolution<br>(bit<br>RES[2:0]) | Analog watchdog comparison<br>between:                |                              | Comments                                                   |
|---------------------------------|-------------------------------------------------------|------------------------------|------------------------------------------------------------|
|                                 | Raw converted<br>data, left<br>aligned <sup>(1)</sup> | Thresholds                   |                                                            |
| 16 bits                         | DATA[15:0]                                            | LTR1[25:0] and<br>HTR1[25:0] | -                                                          |
| 14 bits                         | DATA[15:2],00                                         | LTR1[25:0] and<br>HTR1[25:0] | User must configure LTR1[1:0] and<br>HTR1[1:0] to 00       |
| 12 bits                         | DATA[15:4],0000                                       | LTR1[25:0] and<br>HTR1[25:0] | User must configure LTR1[3:0] and<br>HTR1[3:0] to 0000     |
| 10 bits                         | DATA[15:6],00000<br>0                                 | LTR1[25:0] and<br>HTR1[25:0] | User must configure LTR1[5:0] and<br>HTR1[5:0] to 000000   |
| 8 bits                          | DATA[15:8],00000<br>000                               | LTR1[25:0] and<br>HTR1[25:0] | User must configure LTR1[7:0] and<br>HTR1[7:0] to 00000000 |

1. The watchdog comparison is performed on the raw converted data before any alignment calculation and before applying any offsets (the data which is compared is not signed).

### Description of analog watchdog 2 and 3

The second and third analog watchdogs are more flexible and can guard several selected channels by programming the corresponding bits in AWDCHy[19:0] (y=2,3).

The corresponding watchdog is enabled when any bit of AWDCHy[19:0] (y=2,3) is set.

The threshold can be up to 26-bits (16-bit resolution with oversampling, OSVR[9:0]=1024) and are programmed with the ADC\_HTR2, ADC\_LTR2, ADC\_LTR3, and ADC\_HTR3 registers.

When converting data with a resolution of less than 16 bits (according to bits RES[2:0]), the LSBs of the programmed thresholds must be kept cleared, the internal comparison being performed on the full 16-bit converted data (left aligned to the half-word boundary).

### ADCx\_AWDy\_OUT signal output generation

Each analog watchdog is associated to an internal hardware signal ADCx\_AWDy\_OUT (x=ADC number, y=watchdog number) which is directly connected to the ETR input (external trigger) of some on-chip timers. Refer to the on-chip timers section to understand how to select the ADCx\_AWDy\_OUT signal as ETR.

ADCx\_AWDy\_OUT is activated when the associated analog watchdog is enabled:

- ADCx\_AWDy\_OUT is set when a guarded conversion is outside the programmed thresholds.
- ADCx\_AWDy\_OUT is reset after the end of the next guarded conversion which is inside the programmed thresholds (It remains at 1 if the next guarded conversions are still outside the programmed thresholds).
- ADCx\_AWDy\_OUT is also reset when disabling the ADC (when setting ADDIS=1).  
Note that stopping regular or injected conversions (setting ADSTP=1 or JADSTP=1) has no influence on the generation of ADCy\_AWDx\_OUT.

*Note: AWDx flag is set by hardware and reset by software: AWDy flag has no influence on the generation of ADCx\_AWDy\_OUT (ex: ADCy\_AWDy\_OUT can toggle while AWDx flag remains at 1 if the software did not clear the flag).*

**Figure 222. ADCy\_AWDx\_OUT signal generation (on all regular channels)**

**Figure 223. ADCy\_AWDx\_OUT signal generation (AWDx flag not cleared by SW)**

Figure 225. ADCy\_AWDx\_OUT signal generation (on all injected channels)

### 29.4.31 Oversampler

The oversampling unit performs data preprocessing to offload the CPU. It is able to handle multiple conversions and average them into a single data with increased data width, up to 26-bit (16-bit values and  $OSVR[9:0] = 1024$ ).

It provides a result with the following form, where N and M can be adjusted:

$$\text{Result} = \frac{1}{M} \times \sum_{n=0}^{n=N-1} \text{Conversion}(t_n)$$

It allows to perform by hardware the following functions: averaging, data rate reduction, SNR improvement, basic filtering.

The oversampling ratio  $N$  is defined using the `OSVR[9:0]` bits in the `ADC_CFGR2` register, and can range from  $2x$  to  $1024x$ . The division coefficient  $M$  consists of a right bit shift up to 10 bits, and is defined using the `OVSS[3:0]` bits in the `ADC_CFGR2` register.

The summation unit can yield a result up to 26 bits ( $1024 \times 16$ -bit results), which can be left or right shifted. When right shifting is selected, it is rounded to the nearest value using the least significant bits left apart by the shifting, before being transferred into the `ADC_DR` data register.

The [Table 226](#) gives a numerical example of the processing, from a raw 26-bit accumulated data to the final 16-bit result.

**Figure 226. 16-bit result oversampling with 10-bits right shift and rounding**

There are no changes for conversion timings in oversampled mode: the sample time is maintained equal during the whole oversampling sequence. A new data is provided every  $N$  conversions, with an equivalent delay equal to  $N \times T_{\text{CONV}} = N \times (t_{\text{SMPL}} + t_{\text{SAR}})$ . The flags are set as follow:

- the end of the sampling phase (EOSMP) is set after each sampling phase
- the end of conversion (EOC) occurs once every  $N$  conversions, when the oversampled result is available
- the end of sequence (EOS) occurs once the sequence of oversampled data is completed (i.e. after  $N \times$  sequence length conversions total)

### Single ADC operating modes support when oversampling

In oversampling mode, most of the ADC operating modes are maintained:

- Single or continuous mode conversions
- ADC conversions start either by software or with triggers
- ADC stop during a conversion (abort)
- Data read via CPU or DMA with overrun detection
- Low-power modes (AUTDLY)
- Programmable resolution: in this case, the reduced conversion values (as per RES[2:0] bits in ADC\_CFGR register) are accumulated, truncated, rounded and shifted in the same way as 16-bit conversions are

*Note: The alignment mode is not available when working with oversampled data. The data are always provided right-aligned.*

*Offset correction is not supported in oversampling mode. When ROVSE and/or JOVSE bit is set, the value of the OFFSETy\_EN bit in ADC\_OFRy register is ignored (considered as reset).*

### Analog watchdog

The analog watchdog functionality is maintained (AWDSGL and AWDEN bits), with the following difference:

- the RES[2:0] bits are ignored, comparison is always done on using the full 26-bit values HTRx[25:0] and LTRx[25:0]
- the comparison is performed on the oversampled accumulated value before shifting

*Note: Care must be taken when using high shifting values, this will reduce the comparison range. For instance, if the oversampled result is shifted by 4 bits, thus yielding a 12-bit data right-aligned, the effective analog watchdog comparison can only be performed on 8 bits. The comparison is done between ADC\_DR[11:4] and HT[0:7] / LT[[0:7], and HT[11:8] / LT[11:8] must be kept reset.*

### Triggered mode

The averager can also be used for basic filtering purpose. Although not a very powerful filter (slow roll-off and limited stop band attenuation), it can be used as a notch filter to reject constant parasitic frequencies (typically coming from the mains or from a switched mode power supply). For this purpose, a specific discontinuous mode can be enabled with TROVS bit in ADC\_CFGR2, to be able to have an oversampling frequency defined by a user and independent from the conversion time itself.

The [Figure 227](#) below shows how conversions are started in response to triggers during discontinuous mode.

If the TROVS bit is set, the content of the DISCEN bit is ignored and considered as 1.

**Figure 227. Triggered regular oversampling mode (TROVS bit = 1)**

MS34455V2

### Injected and regular sequencer management when oversampling

In oversampling mode, it is possible to have differentiated behavior for injected and regular sequencers. The oversampling can be enabled for both sequencers with some limitations if they have to be used simultaneously (this is related to a unique accumulation unit).

#### Oversampling regular channels only

The regular oversampling mode bit ROVSM defines how the regular oversampling sequence is resumed if it is interrupted by injected conversion:

- in continued mode, the accumulation re-starts from the last valid data (prior to the conversion abort request due to the injected trigger). This ensures that oversampling will be completed whatever the injection frequency (providing at least one regular conversion can be completed between triggers);
- in resumed mode, the accumulation re-starts from 0 (previous conversions results are ignored). This mode allows to guarantee that all data used for oversampling were converted back-to-back within a single timeslot. Care must be taken to have a injection trigger period above the oversampling period length. If this condition is not respected, the oversampling cannot be completed and the regular sequencer will be blocked.

The [Figure 228](#) gives examples for a 4x oversampling ratio.

Figure 228. Regular oversampling modes (4x ratio)

### Oversampling Injected channels only

The Injected oversampling mode bit JOVSE enables oversampling solely for conversions in the injected sequencer.

### Oversampling regular and Injected channels

It is possible to have both ROVSE and JOVSE bits set. In this case, the regular oversampling mode is forced to resumed mode (ROVSM bit ignored), as represented on [Figure 229](#) below.

Figure 229. Regular and injected oversampling modes used simultaneously

### Triggered regular oversampling with injected conversions

It is possible to have triggered regular mode with injected conversions. In this case, the injected mode oversampling mode must be disabled, and the ROVS<sub>M</sub> bit is ignored (resumed mode is forced). The JOVSE bit must be reset. The behavior is represented on [Figure 230](#) below.

**Figure 230. Triggered regular oversampling with injection**

### Auto-injected mode

It is possible to oversample auto-injected sequences and have all conversions results stored in registers to save a DMA resource. This mode is available only with both regular and injected oversampling active: JAUTO = 1, ROVSE = 1 and JOVSE = 1, other combinations are not supported. The ROVSM bit is ignored in auto-injected mode. The [Figure 231](#) below shows how the conversions are sequenced.

**Figure 231. Oversampling in auto-injected mode**

It is possible to have also the triggered mode enabled, using the TROVS bit. In this case, the ADC must be configured as following: JAUTO=1, DISCEN=0, JDISCEN=0, ROVSE=1, JOVSE=1 and TROVSE=1.

### Dual ADC modes support when oversampling

It is possible to have oversampling enabled when working in dual ADC configuration, for the injected simultaneous mode and regular simultaneous mode. In this case, the two ADCs must be programmed with the very same settings (including oversampling).

All other dual ADC modes are not supported when either regular or injected oversampling is enabled (ROVSE = 1 or JOVSE = 1).

### Combined modes summary

The [Table 195](#) below summarizes all combinations, including modes not supported.

**Table 195. Oversampler operating modes summary**

| Regular Over-sampling<br>ROVSE | Injected Over-sampling<br>JOVSE | Oversampler mode<br>ROVSM<br>0 = continued<br>1 = resumed | Triggered Regular mode<br>TROVS | Comment                           |
|--------------------------------|---------------------------------|-----------------------------------------------------------|---------------------------------|-----------------------------------|
| 1                              | 0                               | 0                                                         | 0                               | Regular continued mode            |
| 1                              | 0                               | 0                                                         | 1                               | Not supported                     |
| 1                              | 0                               | 1                                                         | 0                               | Regular resumed mode              |
| 1                              | 0                               | 1                                                         | 1                               | Triggered regular resumed mode    |
| 1                              | 1                               | 0                                                         | X                               | Not supported                     |
| 1                              | 1                               | 1                                                         | 0                               | Injected and regular resumed mode |
| 1                              | 1                               | 1                                                         | 1                               | Not supported                     |
| 0                              | 1                               | X                                                         | X                               | Injected oversampling             |

### 29.4.32 Dual ADC modes

In devices with two ADCs or more, dual ADC modes can be used (see [Figure 232](#)):

- ADC1 and ADC2 can be used together in dual mode (ADC1 is master)

In dual ADC mode the start of conversion is triggered alternately or simultaneously by the ADCx master to the ADC slave, depending on the mode selected by the bits DUAL[4:0] in the ADC\_CCR register.

Four possible modes are implemented:

- Injected simultaneous mode
- Regular simultaneous mode
- Interleaved mode
- Alternate trigger mode

It is also possible to use these modes combined in the following ways:

- Injected simultaneous mode + Regular simultaneous mode
- Regular simultaneous mode + Alternate trigger mode
- Injected simultaneous mode + Interleaved mode

In dual ADC mode (when bits DUAL[4:0] in ADC\_CCR register are not equal to zero), the bits CONT, AUTDLY, DISCEN, DISCNUM[2:0], JDISCEN, JQM, JAUTO of the ADC\_CFGR register are shared between the master and slave ADC: the bits in the slave ADC are always equal to the corresponding bits of the master ADC.

To start a conversion in dual mode, the user must program the bits EXTEN, EXTSEL, JEXTEN, JEXTSEL of the master ADC only, to configure a software or hardware trigger,

and a regular or injected trigger. (the bits EXTEN[1:0] and JEXTEN[1:0] of the slave ADC are don't care).

In regular simultaneous or interleaved modes: once the user sets bit ADSTART or bit ADSTP of the master ADC, the corresponding bit of the slave ADC is also automatically set. However, bit ADSTART or bit ADSTP of the slave ADC is not necessary cleared at the same time as the master ADC bit.

In injected simultaneous or alternate trigger modes: once the user sets bit JADSTART or bit JADSTP of the master ADC, the corresponding bit of the slave ADC is also automatically set. However, bit JADSTART or bit JADSTP of the slave ADC is not necessary cleared at the same time as the master ADC bit.

In dual ADC mode, the converted data of the master and slave ADC can be read in parallel, by reading the ADC common data register (ADC\_CDR). The status bits can be also read in parallel by reading the dual-mode status register (ADC\_CSR).

**Figure 232. Dual ADC block diagram<sup>(1)</sup>**

1. External triggers also exist on slave ADC but are not shown for the purposes of this diagram.
2. The ADC common data register (ADC\_CDR) contains both the master and slave ADC regular converted data.

### Injected simultaneous mode

This mode is selected by programming bits DUAL[4:0]=00101

This mode converts an injected group of channels. The external trigger source comes from the injected group multiplexer of the master ADC (selected by the JEXTSEL[4:0] bits in the ADC\_JSQR register).

**Note:** *Do not convert the same channel on the two ADCs (no overlapping sampling times for the two ADCs when converting the same channel).*

*In simultaneous mode, one must convert sequences with the same length and inside a sequence, the N-th conversion in master and slave must be configured with the same sampling time.*

*Regular conversions can be performed on one or all ADCs. In that case, they are independent of each other and are interrupted when an injected event occurs. They are resumed at the end of the injected conversion group.*

- At the end of injected sequence of conversion event (JEOS) on the master ADC, the converted data is stored into the master ADC\_JDRy registers and a JEOS interrupt is generated (if enabled)
- At the end of injected sequence of conversion event (JEOS) on the slave ADC, the converted data is stored into the slave ADC\_JDRy registers and a JEOS interrupt is generated (if enabled)
- If the duration of the master injected sequence is equal to the duration of the slave injected one (like in [Figure 233](#)), it is possible for the software to enable only one of the two JEOS interrupt (ex: master JEOS) and read both converted data (from master ADC\_JDRy and slave ADC\_JDRy registers).

**Figure 233. Injected simultaneous mode on 4 channels: dual ADC mode**

If JDISCEN=1, each simultaneous conversion of the injected sequence requires an injected trigger event to occur.

This mode can be combined with AUTDLY mode:

- Once a simultaneous injected sequence of conversions has ended, a new injected trigger event is accepted only if both JEOS bits of the master and the slave ADC have been cleared (delay phase). Any new injected trigger events occurring during the ongoing injected sequence and the associated delay phase are ignored.
- Once a regular sequence of conversions of the master ADC has ended, a new regular trigger event of the master ADC is accepted only if the master data register (ADC\_DR) has been read. Any new regular trigger events occurring for the master ADC during the ongoing regular sequence and the associated delay phases are ignored. There is the same behavior for regular sequences occurring on the slave ADC.

### Regular simultaneous mode with independent injected

This mode is selected by programming bits DUAL[4:0] = 00110.

This mode is performed on a regular group of channels. The external trigger source comes from the regular group multiplexer of the master ADC (selected by the EXTSEL[4:0] bits in the ADC\_CFGR register). A simultaneous trigger is provided to the slave ADC.

In this mode, independent injected conversions are supported. An injection request (either on master or on the slave) will abort the current simultaneous conversions, which are re-started once the injected conversion is completed.

**Note:** *Do not convert the same channel on the two ADCs (no overlapping sampling times for the two ADCs when converting the same channel).*

*In regular simultaneous mode, one must convert sequences with the same length and inside a sequence, the N-th conversion in master and slave must be configured with the same sampling time.*

Software is notified by interrupts when it can read the data:

- At the end of each conversion event (EOC) on the master ADC, a master EOC interrupt is generated (if EOCIE is enabled) and software can read the ADC\_DR of the master ADC.
- At the end of each conversion event (EOC) on the slave ADC, a slave EOC interrupt is generated (if EOCIE is enabled) and software can read the ADC\_DR of the slave ADC.
- If the duration of the master regular sequence is equal to the duration of the slave one (like in [Figure 234](#)), it is possible for the software to enable only one of the two EOC interrupt (ex: master EOC) and read both converted data from the Common Data register (ADC\_CDR).

It is also possible to read the regular data using the DMA. Two methods are possible:

- Using two DMA channels (one for the master and one for the slave). In this case bits DAMDF[1:0] must be kept cleared.
  - Configure the DMA master ADC channel to read ADC\_DR from the master. DMA requests are generated at each EOC event of the master ADC.
  - Configure the DMA slave ADC channel to read ADC\_DR from the slave. DMA requests are generated at each EOC event of the slave ADC.
- Configuring Dual ADC mode data format DAMDF[1:0] bits, which leaves one DMA channel free for other uses:
  - Configure DAMDF[1:0]=0b10 or 0b11 (depending on resolution).
  - A single DMA channel is used (the one of the master). Configure the DMA master ADC channel to read the common ADC register (ADC\_CDR)
  - A single DMA request is generated each time both master and slave EOC events have occurred. At that time, the slave ADC converted data is available in the upper half-word of the ADC\_CDR 32-bit register and the master ADC converted data is available in the lower half-word of ADC\_CCR register.
  - both EOC flags are cleared when the DMA reads the ADC\_CCR register.

**Note:** *When DAMDF[1:0]=0b10 or 0b11, the user must program the same number of conversions in the master's sequence as in the slave's sequence. Otherwise, the remaining conversions will not generate a DMA request.*

**Figure 234. Regular simultaneous mode on 16 channels: dual ADC mode**

If DISCEN=1 then each “n” simultaneous conversions of the regular sequence require a regular trigger event to occur (“n” is defined by DISCNUM).

This mode can be combined with AUTDLY mode:

- Once a simultaneous conversion of the sequence has ended, the next conversion in the sequence is started only if the common data register, ADC\_CDR (or the regular data register of the master ADC) has been read (delay phase).
- Once a simultaneous regular sequence of conversions has ended, a new regular trigger event is accepted only if the common data register (ADC\_CDR) has been read (delay phase). Any new regular trigger events occurring during the ongoing regular sequence and the associated delay phases are ignored.

It is possible to use the DMA to handle data in regular simultaneous mode combined with AUTDLY mode, assuming that multi-DMA mode is used: bits DAMDF must be set to 0b10 or 0b11.

When regular simultaneous mode is combined with AUTDLY mode, it is mandatory for the user to ensure that:

- The number of conversions in the master’s sequence is equal to the number of conversions in the slave’s.
- For each simultaneous conversions of the sequence, the length of the conversion of the slave ADC is inferior to the length of the conversion of the master ADC. Note that the length of the sequence depends on the number of channels to convert and the sampling time and the resolution of each channels.

**Note:** *This combination of regular simultaneous mode and AUTDLY mode is restricted to the use case when only regular channels are programmed: it is forbidden to program injected channels in this combined mode.*

### Interleaved mode with independent injected

This mode is selected by programming bits DUAL[4:0] = 00111.

This mode can be started only on a regular group (usually one channel). The external trigger source comes from the regular channel multiplexer of the master ADC.

After an external trigger occurs:

- The master ADC starts immediately.
- The slave ADC starts after a delay of several-ADC clock cycles after the sampling phase of the master ADC has complete.

The minimum delay which separates 2 conversions in interleaved mode is configured in the DELAY bits in the ADC\_CCR register. This delay starts to count after the end of the sampling phase of the master conversion. This way, an ADC cannot start a conversion if the

complementary ADC is still sampling its input (only one ADC can sample the input signal at a given time).

- The minimum possible DELAY is 1 to ensure that there is at least one cycle time between the opening of the analog switch of the master ADC sampling phase and the closing of the analog switch of the slave ADC sampling phase.
- The maximum DELAY is equal to the number of cycles corresponding to the selected resolution. However the user must properly calculate this delay to ensure that an ADC does not start a conversion while the other ADC is still sampling its input.

If the CONT bit is set on both master and slave ADCs, the selected regular channels of both ADCs are continuously converted.

The software is notified by interrupts when it can read the data at the end of each conversion event (EOC) on the slave ADC. A slave and master EOC interrupts are generated (if EOCIE is enabled) and the software can read the ADC\_DR of the slave/master ADC.

**Note:** *It is possible to enable only the EOC interrupt of the slave and read the common data register (ADC\_CDR). But in this case, the user must ensure that the duration of the conversions are compatible to ensure that inside the sequence, a master conversion is always followed by a slave conversion before a new master conversion restarts. It is recommended to use the MDMA mode.*

It is also possible to have the regular data transferred by DMA. In this case, individual DMA requests on each ADC cannot be used and it is mandatory to use the MDMA mode, as following:

- Configure DAMDF[1:0]=0b10 or 0b11 (depending on resolution).
- A single DMA channel is used (the one of the master). Configure the DMA master ADC channel to read the common ADC register (ADC\_CDR).
- A single DMA request is generated each time both master and slave EOC events have occurred. At that time, the slave ADC converted data is available in the upper half-word of the ADC\_CDR 32-bit register and the master ADC converted data is available in the lower half-word of ADC\_CCR register.
- Both EOC flags are cleared when the DMA reads the ADC\_CCR register.

**Figure 235. Interleaved mode on 1 channel in continuous conversion mode: dual ADC mode**

**Figure 236. Interleaved mode on 1 channel in single conversion mode: dual ADC mode**

If DISCEN=1, each “n” simultaneous conversions (“n” is defined by DISCNUM) of the regular sequence require a regular trigger event to occur.

In this mode, injected conversions are supported. When injection is done (either on master or on slave), both the master and the slave regular conversions are aborted and the sequence is re-started from the master (see [Figure 237](#) below).

**Figure 237. Interleaved conversion with injection**

### Alternate trigger mode

This mode is selected by programming bits DUAL[4:0] = 01001.

This mode can be started only on an injected group. The source of external trigger comes from the injected group multiplexer of the master ADC.

This mode is only possible when selecting hardware triggers: JEXTEN must not be 0x0.

**Injected discontinuous mode disabled (JDISCEN=0 for both ADC)**

1. When the 1st trigger occurs, all injected master ADC channels in the group are converted.
2. When the 2nd trigger occurs, all injected slave ADC channels in the group are converted.
3. And so on.

A JEOS interrupt, if enabled, is generated after all injected channels of the master ADC in the group have been converted.

A JEOS interrupt, if enabled, is generated after all injected channels of the slave ADC in the group have been converted.

JEOC interrupts, if enabled, can also be generated after each injected conversion.

If another external trigger occurs after all injected channels in the group have been converted then the alternate trigger process restarts by converting the injected channels of the master ADC in the group.

**Figure 238. Alternate trigger: injected group of each ADC****Note:**

Regular conversions can be enabled on one or all ADCs. In this case the regular conversions are independent of each other. A regular conversion is interrupted when the ADC has to perform an injected conversion. It is resumed when the injected conversion is finished.

The time interval between 2 trigger events must be greater than or equal to 1 ADC clock period. The minimum time interval between 2 trigger events that start conversions on the same ADC is the same as in the single ADC mode.

### Injected discontinuous mode enabled (JDISCEN=1 for both ADC)

If the injected discontinuous mode is enabled for both master and slave ADCs:

- When the 1st trigger occurs, the first injected channel of the master ADC is converted.
- When the 2nd trigger occurs, the first injected channel of the slave ADC is converted.
- And so on.

A JEOS interrupt, if enabled, is generated after all injected channels of the master ADC in the group have been converted.

A JEOS interrupt, if enabled, is generated after all injected channels of the slave ADC in the group have been converted.

JEOS interrupts, if enabled, can also be generated after each injected conversions.

If another external trigger occurs after all injected channels in the group have been converted then the alternate trigger process restarts.

**Figure 239. Alternate trigger: 4 injected channels (each ADC) in discontinuous mode**

### Combined regular/injected simultaneous mode

This mode is selected by programming bits DUAL[4:0] = 00001.

It is possible to interrupt the simultaneous conversion of a regular group to start the simultaneous conversion of an injected group.

**Note:** *The sequences must be converted with the same length, the N-th conversion in master and slave mode must be configured with the same sampling time inside a given sequence, or the interval between triggers has to be longer than the long conversion time of the 2 sequences. If the above conditions are not respected, the ADC with the shortest sequence may restart while the ADC with the longest sequence is completing the previous conversions.*

### Combined regular simultaneous + alternate trigger mode

This mode is selected by programming bits DUAL[4:0]=00010.

It is possible to interrupt the simultaneous conversion of a regular group to start the alternate trigger conversion of an injected group. [Figure 240](#) shows the behavior of an alternate trigger interrupting a simultaneous regular conversion.

The injected alternate conversion is immediately started after the injected event. If a regular conversion is already running, in order to ensure synchronization after the injected

conversion, the regular conversion of all (master/slave) ADCs is stopped and resumed synchronously at the end of the injected conversion.

**Note:** *The sequences must be converted with the same length, the N-th conversion in master and slave mode must be configured with the same sampling time inside a given sequence, or the interval between triggers has to be longer than the long conversion time of the 2 sequences. If the above conditions are not respected, the ADC with the shortest sequence may restart while the ADC with the longest sequence is completing the previous conversions.*

**Figure 240. Alternate + regular simultaneous**

If a trigger occurs during an injected conversion that has interrupted a regular conversion, the alternate trigger is served. [Figure 241](#) shows the behavior in this case (note that the 6th trigger is ignored because the associated alternate conversion is not complete).

**Figure 241. Case of trigger occurring during injected conversion**

### Combined injected simultaneous plus interleaved

This mode is selected by programming bits DUAL[4:0]=00011.

It is possible to interrupt an interleaved conversion with a simultaneous injected event.

In this case the interleaved conversion is interrupted immediately and the simultaneous injected conversion starts. At the end of the injected sequence the interleaved conversion is resumed. When the interleaved regular conversion resumes, the first regular conversion which is performed is always the master's one. [Figure 242](#), [Figure 243](#) and [Figure 244](#) show the behavior using an example.

**Caution:** In this mode, it is mandatory to use the Common Data Register to read the regular data with a single read access. On the contrary, master-slave data coherency is not guaranteed.

Figure 242. Interleaved single channel CH0 with injected sequence CH11, CH12

Figure 243. Two Interleaved channels (CH1, CH2) with injected sequence CH11, CH12 - case 1: Master interrupted first

Figure 244. Two Interleaved channels (CH1, CH2) with injected sequence CH11, CH12 - case 2: Slave interrupted first

### DMA requests in dual ADC mode

In all dual ADC modes, it is possible to use two DMA channels (one for the master, one for the slave) to transfer the data, like in single mode (refer to [Figure 245: DMA Requests in regular simultaneous mode when DAMDF=0b00](#)).

**Figure 245. DMA Requests in regular simultaneous mode when DAMDF=0b00**

In simultaneous regular and interleaved modes, it is also possible to save one DMA channel and transfer both data using a single DMA channel. For this DAMDF bits must be configured in the ADC\_CCR register:

- DAMDF=0b10, 32-bit format:** A single DMA request is generated alternatively when either the master or slave EOC events have occurred. At that time, the data items are alternatively available in the ADC\_CDR2 32-bit register. This mode is used in interleaved mode and in regular simultaneous mode when resolution is above 16-bit.  
**Example:**  
 Interleaved dual mode: a DMA request is generated each time a new 32-bit data is available:  
 1st DMA request: ADC\_CDR2[31:0] = MST\_ADC\_DR[31:0]  
 2nd DMA request: ADC\_CDR2[31:0] = SLV\_ADC\_DR[31:0]
- DAMDF=0b10, 16-bit format:** A single DMA request is generated each time both master and slave EOC events have occurred. At that time, two data items are available and the 32-bit register ADC\_CDR contains the two half-words representing two ADC-

converted data items. The slave ADC data take the upper half-word and the master ADC data take the lower half-word.

This mode is used in interleaved mode and in regular simultaneous mode when resolution is ranging from 10 to 16-bit. Any value above 16-bit in the master or the slave converter will be truncated to the least 16 significant bits.

**Example:**

Interleaved dual mode: a DMA request is generated each time 2 data items are available:

1st DMA request:  $\text{ADC\_CDR}[31:0] = \text{SLV\_ADC\_DR}[15:0] \mid \text{MST\_ADC\_DR}[15:0]$

2nd DMA request:  $\text{ADC\_CDR}[31:0] = \text{SLV\_ADC\_DR}[15:0] \mid \text{MST\_ADC\_DR}[15:0]$

**Figure 246. DMA requests in regular simultaneous mode when DAMDF=0b10**

**Figure 247. DMA requests in interleaved mode when DAMDF=0b10**

**Note:** *When using Multi ADC mode, the user must take care to configure properly the duration of the master and slave conversions so that a DMA request is generated and served for reading both data (master + slave) before a new conversion is available.*

- **DAMDF=0b11:** This mode is similar to the DAMDF=0b10. The only differences are that on each DMA request (two data items are available), two bytes representing two ADC converted data items are transferred as a half-word.

This mode is used in interleaved and regular simultaneous mode when the result is 8-bit. A new DMA request is issued when 4 new 8-bit values are available.

**Example:**

Interleaved dual mode: a DMA request is generated each time 4 data items are available (t0, t1,... are corresponding to the consecutive sampling instants)

1st DMA request:

ADC\_CDR[7:0] = MST\_ADC\_DR[7:0]<sub>t0</sub>

ADC\_CDR[15:8] = SLV\_ADC\_DR[7:0]<sub>t0</sub>

ADC\_CDR[23:16] = MST\_ADC\_DR[7:0]<sub>t1</sub>

ADC\_CDR[31:24] = SLV\_ADC\_DR[7:0]<sub>t1</sub>

2nd DMA request:

ADC\_CDR[7:0] = MST\_ADC\_DR[7:0]<sub>t2</sub>

ADC\_CDR[15:8] = SLV\_ADC\_DR[7:0]<sub>t2</sub>

ADC\_CDR[23:16] = MST\_ADC\_DR[7:0]<sub>t3</sub>

ADC\_CDR[31:24] = SLV\_ADC\_DR[7:0]<sub>t3</sub>

### Overrun detection

In dual ADC mode (when DUAL[4:0] is not equal to b00000), if an overrun is detected on one of the ADCs, the DMA requests are no longer issued to ensure that all the data transferred to the RAM are valid (this behavior occurs whatever the DAMDF configuration). It may happen that the EOC bit corresponding to one ADC remains set because the data register of this ADC contains valid data.

### DMA one shot mode/ DMA circular mode when Multi ADC mode is selected

When DAMDF mode is selected (0b10 or 0b11), bit DMNGT[1:0]=0b10 in the master ADC's ADC\_CCR register must also be configured to select between DMA one shot mode and circular mode, as explained in section [Section : Managing conversions using the DMA](#).

### Stopping the conversions in dual ADC modes

The user must set the control bits ADSTP/JADSTP of the master ADC to stop the conversions of both ADC in dual ADC mode. The other ADSTP control bit of the slave ADC has no effect in dual ADC mode.

Once both ADC are effectively stopped, the bits ADSTART/JADSTART of the master and slave ADCs are both cleared by hardware.

### DFSDM mode in dual ADC mode interleaved mode

In dual ADC interleaved modes, the ADC conversion results can be transferred directly to the Digital Filter for Sigma Delta Modulators (DFSDM).

This mode is enabled by setting the bits DMNGT[1:0] = 0b10 in the master ADC's ADC\_CFGR register.

The ADC transfers alternatively the 16 least significant bits of the regular data register from the master and the slave converter to a single channel of the DFSDM.

The data format must be 16-bit signed:

ADC\_DR[31:16] = 0x0000

ADC\_DR[15] = sign

ADC\_DR[14:0] = data

Any value above 16-bit signed format in any converter will be truncated.

### DFSDM mode in dual ADC simultaneous mode

The dual mode is not required to use DFSDM in dual ADC simultaneous mode since conversion data will be treated by each individual channel. Single mode with same trigger source results in simultaneous conversion with DFSDM interface.

## 29.4.33 Temperature sensor

The temperature sensor can measure the junction temperature ( $T_J$ ) of the device in the  $-40$  to  $125$  °C temperature range.

The temperature sensor is internally connected to an ADC internal channel which is used to convert the sensor's output voltage to a digital value (refer to *Table ADC interconnection* in [Section 29.4.2: ADC pins and internal signals](#)). The sampling time for the temperature sensor's analog pin must be greater than the stabilization time specified in the product datasheet.

When not in use, the sensor can be put in power-down mode.

[Figure 248](#) shows the block diagram of the temperature sensor.

**Figure 248. Temperature sensor channel block diagram**

**Note:** The TSEN bit must be set to enable the conversion of the corresponding ADC internal channel (temperature sensor,  $V_{SENSE}$ ).

## Reading the temperature

To use the sensor:

1. Select the ADC input channels (with the appropriate sampling time).
2. Program with the appropriate sampling time (refer to electrical characteristics section of the device datasheet).
3. Set the TSEN bit in the ADCx\_CCR register to wake up the temperature sensor from power-down mode.
4. Start the ADC conversion.
5. Read the resulting  $V_{SENSE}$  data in the ADC data register.
6. Calculate the actual temperature using the following formula:

$$\text{Temperature (in } ^\circ\text{C)} = \frac{110\text{ }^\circ\text{C} - 30\text{ }^\circ\text{C}}{\text{TS\_CAL2} - \text{TS\_CAL1}} \times (\text{TS\_DATA} - \text{TS\_CAL1}) + 30\text{ }^\circ\text{C}$$

Where:

- TS\_CAL2 is the temperature sensor calibration value acquired at 110°C
  - TS\_CAL1 is the temperature sensor calibration value acquired at 30°C
  - TS\_DATA is the actual temperature sensor output value converted by ADC
- Refer to the device datasheet for more information about TS\_CAL1 and TS\_CAL2 calibration points.

*Note: The sensor has a startup time after waking from power-down mode before it can output  $V_{SENSE}$  at the correct level. The ADC also has a startup time after power-on, so to minimize the delay, the ADEN and SENSEN bits should be set at the same time.*

### 29.4.34 $V_{BAT}$ supply monitoring

The VBATEN bit of the ADC\_CCR register is used to switch to the battery voltage. As the  $V_{BAT}$  voltage could be higher than  $V_{DDA}$ , to ensure the correct operation of the ADC, the  $V_{BAT}$  pin is internally connected to a bridge divider by 4. This bridge is automatically enabled when VBATEN is set, to connect  $V_{BAT}/4$  to an ADC input channel (refer to *Table ADC interconnection* in [Section 29.4.2: ADC pins and internal signals](#)).

As a consequence, the converted digital value is one fourth of the  $V_{BAT}$  voltage. To prevent any unwanted consumption on the battery, it is recommended to enable the bridge divider only when needed, for ADC conversion.

Refer to the electrical characteristics of the device datasheet for the sampling time value to be applied when converting the  $V_{BAT}/4$  voltage.

[Figure 249](#) shows the block diagram of the  $V_{BAT}$  sensing feature.

Figure 249.  $V_{BAT}$  channel block diagram

**Note:** The *VBATEN* bit in *ADC\_CCR* must be configured to enable the conversion of the corresponding ADC internal channel.

### 29.4.35 Monitoring the internal voltage reference

The internal voltage reference can be monitored to have a reference point for evaluating the ADC  $V_{REF+}$  voltage level.

The internal voltage reference is internally connected to an ADC input channel (refer to *Table ADC interconnection* in [Section 29.4.2: ADC pins and internal signals](#)).

The sampling time for this channel must be greater than the stabilization time specified in the product datasheet.

[Figure 249](#) shows the block diagram of the  $V_{REFINT}$  sensing feature.

Figure 250.  $V_{REFINT}$  channel block diagram

**Note:** The *VREFEN* bit of the *ADC\_CCR* register must be configured to enable the conversion of the corresponding ADC internal channel ( $V_{REFINT}$ ).

### Calculating the actual $V_{DDA}$ voltage using the internal reference voltage

The power supply voltage applied to the device may be subject to variations or not precisely known. When  $V_{DDA}$  is connected to  $V_{REF+}$ , it is possible to compute the actual  $V_{DDA}$  voltage using the embedded internal reference voltage ( $V_{REFINT}$ ).  $V_{REFINT}$  and its calibration data acquired by the ADC during the manufacturing process at  $V_{DDA} = 3.3\text{ V}$  can be used to evaluate the actual  $V_{DDA}$  voltage level.

The following formula gives the actual  $V_{DDA}$  voltage supplying the device:

$$V_{REF+} = 3.3\text{ V} \times V_{REFINT\_CAL} / V_{REFINT\_DATA}$$

Where:

- $V_{REFINT\_CAL}$  is the  $V_{REFINT}$  calibration value
- $V_{REFINT\_DATA}$  is the actual  $V_{REFINT}$  output value converted by ADC

### Converting a supply-relative ADC measurement to an absolute voltage value

The ADC is designed to deliver a digital value corresponding to the ratio between  $V_{REF+}$  and the voltage applied on the converted channel.

For most applications  $V_{DDA}$  value is unknown and ADC converted values are right-aligned. In this case, it is necessary to convert this ratio into a voltage independent from  $V_{DDA}$ :

$$V_{CHANNELx} = \frac{V_{REF+}}{FULL\_SCALE} \times ADC\_DATA$$

By replacing  $V_{REF+}$  by the formula provided above, the absolute voltage value is given by the following formula

$$V_{CHANNELx} = \frac{3.3\text{ V} \times V_{REFINT\_CAL} \times ADC\_DATA}{V_{REFINT\_DATA} \times FULL\_SCALE}$$

For applications where  $V_{DDA}$  is known and ADC converted values are right-aligned, the absolute voltage value can be obtained by using the following formula:

$$V_{CHANNELx} = \frac{V_{DDA}}{FULL\_SCALE} \times ADC\_DATA$$

Where:

- $V_{REFINT\_CAL}$  is the  $V_{REFINT}$  calibration value
- $ADC\_DATA$  is the value measured by the ADC on channel x (right-aligned)
- $V_{REFINT\_DATA}$  is the actual  $V_{REFINT}$  output value converted by the ADC
- $FULL\_SCALE$  is the maximum digital value of the ADC output. For example with 16-bit resolution, it will be  $2^{16} - 1 = 65535$  or with 8-bit resolution,  $2^8 - 1 = 255$ .

**Note:** *If ADC measurements are done using an output format other than 16-bit right-aligned, all the parameters must first be converted to a compatible format before the calculation is done.*

### 29.4.36 $V_{DDCORE}$ supply voltage monitoring

$V_{DDCORE}$  internal voltage can be monitored.  $V_{DDCORE}$  is internally connected to ADC2  $V_{INP}[14]$  input channel.

The sampling time for this channel must be greater than the stabilization time specified in the product datasheet.

Figure 251 shows the block diagram of the  $V_{DDCORE}$  sensing feature.

**Figure 251.  $V_{DDCORE}$  channel block diagram**

**Note:**  $VDDCOREEN$  bit of  $ADC2\_OR$  register must be set to enable  $ADC2 V_{INP}[14]$  conversion.

## 29.5 ADC interrupts

For each ADC, an interrupt can be generated:

- After ADC power-up, when the ADC is ready (flag  $ADRDY$ )
- On the end of any conversion for regular groups (flag  $EOC$ )
- On the end of a sequence of conversion for regular groups (flag  $EOS$ )
- On the end of any conversion for injected groups (flag  $JEOC$ )
- On the end of a sequence of conversion for injected groups (flag  $JEOS$ )
- When an analog watchdog detection occurs (flag  $AWD1$ ,  $AWD2$  and  $AWD3$ )
- When the end of sampling phase occurs (flag  $EOSMP$ )
- When the data overrun occurs ( $OV$  flag)
- When the injected sequence context queue overflows (flag  $JQOVF$ )

Separate interrupt enable bits are available for flexibility.

**Table 196. ADC interrupts per each ADC**

| Interrupt event                                     | Event flag | Enable control bit |
|-----------------------------------------------------|------------|--------------------|
| ADC ready                                           | $ADRDY$    | $ADRDYIE$          |
| End of conversion of a regular group                | $EOC$      | $EOCIE$            |
| End of sequence of conversions of a regular group   | $EOS$      | $EOSIE$            |
| End of conversion of a injected group               | $JEOC$     | $JEOCIE$           |
| End of sequence of conversions of an injected group | $JEOS$     | $JEOSIE$           |
| Analog watchdog 1 status bit is set                 | $AWD1$     | $AWD1IE$           |
| Analog watchdog 2 status bit is set                 | $AWD2$     | $AWD2IE$           |
| Analog watchdog 3 status bit is set                 | $AWD3$     | $AWD3IE$           |
| End of sampling phase                               | $EOSMP$    | $EOSMPIE$          |

Table 196. ADC interrupts (continued)per each ADC

| Interrupt event                  | Event flag | Enable control bit |
|----------------------------------|------------|--------------------|
| Overflow                         | OVR        | OVRIE              |
| Injected context queue overflows | JQOVF      | JQOVFIE            |

## 29.6 ADC registers (for each ADC)

Refer to [Section 1.2 on page 119](#) for a list of abbreviations used in register descriptions.

### 29.6.1 ADC interrupt and status register (ADC\_ISR)

Address offset: 0x00

Reset value: 0x0000 0000

|      |      |      |            |      |       |       |       |       |       |       |       |       |       |       |       |
|------|------|------|------------|------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|

| 15   | 14   | 13   | 12         | 11   | 10    | 9     | 8     | 7     | 6     | 5     | 4     | 3     | 2     | 1     | 0     |
| Res. | Res. | Res. | LDOR<br>DY | Res. | JQOVF | AWD3  | AWD2  | AWD1  | JEOS  | JEOC  | OVR   | EOS   | EOC   | EOSMP | ADRDY |
|      |      |      | r          |      | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 |

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **LDORDY**: ADC LDO output voltage ready bit

This bit is set and cleared by hardware. It indicates that the ADC internal LDO output is ready and that the ADC can be enabled or calibrated.

0: ADC LDO voltage regulator disabled

1: ADC LDO voltage regulator enabled

*Note:* Refer to [Section 29.3: ADC implementation](#) for the availability of the LDO regulator.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **JQOVF**: Injected context queue overflow

This bit is set by hardware when an Overflow of the Injected Queue of Context occurs. It is cleared by software writing 1 to it. Refer to [Section 29.4.22: Queue of context for injected conversions](#) for more information.

0: No injected context queue overflow occurred (or the flag event was already acknowledged and cleared by software)

1: Injected context queue overflow has occurred

Bit 9 **AWD3**: Analog watchdog 3 flag

This bit is set by hardware when the converted voltage crosses the values programmed in the fields LT3[7:0] and HT3[7:0] of ADC\_TR3 register. It is cleared by software writing 1 to it.

0: No analog watchdog 3 event occurred (or the flag event was already acknowledged and cleared by software)

1: Analog watchdog 3 event occurred

Bit 8 **AWD2**: Analog watchdog 2 flag

This bit is set by hardware when the converted voltage crosses the values programmed in the fields LT2[7:0] and HT2[7:0] of ADC\_TR2 register. It is cleared by software writing 1 to it.

0: No analog watchdog 2 event occurred (or the flag event was already acknowledged and cleared by software)

1: Analog watchdog 2 event occurred

**Bit 7 AWD1:** Analog watchdog 1 flag

This bit is set by hardware when the converted voltage crosses the values programmed in the fields LT1[11:0] and HT1[11:0] of ADC\_TR1 register. It is cleared by software, writing 1 to it.

0: No analog watchdog 1 event occurred (or the flag event was already acknowledged and cleared by software)

1: Analog watchdog 1 event occurred

**Bit 6 JEOS:** Injected channel end of sequence flag

This bit is set by hardware at the end of the conversions of all injected channels in the group. It is cleared by software writing 1 to it.

0: Injected conversion sequence not complete (or the flag event was already acknowledged and cleared by software)

1: Injected conversions complete

**Bit 5 JEOC:** Injected channel end of conversion flag

This bit is set by hardware at the end of each injected conversion of a channel when a new data is available in the corresponding ADC\_JDRy register. It is cleared by software writing 1 to it or by reading the corresponding ADC\_JDRy register

0: Injected channel conversion not complete (or the flag event was already acknowledged and cleared by software)

1: Injected channel conversion complete

**Bit 4 OVR:** ADC overrun

This bit is set by hardware when an overrun occurs on a regular channel, meaning that a new conversion has completed while the EOC flag was already set. It is cleared by software writing 1 to it.

0: No overrun occurred (or the flag event was already acknowledged and cleared by software)

1: Overrun has occurred

**Bit 3 EOS:** End of regular sequence flag

This bit is set by hardware at the end of the conversions of a regular sequence of channels. It is cleared by software writing 1 to it.

0: Regular Conversions sequence not complete (or the flag event was already acknowledged and cleared by software)

1: Regular Conversions sequence complete

**Bit 2 EOC:** End of conversion flag

This bit is set by hardware at the end of each regular conversion of a channel when a new data is available in the ADC\_DR register. It is cleared by software writing 1 to it or by reading the ADC\_DR register

0: Regular channel conversion not complete (or the flag event was already acknowledged and cleared by software)

1: Regular channel conversion complete

**Bit 1 EOSMP:** End of sampling flag

This bit is set by hardware during the conversion of any channel (only for regular channels), at the end of the sampling phase.

0: not at the end of the sampling phase (or the flag event was already acknowledged and cleared by software)

1: End of sampling phase reached

**Bit 0 ADRDY:** ADC ready

This bit is set by hardware after the ADC has been enabled (bit ADEN=1) and when the ADC reaches a state where it is ready to accept conversion requests.

It is cleared by software writing 1 to it.

0: ADC not yet ready to start conversion (or the flag event was already acknowledged and cleared by software)

1: ADC is ready to start conversion

## 29.6.2 ADC interrupt enable register (ADC\_IER)

Address offset: 0x04

Reset value: 0x0000 0000

|      |      |      |      |      |             |            |            |            |        |        |       |       |       |             |             |

|      |      |      |      |      | rw          | rw         | rw         | rw         | rw     | rw     | rw    | rw    | rw    | rw          | rw          |

Bits 31:11 Reserved, must be kept at reset value.

**Bit 10 JQOVFIE:** Injected context queue overflow interrupt enable

This bit is set and cleared by software to enable/disable the Injected Context Queue Overflow interrupt.

0: Injected Context Queue Overflow interrupt disabled

1: Injected Context Queue Overflow interrupt enabled. An interrupt is generated when the JQOVF bit is set.

*Note: The software is allowed to write this bit only when JADSTART=0 (which ensures that no injected conversion is ongoing).*

**Bit 9 AWD3IE:** Analog watchdog 3 interrupt enable

This bit is set and cleared by software to enable/disable the analog watchdog 2 interrupt.

0: Analog watchdog 3 interrupt disabled

1: Analog watchdog 3 interrupt enabled

*Note: The software is allowed to write this bit only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

**Bit 8 AWD2IE:** Analog watchdog 2 interrupt enable

This bit is set and cleared by software to enable/disable the analog watchdog 2 interrupt.

0: Analog watchdog 2 interrupt disabled

1: Analog watchdog 2 interrupt enabled

*Note: The software is allowed to write this bit only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

**Bit 7 AWD1IE:** Analog watchdog 1 interrupt enable

This bit is set and cleared by software to enable/disable the analog watchdog 1 interrupt.

0: Analog watchdog 1 interrupt disabled

1: Analog watchdog 1 interrupt enabled

*Note: The software is allowed to write this bit only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

**Bit 6 JEOSIE:** End of injected sequence of conversions interrupt enable

This bit is set and cleared by software to enable/disable the end of injected sequence of conversions interrupt.

0: JEOS interrupt disabled

1: JEOS interrupt enabled. An interrupt is generated when the JEOS bit is set.

*Note: The software is allowed to write this bit only when JADSTART=0 (which ensures that no injected conversion is ongoing).*

**Bit 5 JEOCIE:** End of injected conversion interrupt enable

This bit is set and cleared by software to enable/disable the end of an injected conversion interrupt.

0: JEOC interrupt disabled.

1: JEOC interrupt enabled. An interrupt is generated when the JEOC bit is set.

*Note: The software is allowed to write this bit only when JADSTART is cleared to 0 (no injected conversion is ongoing).*

**Bit 4 OVRIE:** Overrun interrupt enable

This bit is set and cleared by software to enable/disable the Overrun interrupt of a regular conversion.

0: Overrun interrupt disabled

1: Overrun interrupt enabled. An interrupt is generated when the OVR bit is set.

*Note: The software is allowed to write this bit only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

**Bit 3 EOSIE:** End of regular sequence of conversions interrupt enable

This bit is set and cleared by software to enable/disable the end of regular sequence of conversions interrupt.

0: EOS interrupt disabled

1: EOS interrupt enabled. An interrupt is generated when the EOS bit is set.

*Note: The software is allowed to write this bit only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

**Bit 2 EOCIE:** End of regular conversion interrupt enable

This bit is set and cleared by software to enable/disable the end of a regular conversion interrupt.

0: EOC interrupt disabled.

1: EOC interrupt enabled. An interrupt is generated when the EOC bit is set.

*Note: The software is allowed to write this bit only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

**Bit 1 EOSMPIE:** End of sampling flag interrupt enable for regular conversions

This bit is set and cleared by software to enable/disable the end of the sampling phase interrupt for regular conversions.

0: EOSMP interrupt disabled.

1: EOSMP interrupt enabled. An interrupt is generated when the EOSMP bit is set.

*Note: The software is allowed to write this bit only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

**Bit 0 ADRDYIE:** ADC ready interrupt enable

This bit is set and cleared by software to enable/disable the ADC Ready interrupt.

0: ADRDY interrupt disabled

1: ADRDY interrupt enabled. An interrupt is generated when the ADRDY bit is set.

*Note: The software is allowed to write this bit only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

### 29.6.3 ADC control register (ADC\_CR)

Address offset: 0x08

Reset value: 0x2000 0000

#### Bit 31 ADCAL: ADC calibration

This bit is set by software to start the calibration of the ADC. Program first the bit ADCALDIF to determine if this calibration applies for single-ended or differential inputs mode.

It is cleared by hardware after calibration is complete.

0: Calibration complete

1: Write 1 to calibrate the ADC. Read at 1 means that a calibration in progress.

*Note: The software is allowed to launch a calibration by setting ADCAL only when ADEN=0.*

*The software is allowed to update the calibration factor by writing ADC\_CALFACT only when ADEN=1 and ADSTART=0 and JADSTART=0 (ADC enabled and no conversion is ongoing)*

#### Bit 30 ADCALDIF: Differential mode for calibration

This bit is set and cleared by software to configure the single-ended or differential inputs mode for the calibration.

0: Writing ADCAL will launch a calibration in Single-ended inputs Mode.

1: Writing ADCAL will launch a calibration in Differential inputs Mode.

*Note: The software is allowed to write this bit only when the ADC is disabled and is not calibrating (ADCAL=0, JADSTART=0, JADSTP=0, ADSTART=0, ADSTP=0, ADDIS=0 and ADEN=0).*

#### Bit 29 DEEPPWD: Deep-power-down enable

This bit is set and cleared by software to put the ADC in deep-power-down mode.

0: ADC not in deep-power down

1: ADC in deep-power-down (default reset state)

*Note: The software is allowed to write this bit only when the ADC is disabled (ADCAL=0, JADSTART=0, JADSTP=0, ADSTART=0, ADSTP=0, ADDIS=0 and ADEN=0).*

#### Bit 28 ADVREGEN: ADC voltage regulator enable

This bits is set by software to enable the ADC voltage regulator.

Before performing any operation such as launching a calibration or enabling the ADC, the ADC voltage regulator must first be enabled and the software must wait for the regulator start-up time.

0: ADC Voltage regulator disabled

1: ADC Voltage regulator enabled.

For more details about the ADC voltage regulator enable and disable sequences, refer to [Section 29.4.6: ADC deep-power-down mode \(DEEPPWD\) and ADC voltage regulator \(ADVREGEN\)](#).

The software can program this bitfield only when the ADC is disabled (ADCAL=0, JADSTART=0, ADSTART=0, ADSTP=0, ADDIS=0 and ADEN=0).

**Bit 27 LINCALRDYW6:** Linearity calibration ready Word 6

This control / status bit allows to read/write the 6th linearity calibration factor.

When the linearity calibration is complete, this bit is set. A bit clear will launch the transfer of the linearity factor 6 into the LINCALFACT[29:0] of the ADC\_CALFACT2 register. The bit will be reset by hardware when the ADC\_CALFACT2 register can be read (software must poll the bit until it is cleared).

When the LINCALRDYW6 bit is reset, a new linearity factor 6 value can be written into the LINCALFACT[29:0] of the ADC\_CALFACT2 register. A bit set will launch the linearity factor 6 update and the bit will be effectively set by hardware once the update will be done (software must poll the bit until it is set to indicate the write is effective).

**Note:** ADC\_CALFACT2[29:10] contains 0. ADC\_CALFACT2[9:0] corresponds linearity correction factor bits[159:150].

*The software is allowed to toggle this bit only if the LINCALRDYW5, LINCALRDYW4, LINCALRDYW3, LINCALRDYW2 and LINCALRDYW1 bits are left unchanged, see chapter 29.4.8: Calibration (ADCAL, ADCALDIF, ADCALLIN, ADC\_CALFACT) for details.*

*The software is allowed to update the linearity calibration factor by writing LINCALRDYWx only when ADEN=1 and ADSTART=0 and JADSTART=0 (ADC enabled and no conversion is ongoing)*

**Bit 26 LINCALRDYW5:** Linearity calibration ready Word 5

Refer to LINCALRDYW6 description.

**Note:** ADC\_CALFACT2[29:0] corresponds linearity correction factor bits[149:120].

*The software is allowed to toggle this bit only if the LINCALRDYW6, LINCALRDYW5, LINCALRDYW3, LINCALRDYW2 and LINCALRDYW1 bits are left unchanged.*

**Bit 25 LINCALRDYW4:** Linearity calibration ready Word 4

Refer to LINCALRDYW6 description.

**Note:** ADC\_CALFACT2[29:0] correspond linearity correction factor bits[119:90].

*The software is allowed to toggle this bit only if the LINCALRDYW6, LINCALRDYW5, LINCALRDYW3, LINCALRDYW2 and LINCALRDYW1 bits are left unchanged.*

**Bit 24 LINCALRDYW3:** Linearity calibration ready Word 3

Refer to LINCALRDYW6 description.

**Note:** ADC\_CALFACT2[29:0] corresponds linearity correction factor bits[89:60].

*The software is allowed to toggle this bit only if the LINCALRDYW6, LINCALRDYW5, LINCALRDYW4, LINCALRDYW2 and LINCALRDYW1 bits are left unchanged.*

**Bit 23 LINCALRDYW2:** Linearity calibration ready Word 2

Refer to LINCALRDYW6 description.

**Note:** ADC\_CALFACT2[29:0] corresponds linearity correction factor bits[59:30].

*The software is allowed to toggle this bit only if the LINCALRDYW6, LINCALRDYW5, LINCALRDYW4, LINCALRDYW3 and LINCALRDYW1 bits are left unchanged.*

**Bit 22 LINCALRDYW1:** Linearity calibration ready Word 1

Refer to LINCALRDYW6 description.

**Note:** ADC\_CALFACT2[29:0] corresponds linearity correction factor bits[29:0].

*The software is allowed to toggle this bit only if the LINCALRDYW6, LINCALRDYW5, LINCALRDYW4, LINCALRDYW3 and LINCALRDYW2 bits are left unchanged.*

Bits 21:17 Reserved, must be kept at reset value.

**Bit 16 ADCALLIN:** Linearity calibration

This bit is set and cleared by software to enable the Linearity calibration.

0: Writing ADCAL will launch a calibration without the Linearity calibration.

1: Writing ADCAL will launch a calibration with the Linearity calibration.

*Note: The software is allowed to write this bit only when the ADC is disabled and is not calibrating (ADCAL=0, JADSTART=0, JADSTP=0, ADSTART=0, ADSTP=0, ADDIS=0 and ADEN=0).*

Bits 15:9 Reserved, must be kept at reset value.

**Bit 8 BOOST:** Boost mode control

This bit is set and cleared by software to enable/disable the Boost mode.

0: Boost mode off. Used when ADC clock < 20 MHz to save power at lower clock frequency.

1: Boost mode on. Must be used when ADC clock > 20 MHz.

*Note: The software is allowed to write this bit only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

*When dual mode is enabled (bits DAMDF of ADC\_CCR register are not equal to zero), the bit BOOST of the slave ADC is no more writable and its content must be equal to the master ADC BOOST bit.*

Bits 7:6 Reserved, must be kept at reset value.

**Bit 5 JADSTP:** ADC stop of injected conversion command

This bit is set by software to stop and discard an ongoing injected conversion (JADSTP Command). It is cleared by hardware when the conversion is effectively discarded and the ADC injected sequence and triggers can be re-configured. The ADC is then ready to accept a new start of injected conversions (JADSTART command).

0: No ADC stop injected conversion command ongoing

1: Write 1 to stop injected conversions ongoing. Read 1 means that an ADSTP command is in progress.

*Note: The software is allowed to set JADSTP only when JADSTART=1 and ADDIS=0 (ADC is enabled and eventually converting an injected conversion and there is no pending request to disable the ADC).*

*In auto-injection mode (JAUTO=1), setting ADSTP bit aborts both regular and injected conversions (do not use JADSTP)*

**Bit 4 ADSTP:** ADC stop of regular conversion command

This bit is set by software to stop and discard an ongoing regular conversion (ADSTP Command).

It is cleared by hardware when the conversion is effectively discarded and the ADC regular sequence and triggers can be re-configured. The ADC is then ready to accept a new start of regular conversions (ADSTART command).

0: No ADC stop regular conversion command ongoing

1: Write 1 to stop regular conversions ongoing. Read 1 means that an ADSTP command is in progress.

*Note: The software is allowed to set ADSTP only when ADSTART=1 and ADDIS=0 (ADC is enabled and eventually converting a regular conversion and there is no pending request to disable the ADC).*

*In auto-injection mode (JAUTO=1), setting ADSTP bit aborts both regular and injected conversions (do not use JADSTP).*

*In dual ADC regular simultaneous mode and interleaved mode, the bit ADSTP of the master ADC must be used to stop regular conversions. The other ADSTP bit is inactive.*

**Bit 3 JADSTART:** ADC start of injected conversion

This bit is set by software to start ADC conversion of injected channels. Depending on the configuration bits JEXTEN, a conversion will start immediately (software trigger configuration) or once an injected hardware trigger event occurs (hardware trigger configuration).

It is cleared by hardware:

- in single conversion mode when software trigger is selected (JEXTSEL=0x0): at the assertion of the End of Injected Conversion Sequence (JEOS) flag.
- in all cases: after the execution of the JADSTP command, at the same time that JADSTP is cleared by hardware.

0: No ADC injected conversion is ongoing.

1: Write 1 to start injected conversions. Read 1 means that the ADC is operating and eventually converting an injected channel.

*Note: The software is allowed to set JADSTART only when ADEN=1 and ADDIS=0 (ADC is enabled and there is no pending request to disable the ADC).*

*In auto-injection mode (JAUTO=1), regular and auto-injected conversions are started by setting bit ADSTART (JADSTART must be kept cleared)*

**Bit 2 ADSTART:** ADC start of regular conversion

This bit is set by software to start ADC conversion of regular channels. Depending on the configuration bits EXTEN, a conversion will start immediately (software trigger configuration) or once a regular hardware trigger event occurs (hardware trigger configuration).

It is cleared by hardware:

- in single conversion mode (CONT=0, DISCEN=0) when software trigger is selected (EXTEN=0x0): at the assertion of the End of Regular Conversion Sequence (EOS) flag.
- In discontinuous conversion mode (CONT=0, DISCEN=1), when the software trigger is selected (EXTEN=0x0): at the end of conversion (EOC) flag.
- in all other cases: after the execution of the ADSTP command, at the same time that ADSTP is cleared by hardware.

0: No ADC regular conversion is ongoing.

1: Write 1 to start regular conversions. Read 1 means that the ADC is operating and eventually converting a regular channel.

*Note: The software is allowed to set ADSTART only when ADEN=1 and ADDIS=0 (ADC is enabled and there is no pending request to disable the ADC)*

*In auto-injection mode (JAUTO=1), regular and auto-injected conversions are started by setting bit ADSTART (JADSTART must be kept cleared)*

**Bit 1 ADDIS:** ADC disable command

This bit is set by software to disable the ADC (ADDIS command) and put it into power-down state (OFF state).

It is cleared by hardware once the ADC is effectively disabled (ADEN is also cleared by hardware at this time).

0: no ADDIS command ongoing

1: Write 1 to disable the ADC. Read 1 means that an ADDIS command is in progress.

*Note: The software is allowed to set ADDIS only when ADEN=1 and both ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing)*

**Bit 0 ADEN:** ADC enable control

This bit is set by software to enable the ADC. The ADC will be effectively ready to operate once the flag ADRDY has been set.

It is cleared by hardware when the ADC is disabled, after the execution of the ADDIS command.

0: ADC is disabled (OFF state)

1: Write 1 to enable the ADC.

*Note: The software is allowed to set ADEN only when all bits of ADC\_CR registers are 0 (ADCAL=0, JADSTART=0, ADSTART=0, ADSTP=0, ADDIS=0 and ADEN=0) except for bit ADVREGEN which must be 1 (and the software must have wait for the startup time of the voltage regulator)*

## 29.6.4 ADC configuration register (ADC\_CFGR)

Address offset: 0x0C

Reset value: 0x8000 0000

### Bit 31 JQDIS: Injected Queue disable

These bits are set and cleared by software to disable the Injected Queue mechanism:

0: Injected Queue enabled

1: Injected Queue disabled

*Note: The software is allowed to write this bit only when ADSTART=0 and JADSTART=0 (which ensures that no regular nor injected conversion is ongoing).*

*A set or reset of JQDIS bit causes the injected queue to be flushed and the JSQR register is cleared.*

### Bits 30:26 AWD1CH[4:0]: Analog watchdog 1 channel selection

These bits are set and cleared by software. They select the input channel to be guarded by the analog watchdog.

00000: ADC analog input channel-0 monitored by AWD1

00001: ADC analog input channel-1 monitored by AWD1

.....

10010: ADC analog input channel-19 monitored by AWD1

others: Reserved, must not be used

*Note: The channel selected by AWD1CH must be also selected into the SQRi or JSQRi registers.*

*The software is allowed to write these bits only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

### Bit 25 JAUTO: Automatic injected group conversion

This bit is set and cleared by software to enable/disable automatic injected group conversion after regular group conversion.

0: Automatic injected group conversion disabled

1: Automatic injected group conversion enabled

*Note: The software is allowed to write this bit only when ADSTART=0 and JADSTART=0 (which ensures that no regular nor injected conversion is ongoing).*

*When dual mode is enabled (DAMDF bits in ADC\_CCR register are not equal to zero), the bit JAUTO of the slave ADC is no more writable and its content is equal to the bit JAUTO of the master ADC.*

### Bit 24 JAWD1EN: Analog watchdog 1 enable on injected channels

This bit is set and cleared by software

0: Analog watchdog 1 disabled on injected channels

1: Analog watchdog 1 enabled on injected channels

*Note: The software is allowed to write this bit only when JADSTART=0 (which ensures that no injected conversion is ongoing).*

Bit 23 **AWD1EN**: Analog watchdog 1 enable on regular channels

This bit is set and cleared by software

0: Analog watchdog 1 disabled on regular channels

1: Analog watchdog 1 enabled on regular channels

*Note: The software is allowed to write this bit only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

Bit 22 **AWD1SGL**: Enable the watchdog 1 on a single channel or on all channels

This bit is set and cleared by software to enable the analog watchdog on the channel identified by the AWD1CH[4:0] bits or on all the channels

0: Analog watchdog 1 enabled on all channels

1: Analog watchdog 1 enabled on a single channel

*Note: The software is allowed to write this bit only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

Bit 21 **JQM**: JSQR queue mode

This bit is set and cleared by software.

It defines how an empty Queue is managed.

0: JSQR Mode 0: The Queue is never empty and maintains the last written configuration into JSQR.

1: JSQR Mode 1: The Queue can be empty and when this occurs, the software and hardware triggers of the injected sequence are both internally disabled just after the completion of the last valid injected sequence.

Refer to [Section 29.4.22: Queue of context for injected conversions](#) for more information.

*Note: The software is allowed to write this bit only when JADSTART=0 (which ensures that no injected conversion is ongoing).*

*When dual mode is enabled (DAMDF bits in ADC\_CCR register are not equal to zero), the bit JQM of the slave ADC is no more writable and its content is equal to the bit JQM of the master ADC.*

Bit 20 **JDISCEN**: Discontinuous mode on injected channels

This bit is set and cleared by software to enable/disable discontinuous mode on the injected channels of a group.

0: Discontinuous mode on injected channels disabled

1: Discontinuous mode on injected channels enabled

*Note: The software is allowed to write this bit only when JADSTART=0 (which ensures that no injected conversion is ongoing).*

*It is not possible to use both auto-injected mode and discontinuous mode simultaneously: the bits DISCEN and JDISCEN must be kept cleared by software when JAUTO is set.*

*When dual mode is enabled (bits DAMDF of ADC\_CCR register are not equal to zero), the bit JDISCEN of the slave ADC is no more writable and its content is equal to the bit JDISCEN of the master ADC.*

Bits 19:17 **DISCNUM[2:0]**: Discontinuous mode channel count

These bits are written by software to define the number of regular channels to be converted in discontinuous mode, after receiving an external trigger.

000: 1 channel

001: 2 channels

...

111: 8 channels

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

*When dual mode is enabled (DAMDF bits in ADC\_CCR register are not equal to zero), the bits DISCNUM[2:0] of the slave ADC are no more writable and their content is equal to the bits DISCNUM[2:0] of the master ADC.*

**Bit 16 DISCEN:** Discontinuous mode for regular channels

This bit is set and cleared by software to enable/disable Discontinuous mode for regular channels.

0: Discontinuous mode for regular channels disabled

1: Discontinuous mode for regular channels enabled

*Note: It is not possible to have both discontinuous mode and continuous mode enabled: it is forbidden to set both DISCEN=1 and CONT=1.*

*It is not possible to use both auto-injected mode and discontinuous mode simultaneously: the bits DISCEN and JDISCEN must be kept cleared by software when JAUTO is set.*

*The software is allowed to write this bit only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

*When dual mode is enabled (DAMDF bits in ADC\_CCR register are not equal to zero), the bit DISCEN of the slave ADC is no more writable and its content is equal to the bit DISCEN of the master ADC.*

**Bit 15** Reserved, must be kept at reset value.**Bit 14 AUTDLY:** Delayed conversion mode

This bit is set and cleared by software to enable/disable the Auto Delayed Conversion mode.

0: Auto-delayed conversion mode off

1: Auto-delayed conversion mode on

*Note: The software is allowed to write this bit only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

*When dual mode is enabled (DAMDF bits in ADC\_CCR register are not equal to zero), the bit AUTDLY of the slave ADC is no more writable and its content is equal to the bit AUTDLY of the master ADC.*

**Bit 13 CONT:** Single / continuous conversion mode for regular conversions

This bit is set and cleared by software. If it is set, regular conversion takes place continuously until it is cleared.

0: Single conversion mode

1: Continuous conversion mode

*Note: It is not possible to have both discontinuous mode and continuous mode enabled: it is forbidden to set both DISCEN=1 and CONT=1.*

*The software is allowed to write this bit only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

*When dual mode is enabled (DAMDF bits in ADC\_CCR register are not equal to zero), the bit CONT of the slave ADC is no more writable and its content is equal to the bit CONT of the master ADC.*

**Bit 12 OVRMOD:** Overrun Mode

This bit is set and cleared by software and configure the way data overrun is managed.

0: ADC\_DR register is preserved with the old data when an overrun is detected.

1: ADC\_DR register is overwritten with the last conversion result when an overrun is detected.

*Note: The software is allowed to write this bit only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

**Bits 11:10 EXTEN[1:0]:** External trigger enable and polarity selection for regular channels

These bits are set and cleared by software to select the external trigger polarity and enable the trigger of a regular group.

00: Hardware trigger detection disabled (conversions can be launched by software)

01: Hardware trigger detection on the rising edge

10: Hardware trigger detection on the falling edge

11: Hardware trigger detection on both the rising and falling edges

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

Bits 9:5 **EXTSEL[4:0]**: External trigger selection for regular group

These bits select the external event used to trigger the start of conversion of a regular group:

00000: Event 0  
00001: Event 1  
00010: Event 2  
00011: Event 3  
00100: Event 4  
00101: Event 5  
00110: Event 6  
00111: Event 7

...

11111: Event 31

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

Bits 4:2 **RES[2:0]**: Data resolution

These bits are written by software to select the resolution of the conversion.

000: 16 bits  
001: 14 bits  
010: 12 bits  
011: 10 bits  
100: 8 bits

Others: Reserved, must not be used.

*Note: The software is allowed to write these bits only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

Bits 1:0 **DMNGT[1:0]**: Data Management configuration

This bit is set and cleared by software to select how ADC interface output data are managed.

00: Regular conversion data stored in DR only  
01: DMA One Shot Mode selected  
10: DFSDM mode selected  
11: DMA Circular Mode selected

*Note: The software is allowed to write this bit only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

*In dual-ADC modes, this bit is not relevant and replaced by control bit DAMDF of the ADC\_CCR register.*

## 29.6.5 ADC configuration register 2 (ADC\_CFGR2)

Bits 31:28 **LSHIFT[3:0]**: Left shift factor

This bitfield is set and cleared by software to define the left shifting applied to the final result with or without oversampling.

0000: No left shift

0001: Shift left 1-bit

0010: Shift left 2-bits

0011: Shift left 3-bits

0100: Shift left 4-bits

0101: Shift left 5-bits

0110: Shift left 6-bits

0111: Shift left 7-bits

1000: Shift left 8-bits

1001: Shift left 9-bits

1010: Shift left 10-bits

1011: Shift left 11-bits

1100: Shift left 12-bits

1101: Shift left 13-bits

1110: Shift left 14-bits

1111: Shift left 15-bits

*Note: The software is allowed to write this bit only when ADSTART=0 (which ensures that no conversion is ongoing).*

Bits 27:26 Reserved, must be kept at reset value.

Bits 25:16 **OSVR[9:0]**: Oversampling ratio

This bitfield is set and cleared by software to define the oversampling ratio.

0: 1x (no oversampling)

1: 2x

2: 3x

...

1023: 1024x

*Note: The software is allowed to write this bit only when ADSTART=0 (which ensures that no conversion is ongoing).*

Bit 15 Reserved, must be kept at reset value.

Bit 14 **RSHIFT4**: Right-shift data after Offset 4 correction

Refer to RSHIFT1 description.

Bit 13 **RSHIFT3**: Right-shift data after Offset 3 correction

Refer to RSHIFT1 description

Bit 12 **RSHIFT2**: Right-shift data after Offset 2 correction

Refer to RSHIFT1 description

Bit 11 **RSHIFT1**: Right-shift data after Offset 1 correction

This bitfield is set and cleared by software to right-shift 1-bit data after offset1 correction. This bit can only be used for 8-bit and 16-bit data format (see [Section : Data register, data alignment and offset \(ADC\\_DR, ADC\\_JDRy, OFFSETy, OFFSETy\\_CH, OVSS, LSHIFT, RSHIFT, SSATE\)](#) for details).

0: Right-shifting disabled

1: Data is right-shifted 1-bit.

Bit 10 **ROVSM**: Regular Oversampling mode

This bit is set and cleared by software to select the regular oversampling mode.

0: Continued mode: When injected conversions are triggered, the oversampling is temporary stopped and continued after the injection sequence (oversampling buffer is maintained during injected sequence)

1: Resumed mode: When injected conversions are triggered, the current oversampling is aborted and resumed from start after the injection sequence (oversampling buffer is zeroed by injected sequence start)

*Note: The software is allowed to write this bit only when ADSTART=0 (which ensures that no conversion is ongoing).*

Bit 9 **TROVS**: Triggered Regular Oversampling

This bit is set and cleared by software to enable triggered oversampling

0: All oversampled conversions for a channel are done consecutively following a trigger

1: Each oversampled conversion for a channel needs a new trigger

*Note: The software is allowed to write this bit only when ADSTART=0 (which ensures that no conversion is ongoing).*

Bits 8:5 **OVSS[3:0]**: Oversampling right shift

This bitfield is set and cleared by software to define the right shifting applied to the raw oversampling result.

0000: No right shift

0001: Shift right 1-bit

0010: Shift right 2-bits

0011: Shift right 3-bits

0100: Shift right 4-bits

0101: Shift right 5-bits

0110: Shift right 6-bits

0111: Shift right 7-bits

1000: Shift right 8-bits

1001: Shift right 9-bits

1010: Shift right 10-bits

1011: Shift right 11-bits

Others: Reserved, must not be used.

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no conversion is ongoing).*

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **JOVSE**: Injected Oversampling Enable

This bit is set and cleared by software to enable injected oversampling.

0: Injected Oversampling disabled

1: Injected Oversampling enabled

*Note: The software is allowed to write this bit only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing)*

Bit 0 **ROVSE**: Regular Oversampling Enable

This bit is set and cleared by software to enable regular oversampling.

0: Regular Oversampling disabled

1: Regular Oversampling enabled

*Note: The software is allowed to write this bit only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing)*

## 29.6.6 ADC sample time register 1 (ADC\_SMPR1)

Address offset: 0x14

Reset value: 0x0000 0000

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:0 **SMP[9:0][2:0]**: Channel x sampling time selection (x = 0 to 9)

These bits are written by software to select the sampling time individually for each channel. During sample cycles, the channel selection bits must remain unchanged.

000: 1.5 ADC clock cycles

001: 2.5 ADC clock cycles

010: 8.5 ADC clock cycles

011: 16.5 ADC clock cycles

100: 32.5 ADC clock cycles

101: 64.5 ADC clock cycles
