Bits 31:30 Reserved, must be kept at reset value.

Bits 29:0 **SMP[19:10][2:0]**: Channel x sampling time selection (x = 10 to 19)

These bits are written by software to select the sampling time individually for each channel. During sampling cycles, the channel selection bits must remain unchanged.

000: 1.5 ADC clock cycles

001: 2.5 ADC clock cycles

010: 8.5 ADC clock cycles

011: 16.5 ADC clock cycles

100: 32.5 ADC clock cycles

101: 64.5 ADC clock cycles

110: 387.5 ADC clock cycles

111: 810.5 ADC clock cycles

*Note: The software is allowed to write these bits only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

### 29.6.8 ADC channel preselection register (ADC\_PCSEL)

Address offset: 0x1C

Reset value: 0x0000 0000

|              |              |              |              |              |              |            |            |            |            |            |            |             |             |             |             |

| rw           | rw           | rw           | rw           | rw           | rw           | rw         | rw         | rw         | rw         | rw         | rw         | rw          | rw          | rw          | rw          |

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 PCSEL[19:0]: Channel x ( $V_{INP[i]}$ ) pre selection ( $x = 0$  to 19)

These bits are written by software to pre select the input channel at IO instance to be converted.

0: Input Channel x ( $V_{in} x$ ) is not pre selected for conversion, the ADC conversion result with this channel shows wrong result.

1: Input Channel x ( $V_{in} x$ ) is pre selected for conversion

*Note: The software is allowed to write these bits only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

### 29.6.9 ADC watchdog threshold register 1 (ADC\_LTR1)

Address offset: 0x20

Reset value: 0x0000 0000

|            |      |      |      |      |      |             |    |    |    |    |    |    |    |    |    |
|------------|------|------|------|------|------|-------------|----|----|----|----|----|----|----|----|----|
| 31         | 30   | 29   | 28   | 27   | 26   | 25          | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res.       | Res. | Res. | Res. | Res. | Res. | LTR1[25:16] |    |    |    |    |    |    |    |    |    |
|            |      |      |      |      |      | rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14   | 13   | 12   | 11   | 10   | 9           | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| LTR1[15:0] |      |      |      |      |      |             |    |    |    |    |    |    |    |    |    |
| rw         | rw   | rw   | rw   | rw   | rw   | rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:0 LTR1[25:0]: Analog watchdog 1 lower threshold

These bits are written by software to define the lower threshold for the analog watchdog 1.

Refer to [Section 29.4.30: Analog window watchdog \(AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWD2CH, AWD3CH, AWD\\_HTRy, AWD\\_LTRy, AWDy\)](#)

*Note: The software is allowed to write these bits only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

### 29.6.10 ADC watchdog threshold register 1 (ADC\_HTR1)

Address offset: 0x24

Reset value: 0x03FF FFFF

|            |      |      |      |      |      |             |    |    |    |    |    |    |    |    |    |
|------------|------|------|------|------|------|-------------|----|----|----|----|----|----|----|----|----|
| 31         | 30   | 29   | 28   | 27   | 26   | 25          | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res.       | Res. | Res. | Res. | Res. | Res. | HTR1[25:16] |    |    |    |    |    |    |    |    |    |
|            |      |      |      |      |      | rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14   | 13   | 12   | 11   | 10   | 9           | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| HTR1[15:0] |      |      |      |      |      |             |    |    |    |    |    |    |    |    |    |
| rw         | rw   | rw   | rw   | rw   | rw   | rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:0 **HTR1[25:0]**: Analog watchdog 1 higher threshold

These bits are written by software to define the higher threshold for the analog watchdog 1.

Refer to [Section 29.4.30: Analog window watchdog \(AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWD2CH, AWD3CH, AWD\\_HTRy, AWD\\_LTRy, AWDy\)](#)

*Note: The software is allowed to write these bits only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

## 29.6.11 ADC regular sequence register 1 (ADC\_SQR1)

Address offset: 0x30

Reset value: 0x0000 0000

|          |      |      |          |      |          |    |    |      |          |      |      |        |    |      |        |
|----------|------|------|----------|------|----------|----|----|------|----------|------|------|--------|----|------|--------|
| 31       | 30   | 29   | 28       | 27   | 26       | 25 | 24 | 23   | 22       | 21   | 20   | 19     | 18 | 17   | 16     |
| Res.     | Res. | Res. | SQ4[4:0] |      |          |    |    | Res. | SQ3[4:0] |      |      |        |    | Res. | SQ2[4] |
|          |      |      | rw       | rw   | rw       | rw | rw |      | rw       | rw   | rw   | rw     | rw |      | rw     |
| 15       | 14   | 13   | 12       | 11   | 10       | 9  | 8  | 7    | 6        | 5    | 4    | 3      | 2  | 1    | 0      |
| SQ2[3:0] |      |      |          | Res. | SQ1[4:0] |    |    |      |          | Res. | Res. | L[3:0] |    |      |        |
| rw       | rw   | rw   | rw       |      | rw       | rw | rw | rw   | rw       |      |      | rw     | rw | rw   | rw     |

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **SQ4[4:0]**: 4th conversion in regular sequence

These bits are written by software with the channel number (0..19) assigned as the 4th in the regular conversion sequence.

Bit 23 Reserved, must be kept at reset value.

Bits 22:18 **SQ3[4:0]**: 3rd conversion in regular sequence

These bits are written by software with the channel number (0..19) assigned as the 3rd in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

Bit 17 Reserved, must be kept at reset value.

Bits 16:12 **SQ2[4:0]**: 2nd conversion in regular sequence

These bits are written by software with the channel number (0..19) assigned as the 2nd in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

Bit 11 Reserved, must be kept at reset value.

Bits 10:6 **SQ1[4:0]**: 1st conversion in regular sequence

These bits are written by software with the channel number (0..19) assigned as the 1st in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

Bits 5:4 Reserved, must be kept at reset value.

Bits 3:0 **L[3:0]**: Regular channel sequence length

These bits are written by software to define the total number of conversions in the regular channel conversion sequence.

0000: 1 conversion

0001: 2 conversions

...

1111: 16 conversions

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

## 29.6.12 ADC regular sequence register 2 (ADC\_SQR2)

Address offset: 0x34

Reset value: 0x0000 0000

|          |      |      |          |      |          |    |    |      |          |      |          |    |    |      |        |
|----------|------|------|----------|------|----------|----|----|------|----------|------|----------|----|----|------|--------|
| 31       | 30   | 29   | 28       | 27   | 26       | 25 | 24 | 23   | 22       | 21   | 20       | 19 | 18 | 17   | 16     |
| Res.     | Res. | Res. | SQ9[4:0] |      |          |    |    | Res. | SQ8[4:0] |      |          |    |    | Res. | SQ7[4] |
|          |      |      | rw       | rw   | rw       | rw | rw |      | rw       | rw   | rw       | rw | rw |      | rw     |
| 15       | 14   | 13   | 12       | 11   | 10       | 9  | 8  | 7    | 6        | 5    | 4        | 3  | 2  | 1    | 0      |
| SQ7[3:0] |      |      |          | Res. | SQ6[4:0] |    |    |      |          | Res. | SQ5[4:0] |    |    |      |        |
| rw       | rw   | rw   | rw       |      | rw       | rw | rw | rw   | rw       |      | rw       | rw | rw | rw   | rw     |

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **SQ9[4:0]**: 9th conversion in regular sequence

These bits are written by software with the channel number (0..19) assigned as the 9th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

Bit 23 Reserved, must be kept at reset value.

Bits 22:18 **SQ8[4:0]**: 8th conversion in regular sequence

These bits are written by software with the channel number (0..19) assigned as the 8th in the regular conversion sequence

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

Bit 17 Reserved, must be kept at reset value.

Bits 16:12 **SQ7[4:0]**: 7th conversion in regular sequence

These bits are written by software with the channel number (0..19) assigned as the 7th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

Bit 11 Reserved, must be kept at reset value.

Bits 10:6 **SQ6[4:0]**: 6th conversion in regular sequence

These bits are written by software with the channel number (0..19) assigned as the 6th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **SQ5[4:0]**: 5th conversion in regular sequence

These bits are written by software with the channel number (0..19) assigned as the 5th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

### 29.6.13 ADC regular sequence register 3 (ADC\_SQR3)

Address offset: 0x38

Reset value: 0x0000 0000

|           |      |      |           |      |           |    |    |      |           |      |           |    |    |      |         |

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **SQ14[4:0]**: 14th conversion in regular sequence

These bits are written by software with the channel number (0..19) assigned as the 14th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

Bit 23 Reserved, must be kept at reset value.

Bits 22:18 **SQ13[4:0]**: 13th conversion in regular sequence

These bits are written by software with the channel number (0..19) assigned as the 13th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

Bit 17 Reserved, must be kept at reset value.

Bits 16:12 **SQ12[4:0]**: 12th conversion in regular sequence

These bits are written by software with the channel number (0..19) assigned as the 12th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

Bit 11 Reserved, must be kept at reset value.

Bits 10:6 **SQ11[4:0]**: 11th conversion in regular sequence

These bits are written by software with the channel number (0..19) assigned as the 11th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **SQ10[4:0]**: 10th conversion in regular sequence

These bits are written by software with the channel number (0..19) assigned as the 10th in the regular conversion sequence.

*Note: The software is allowed to write these bits only when ADSTART=0 (which ensures that no regular conversion is ongoing).*

### 29.6.14 ADC regular sequence register 4 (ADC\_SQR4)

Address offset: 0x3C

Reset value: 0x0000 0000

Bits 31:0 **RDATA[31:0]**: Regular Data converted

These bits are read-only. They contain the conversion result from the last converted regular channel.  
The data are left- or right-aligned as described in [Section 29.4.27: Data management](#).

## 29.6.16 ADC injected sequence register (ADC\_JSQR)

Address offset: 0x4C

Reset value: 0x0000 0000

|           |      |           |    |    |      |           |             |    |              |    |      |           |         |    |    |
|-----------|------|-----------|----|----|------|-----------|-------------|----|--------------|----|------|-----------|---------|----|----|
| 31        | 30   | 29        | 28 | 27 | 26   | 25        | 24          | 23 | 22           | 21 | 20   | 19        | 18      | 17 | 16 |
| JSQ4[4:0] |      |           |    |    | Res. | JSQ3[4:0] |             |    |              |    | Res. | JSQ2[4:1] |         |    |    |
| rw        | rw   | rw        | rw | rw |      | rw        | rw          | rw | rw           | rw |      | rw        | rw      | rw | rw |
| 15        | 14   | 13        | 12 | 11 | 10   | 9         | 8           | 7  | 6            | 5  | 4    | 3         | 2       | 1  | 0  |
| JSQ2[0]   | Res. | JSQ1[4:0] |    |    |      |           | JEXTEN[1:0] |    | JEXTSEL[4:0] |    |      |           | JL[1:0] |    |    |
| rw        |      | rw        | rw | rw | rw   | rw        | rw          | rw | rw           | rw | rw   | rw        | rw      | rw |    |

Bits 31:27 **JSQ4[4:0]**: 4th conversion in the injected sequence

These bits are written by software with the channel number (0..19) assigned as the 4th in the injected conversion sequence.

*Note: The software is allowed to write these bits only when JADSTART is cleared to 0 (no injected conversion is ongoing) unless the context queue is enabled (JQDIS=0 in ADC\_CFGR register).*

Bit 26 Reserved, must be kept at reset value.

Bits 25:21 **JSQ3[4:0]**: 3rd conversion in the injected sequence

These bits are written by software with the channel number (0..19) assigned as the 3rd in the injected conversion sequence.

*Note: The software is allowed to write these bits only when JADSTART is cleared to 0 (no injected conversion is ongoing) unless the context queue is enabled (JQDIS=0 in ADC\_CFGR register).*

Bit 20 Reserved, must be kept at reset value.

Bits 19:15 **JSQ2[4:0]**: 2nd conversion in the injected sequence

These bits are written by software with the channel number (0..19) assigned as the 2nd in the injected conversion sequence.

*Note: The software is allowed to write these bits only when JADSTART is cleared to 0 (no injected conversion is ongoing) unless the context queue is enabled (JQDIS=0 in ADC\_CFGR register).*

Bit 14 Reserved, must be kept at reset value.

Bits 13:9 **JSQ1[4:0]**: 1st conversion in the injected sequence

These bits are written by software with the channel number (0..19) assigned as the 1st in the injected conversion sequence.

*Note: The software is allowed to write these bits only when JADSTART is cleared to 0 (no injected conversion is ongoing) unless the context queue is enabled (JQDIS=0 in ADC\_CFGR register).*

**Bits 8:7 JEXTEN[1:0]:** External trigger enable and polarity selection for injected channels

These bits are set and cleared by software to select the external trigger polarity and enable the trigger of an injected group.

00: If JQDIS=0 (queue enabled), Hardware and software trigger detection disabled and  
If JQDIS=1 (queue disabled), Hardware trigger detection disabled (conversions can be launched by software)

01: Hardware trigger detection on the rising edge

10: Hardware trigger detection on the falling edge

11: Hardware trigger detection on both the rising and falling edges

*Note: The software is allowed to write these bits only when JADSTART is cleared to 0 (no injected conversion is ongoing).*

*If JQM=1 and if the Queue of Context becomes empty, the software and hardware triggers of the injected sequence are both internally disabled (refer to [Section 29.4.22: Queue of context for injected conversions](#))*

**Bits 6:2 JEXTSEL[4:0]:** External trigger selection for injected group

These bits select the external event used to trigger the start of conversion of an injected group:

00000: Event 0

00001: Event 1

00010: Event 2

00011: Event 3

00100: Event 4

00101: Event 5

00110: Event 6

00111: Event 7

...

11111: Event 31:

*Note: The software is allowed to write these bits only when JADSTART is cleared to 0 (no injected conversion is ongoing).*

**Bits 1:0 JL[1:0]:** Injected channel sequence length

These bits are written by software to define the total number of conversions in the injected channel conversion sequence.

00: 1 conversion

01: 2 conversions

10: 3 conversions

11: 4 conversions

*Note: The software is allowed to write these bits only when JADSTART is cleared to 0 (no injected conversion is ongoing).*

## 29.6.17 ADC injected channel y offset register (ADC\_OFRy)

Address offset:  $0x60 + 0x04 * (y-1)$ , ( $y = 1$  to  $4$ )

Reset value: 0x0000 0000

|               |                 |    |    |    |    |                |    |    |    |    |    |    |    |    |    |
|---------------|-----------------|----|----|----|----|----------------|----|----|----|----|----|----|----|----|----|
| 31            | 30              | 29 | 28 | 27 | 26 | 25             | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SSATE         | OFFSETy_CH[4:0] |    |    |    |    | OFFSETy[25:16] |    |    |    |    |    |    |    |    |    |
| rW            | rW              | rW | rW | rW | rW | rW             | rW | rW | rW | rW | rW | rW | rW | rW | rW |
| 15            | 14              | 13 | 12 | 11 | 10 | 9              | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| OFFSETy[15:0] |                 |    |    |    |    |                |    |    |    |    |    |    |    |    |    |
| rW            | rW              | rW | rW | rW | rW | rW             | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bit 31 **SSATE**: Signed saturation Enable

This bit is written by software to enable or disable the Signed saturation feature.

This bit can be enabled only for 8-bit and 16-bit data format (see [Section : Data register, data alignment and offset \(ADC\\_DR, ADC\\_JDRy, OFFSETy, OFFSETy\\_CH, OVSS, LSHIFT, RSHIFT, SSATE\)](#) for details).

0: Offset is subtracted maintaining data integrity and extending result size (9-bit and 17-bit signed format).

1: Offset is subtracted and result is saturated to maintain result size.

*Note: The software is allowed to write this bit only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

Bits 30:26 **OFFSETy\_CH[4:0]**: Channel selection for the Data offset y

These bits are written by software to define the channel to which the offset programmed into bits OFFSETy[25:0] will apply.

*Note: The software is allowed to write these bits only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

Bits 25:0 **OFFSETy[25:0]**: Data offset y for the channel programmed into bits OFFSETy\_CH[4:0]

These bits are written by software to define the offset y to be subtracted from the raw converted data when converting a channel (can be regular or injected). The channel to which applies the data offset y must be programmed in the bits OFFSETy\_CH[4:0]. The conversion result can be read from in the ADC\_DR (regular conversion) or from in the ADC\_JDRyi registers (injected conversion).

When OFFSETy[25:0] bitfield is reset, the offset compensation is disabled.

*Note: The software is allowed to write these bits only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

*If several offset (OFFSETy) point to the same channel, only the offset with the lowest x value is considered for the subtraction.*

*Ex: if OFFSET1\_CH[4:0]=4 and OFFSET2\_CH[4:0]=4, this is OFFSET1[25:0] which is subtracted when converting channel 4.*

### 29.6.18 ADC injected channel y data register (ADC\_JDRy)

Address offset:  $0x80 + 0x04 * (y-1)$ , ( $y = 1$  to  $4$ )

Reset value: 0x0000 0000

|              |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| JDATA[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r            | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| JDATA[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r            | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **JDATA[31:0]**: Injected data

These bits are read-only. They contain the conversion result from injected channel y. The data are left -or right-aligned as described in [Section 29.4.27: Data management](#).

### 29.6.19 ADC analog watchdog 2 configuration register (ADC\_AWD2CR)

Address offset: 0xA0

Reset value: 0x0000 0000

|              |      |      |      |      |      |      |      |      |      |      |      |               |    |    |    |
|--------------|------|------|------|------|------|------|------|------|------|------|------|---------------|----|----|----|
| 31           | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19            | 18 | 17 | 16 |
| Res.         | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | AWD2CH[19:16] |    |    |    |
|              |      |      |      |      |      |      |      |      |      |      |      | rw            | rw | rw | rw |
| 15           | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3             | 2  | 1  | 0  |
| AWD2CH[15:0] |      |      |      |      |      |      |      |      |      |      |      |               |    |    |    |
| rw           | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw            | rw | rw | rw |

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **AWD2CH[19:0]**: Analog watchdog 2 channel selection

These bits are set and cleared by software. They enable and select the input channels to be guarded by the analog watchdog 2.

AWD2CH[i] = 0: ADC analog input channel-i is not monitored by AWD2

AWD2CH[i] = 1: ADC analog input channel-i is monitored by AWD2

When AWD2CH[19:0] = 000..0, the analog Watchdog 2 is disabled

*Note: The channels selected by AWD2CH must be also selected into the SQRI or JSQRI registers.*

*The software is allowed to write these bits only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

## 29.6.20 ADC analog watchdog 3 configuration register (ADC\_AWD3CR)

Address offset: 0xA4

Reset value: 0x0000 0000

|              |      |      |      |      |      |      |      |      |      |      |      |               |    |    |    |
|--------------|------|------|------|------|------|------|------|------|------|------|------|---------------|----|----|----|

| 15           | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3             | 2  | 1  | 0  |
| AWD3CH[15:0] |      |      |      |      |      |      |      |      |      |      |      |               |    |    |    |
| rw           | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw            | rw | rw | rw |

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **AWD3CH[19:0]**: Analog watchdog 3 channel selection

These bits are set and cleared by software. They enable and select the input channels to be guarded by the analog watchdog 3.

AWD3CH[i] = 0: ADC analog input channel-i is not monitored by AWD3

AWD3CH[i] = 1: ADC analog input channel-i is monitored by AWD3

When AWD3CH[19:0] = 000..0, the analog Watchdog 3 is disabled

*Note: The channels selected by AWD3CH must be also selected into the SQRi or JSQRi registers.*

*The software is allowed to write these bits only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

## 29.6.21 ADC watchdog lower threshold register 2 (ADC\_LTR2)

Address offset: 0xB0

Reset value: 0x0000 0000

|            |      |      |      |      |      |             |    |    |    |    |    |    |    |    |    |
|------------|------|------|------|------|------|-------------|----|----|----|----|----|----|----|----|----|
| 31         | 30   | 29   | 28   | 27   | 26   | 25          | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:0 **LTR2[25:0]**: Analog watchdog 2 lower threshold

These bits are written by software to define the lower threshold for the analog watchdog 2.

Refer to [Section 29.4.30: Analog window watchdog \(AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWD2CH, AWD3CH, AWD\\_HTRY, AWD\\_LTRY, AWdy\)](#).

*Note: The software is allowed to write these bits only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

## 29.6.22 ADC watchdog higher threshold register 2 (ADC\_HTR2)

Address offset: 0xB4

Reset value: 0x03FF FFFF

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:0 **HTR3[25:0]**: Analog watchdog 3 higher threshold

These bits are written by software to define the higher threshold for the analog watchdog 3.

Refer to [Section 29.4.30: Analog window watchdog \(AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWD2CH, AWD3CH, AWD\\_HTRy, AWD\\_LTRy, AWDy\)](#)

*Note: The software is allowed to write these bits only when ADSTART=0 and JADSTART=0 (which ensures that no conversion is ongoing).*

### 29.6.25 ADC differential mode selection register (ADC\_DIFSEL)

Address offset: 0xC0

Reset value: 0x0000 0000

|              |      |      |      |      |      |      |      |      |      |      |      |               |    |    |    |
|--------------|------|------|------|------|------|------|------|------|------|------|------|---------------|----|----|----|
| 31           | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19            | 18 | 17 | 16 |
| Res.         | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DIFSEL[19:16] |    |    |    |
|              |      |      |      |      |      |      |      |      |      |      |      | rW            | rW | rW | rW |
| 15           | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3             | 2  | 1  | 0  |
| DIFSEL[15:0] |      |      |      |      |      |      |      |      |      |      |      |               |    |    |    |
| rW           | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW            | rW | rW | rW |

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **DIFSEL[19:0]**: Differential mode for channels 19 to 0

These bits are set and cleared by software. They allow to select if a channel is configured as single ended or differential mode.

DIFSEL[i] = 0: ADC analog input channel-i is configured in single ended mode

DIFSEL[i] = 1: ADC analog input channel-i is configured in differential mode

*Note: The software is allowed to write these bits only when the ADC is disabled (ADCAL=0, JADSTART=0, JADSTP=0, ADSTART=0, ADSTP=0, ADDIS=0 and ADEN=0).*

## 29.6.26 ADC calibration factors register (ADC\_CALFACT)

Address offset: 0xC4

Reset value: 0x0000 0000

|      |      |      |      |      |                 |    |    |    |    |    |    |    |    |    |    |
|------|------|------|------|------|-----------------|----|----|----|----|----|----|----|----|----|----|
| 31   | 30   | 29   | 28   | 27   | 26              | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | CALFACT_D[10:0] |    |    |    |    |    |    |    |    |    |    |
|      |      |      |      |      | rW              | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |
| 15   | 14   | 13   | 12   | 11   | 10              | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Res. | Res. | Res. | Res. | Res. | CALFACT_S[10:0] |    |    |    |    |    |    |    |    |    |    |
|      |      |      |      |      | rW              | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 31:27 Reserved, must be kept at reset value.

Bits 26:16 **CALFACT\_D[10:0]**: Calibration Factors in differential mode

These bits are written by hardware or by software.

Once a differential inputs calibration is complete, they are updated by hardware with the calibration factors.

Software can write these bits with a new calibration factor. If the new calibration factor is different from the current one stored into the analog ADC, it will then be applied once a new differential conversion is launched.

*Note: The software is allowed to write these bits only when ADEN=1, ADSTART=0 and JADSTART=0 (ADC is enabled and no calibration is ongoing and no conversion is ongoing).*

Bits 15:11 Reserved, must be kept at reset value.

Bits 10:0 **CALFACT\_S[10:0]**: Calibration Factors In Single-Ended mode

These bits are written by hardware or by software.

Once a single-ended inputs calibration is complete, they are updated by hardware with the calibration factors.

Software can write these bits with a new calibration factor. If the new calibration factor is different from the current one stored into the analog ADC, it will then be applied once a new single-ended conversion is launched.

*Note: The software is allowed to write these bits only when ADEN=1, ADSTART=0 and JADSTART=0 (ADC is enabled and no calibration is ongoing and no conversion is ongoing).*

## 29.6.27 ADC calibration factor register 2 (ADC\_CALFACT2)

Address offset: 0xC8

Reset value: 0x0000 0000

|                  |      |                   |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------------|------|-------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31               | 30   | 29                | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res.             | Res. | LINCALFACT[29:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |
|                  |      | rW                | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |
| 15               | 14   | 13                | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| LINCALFACT[15:0] |      |                   |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW               | rW   | rW                | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:0 **LINCALFACT[29:0]**: Linearity Calibration Factor

These bits are written by hardware or by software.

They hold 30-bit out of the 160-bit linearity calibration factor.

Once a single-ended inputs calibration is complete, they are updated by hardware with the calibration factors.

Software can write these bits with a new calibration factor. If the new calibration factor is different from the current one stored into the analog ADC, it will then be applied once a new single-ended calibration is launched.

*Note: The software is allowed to write these bits only when ADEN=1, ADSTART=0 and JADSTART=0 (ADC is enabled and no calibration is ongoing and no conversion is ongoing).*

## 29.6.28 ADC2 option register (ADC2\_OR)

Address offset: 0xD0

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |           |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|-----------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16        |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.      |

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      | rw        |

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **VDDCOREEN**: V<sub>DDCORE</sub> enable bit

This bit can be set and cleared by software to control ADC2 channel 14.

0: V<sub>DDCORE</sub> channel disabled

1: V<sub>DDCORE</sub> channel enabled

## 29.7 ADC common registers

These registers define the control and status registers common to master and slave ADCs:

### 29.7.1 ADC common status register (ADC\_CSR)

Address offset: 0x00

Reset value: 0x0000 0000

The address offset is relative to the master ADC base address + 0x300.

This register provides an image of the status bits of the different ADCs. Nevertheless it is read-only and does not allow to clear the different status bits. Instead each status bit must be cleared by writing 0 to it in the corresponding ADC\_ISR register.

|      |      |      |      |      |               |              |              |              |              |              |             |             |             |               |               |

|      |      |      |      |      | r             | r            | r            | r            | r            | r            | r           | r           | r           | r             | r             |

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **JQOVF\_SLV**: Injected Context Queue Overflow flag of the slave ADC

This bit is a copy of the JQOVF bit in the corresponding ADCx+1\_ISR register.

Bit 25 **AWD3\_SLV**: Analog watchdog 3 flag of the slave ADC

This bit is a copy of the AWD3 bit in the corresponding ADCx+1\_ISR register.

Bit 24 **AWD2\_SLV**: Analog watchdog 2 flag of the slave ADC

This bit is a copy of the AWD2 bit in the corresponding ADCx+1\_ISR register.

Bit 23 **AWD1\_SLV**: Analog watchdog 1 flag of the slave ADC

This bit is a copy of the AWD1 bit in the corresponding ADCx+1\_ISR register.

Bit 22 **JEOS\_SLV**: End of injected sequence flag of the slave ADC

This bit is a copy of the JEOS bit in the corresponding ADCx+1\_ISR register.

Bit 21 **JEOC\_SLV**: End of injected conversion flag of the slave ADC

This bit is a copy of the JEOC bit in the corresponding ADCx+1\_ISR register.

Bit 20 **OVR\_SLV**: Overrun flag of the slave ADC

This bit is a copy of the OVR bit in the corresponding ADCx+1\_ISR register.

Bit 19 **EOS\_SLV**: End of regular sequence flag of the slave ADC

This bit is a copy of the EOS bit in the corresponding ADCx+1\_ISR register.

Bit 18 **EOC\_SLV**: End of regular conversion of the slave ADC

This bit is a copy of the EOC bit in the corresponding ADCx+1\_ISR register.

Bit 17 **EOSMP\_SLV**: End of Sampling phase flag of the slave ADC

This bit is a copy of the EOSMP2 bit in the corresponding ADCx+1\_ISR register.

Bit 16 **ADRDY\_SLV**: Slave ADC ready

This bit is a copy of the ADRDY bit in the corresponding ADCx+1\_ISR register.

Bits 15:11 Reserved, must be kept at reset value.

Bit 10 **JQOVF\_MST**: Injected Context Queue Overflow flag of the master ADC

This bit is a copy of the JQOVF bit in the corresponding ADC\_ISR register.

Bit 9 **AWD3\_MST**: Analog watchdog 3 flag of the master ADC

This bit is a copy of the AWD3 bit in the corresponding ADC\_ISR register.

Bit 8 **AWD2\_MST**: Analog watchdog 2 flag of the master ADC

This bit is a copy of the AWD2 bit in the corresponding ADC\_ISR register.

Bit 7 **AWD1\_MST**: Analog watchdog 1 flag of the master ADC

This bit is a copy of the AWD1 bit in the corresponding ADC\_ISR register.

Bit 6 **JEOS\_MST**: End of injected sequence flag of the master ADC

This bit is a copy of the JEOS bit in the corresponding ADC\_ISR register.

- Bit 5 **JEOC\_MST**: End of injected conversion flag of the master ADC  
This bit is a copy of the JEOC bit in the corresponding ADC\_ISR register.
- Bit 4 **OVR\_MST**: Overrun flag of the master ADC  
This bit is a copy of the OVR bit in the corresponding ADC\_ISR register.
- Bit 3 **EOS\_MST**: End of regular sequence flag of the master ADC  
This bit is a copy of the EOS bit in the corresponding ADC\_ISR register.
- Bit 2 **EOC\_MST**: End of regular conversion of the master ADC  
This bit is a copy of the EOC bit in the corresponding ADC\_ISR register.
- Bit 1 **EOSMP\_MST**: End of Sampling phase flag of the master ADC  
This bit is a copy of the EOSMP bit in the corresponding ADC\_ISR register.
- Bit 0 **ADRDY\_MST**: Master ADC ready  
This bit is a copy of the ADRDY bit in the corresponding ADC\_ISR register.

## 29.7.2 ADC common control register (ADC\_CCR)

Address offset: 0x08

Reset value: 0x0000 0000

The address offset is relative to the master ADC base address + 0x300.

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **VBATEN**: VBAT enable

This bit is set and cleared by software to control V<sub>BAT</sub> channel.

0: V<sub>BAT</sub> channel disabled

1: V<sub>BAT</sub> channel enabled

*Note: The software is allowed to write this bit only when the ADCs are disabled (ADCAL=0, JADSTART=0, ADSTART=0, ADSTP=0, ADDIS=0 and ADEN=0).*

Bit 23 **TSEN**: Temperature sensor voltage enable

This bit is set and cleared by software to control V<sub>SENSE</sub> channel.

0: Temperature sensor channel disabled

1: Temperature sensor channel enabled

*Note: The software is allowed to write this bit only when the ADCs are disabled (ADCAL=0, JADSTART=0, ADSTART=0, ADSTP=0, ADDIS=0 and ADEN=0).*

Bit 22 **VREFEN**: V<sub>REFINT</sub> enable

This bit is set and cleared by software to enable/disable the V<sub>REFINT</sub> channel.

0: V<sub>REFINT</sub> channel disabled

1: V<sub>REFINT</sub> channel enabled

*Note: The software is allowed to write this bit only when the ADCs are disabled (ADCAL=0, JADSTART=0, ADSTART=0, ADSTP=0, ADDIS=0 and ADEN=0).*

Bits 21:18 **PRESC[3:0]**: ADC prescaler

These bits are set and cleared by software to select the frequency of the clock to the ADC. The clock is common for all the ADCs.

0000: input ADC clock not divided  
 0001: input ADC clock divided by 2  
 0010: input ADC clock divided by 4  
 0011: input ADC clock divided by 6  
 0100: input ADC clock divided by 8  
 0101: input ADC clock divided by 10  
 0110: input ADC clock divided by 12  
 0111: input ADC clock divided by 16  
 1000: input ADC clock divided by 32  
 1001: input ADC clock divided by 64  
 1010: input ADC clock divided by 128  
 1011: input ADC clock divided by 256  
 Others: Reserved, must not be used

*Note:* The software is allowed to write these bits only when the ADC is disabled ( $ADCAL=0$ ,  $JADSTART=0$ ,  $ADSTART=0$ ,  $ADSTP=0$ ,  $ADDIS=0$  and  $ADEN=0$ ). The ADC prescaler value is applied only when  $CKMODE[1:0] = 0b00$ .

Bits 17:16 **CKMODE[1:0]**: ADC clock mode

These bits are set and cleared by software to define the ADC clock scheme (which is common to both master and slave ADCs):

00: CK\_ADCx (x=1 to 3) (Asynchronous clock mode), generated at product level (refer to *Section Reset and Clock Control (RCC)*)  
 01: adc\_hclk/1 (Synchronous clock mode). This configuration must be enabled only if the AHB clock prescaler is set to 1 ( $HPRE[3:0] = 0xxx$  in  $RCC\_CFGR$  register) and if the system clock has a 50% duty cycle.  
 10: adc\_hclk/2 (Synchronous clock mode)  
 11: adc\_hclk/4 (Synchronous clock mode)  
 In synchronous clock mode, there is no jitter in the delay from a timer trigger to the start of conversion.

*Note:* The software is allowed to write these bits only when the ADCs are disabled ( $ADCAL=0$ ,  $JADSTART=0$ ,  $ADSTART=0$ ,  $ADSTP=0$ ,  $ADDIS=0$  and  $ADEN=0$ ).

Bits 15:14 **DAMDF[1:0]**: Dual ADC Mode Data Format

This bit-field is set and cleared by software. It specifies the data format in the common data register  $ADC\_CDR$ .

00: Dual ADC mode without data packing ( $ADC\_CDR$  and  $ADC\_CDR2$  registers not used).  
 01: Reserved.  
 10: Data formatting mode for 32 down to 10-bit resolution  
 11: Data formatting mode for 8-bit resolution

*Note:* The software is allowed to write these bits only when  $ADSTART=0$  (which ensures that no regular conversion is ongoing).

## Bits 13:12 Reserved, must be kept at reset value.

Bits 11:8 **DELAY[3:0]**: Delay between 2 sampling phases

These bits are set and cleared by software. These bits are used in dual interleaved modes.  
Refer to [Table 197](#) for the value of ADC resolution versus DELAY bits values.

*Note: The software is allowed to write these bits only when the ADCs are disabled (ADCAL=0, JADSTART=0, ADSTART=0, ADSTP=0, ADDIS=0 and ADEN=0).*

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **DUAL[4:0]**: Dual ADC mode selection

These bits are written by software to select the operating mode.

All the ADCs are independent:

00000: Independent mode

The configurations 00001 to 01001 correspond to the following operating modes: Dual mode, master and slave ADCs working together:

00001: Combined regular simultaneous + injected simultaneous mode

00010: Combined regular simultaneous + alternate trigger mode

00011: Combined Interleaved mode + injected simultaneous mode

00100: Reserved.

00101: Injected simultaneous mode only

00110: Regular simultaneous mode only

00111: Interleaved mode only

01001: Alternate trigger mode only

All other combinations are reserved and must not be programmed

*Note: The software is allowed to write these bits only when the ADCs are disabled (ADCAL=0, JADSTART=0, ADSTART=0, ADSTP=0, ADDIS=0 and ADEN=0).*

**Table 197. DELAY bits versus ADC resolution**

| DELAY bits          | 16-bit resolution               | 14-bit resolution               | 12-bit resolution               | 10-bit resolution               | 8-bit resolution                |
|---------------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|

| others:<br>reserved | -                               | -                               | -                               | -                               | -                               |

### 29.7.3 ADC common regular data register for dual mode (ADC\_CDR)

Address offset: 0x0C

Reset value: 0x0000 0000

The address offset is relative to the master ADC base address + 0x300.

|                 |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31              | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| RDATA_SLV[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r               | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15              | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| RDATA_MST[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r               | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:16 **RDATA\_SLV[15:0]**: Regular data of the slave ADC

In dual mode, these bits contain the regular data of the slave ADC. Refer to [Section 29.4.32: Dual ADC modes](#).

The data alignment is applied as described in [Section : Data register, data alignment and offset \(ADC\\_DR, ADC\\_JDRy, OFFSETy, OFFSETy\\_CH, OVSS, LSHIFT, RSHIFT, SSATE\)](#)

Bits 15:0 **RDATA\_MST[15:0]**: Regular data of the master ADC.

In dual mode, these bits contain the regular data of the master ADC. Refer to [Section 29.4.32: Dual ADC modes](#).

The data alignment is applied as described in [Section : Data register, data alignment and offset \(ADC\\_DR, ADC\\_JDRy, OFFSETy, OFFSETy\\_CH, OVSS, LSHIFT, RSHIFT, SSATE\)](#)

In MDMA=0b11 mode, bits 15:8 contains SLV\_ADC\_DR[7:0], bits 7:0 contains MST\_ADC\_DR[7:0].

### 29.7.4 ADC common regular data register for 32-bit dual mode (ADC\_CDR2)

Address offset: 0x10

Reset value: 0x0000 0000

The address offset is relative to the master ADC base address + 0x300.

|                  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31               | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| RDATA_ALT[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r                | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15               | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| RDATA_ALT[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r                | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **RDATA\_ALT[31:0]**: Regular data of the master/slave alternated ADCs

In dual mode, these bits alternatively contains the regular 32-bit data of the master and the slave ADC. Refer to [Section 29.4.32: Dual ADC modes](#).

The data alignment is applied as described in [Section : Data register, data alignment and offset \(ADC\\_DR, ADC\\_JDRy, OFFSETy, OFFSETy\\_CH, OVSS, LSHIFT, RSHIFT, SSATE\)](#).

### 29.7.5 ADC hardware configuration register (ADC\_HWCFGR0)

Address offset: 0x3F0

Reset value: 0x0000 0082

|      |      |      |      |      |      |      |      |                |      |      |      |              |      |      |      |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **FIFO\_SIZE[3:0]**: FIFO size

1000: FIFO depth = 8 stages

Bits 3:0 **ADC\_NUM[3:0]**: Number of supported ADCs

0010: Two ADCs implemented

### 29.7.6 ADC version register (ADC\_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0031

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision

Major revision = 0x3

Bits 3:0 **MINREV[3:0]**: Minor revision

Minor revision = 0x1

### 29.7.7 ADC identification register (ADC\_IPIDR)

Address offset: 0x3F8

Reset value: 0x0011 0005

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| ID[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **ID[31:0]**: Peripheral identifier

These bits returns the ADC identifier.

ID[31:0]=0x0011 0005

## 29.7.8 ADC size identification register (ADC\_SIDR)

Address offset: 0x3FC

Reset value: 0xA3C5 DD01

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SID[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| SID[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **SID[31:0]**: Size Identification

These bits returns the size of the memory region allocated to ADC registers.

The side of the memory region is of 1 Kbyte.

0xA3C5 DD01 (1 Kbyte)

## 29.8 ADC register map

The following table summarizes the ADC registers.

**Table 198. ADC register map and reset values for each ADC (offset=0x000 for master ADC, 0x100 for slave ADC)**

| Offset | Register name | 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   | 15   | 14   | 13   | 12     | 11   | 10      | 9      | 8      | 7      | 6      | 5      | 4     | 3     | 2     | 1       | 0       |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 30 Digital temperature sensor (DTS)

### 30.1 Introduction

The device embeds a sensor that converts the temperature into a square wave which frequency is proportional to the temperature. The frequency is measured either with the PCLK or the LSE clock.

### 30.2 DTS main features

The temperature sensor block main features are the following:

- Start of measurement triggered by software or 4 hardware sources
- Programmable sampling time to increase temperature measurement precision
- Counter synchronized on LSE or PCLK clock
- Temperature watchdog on low and high threshold
- Interrupt generation when the temperature is lower or higher than predefined thresholds and at the end of measurement.
- Asynchronous wakeup signal generation when the temperature is higher/lower than a predefined threshold (LSE mode only)
- Quick measurement using LSE clock

### 30.3 DTS functional description

#### 30.3.1 DTS block diagram

The temperature sensor block diagram is shown in [Figure 252](#).

Figure 252. Temperature sensor functional block diagram

#### 30.3.2 DTS internal signals

Table 200. DTS internal input/output signals

| Signal name           | Signal type    | Description                  |
|-----------------------|----------------|------------------------------|
| <code>dts_lse</code>  | Digital input  | LSE clock                    |
| <code>dts_pclk</code> | Digital input  | APB clock                    |
| <code>dts_it</code>   | Digital output | Temperature sensor interrupt |
| <code>dts_wkup</code> | Digital output | Temperature sensor wakeup    |

### 30.3.3 DTS block operation

The analog part of the temperature sensor outputs a frequency that is proportional to the absolute temperature (CLK\_PTAT). The frequency measurement is based on the PCLK or the LSE clock.

Before each measurement, the temperature sensor performs a calibration of the frequency generation blocks.

### 30.3.4 Operating modes

Several operating modes can be selected by setting the REFCLK\_SEL bit in [Temperature sensor configuration register 1 \(DTS\\_CFGR1\)](#):

- PCLK only (REFCLK\_SEL = 0)  
The temperature sensor registers can be accessed. The interface can consequently be reconfigured and the measurement sequence is performed using PCLK clock
- PCLK and LSE (REFCLK\_SEL = 1)  
The temperature sensor registers can be accessed. The interface can consequently be reconfigured and the measurement sequence is performed using the LSE clock.
- LSE only (REFCLK\_SEL = 1) and PCLK OFF  
The registers cannot be accessed. The measurement can be performed using the LSE clock. This mode is used to exit from Sleep mode by using hardware triggers and the asynchronous interrupt line.

### 30.3.5 Calibration

The temperature sensor must run the calibration prior to any frequency measurement. The calibration is performed automatically when the temperature measurement is triggered except for quick measurement mode (Q\_MEAS\_OPT set to 1 in DTS\_CFGR1).

### 30.3.6 Prescaler

When a calibration is ongoing, the counter clock must be slower than 1 MHz. This is achieved by the PCLK clock prescaler embedded in the temperature sensor.

During the temperature measurement period, the prescaler is bypassed.

- When PCLK is used as reference clock (REFCLK\_SEL set to 0 in DTS\_CFGR1), a prescaler is used. Its division ratio must be configured up to 127 (refer to the HSREF\_CLK\_DIV[6:0] register definition for the divider setting).
- When LSE is used as reference clock (REFCLK\_SEL set to 1 in DTS\_CFGR1), the timebase is equal to 2 LSE periods. In this case, no prescaler is used.

### 30.3.7 Temperature measurement principles

The analog part of temperature sensor outputs a signal (CLK\_PTAT) which FM(T) frequency is temperature-dependent (typically 641 kHz).

Either PCLK or LSE can be selected as reference clock (REF\_CLK) through the REFCLK\_SEL bit in DTS\_CFGR1.

The counting method depends on the REF\_CLK frequency. This is due to the fact that two counters are implemented in the temperature sensor block:

- For low REF\_CLK frequencies, a counting of FM(T) cycles is performed during one or several REF\_CLK cycles.
- For high REF\_CLK frequencies, a counting of REF\_CLK cycles is performed during one or several FM(T) cycles.

This counter behavior is shown in [Figure 253](#) and [Figure 254](#).

**Figure 253. Method for low REF\_CLK frequencies**

1. To increase the precision, FM(T) measurement can be done on several LSE periods.

**Figure 254. Method for high REF\_CLK frequencies**

1. To increase the precision, PCLK measurement can be done on several FM(T) periods.

The counting result is stored in the DTS\_DR register (see [Temperature sensor data register \(DTS\\_DR\)](#)).

Once the FM(T) frequency has been obtained, the corresponding temperature can be calculated by software using the following formula:

- When PCLK is used:

$$T = T_0 + ((F_{PCLK} / TS1\_MFREQ) \times TS1\_SMP\_TIME - 100 \times TS1\_FMT0) / TS1\_RAMP\_COEFF$$

where

$T_0$  (factory calibration temperature) is equal to 30 °C.

$TS1\_FMT0$  is measured and stored in the DTS\_T0VALR1 register. It is expressed in hundreds of Hertz.

TS1\_RAMP\_COEFF is measured during tests in factory and stored in DTS\_RAMPVALR register. This value is expressed in Hz/°C.

- When the LSE clock is used

$$T = T_0 + ((F_{LSE} \times TS1\_MFREQ / TS1\_SMP\_TIME) - (100 \times TS1\_FMT0)) / TS1\_RAMP\_COEFF$$

### 30.3.8 Sampling time

The sampling period can be increased to improve measurement accuracy. This is useful when the reference frequency (REF\_CLK) is close to the FM(T) frequency. The default value is one REF\_CLK cycle in LSE mode, and one FM(T) cycle in PCLK mode.

The sampling time is configured through TS1\_SMP\_TIME bits in DTS\_CFGR1 register (see [Table 201](#)).

**Table 201. Sampling time configuration**

| TS1_SMP_TIME[3:0] | LSE or FM(T) clock cycle(s) |
|-------------------|-----------------------------|
| 0000              | 1                           |
| 0001              | 1                           |
| 0010              | 2                           |
| 0011              | 3                           |
| 0100              | 4                           |
| 0101              | 5                           |
| 0110              | 6                           |
| 0111              | 7                           |
| 1000              | 8                           |
| 1001              | 9                           |
| 1010              | 10                          |
| 1011              | 11                          |
| 1100              | 12                          |
| 1101              | 13                          |
| 1110              | 14                          |
| 1111              | 15                          |

### 30.3.9 Quick measurement mode

If a high precision is not required, the calibration step included in each measurement sequence can be skipped by setting Q\_MEAS\_OPT to 1 in the DTS\_CFGR1 register. This method shall be used only when the LSE clock is selected as reference clock (LSREF\_CLK set to 1). This mode can reduce the measurement time down to 162 μs.

### 30.3.10 Trigger input

The temperature measurement can be triggered either by software or by an external event. The trigger source can be selected through TS1\_INTRIG[3:0] bits in DTS\_CFGR1.

**Table 202. Trigger configuration**

| Name      | TS1_INTRIG[3:0] |   |   |   | Comment             |
|-----------|-----------------|---|---|---|---------------------|
| N.A       | 0               | 0 | 0 | 0 | No hardware trigger |
| ts1_trg0  | 0               | 0 | 0 | 1 | LPTIMER1            |
| ts1_trg1  | 0               | 0 | 1 | 0 | LPTIMER2            |
| ts1_trg2  | 0               | 0 | 1 | 1 | LPTIMER3            |
| ts1_trg3  | 0               | 1 | 0 | 0 | Reserved            |
| ts1_trg4  | 0               | 1 | 0 | 1 |                     |
| ts1_trg5  | 0               | 1 | 1 | 0 |                     |
| ts1_trg6  | 0               | 1 | 1 | 1 |                     |
| ts1_trg7  | 1               | 0 | 0 | 0 |                     |
| ts1_trg8  | 1               | 0 | 0 | 1 |                     |
| ts1_trg9  | 1               | 0 | 1 | 0 |                     |
| ts1_trg10 | 1               | 0 | 1 | 1 |                     |
| ts1_trg11 | 1               | 1 | 0 | 0 |                     |
| ts1_trg12 | 1               | 1 | 0 | 1 |                     |
| ts1_trg13 | 1               | 1 | 1 | 0 |                     |
| ts1_trg14 | 1               | 1 | 1 | 1 |                     |

**Note:** Hardware triggers are active only on the rising edge.

The temperature sensor can only capture a hardware trigger rising edge when TS1\_RDY bit is set (see [Section 30.3.11: On-off control and ready flag](#), otherwise the trigger is ignored.

If a trigger source changes on-the-fly, the new trigger source signal should be low. If the new source signal is high, the temperature sensor detects a rising edge and start the measurement sequence.

### 30.3.11 On-off control and ready flag

The DTS block can be enabled by setting TS1\_EN bit in DTS\_CFGR1 register. The TS1\_RDY flag in the [Temperature sensor status register \(DTS\\_SR\)](#) indicate that the DTS block is ready for temperature measurement: when TS1\_RDY bit is set to 1, the measurement can be started. Once a measurement has started, TS1\_RDY bit is reset. New measurement requests will then be ignored. Once the measurement is finished, TS1\_RDY bit is set again to indicate the sensor is ready to start a new measurement.

### 30.3.12 Temperature measurement sequence

Start of measurement can be triggered by software or hardware.

#### Software trigger

The software trigger is selected when TS1\_INTRIG\_SEL[3:0] is set to '0000' in DTS\_CFGR1.

If TS1\_RDY is set to 1, writing TS1\_START bit to 1 in DTS\_CFGR1 starts the measurement.

If TS1\_RDY equals 0, the software trigger does not start until TS1\_RDY is set.

If TS1\_START bit is kept at 1 once the measurement is finished, then the TS1\_RDY flag become 1 and the measurement restarts.

#### Hardware trigger

TS1\_INTRIG\_SEL[3:0] bits allow selecting one hardware trigger out of 4. If TS1\_RDY is set to 1, a rising edge on the trigger signal starts the measurement. When TS1\_RDY is 0, the rising edge is ignored.

#### Measurement sequence

One measurement contains two steps: the calibration of the analog blocks and the measurement. The calibration automatically starts when the measurement is triggered (see [Section 30.3.5: Calibration](#)). The measurement period depends on the following DTS\_CFGR1 bits:

- the reference clock selected through REFCLK\_SEL bit
- the divider ratio configured by HSREF\_CLK\_DIV bits
- the sampling time defined by TS1\_SMP\_TIME bits.

**Figure 255. Temperature sensor sequence**

## 30.4 DTS low-power modes

Table 203. Temperature sensor behavior in low-power modes

| Mode  | Description                                                                         |
|-------|-------------------------------------------------------------------------------------|
| Sleep | Only works in LSE mode.<br>DTS interrupt causes the device to exit from Sleep mode. |
| Stop  | Only works in LSE mode.<br>DTS interrupt cause the device to exit from Stop mode.   |

## 30.5 DTS interrupts

There are two ways to use the DTS block as an interrupt source. The DTS interrupt line can be connected to the CPU NVIC (see [Section 30.5.2: Synchronous interrupt](#)) or to the EXTI controller (see [Section 30.5.3: Asynchronous wakeup](#)).

### 30.5.1 Temperature window comparator

The DTS\_ITR1 register allows defining the high and low threshold that will be used for temperature comparison. If the temperature data is equal or higher than TS1\_HITTHD, or equal or lower than TS1\_LITTHD bit, an interrupt is generated and the corresponding flag, TS1\_ITLF, TS1\_ITHF, TS1\_AITLF and TS1\_AITHF, is set in the DTS\_SR register (see [Section 30.6.6](#)).

### 30.5.2 Synchronous interrupt

A global interrupt output line is available on the DTS block. The interrupt can be generated at the end of measurement and/or when the measurement result is equal/higher or equal/lower than a predefined threshold (see [Section 30.5.1: Temperature window comparator](#)).

Three interrupt events can be select via 3 bits in DTS\_ITENR register (see [Section 30.6.7](#)). All combinations of interrupts are allowed.

The TS1\_ITEF, TS1\_ITLF and TS1\_ITHF flags in the DTS\_SR register reflect the interrupt event. They can be reset with the correspond bits of the DTS\_ICIFR register (see [Section 30.6.8](#)).

### 30.5.3 Asynchronous wakeup

The DTS block also provides an asynchronous interrupt line. It is used only when the LSE is selected as reference clock (REFCLK\_SEL=1).

This line can generate a signal that wakes up the system from Sleep mode at the end of measurement and/or when the measurement result is equal/higher or equal/lower than a predefined threshold (see [Section 30.5.1: Temperature window comparator](#)).

Three asynchronous wakeup events can be selected via 3 bits in DTS\_ITENR register. All combination of interrupts are allowed.

The TS1\_AITEF, TS1\_AITLF and TS1\_AITHF flags in the DTS\_SR register reflect the interrupt status. They can be reset with the correspond bits of the DTS\_ICIFR register.

The following table shows the interrupt bits and their description.

**Table 204. Interrupt control bits**

| Interrupt event                                         | Interrupt flag      | Enable control bit      | Interrupt clear bit     | Exit from Sleep mode | Synchronous/ Asynchronous |
|---------------------------------------------------------|---------------------|-------------------------|-------------------------|----------------------|---------------------------|
| At the end of measurement                               | TS1_ITEF in DTS_SR  | TS1_ITEEN in DTS_ITENR  | TS1_CITEF in DTS_ICIFR  | NO                   | Synchronous on PCLK       |
| When the measure is equal or exceeds the low threshold  | TS1_ITLF in DTS_SR  | TS1_ITLEN in DTS_ITENR  | TS1_CITLF in DTS_ICIFR  | NO                   |                           |
| When the measure is equal or exceeds the high threshold | TS1_ITHF in DTS_SR  | TS1_ITHEN in DTS_ITENR  | TS1_CITHF in DTS_ICIFR  | NO                   |                           |
| At the end of measurement                               | TS1_AITEF in DTS_SR | TS1_AITEEN in DTS_ITENR | TS1_CAITEF in DTS_ICIFR | YES                  | Asynchronous              |
| When the measure is equal or exceeds the low threshold  | TS1_AITLF in DTS_SR | TS1_AITLEN in DTS_ITENR | TS1_CAITLF in DTS_ICIFR | YES                  |                           |
| When the measure is equal or exceeds the high threshold | TS1_AITHF in DTS_SR | TS1_AITHEN in DTS_ITENR | TS1_CAITHF in DTS_ICIFR | YES                  |                           |

## 30.6 DTS registers

The registers of this peripheral can only be accessed by-word (32-bit).

### 30.6.1 Temperature sensor configuration register 1 (DTS\_CFGR1)

DTS\_CFGR1 is the configuration register for temperature sensor 1.

Address offset: 0x00

System reset value: 0x0000 0000

|      |                    |      |      |                     |    |    |    |      |      |            |            |                   |      |      |        |
|------|--------------------|------|------|---------------------|----|----|----|------|------|------------|------------|-------------------|------|------|--------|
| 31   | 30                 | 29   | 28   | 27                  | 26 | 25 | 24 | 23   | 22   | 21         | 20         | 19                | 18   | 17   | 16     |
| Res. | HSREF_CLK_DIV[6:0] |      |      |                     |    |    |    | Res. | Res. | Q_MEAS_OPT | REFCLK_SEL | TS1_SMP_TIME[3:0] |      |      |        |
|      | rw                 | rw   | rw   | rw                  | rw | rw | rw |      |      | rw         | rw         | rw                | rw   | rw   | rw     |
| 15   | 14                 | 13   | 12   | 11                  | 10 | 9  | 8  | 7    | 6    | 5          | 4          | 3                 | 2    | 1    | 0      |
| Res. | Res.               | Res. | Res. | TS1_INTRIG_SEL[3:0] |    |    |    | Res. | Res. | Res.       | TS1_START  | Res.              | Res. | Res. | TS1_EN |
|      |                    |      |      | rw                  | rw | rw | rw |      |      |            | rw         |                   |      |      | rw     |

Bit 31 Reserved, must be kept at reset value.

Bits 30:24 **HSREF\_CLK\_DIV[6:0]**: High speed clock division ratio

These bits are set and cleared by software. They can be used to define the division ratio for the main clock in order to obtain the internal frequency lower than 1 MHz required for the calibration. They are applicable only for calibration when PCLK is selected as reference clock (REFCLK\_SEL=0).

0000000: No divider

0000001: No divider

0000010: 1/2 division ratio

...

1111111: 1/127 division ratio

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **Q\_MEAS\_OPT**: Quick measurement option bit

This bit is set and cleared by software. It is used to increase the measurement speed by suppressing the calibration step. It is effective only when the LSE clock is used as reference clock (REFCLK\_SEL=1).

0: Measurement with calibration

1: Measurement without calibration

Bit 20 **REFCLK\_SEL**: Reference clock selection bit

This bit is set and cleared by software. It indicates whether the reference clock is the high speed clock (PCLK) or the low speed clock (LSE).

0: High speed reference clock (PCLK)

1: Low speed reference clock (LSE)

Bits 19:16 **TS1\_SMP\_TIME[3:0]**: Sampling time for temperature sensor 1

These bits allow increasing the sampling time to improve measurement precision.

When the PCLK clock is selected as reference clock (REFCLK\_SEL = 0), the measurement will be performed at TS1\_SMP\_TIME period of CLK\_PTAT.

When the LSE is selected as reference clock (REFCLK\_SEL = 1), the measurement will be performed at TS1\_SMP\_TIME period of LSE.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **TS1\_INTRIG\_SEL[3:0]**: Input trigger selection bit for temperature sensor 1

These bits are set and cleared by software. They select which input triggers a temperature measurement. Refer to [Table 202: Trigger configuration](#).

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **TS1\_START**: Start frequency measurement on temperature sensor 1

This bit is set and cleared by software.

0: No software trigger.

1: Software trigger for a frequency measurement. (only if TS1 is ready).

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **TS1\_EN**: Temperature sensor 1 enable bit

This bit is set and cleared by software.

0: Temperature sensor 1 disabled

1: Temperature sensor 1 enabled

*Note: Once enabled, the temperature sensor is active after a specific delay time. The TS1\_RDY flag will be set when the sensor is ready.*

### 30.6.2 Temperature sensor T0 value register 1 (DTS\_T0VALR1)

DTS\_T0VALR1 contains the value of the factory calibration temperature (T0) for temperature sensor 1. The system reset value is factory trimmed.

Address offset: 0x08

System reset value: 0x000X XXXX

|                |      |      |      |      |      |      |      |      |      |      |      |      |      |             |    |

|                |      |      |      |      |      |      |      |      |      |      |      |      |      | r           | r  |
| 15             | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1           | 0  |
| TS1_FMT0[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |             |    |
| r              | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r           | r  |

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:16 **TS1\_T0[1:0]**: Engineering value of the T0 temperature for temperature sensor 1.

00: 30 °C

01: 110 °C

Others: Reserved, must not be used.

Bits 15:0 **TS1\_FMT0[15:0]**: Engineering value of the frequency measured at T0 for temperature sensor 1

This value is expressed in 0.1 kHz.

### 30.6.3 Temperature sensor ramp value register (DTS\_RAMPVALR)

The DTS\_RAMPVALR is the ramp coefficient for the temperature sensor. The system reset value is factory trimmed.

Address offset: 0x10

System reset value: 0xFFFF XXXX

|                      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|----------------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31                   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |

| 15                   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| TS1_RAMP_COEFF[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| r                    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **TS1\_RAMP\_COEFF[15:0]**: Engineering value of the ramp coefficient for the temperature sensor 1.

This value is expressed in Hz/°C.

### 30.6.4 Temperature sensor interrupt threshold register 1 (DTS\_ITR1)

DTS\_ITR1 contains the threshold values for sensor 1.

Address offset: 0x14

System reset value: 0x0000 0000

|                  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31               | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| TS1_HITTHD[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw               | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15               | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| TS1_LITTHD[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw               | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **TS1\_HITTHD[15:0]**: High interrupt threshold for temperature sensor 1

These bits are set and cleared by software. They indicate the highest value than can be reached before raising an interrupt signal.

Bits 15:0 **TS1\_LITTHD[15:0]**: High interrupt threshold for temperature sensor 1

These bits are set and cleared by software. They indicate the lowest value than can be reached before raising an interrupt signal.

### 30.6.5 Temperature sensor data register (DTS\_DR)

The DTS\_DR contains the number of REF\_CLK cycles used to compute the FM(T) frequency.

Address offset: 0x1C

System reset value: 0x0000 0000

|                 |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|-----------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31              | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.            | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|                 |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15              | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| TS1_MFREQ[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| rw              | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **TS1\_MFREQ[15:0]**: Value of the counter output value for temperature sensor 1

### 30.6.6 Temperature sensor status register (DTS\_SR)

Address offset: 0x20

System reset value: 0x0000 0000

|         |      |      |      |      |      |      |      |      |           |           |           |      |          |          |          |
|---------|------|------|------|------|------|------|------|------|-----------|-----------|-----------|------|----------|----------|----------|
| 31      | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22        | 21        | 20        | 19   | 18       | 17       | 16       |
| Res.    | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.      | Res.      | Res.      | Res. | Res.     | Res.     | Res.     |
|         |      |      |      |      |      |      |      |      |           |           |           |      |          |          |          |
| 15      | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6         | 5         | 4         | 3    | 2        | 1        | 0        |
| TS1_RDY | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TS1_AITHF | TS1_AITLF | TS1_AITEF | Res. | TS1_ITHF | TS1_ITLF | TS1_ITEF |
| r       |      |      |      |      |      |      |      |      | r         | r         | r         |      | r        | r        | r        |

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **TS1\_RDY**: Temperature sensor 1 ready flag

This bit is set and reset by hardware.

It indicates that a measurement is ongoing.

0: Temperature sensor 1 busy

1: Temperature sensor 1 ready

Bits 14:7 Reserved, must be kept at reset value.

Bit 6 **TS1\_AITHF**: Asynchronous interrupt flag for high threshold on temperature sensor 1

This bit is set by hardware when the high threshold is reached.

It is cleared by software by writing 1 to the TS1\_CAITHF bit in the DTS\_ICIFR register.

0: High threshold not reached on temperature sensor 1

1: High threshold reached on temperature sensor 1

*Note: This bit is active only when the TS1\_AITHFEN bit is set*

Bit 5 **TS1\_AITLF**: Asynchronous interrupt flag for low threshold on temperature sensor 1

This bit is set by hardware when the low threshold is reached.

It is cleared by software by writing 1 to the TS1\_CAITLF bit in the DTS\_ICIFR register.

0: Low threshold not reached on temperature sensor 1

1: Low threshold reached on temperature sensor 1

*Note: This bit is active only when the TS1\_AITLFEN bit is set*

Bit 4 **TS1\_AITEF**: Asynchronous interrupt flag for end of measure on temperature sensor 1

This bit is set by hardware when a temperature measure is done.

It is cleared by software by writing 1 to the TS1\_CAITEF bit in the DTS\_ICIFR register.

0: End of measure not detected on temperature sensor 1

1: End of measure detected on temperature sensor 1

*Note: This bit is active only when the TS1\_AITEFEN bit is set*

Bit 3 Reserved, must be kept at reset value.

Bit 2 **TS1\_ITHF**: Interrupt flag for high threshold on temperature sensor 1, synchronized on PCLK

This bit is set by hardware when the high threshold is set and reached.

It is cleared by software by writing 1 to the TS1\_CITHF bit in the DTS\_ICIFR register.

0: High threshold not reached on temperature sensor 1

1: High threshold reached on temperature sensor 1

*Note: This bit is active only when the TS1\_ITHFEN bit is set*

Bit 1 **TS1\_ITLF**: Interrupt flag for low threshold on temperature sensor 1, synchronized on PCLK.

This bit is set by hardware when the low threshold is set and reached.

It is cleared by software by writing 1 to the TS1\_CITLF bit in the DTS\_ICIFR register.

0: Low threshold not reached on temperature sensor 1

1: Low threshold reached on temperature sensor 1

*Note: This bit is active only when the TS1\_ITLFEN bit is set*

Bit 0 **TS1\_ITEF**: Interrupt flag for end of measurement on temperature sensor 1, synchronized on PCLK.

This bit is set by hardware when a temperature measure is done.

It is cleared by software by writing 1 to the TS2\_CITEF bit in the DTS\_ICIFR register.

0: No end of measurement detected on temperature sensor 1

1: End of measure detected on temperature sensor 1

*Note: This bit is active only when the TS1\_ITEFEN bit is set*

### 30.6.7 Temperature sensor interrupt enable register (DTS\_ITENR)

Address offset: 0x24

System reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |            |            |            |      |           |           |           |
|------|------|------|------|------|------|------|------|------|------------|------------|------------|------|-----------|-----------|-----------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22         | 21         | 20         | 19   | 18        | 17        | 16        |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.       | Res.       | Res.       | Res. | Res.      | Res.      | Res.      |
|      |      |      |      |      |      |      |      |      |            |            |            |      |           |           |           |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6          | 5          | 4          | 3    | 2         | 1         | 0         |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TS1_AITHEN | TS1_AITLEN | TS1_AITEEN | Res. | TS1_ITHEN | TS1_ITLEN | TS1_ITEEN |
|      |      |      |      |      |      |      |      |      | rw         | rw         | rw         |      | rw        | rw        | rw        |

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **TS1\_AITHEN**: Asynchronous interrupt enable flag on high threshold for temperature sensor 1.

This bit are set and cleared by software.

It enables the asynchronous interrupt when the temperature is above the high threshold (only when REFCLK\_SEL= 1")

0: Asynchronous interrupt on high threshold disabled for temperature sensor 1

1: Asynchronous interrupt on high threshold enabled for temperature sensor 1

Bit 5 **TS1\_AITLEN**: Asynchronous interrupt enable flag for low threshold on temperature sensor 1.

This bit are set and cleared by software.

It enables the asynchronous interrupt when the temperature is below the low threshold (only when REFCLK\_SEL= 1)

0: Asynchronous interrupt on low threshold disabled for temperature sensor 1

1: Asynchronous interrupt on low threshold enabled for temperature sensor 1

Bit 4 **TS1\_AITEEN**: Asynchronous interrupt enable flag for end of measurement on temperature sensor 1

This bit are set and cleared by software.

It enables the asynchronous interrupt for end of measurement (only when REFCLK\_SEL = 1).

0: Asynchronous interrupt for end of measurement disabled on temperature sensor 1

1: Asynchronous interrupt for end of measurement enabled on temperature sensor 1

Bit 3 Reserved, must be kept at reset value.

Bit 2 **TS1\_ITHEN**: Interrupt enable flag for high threshold on temperature sensor 1, synchronized on PCLK.

This bit are set and cleared by software.

It enables the interrupt when the measure reaches or is above the high threshold.

0: Synchronous interrupt for high threshold disabled on temperature sensor 1

1: Synchronous interrupt for high threshold enabled on temperature sensor 1

Bit 1 **TS1\_ITLEN**: Interrupt enable flag for low threshold on temperature sensor 1, synchronized on PCLK.

This bit are set and cleared by software.

It enables the synchronous interrupt when the measure reaches or is below the low threshold.

0: Synchronous interrupt for low threshold disabled on temperature sensor 1

1: Synchronous interrupt for low threshold enabled on temperature sensor 1

Bit 0 **TS1\_ITEEN**: Interrupt enable flag for end of measurement on temperature sensor 1, synchronized on PCLK.

This bit are set and cleared by software.

It enables the synchronous interrupt for end of measurement.

0: Synchronous interrupt for end of measurement disabled on temperature sensor 1

1: Synchronous interrupt for end of measurement enabled on temperature sensor 1

### 30.6.8 Temperature sensor clear interrupt flag register (DTS\_ICIFR)

DTS\_ICIFR is the control register for the interrupt flags.

Address offset: 0x28

System reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |               |               |               |      |              |              |              |
|------|------|------|------|------|------|------|------|------|---------------|---------------|---------------|------|--------------|--------------|--------------|

|      |      |      |      |      |      |      |      |      | rc_w1         | rc_w1         | rc_w1         |      | rc_w1        | rc_w1        | rc_w1        |

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **TS1\_CAITHF**: Asynchronous interrupt clear flag for high threshold on temperature sensor 1  
Writing 1 to this bit clears the TS1\_AITHF flag in the DTS\_SR register.

Bit 5 **TS1\_CAITLF**: Asynchronous interrupt clear flag for low threshold on temperature sensor 1  
Writing 1 to this bit clears the TS1\_AITLF flag in the DTS\_SR register.

Bit 4 **TS1\_CAITEF**: Write once bit. Clear the asynchronous IT flag for End Of Measure for thermal sensor 1.

Writing 1 clears the TS1\_AITEF flag of the DTS\_SR register.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **TS1\_CITHF**: Interrupt clear flag for high threshold on temperature sensor 1

Writing this bit to 1 clears the TS1\_ITHF flag in the DTS\_SR register.

Bit 1 **TS1\_CITLF**: Interrupt clear flag for low threshold on temperature sensor 1

Writing 1 to this bit clears the TS1\_ITLF flag in the DTS\_SR register.

Bit 0 **TS1\_CITEF**: Interrupt clear flag for end of measurement on temperature sensor 1

Writing 1 to this bit clears the TS1\_ITEF flag in the DTS\_SR register.

### 30.6.9 Temperature sensor option register (DTS\_OR)

The DTS\_OR contains general-purpose option bits.

Address offset: 0x2C

System reset value: 0x0000 0000

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 31 Digital-to-analog converter (DAC)

### 31.1 Introduction

The DAC module is a 12-bit, voltage output digital-to-analog converter. The DAC can be configured in 8- or 12-bit mode and may be used in conjunction with the DMA controller. In 12-bit mode, the data could be left- or right-aligned. The DAC features two output channels, each with its own converter. In dual DAC channel mode, conversions could be done independently or simultaneously when both channels are grouped together for synchronous update operations. An input reference pin,  $V_{REF+}$  (shared with others analog peripherals) is available for better resolution. An internal reference can also be set on the same input. Refer to *voltage reference buffer (VREFBUF)* section.

The DAC\_OUTx pin can be used as general purpose input/output (GPIO) when the DAC output is disconnected from output pad and connected to on chip peripheral. The DAC output buffer can be optionally enabled to allow a high drive output current. An individual calibration can be applied on each DAC output channel. The DAC output channels support a low power mode, the Sample and hold mode.

### 31.2 DAC main features

The DAC main features are the following (see [Figure 256: Dual-channel DAC block diagram](#))

- One DAC interface, maximum two output channels
- Left or right data alignment in 12-bit mode
- Synchronized update capability
- Noise-wave and Triangular-wave generation
- Dual DAC channel for independent or simultaneous conversions
- DMA capability for each channel including DMA underrun error detection
- External triggers for conversion
- DAC output channel buffered/unbuffered modes
- Buffer offset calibration
- Each DAC output can be disconnected from the DAC\_OUTx output pin
- DAC output connection to on chip peripherals
- Sample and hold mode for low power operation in Stop mode
- Input voltage reference,  $V_{REF+}$

[Figure 256](#) shows the block diagram of a DAC channel and [Table 207](#) gives the pin description.

## 31.3 DAC implementation

Table 206. DAC implementation

| DAC features          | DAC1                               |
|-----------------------|------------------------------------|
| Dual channel          | X                                  |
| Output buffer         | X                                  |
| I/O connection        | DAC1_OUT1 on PA4, DAC1_OUT2 on PA5 |
| Maximum sampling time | 1MSPS                              |
| Autonomous mode       | -                                  |

## 31.4 DAC functional description

### 31.4.1 DAC block diagram

Figure 256. Dual-channel DAC block diagram

1. MODEx bits in the DAC\_MCR control the output mode and allow switching between the Normal mode in buffer/unbuffered configuration and the Sample and hold mode.
2. Refer to [Section 31.3: DAC implementation](#) for channel2 availability.

### 31.4.2 DAC pins and internal signals

The DAC includes:

- Up to two output channels
- The DAC\_OUTx can be disconnected from the output pin and used as an ordinary GPIO
- The dac\_outx can use an internal pin connection to on-chip peripherals such as comparator, operational amplifier and ADC (if available).
- DAC output channel buffered or non buffered
- Sample and hold block and registers operational in Stop mode, using the LSI clock source (dac\_hold\_ck) for static conversion.

The DAC includes up to two separate output channels. Each output channel can be connected to on-chip peripherals such as comparator, operational amplifier and ADC (if available). In this case, the DAC output channel can be disconnected from the DAC\_OUTx output pin and the corresponding GPIO can be used for another purpose.

The DAC output can be buffered or not. The Sample and hold block and its associated registers can run in Stop mode using the LSI clock source (dac\_hold\_ck).

**Table 207. DAC input/output pins**

| Pin name | Signal type                      | Remarks                                                                                            |
|----------|----------------------------------|----------------------------------------------------------------------------------------------------|
| VREF+    | Input, analog reference positive | The higher/positive reference voltage for the DAC, $V_{REF+} \leq V_{DDAmax}$ (refer to datasheet) |
| VDDA     | Input, analog supply             | Analog power supply                                                                                |
| VSSA     | Input, analog supply ground      | Ground for analog power supply                                                                     |
| DAC_OUTx | Analog output signal             | DAC channelx analog output                                                                         |

**Table 208. DAC internal input/output signals**

| Internal signal name       | Signal type   | Description                                      |
|----------------------------|---------------|--------------------------------------------------|
| dac_ch1_dma                | Bidirectional | DAC channel1 DMA request/acknowledge             |
| dac_ch2_dma                | Bidirectional | DAC channel2 DMA request/acknowledge             |
| dac_ch1_trgx (x = 1 to 15) | Inputs        | DAC channel1 trigger inputs                      |
| dac_ch2_trgx (x = 1 to 15) | Inputs        | DAC channel2 trigger inputs                      |
| dac_unr_it                 | Output        | DAC underrun interrupt                           |
| dac_pclk                   | Input         | DAC peripheral clock                             |
| dac_hold_ck                | Input         | DAC low-power clock used in Sample and hold mode |
| dac_out1                   | Analog output | DAC channel1 output for on-chip peripherals      |
| dac_out2                   | Analog output | DAC channel2 output for on-chip peripherals      |

Table 209. DAC interconnection

| Signal name              | Source                       | Source type                         |
|--------------------------|------------------------------|-------------------------------------|
| dac_hold_ck              | ck_lsi (selected in the RCC) | LSI clock selected in the RCC       |

### 31.4.3 DAC channel enable

Each DAC channel can be powered on by setting its corresponding ENx bit in the DAC\_CR register. The DAC channel is then enabled after a  $t_{WAKEUP}$  startup time.

*Note:* The ENx bit enables the analog DAC channelx only. The DAC channelx digital interface is enabled even if the ENx bit is reset.

### 31.4.4 DAC data format

Depending on the selected configuration mode, the data have to be written into the specified register as described below:

- Single DAC channel
 

There are three possibilities:

  - 8-bit right alignment: the software has to load data into the DAC\_DHR8Rx[7:0] bits (stored into the DHRx[11:4] bits)
  - 12-bit left alignment: the software has to load data into the DAC\_DHR12Lx [15:4] bits (stored into the DHRx[11:0] bits)
  - 12-bit right alignment: the software has to load data into the DAC\_DHR12Rx [11:0] bits (stored into the DHRx[11:0] bits)

Depending on the loaded DAC\_DHRyyx register, the data written by the user is shifted and stored into the corresponding DHRx (data holding registerx, which are internal non-memory-mapped registers). The DHRx register is then loaded into the DORx register either automatically, by software trigger or by an external event trigger.

**Figure 257. Data registers in single DAC channel mode**

- Dual DAC channels (when available)  
There are three possibilities:
  - 8-bit right alignment: data for DAC channel1 to be loaded into the DAC\_DHR8RD [7:0] bits (stored into the DHR1[11:4] bits) and data for DAC channel2 to be loaded into the DAC\_DHR8RD [15:8] bits (stored into the DHR2[11:4] bits)
  - 12-bit left alignment: data for DAC channel1 to be loaded into the DAC\_DHR12LD [15:4] bits (stored into the DHR1[11:0] bits) and data for DAC channel2 to be loaded into the DAC\_DHR12LD [31:20] bits (stored into the DHR2[11:0] bits)
  - 12-bit right alignment: data for DAC channel1 to be loaded into the DAC\_DHR12RD [11:0] bits (stored into the DHR1[11:0] bits) and data for DAC channel2 to be loaded into the DAC\_DHR12RD [27:16] bits (stored into the DHR2[11:0] bits)

Depending on the loaded DAC\_DHRyyyD register, the data written by the user is shifted and stored into DHR1 and DHR2 (data holding registers, which are internal non-memory-mapped registers). The DHR1 and DHR2 registers are then loaded into the DAC\_DOR1 and DOR2 registers, respectively, either automatically, by software trigger or by an external event trigger.

**Figure 258. Data registers in dual DAC channel mode**

### 31.4.5 DAC conversion

The DAC\_DORx cannot be written directly and any data transfer to the DAC channelx must be performed by loading the DAC\_DHRx register (write operation to DAC\_DHR8Rx, DAC\_DHR12Lx, DAC\_DHR12Rx, DAC\_DHR8RD, DAC\_DHR12RD or DAC\_DHR12LD).

Data stored in the DAC\_DHRx register are automatically transferred to the DAC\_DORx register after one `dac_pclk` clock cycle, if no hardware trigger is selected (TENx bit in DAC\_CR register is reset). However, when a hardware trigger is selected (TENx bit in DAC\_CR register is set) and a trigger occurs, the transfer is performed three `dac_pclk` clock cycles after the trigger signal.

When DAC\_DORx is loaded with the DAC\_DHRx contents, the analog output voltage becomes available after a time  $t_{\text{SETTLING}}$  that depends on the power supply voltage and the analog output load.

HFSEL bit of DAC\_CR must be set when `dac_pclk` clock speed is faster than 80 MHz. It adds an extra delay of three `dac_pclk` clock cycles to the transfer from DAC\_DHRx register to DAC\_DORx register ( $t_{\text{SETTLING}}$ ).

The DAC\_DORx update rate is limited to 1/3 of `dac_pclk` clock frequency. When HFSEL bit is set, this rate is limited to 1/8 of the `dac_pclk` clock frequency.

When HFSEL is set, it is not allowed to write the DHRx register during a period of eight clock cycles after the ENx bit is set. During this period, making software/hardware triggering is not allowed either.

**Figure 259. Timing diagram for conversion with trigger disabled TEN = 0**

### 31.4.6 DAC output voltage

Digital inputs are converted to output voltages on a linear conversion between 0 and  $V_{\text{REF+}}$ .

The analog output voltages on each DAC channel pin are determined by the following equation:

$$\text{DACoutput} = V_{\text{REF}} \times \frac{\text{DOR}}{4096}$$

### 31.4.7 DAC trigger selection

If the TENx control bit is set, the conversion can then be triggered by an external event (timer counter, external interrupt line). The TSELx[3:0] control bits determine which out of 16 possible events triggers the conversion as shown in TSELx[3:0] bits of the DAC\_CR register. These events can be either the software trigger or hardware triggers. Refer to the interconnection table in [Section 31.4.2: DAC pins and internal signals](#).

Each time a DAC interface detects a rising edge on the selected trigger source (refer to the table below), the last data stored into the DAC\_DHRx register are transferred into the DAC\_DORx register. The DAC\_DORx register is updated three dac\_pclk cycles after the trigger occurs.

If the software trigger is selected, the conversion starts once the SWTRIG bit is set. SWTRIG is reset by hardware once the DAC\_DORx register has been loaded with the DAC\_DHRx register contents.

*Note:* TSELx[3:0] bit cannot be changed when the ENx bit is set.

*When software trigger is selected, the transfer from the DAC\_DHRx register to the DAC\_DORx register takes only one dac\_pclk clock cycle.*

### 31.4.8 DMA requests

Each DAC channel has a DMA capability. Two DMA channels are used to service DAC channel DMA requests.

When an external trigger (but not a software trigger) occurs while the DMAENx bit is set, the value of the DAC\_DHRx register is transferred into the DAC\_DORx register when the transfer is complete, and a DMA request is generated.

In dual mode, if both DMAENx bits are set, two DMA requests are generated. If only one DMA request is needed, only the corresponding DMAENx bit must be set. In this way, the application can manage both DAC channels in dual mode by using one DMA request and a unique DMA channel.

As DAC\_DHRx to DAC\_DORx data transfer occurred before the DMA request, the very first data has to be written to the DAC\_DHRx before the first trigger event occurs.

#### DMA underrun

The DAC DMA request is not queued so that if a second external trigger arrives before the acknowledgment for the first external trigger is received (first request), then no new request is issued and the DMA channelx underrun flag DMAUDRx in the DAC\_SR register is set, reporting the error condition. The DAC channelx continues to convert old data.

The software must clear the DMAUDRx flag by writing 1, clear the DMAEN bit of the used DMA stream and re-initialize both DMA and DAC channelx to restart the transfer correctly. The software must modify the DAC trigger conversion frequency or lighten the DMA workload to avoid a new DMA underrun. Finally, the DAC conversion could be resumed by enabling both DMA data transfer and conversion trigger.

For each DAC channelx, an interrupt is also generated if its corresponding DMAUDRIEx bit in the DAC\_CR register is enabled.

### 31.4.9 DAC noise generation

In order to generate a variable-amplitude pseudonoise, an LFSR (linear feedback shift register) is available. DAC noise generation is selected by setting WAVEx[1:0] to 01. The preloaded value in LFSR is 0xAAA. This register is updated three dac\_pclk clock cycles after each trigger event, following a specific calculation algorithm.

Figure 260. DAC LFSR register calculation algorithm

The LFSR value, that may be masked partially or totally by means of the MAMPx[3:0] bits in the DAC\_CR register, is added up to the DAC\_DHRx contents without overflow and this value is then transferred into the DAC\_DORx register.

If LFSR is 0x0000, a '1' is injected into it (antilock-up mechanism).

It is possible to reset LFSR wave generation by resetting the WAVEx[1:0] bits.

Figure 261. DAC conversion (SW trigger enabled) with LFSR wave generation

**Note:** The DAC trigger must be enabled for noise generation by setting the TENx bit in the DAC\_CR register.

### 31.4.10 DAC triangle-wave generation

It is possible to add a small-amplitude triangular waveform on a DC or slowly varying signal. DAC triangle-wave generation is selected by setting `WAVEx[1:0]` to `10`". The amplitude is configured through the `MAMPx[3:0]` bits in the `DAC_CR` register. An internal triangle counter is incremented three `dac_pclk` clock cycles after each trigger event. The value of this counter is then added to the `DAC_DHRx` register without overflow and the sum is transferred into the `DAC_DORx` register. The triangle counter is incremented as long as it is less than the maximum amplitude defined by the `MAMPx[3:0]` bits. Once the configured amplitude is reached, the counter is decremented down to 0, then incremented again and so on.

It is possible to reset triangle wave generation by resetting the `WAVEx[1:0]` bits.

**Figure 262. DAC triangle wave generation**

**Figure 263. DAC conversion (SW trigger enabled) with triangle wave generation**

**Note:** The DAC trigger must be enabled for triangle wave generation by setting the `TENx` bit in the `DAC_CR` register.

The `MAMPx[3:0]` bits must be configured before enabling the DAC, otherwise they cannot be changed.

### 31.4.11 DAC channel modes

Each DAC channel can be configured in Normal mode or Sample and hold mode. The output buffer can be enabled to allow a high drive capability. Before enabling output buffer, the voltage offset needs to be calibrated. This calibration is performed at the factory (loaded after reset) and can be adjusted by software during application operation.

#### Normal mode

In Normal mode, there are four combinations, by changing the buffer state and by changing the DAC\_OUTx pin interconnections.

To enable the output buffer, the MODEx[2:0] bits in DAC\_MCR register must be:

- 000: DAC is connected to the external pin
- 001: DAC is connected to external pin and to on-chip peripherals

To disable the output buffer, the MODEx[2:0] bits in DAC\_MCR register must be:

- 010: DAC is connected to the external pin
- 011: DAC is connected to on-chip peripherals

#### Sample and hold mode

In Sample and hold mode, the DAC core converts data on a triggered conversion, and then holds the converted voltage on a capacitor. When not converting, the DAC cores and buffer are completely turned off between samples and the DAC output is tri-stated, therefore reducing the overall power consumption. A stabilization period, which value depends on the buffer state, is required before each new conversion.

In this mode, the DAC core and all corresponding logic and registers are driven by the LSI low-speed clock (dac\_hold\_ck) in addition to the dac\_pclk clock, allowing to use the DAC channels in deep low power modes such as Stop mode.

The LSI low-speed clock (dac\_hold\_ck) must not be stopped on-the-fly when the Sample and hold mode is enabled.

The sample/hold mode operations can be divided into 3 phases:

1. Sample phase: the sample/hold element is charged to the desired voltage. The charging time depends on capacitor value (internal or external, selected by the user). The sampling time is configured with the TSAMPLEx[9:0] bits in DAC\_SHSRx register. During the write of the TSAMPLEx[9:0] bits, the BWSTx bit in DAC\_SR register is set to 1 to synchronize between both clocks domains (APB and low speed clock) and allowing the software to change the value of sample phase during the DAC channel operation
2. Hold phase: the DAC output channel is tri-stated, the DAC core and the buffer are turned off, to reduce the current consumption. The hold time is configured with the THOLDx[9:0] bits in DAC\_SHHR register
3. Refresh phase: the refresh time is configured with the TREFRESHx[7:0] bits in DAC\_SHRR register

The timings for the three phases above are in units of LSI clock periods. As an example, to configure a sample time of 350  $\mu$ s, a hold time of 2 ms and a refresh time of 100  $\mu$ s assuming LSI ~32 KHz is selected:

12 cycles are required for sample phase:  $TSAMPLEx[9:0] = 11$ ,

62 cycles are required for hold phase:  $THOLDx[9:0] = 62$ ,

and 4 cycles are required for refresh period:  $TREFRESHx[7:0] = 4$ .

In this example, the power consumption is reduced by almost a factor of 15 versus Normal modes.

The formulas to compute the right sample and refresh timings are described in the table below, the Hold time depends on the leakage current.

**Table 210. Sample and refresh timings**

| Buffer State | $t_{SAMP}^{(1)(2)}$                          | $t_{REFRESH}^{(2)(3)}$                                         |
|--------------|----------------------------------------------|----------------------------------------------------------------|
| Enable       | $7 \mu s + (10 \cdot R_{BON} \cdot C_{SH})$  | $7 \mu s + (R_{BON} \cdot C_{SH}) \cdot \ln(2 \cdot N_{LSB})$  |
| Disable      | $3 \mu s + (10 \cdot R_{BOFF} \cdot C_{SH})$ | $3 \mu s + (R_{BOFF} \cdot C_{SH}) \cdot \ln(2 \cdot N_{LSB})$ |

1. In the above formula the settling to the desired code value with  $\frac{1}{2}$  LSB or accuracy requires 10 constant time for 12 bits resolution. For 8 bits resolution, the settling time is 7 constant time.
2.  $C_{SH}$  is the capacitor in Sample and hold mode.
3. The tolerated voltage drop during the hold phase "Vd" is represented by the number of LSBs after the capacitor discharging with the output leakage current. The settling back to the desired value with  $\frac{1}{2}$  LSB error accuracy requires  $\ln(2 \cdot N_{LSB})$  constant time of the DAC.

### Example of the sample and refresh time calculation with output buffer on

The values used in the example below are provided as indication only. Please refer to the product datasheet for product data.

$$C_{SH} = 100 \text{ nF}$$

$$V_{DDA} = 3.0 \text{ V}$$

Sampling phase:

$$t_{SAMP} = 7 \mu s + (10 \cdot 2000 \cdot 100 \cdot 10^{-9}) = 2.007 \text{ ms}$$

(where  $R_{BON} = 2 \text{ k}\Omega$ )

Refresh phase:

$$t_{REFRESH} = 7 \mu s + (2000 \cdot 100 \cdot 10^{-9}) \cdot \ln(2 \cdot 10) = 606.1 \mu s$$

(where  $N_{LSB} = 10$  (10 LSB drop during the hold phase))

Hold phase:

$$D_V = i_{leak} \cdot t_{hold} / C_{SH} = 0.0073 \text{ V (10 LSB of 12bit at 3 V)}$$

$$i_{leak} = 150 \text{ nA (worst case on the IO leakage on all the temperature range)}$$

$$t_{hold} = 0.0073 \cdot 100 \cdot 10^{-9} / (150 \cdot 10^{-9}) = 4.867 \text{ ms}$$

Figure 264. DAC Sample and hold mode phase diagram

Like in Normal mode, the Sample and hold mode has different configurations.

To enable the output buffer, `MODEx[2:0]` bits in `DAC_MCR` register must be set to:

- 100: DAC is connected to the external pin
- 101: DAC is connected to external pin and to on chip peripherals

To disabled the output buffer, `MODEx[2:0]` bits in `DAC_MCR` register must be set to:

- 110: DAC is connected to external pin and to on chip peripherals
- 111: DAC is connected to on chip peripherals

When `MODEx[2:0]` bits are equal to 111, an internal capacitor,  $C_{Lint}$ , holds the voltage output of the DAC core and then drive it to on-chip peripherals.

All Sample and hold phases are interruptible, and any change in `DAC_DHRx` immediately triggers a new sample phase.

Table 211. Channel output modes summary

| MODEx[2:0] |   |   | Mode        | Buffer   | Output connections                                                         |
|------------|---|---|-------------|----------|----------------------------------------------------------------------------|
| 0          | 0 | 0 | Normal mode | Enabled  | Connected to external pin                                                  |
| 0          | 0 | 1 |             |          | Connected to external pin and to on chip-peripherals (such as comparators) |
| 0          | 1 | 0 |             | Disabled | Connected to external pin                                                  |
| 0          | 1 | 1 |             |          | Connected to on chip peripherals (such as comparators)                     |

Table 211. Channel output modes summary (continued)

### 31.4.12 DAC channel buffer calibration

The transfer function for an N-bit digital-to-analog converter (DAC) is:

$$V_{\text{out}} = ((D/2^N - 1) \times G \times V_{\text{ref}}) + V_{\text{OS}}$$

Where  $V_{\text{OUT}}$  is the analog output, D is the digital input, G is the gain,  $V_{\text{ref}}$  is the nominal full-scale voltage, and  $V_{\text{os}}$  is the offset voltage. For an ideal DAC channel,  $G = 1$  and  $V_{\text{os}} = 0$ .

Due to output buffer characteristics, the voltage offset may differ from part-to-part and introduce an absolute offset error on the analog output. To compensate the  $V_{\text{os}}$ , a calibration is required by a trimming technique.

The calibration is only valid when the DAC channelx is operating with buffer enabled (MODEx[2:0] = 000b or 001b or 100b or 101b). if applied in other modes when the buffer is off, it has no effect. During the calibration:

- The buffer output is disconnected from the pin internal/external connections and put in tristate mode (HiZ).
- The buffer acts as a comparator to sense the middle-code value 0x800 and compare it to  $V_{\text{REF}}/2$  signal through an internal bridge, then toggle its output signal to 0 or 1 depending on the comparison result (CAL\_FLAGx bit).

Two calibration techniques are provided:

- **Factory trimming (default setting)**  
The DAC buffer offset is factory trimmed. The default value of OTRIMx[4:0] bits in DAC\_CCR register is the factory trimming value and it is loaded once DAC digital interface is reset.
- **User trimming**  
The user trimming can be done when the operating conditions differs from nominal factory trimming conditions and in particular when  $V_{\text{DDA}}$  voltage, temperature,  $V_{\text{REF+}}$  values change and can be done at any point during application by software.

**Note:** Refer to the datasheet for more details of the Nominal factory trimming conditions

In addition, when  $V_{\text{DD}}$  is removed (example the device enters in STANDBY or VBAT modes) the calibration is required.

The steps to perform a user trimming calibration are as below:

1. If the DAC channel is active, write 0 to ENx bit in DAC\_CR to disable the channel.
2. Select a mode where the buffer is enabled, by writing to DAC\_MCR register, MODEx[2:0] = 000b or 001b or 100b or 101b.
3. Start the DAC channelx calibration, by setting the CENx bit in DAC\_CR register to 1.
4. Apply a trimming algorithm:
  - a) Write a code into OTRIMx[4:0] bits, starting by 00000b.
  - b) Wait for  $t_{TRIM}$  delay.
  - c) Check if CAL\_FLAGx bit in DAC\_SR is set to 1.
  - d) If CAL\_FLAGx is set to 1, the OTRIMx[4:0] trimming code is found and can be used during device operation to compensate the output value, else increment OTRIMx[4:0] and repeat sub-steps from (a) to (d) again.

The software algorithm may use either a successive approximation or dichotomy techniques to compute and set the content of OTRIMx[4:0] bits in a faster way.

The commutation/toggle of CAL\_FLAGx bit indicates that the offset is correctly compensated and the corresponding trim code must be kept in the OTRIMx[4:0] bits in DAC\_CCR register.

**Note:** A  $t_{TRIM}$  delay must be respected between the write to the OTRIMx[4:0] bits and the read of the CAL\_FLAGx bit in DAC\_SR register in order to get a correct value. This parameter is specified into datasheet electrical characteristics section.

*If  $V_{DDA}$ , VREF+ and temperature conditions do not change during device operation while it enters more often in standby and VBAT mode, the software may store the OTRIMx[4:0] bits found in the first user calibration in the flash or in back-up registers. then to load/write them directly when the device power is back again thus avoiding to wait for a new calibration time.*

*When CENx bit is set, it is not allowed to set ENx bit.*

### 31.4.13 Dual DAC channel conversion modes (if dual channels are available)

To efficiently use the bus bandwidth in applications that require the two DAC channels at the same time, three dual registers are implemented: DHR8RD, DHR12RD and DHR12LD. A unique register access is then required to drive both DAC channels at the same time. For the wave generation, no accesses to DHRxxxD registers are required. As a result, two output channels can be used either independently or simultaneously.

11 conversion modes are possible using the two DAC channels and these dual registers. All the conversion modes can nevertheless be obtained using separate DHRx registers if needed.

All modes are described in the paragraphs below.

#### Independent trigger without wave generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure different trigger sources by setting different values in the TSEL1 and TSEL2 bitfields.
3. Load the dual DAC channel data into the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a DAC channel1 trigger arrives, the DHR1 register is transferred into DAC\_DOR1 (three `dac_pclk` clock cycles later).

When a DAC channel2 trigger arrives, the DHR2 register is transferred into DAC\_DOR2 (three `dac_pclk` clock cycles later).

### Independent trigger with single LFSR generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits `TEN1` and `TEN2`.
2. Configure different trigger sources by setting different values in the `TSEL1` and `TSEL2` bitfields.
3. Configure the two DAC channel `WAVEx[1:0]` bits as 01 and the same LFSR mask value in the `MAMPx[3:0]` bits.
4. Load the dual DAC channel data into the desired DHR register (`DAC_DHR12RD`, `DAC_DHR12LD` or `DAC_DHR8RD`).

When a DAC channel1 trigger arrives, the LFSR1 counter, with the same mask, is added to the DHR1 register and the sum is transferred into `DAC_DOR1` (three `dac_pclk` clock cycles later). Then the LFSR1 counter is updated.

When a DAC channel2 trigger arrives, the LFSR2 counter, with the same mask, is added to the DHR2 register and the sum is transferred into `DAC_DOR2` (three `dac_pclk` clock cycles later). Then the LFSR2 counter is updated.

### Independent trigger with different LFSR generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits `TEN1` and `TEN2`.
2. Configure different trigger sources by setting different values in the `TSEL1` and `TSEL2` bitfields.
3. Configure the two DAC channel `WAVEx[1:0]` bits as 01 and set different LFSR masks values in the `MAMP1[3:0]` and `MAMP2[3:0]` bits.
4. Load the dual DAC channel data into the desired DHR register (`DAC_DHR12RD`, `DAC_DHR12LD` or `DAC_DHR8RD`).

When a DAC channel1 trigger arrives, the LFSR1 counter, with the mask configured by `MAMP1[3:0]`, is added to the DHR1 register and the sum is transferred into `DAC_DOR1` (three `dac_pclk` clock cycles later). Then the LFSR1 counter is updated.

When a DAC channel2 trigger arrives, the LFSR2 counter, with the mask configured by `MAMP2[3:0]`, is added to the DHR2 register and the sum is transferred into `DAC_DOR2` (three `dac_pclk` clock cycles later). Then the LFSR2 counter is updated.

### Independent trigger with single triangle generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure different trigger sources by setting different values in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 1x and the same maximum amplitude value in the MAMPx[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a DAC channel1 trigger arrives, the DAC channel1 triangle counter, with the same triangle amplitude, is added to the DHR1 register and the sum is transferred into DAC\_DOR1 (three dac\_pclk clock cycles later). The DAC channel1 triangle counter is then updated.

When a DAC channel2 trigger arrives, the DAC channel2 triangle counter, with the same triangle amplitude, is added to the DHR2 register and the sum is transferred into DAC\_DOR2 (three dac\_pclk clock cycles later). The DAC channel2 triangle counter is then updated.

### Independent trigger with different triangle generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure different trigger sources by setting different values in the TSEL1 and TSEL2 bits.
3. Configure the two DAC channel WAVEx[1:0] bits as 1x and set different maximum amplitude values in the MAMP1[3:0] and MAMP2[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a DAC channel1 trigger arrives, the DAC channel1 triangle counter, with a triangle amplitude configured by MAMP1[3:0], is added to the DHR1 register and the sum is transferred into DAC\_DOR1 (three dac\_pclk clock cycles later). The DAC channel1 triangle counter is then updated.

When a DAC channel2 trigger arrives, the DAC channel2 triangle counter, with a triangle amplitude configured by MAMP2[3:0], is added to the DHR2 register and the sum is transferred into DAC\_DOR2 (three dac\_pclk clock cycles later). The DAC channel2 triangle counter is then updated.

### Simultaneous software start

To configure the DAC in this conversion mode, the following sequence is required:

- Load the dual DAC channel data to the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

In this configuration, one dac\_pclk clock cycle later, the DHR1 and DHR2 registers are transferred into DAC\_DOR1 and DAC\_DOR2, respectively.

### Simultaneous trigger without wave generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
3. Load the dual DAC channel data to the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a trigger arrives, the DHR1 and DHR2 registers are transferred into DAC\_DOR1 and DAC\_DOR2, respectively (after three dac\_pclk clock cycles).

#### **Simultaneous trigger with single LFSR generation**

1. To configure the DAC in this conversion mode, the following sequence is required:
2. Set the two DAC channel trigger enable bits TEN1 and TEN2.
3. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
4. Configure the two DAC channel WAVEx[1:0] bits as 01 and the same LFSR mask value in the MAMPx[3:0] bits.
5. Load the dual DAC channel data to the desired DHR register (DHR12RD, DHR12LD or DHR8RD).

When a trigger arrives, the LFSR1 counter, with the same mask, is added to the DHR1 register and the sum is transferred into DAC\_DOR1 (three dac\_pclk clock cycles later). The LFSR1 counter is then updated. At the same time, the LFSR2 counter, with the same mask, is added to the DHR2 register and the sum is transferred into DAC\_DOR2 (three dac\_pclk clock cycles later). The LFSR2 counter is then updated.

#### **Simultaneous trigger with different LFSR generation**

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2
2. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 01 and set different LFSR mask values using the MAMP1[3:0] and MAMP2[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a trigger arrives, the LFSR1 counter, with the mask configured by MAMP1[3:0], is added to the DHR1 register and the sum is transferred into DAC\_DOR1 (three dac\_pclk clock cycles later). The LFSR1 counter is then updated.

At the same time, the LFSR2 counter, with the mask configured by MAMP2[3:0], is added to the DHR2 register and the sum is transferred into DAC\_DOR2 (three dac\_pclk clock cycles later). The LFSR2 counter is then updated.

#### **Simultaneous trigger with single triangle generation**

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2
2. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 1x and the same maximum amplitude value using the MAMPx[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a trigger arrives, the DAC channel1 triangle counter, with the same triangle amplitude, is added to the DHR1 register and the sum is transferred into DAC\_DOR1 (three dac\_pclk clock cycles later). The DAC channel1 triangle counter is then updated.

At the same time, the DAC channel2 triangle counter, with the same triangle amplitude, is added to the DHR2 register and the sum is transferred into DAC\_DOR2 (three dac\_pclk clock cycles later). The DAC channel2 triangle counter is then updated.

### Simultaneous trigger with different triangle generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2
2. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 1x and set different maximum amplitude values in the MAMP1[3:0] and MAMP2[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC\_DHR12RD, DAC\_DHR12LD or DAC\_DHR8RD).

When a trigger arrives, the DAC channel1 triangle counter, with a triangle amplitude configured by MAMP1[3:0], is added to the DHR1 register and the sum is transferred into DAC\_DOR1 (three APB clock cycles later). Then the DAC channel1 triangle counter is updated.

At the same time, the DAC channel2 triangle counter, with a triangle amplitude configured by MAMP2[3:0], is added to the DHR2 register and the sum is transferred into DAC\_DOR2 (three dac\_pclk clock cycles later). Then the DAC channel2 triangle counter is updated.

## 31.5 DAC low-power modes

Table 212. Effect of low-power modes on DAC

| Mode    | Description                                                                                       |
|---------|---------------------------------------------------------------------------------------------------|
| Sleep   | No effect, DAC can be used with DMA                                                               |
| Stop    | DAC remains active with a static output value if Sample and hold mode is selected using LSI clock |
| Standby | The DAC peripheral is powered down and must be reinitialized after exiting Standby mode.          |

## 31.6 DAC interrupts

Table 213. DAC interrupts

| Interrupt acronym | Interrupt event | Event flag | Enable control bit | Interrupt clear method | Exit Sleep mode | Exit Stop mode | Exit Standby mode |
|-------------------|-----------------|------------|--------------------|------------------------|-----------------|----------------|-------------------|
| DAC               | DMA underrun    | DMAUDRx    | DMAUDRIEx          | Write DMAUDRx = 1      | Yes             | No             | No                |

## 31.7 DAC registers

Refer to [Section 1 on page 119](#) for a list of abbreviations used in register descriptions.

The peripheral registers have to be accessed by words (32-bit).

### 31.7.1 DAC control register (DAC\_CR)

Bit 31 Reserved, must be kept at reset value.

Bit 30 **CEN2**: DAC channel2 calibration enable

This bit is set and cleared by software to enable/disable DAC channel2 calibration, it can be written only if EN2 bit is set to 0 into DAC\_CR (the calibration mode can be entered/exit only when the DAC channel is disabled) Otherwise, the write operation is ignored.

0: DAC channel2 in Normal operating mode

1: DAC channel2 in calibration mode

*Note: This bit is available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).*

Bit 29 **DMAUDRIE2**: DAC channel2 DMA underrun interrupt enable

This bit is set and cleared by software.

0: DAC channel2 DMA underrun interrupt disabled

1: DAC channel2 DMA underrun interrupt enabled

*Note: This bit is available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).*

Bit 28 **DMAEN2**: DAC channel2 DMA enable

This bit is set and cleared by software.

0: DAC channel2 DMA mode disabled

1: DAC channel2 DMA mode enabled

*Note: This bit is available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).*

Bits 27:24 **MAMP2[3:0]**: DAC channel2 mask/amplitude selector

These bits are written by software to select mask in wave generation mode or amplitude in triangle generation mode.

0000: Unmask bit0 of LFSR/ triangle amplitude equal to 1

0001: Unmask bits[1:0] of LFSR/ triangle amplitude equal to 3

0010: Unmask bits[2:0] of LFSR/ triangle amplitude equal to 7

0011: Unmask bits[3:0] of LFSR/ triangle amplitude equal to 15

0100: Unmask bits[4:0] of LFSR/ triangle amplitude equal to 31

0101: Unmask bits[5:0] of LFSR/ triangle amplitude equal to 63

0110: Unmask bits[6:0] of LFSR/ triangle amplitude equal to 127

0111: Unmask bits[7:0] of LFSR/ triangle amplitude equal to 255

1000: Unmask bits[8:0] of LFSR/ triangle amplitude equal to 511

1001: Unmask bits[9:0] of LFSR/ triangle amplitude equal to 1023

1010: Unmask bits[10:0] of LFSR/ triangle amplitude equal to 2047

≥ 1011: Unmask bits[11:0] of LFSR/ triangle amplitude equal to 4095

*Note: These bits are available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).*

Bits 23:22 **WAVE2[1:0]**: DAC channel2 noise/triangle wave generation enable

These bits are set/reset by software.

00: wave generation disabled

01: Noise wave generation enabled

1x: Triangle wave generation enabled

*Note: Only used if bit TEN2 = 1 (DAC channel2 trigger enabled)*

*These bits are available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).*

Bits 21:18 **TSEL2[3:0]**: DAC channel2 trigger selection

These bits select the external event used to trigger DAC channel2

0000: SWTRIG2

0001: dac\_ch2\_trig1

0010: dac\_ch2\_trig2

...

1111: dac\_ch2\_trig15

Refer to the trigger selection tables in [Section 31.4.2: DAC pins and internal signals](#) for details on trigger configuration and mapping.

*Note: Only used if bit TEN2 = 1 (DAC channel2 trigger enabled).*

*These bits are available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).*

Bit 17 **TEN2**: DAC channel2 trigger enable

This bit is set and cleared by software to enable/disable DAC channel2 trigger

0: DAC channel2 trigger disabled and data written into the DAC\_DHR2 register are transferred one dac\_pclk clock cycle later to the DAC\_DOR2 register

1: DAC channel2 trigger enabled and data from the DAC\_DHR2 register are transferred three dac\_pclk clock cycles later to the DAC\_DOR2 register

*Note: When software trigger is selected, the transfer from the DAC\_DHR2 register to the DAC\_DOR2 register takes only one dac\_pclk clock cycle.*

*These bits are available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).*

**Bit 16 EN2:** DAC channel2 enable

This bit is set and cleared by software to enable/disable DAC channel2.

0: DAC channel2 disabled

1: DAC channel2 enabled

*Note: These bits are available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).*

**Bit 15 HFSEL:** High frequency interface mode enable

This bit is set and cleared by software to enable/disable DAC interface high speed mode

This bit need to be set when dac\_pclk clock frequency is higher than 80 MHz.

0: High frequency interface mode disabled

1: High frequency interface mode enabled

**Bit 14 CEN1:** DAC channel1 calibration enable

This bit is set and cleared by software to enable/disable DAC channel1 calibration, it can be written only if bit EN1=0 into DAC\_CR (the calibration mode can be entered/exit only when the DAC channel is disabled) Otherwise, the write operation is ignored.

0: DAC channel1 in Normal operating mode

1: DAC channel1 in calibration mode

**Bit 13 DMAUDRIE1:** DAC channel1 DMA Underrun Interrupt enable

This bit is set and cleared by software.

0: DAC channel1 DMA Underrun Interrupt disabled

1: DAC channel1 DMA Underrun Interrupt enabled

**Bit 12 DMAEN1:** DAC channel1 DMA enable

This bit is set and cleared by software.

0: DAC channel1 DMA mode disabled

1: DAC channel1 DMA mode enabled

**Bits 11:8 MAMP1[3:0]:** DAC channel1 mask/amplitude selector

These bits are written by software to select mask in wave generation mode or amplitude in triangle generation mode.

0000: Unmask bit0 of LFSR/ triangle amplitude equal to 1

0001: Unmask bits[1:0] of LFSR/ triangle amplitude equal to 3

0010: Unmask bits[2:0] of LFSR/ triangle amplitude equal to 7

0011: Unmask bits[3:0] of LFSR/ triangle amplitude equal to 15

0100: Unmask bits[4:0] of LFSR/ triangle amplitude equal to 31

0101: Unmask bits[5:0] of LFSR/ triangle amplitude equal to 63

0110: Unmask bits[6:0] of LFSR/ triangle amplitude equal to 127

0111: Unmask bits[7:0] of LFSR/ triangle amplitude equal to 255

1000: Unmask bits[8:0] of LFSR/ triangle amplitude equal to 511

1001: Unmask bits[9:0] of LFSR/ triangle amplitude equal to 1023

1010: Unmask bits[10:0] of LFSR/ triangle amplitude equal to 2047

≥ 1011: Unmask bits[11:0] of LFSR/ triangle amplitude equal to 4095

**Bits 7:6 WAVE1[1:0]:** DAC channel1 noise/triangle wave generation enable

These bits are set and cleared by software.

00: wave generation disabled

01: Noise wave generation enabled

1x: Triangle wave generation enabled

Only used if bit TEN1 = 1 (DAC channel1 trigger enabled).

Bits 5:2 **TSEL1[3:0]**: DAC channel1 trigger selection

These bits select the external event used to trigger DAC channel1

0000: SWTRIG1

0001: dac\_ch1\_trig1

0010: dac\_ch1\_trig2

...

1111: dac\_ch1\_trig15

Refer to the trigger selection tables in [Section 31.4.2: DAC pins and internal signals](#) for details on trigger configuration and mapping.

*Note: Only used if bit TEN1 = 1 (DAC channel1 trigger enabled).*

Bit 1 **TEN1**: DAC channel1 trigger enable

This bit is set and cleared by software to enable/disable DAC channel1 trigger.

0: DAC channel1 trigger disabled and data written into the DAC\_DHR1 register are transferred one dac\_pclk clock cycle later to the DAC\_DOR1 register

1: DAC channel1 trigger enabled and data from the DAC\_DHR1 register are transferred three dac\_pclk clock cycles later to the DAC\_DOR1 register

*Note: When software trigger is selected, the transfer from the DAC\_DHR1 register to the DAC\_DOR1 register takes only one dac\_pclk clock cycle.*

Bit 0 **EN1**: DAC channel1 enable

This bit is set and cleared by software to enable/disable DAC channel1.

0: DAC channel1 disabled

1: DAC channel1 enabled

### 31.7.2 DAC software trigger register (DAC\_SWTRGR)

Address offset: 0x04

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |         |         |

|      |      |      |      |      |      |      |      |      |      |      |      |      |      | w       | w       |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **SWTRIG2**: DAC channel2 software trigger

This bit is set by software to trigger the DAC in software trigger mode.

0: No trigger

1: Trigger

*Note: This bit is cleared by hardware (one dac\_pclk clock cycle later) once the DAC\_DHR2 register value has been loaded into the DAC\_DOR2 register.*

*This bit is available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).*

Bit 0 **SWTRIG1**: DAC channel1 software trigger

This bit is set by software to trigger the DAC in software trigger mode.

0: No trigger

1: Trigger

*Note: This bit is cleared by hardware (one dac\_pclk clock cycle later) once the DAC\_DHR1 register value has been loaded into the DAC\_DOR1 register.*

### 31.7.3 DAC channel1 12-bit right-aligned data holding register (DAC\_DHR12R1)

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **DACC2DHR[7:0]**: DAC channel2 8-bit right-aligned data

These bits are written by software which specifies 8-bit data for DAC channel2.

### 31.7.9 Dual DAC 12-bit right-aligned data holding register (DAC\_DHR12RD)

Address offset: 0x20

Reset value: 0x0000 0000

|      |      |      |      |                |    |    |    |    |    |    |    |    |    |    |    |
|------|------|------|------|----------------|----|----|----|----|----|----|----|----|----|----|----|

|      |      |      |      | rw             | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15   | 14   | 13   | 12   | 11             | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Res. | Res. | Res. | Res. | DACC1DHR[11:0] |    |    |    |    |    |    |    |    |    |    |    |
|      |      |      |      | rw             | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **DACC2DHR[11:0]**: DAC channel2 12-bit right-aligned data

These bits are written by software which specifies 12-bit data for DAC channel2.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **DACC1DHR[11:0]**: DAC channel1 12-bit right-aligned data

These bits are written by software which specifies 12-bit data for DAC channel1.

### 31.7.10 Dual DAC 12-bit left aligned data holding register (DAC\_DHR12LD)

Address offset: 0x24

Reset value: 0x0000 0000

|                |    |    |    |    |    |    |    |    |    |    |    |      |      |      |      |
|----------------|----|----|----|----|----|----|----|----|----|----|----|------|------|------|------|
| 31             | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19   | 18   | 17   | 16   |
| DACC2DHR[11:0] |    |    |    |    |    |    |    |    |    |    |    | Res. | Res. | Res. | Res. |
| rw             | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |      |      |      |      |
| 15             | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3    | 2    | 1    | 0    |
| DACC1DHR[11:0] |    |    |    |    |    |    |    |    |    |    |    | Res. | Res. | Res. | Res. |
| rw             | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |      |      |      |      |

Bits 31:20 **DACC2DHR[11:0]**: DAC channel2 12-bit left-aligned data

These bits are written by software which specifies 12-bit data for DAC channel2.

Bits 19:16 Reserved, must be kept at reset value.

Bits 15:4 **DACC1DHR[11:0]**: DAC channel1 12-bit left-aligned data

These bits are written by software which specifies 12-bit data for DAC channel1.

Bits 3:0 Reserved, must be kept at reset value.

### 31.7.11 Dual DAC 8-bit right aligned data holding register (DAC\_DHR8RD)

Address offset: 0x28

Reset value: 0x0000 0000

|               |      |      |      |      |      |      |      |               |      |      |      |      |      |      |      |
|---------------|------|------|------|------|------|------|------|---------------|------|------|------|------|------|------|------|
| 31            | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23            | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.          | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.          | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|               |      |      |      |      |      |      |      |               |      |      |      |      |      |      |      |
| 15            | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7             | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| DACC2DHR[7:0] |      |      |      |      |      |      |      | DACC1DHR[7:0] |      |      |      |      |      |      |      |
| r/w           | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w           | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **DACC2DHR[7:0]**: DAC channel2 8-bit right-aligned data

These bits are written by software which specifies 8-bit data for DAC channel2.

Bits 7:0 **DACC1DHR[7:0]**: DAC channel1 8-bit right-aligned data

These bits are written by software which specifies 8-bit data for DAC channel1.

### 31.7.12 DAC channel1 data output register (DAC\_DOR1)

Address offset: 0x2C

Reset value: 0x0000 0000

|      |      |      |      |                |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|----------------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27             | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res.           | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |                |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11             | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | DACC1DOR[11:0] |      |      |      |      |      |      |      |      |      |      |      |
|      |      |      |      | r              | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **DACC1DOR[11:0]**: DAC channel1 data output

These bits are read-only, they contain data output for DAC channel1.

### 31.7.13 DAC channel2 data output register (DAC\_DOR2)

This register is available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).

Address offset: 0x30

Reset value: 0x0000 0000

|      |      |      |      |                |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|----------------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27             | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res.           | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |                |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11             | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | DACC2DOR[11:0] |      |      |      |      |      |      |      |      |      |      |      |
|      |      |      |      | r              | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **DACC2DOR[11:0]**: DAC channel2 data output

These bits are read-only, they contain data output for DAC channel2.

### 31.7.14 DAC status register (DAC\_SR)

Address offset: 0x34

Reset value: 0x0000 0000

|       |           |          |      |      |      |      |      |      |      |      |      |      |      |      |      |
|-------|-----------|----------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31    | 30        | 29       | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| BWST2 | CAL_FLAG2 | DMAU DR2 | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| r     | r         | rc_w1    |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15    | 14        | 13       | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| BWST1 | CAL_FLAG1 | DMAU DR1 | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| r     | r         | rc_w1    |      |      |      |      |      |      |      |      |      |      |      |      |      |

**Bit 31 BWST2:** DAC channel2 busy writing sample time flag

This bit is systematically set just after Sample and hold mode enable. It is set each time the software writes the register DAC\_SHSR2, It is cleared by hardware when the write operation of DAC\_SHSR2 is complete. (It takes about 3 LSI periods of synchronization).

0: There is no write operation of DAC\_SHSR2 ongoing: DAC\_SHSR2 can be written

1: There is a write operation of DAC\_SHSR2 ongoing: DAC\_SHSR2 cannot be written

*Note: This bit is available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).*

**Bit 30 CAL\_FLAG2:** DAC channel2 calibration offset status

This bit is set and cleared by hardware

0: calibration trimming value is lower than the offset correction value

1: calibration trimming value is equal or greater than the offset correction value

*Note: This bit is available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).*

**Bit 29 DMAUDR2:** DAC channel2 DMA underrun flag

This bit is set by hardware and cleared by software (by writing it to 1).

0: No DMA underrun error condition occurred for DAC channel2

1: DMA underrun error condition occurred for DAC channel2 (the currently selected trigger is driving DAC channel2 conversion at a frequency higher than the DMA service capability rate).

*Note: This bit is available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).*

Bit 28 Reserved, must be kept at reset value.

Bit 27 Reserved, must be kept at reset value.

Bits 26:16 Reserved, must be kept at reset value.

**Bit 15 BWST1:** DAC channel1 busy writing sample time flag

This bit is systematically set just after Sample and hold mode enable and is set each time the software writes the register DAC\_SHSR1, It is cleared by hardware when the write operation of DAC\_SHSR1 is complete. (It takes about 3 LSI periods of synchronization).

0: There is no write operation of DAC\_SHSR1 ongoing: DAC\_SHSR1 can be written

1: There is a write operation of DAC\_SHSR1 ongoing: DAC\_SHSR1 cannot be written

**Bit 14 CAL\_FLAG1:** DAC channel1 calibration offset status

This bit is set and cleared by hardware

0: calibration trimming value is lower than the offset correction value

1: calibration trimming value is equal or greater than the offset correction value

**Bit 13 DMAUDR1:** DAC channel1 DMA underrun flag

This bit is set by hardware and cleared by software (by writing it to 1).

0: No DMA underrun error condition occurred for DAC channel1

1: DMA underrun error condition occurred for DAC channel1 (the currently selected trigger is driving DAC channel1 conversion at a frequency higher than the DMA service capability rate)

Bit 12 Reserved, must be kept at reset value.

Bit 11 Reserved, must be kept at reset value.

Bits 10:0 Reserved, must be kept at reset value.

### 31.7.15 DAC calibration control register (DAC\_CCR)

Address offset: 0x38

Reset value: 0x00XX 00XX

|      |      |      |      |      |      |      |      |      |      |      |             |    |    |    |    |
|------|------|------|------|------|------|------|------|------|------|------|-------------|----|----|----|----|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20          | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | OTRIM2[4:0] |    |    |    |    |
|      |      |      |      |      |      |      |      |      |      |      | rw          | rw | rw | rw | rw |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4           | 3  | 2  | 1  | 0  |

|      |      |      |      |      |      |      |      |      |      |      | rw          | rw | rw | rw | rw |

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **OTRIM2[4:0]**: DAC channel2 offset trimming value

These bits are available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).

Bits 15:5 Reserved, must be kept at reset value.

Bits 4:0 **OTRIM1[4:0]**: DAC channel1 offset trimming value

### 31.7.16 DAC mode control register (DAC\_MCR)

Address offset: 0x3C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |            |    |    |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------------|----|----|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18         | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MODE2[2:0] |    |    |
|      |      |      |      |      |      |      |      |      |      |      |      |      | rw         | rw | rw |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2          | 1  | 0  |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MODE1[2:0] |    |    |
|      |      |      |      |      |      |      |      |      |      |      |      |      | rw         | rw | rw |

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 Reserved, must be kept at reset value.

Bit 24 Reserved, must be kept at reset value.

Bits 23:19 Reserved, must be kept at reset value.

Bits 18:16 **MODE2[2:0]**: DAC channel2 mode

These bits can be written only when the DAC is disabled and not in the calibration mode (when bit EN2=0 and bit CEN2 =0 in the DAC\_CR register). If EN2=1 or CEN2 =1 the write operation is ignored.

They can be set and cleared by software to select the DAC channel2 mode:

- DAC channel2 in Normal mode
  - 000: DAC channel2 is connected to external pin with Buffer enabled
  - 001: DAC channel2 is connected to external pin and to on chip peripherals with buffer enabled
  - 010: DAC channel2 is connected to external pin with buffer disabled
  - 011: DAC channel2 is connected to on chip peripherals with Buffer disabled
- DAC channel2 in Sample and hold mode
  - 100: DAC channel2 is connected to external pin with Buffer enabled
  - 101: DAC channel2 is connected to external pin and to on chip peripherals with Buffer enabled
  - 110: DAC channel2 is connected to external pin and to on chip peripherals with Buffer disabled
  - 111: DAC channel2 is connected to on chip peripherals with Buffer disabled

*Note: This register can be modified only when EN2=0.*

*Refer to [Section 31.3: DAC implementation](#) for the availability of DAC channel2.*

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:10 Reserved, must be kept at reset value.

Bit 9 Reserved, must be kept at reset value.

Bit 8 Reserved, must be kept at reset value.

Bits 7:3 Reserved, must be kept at reset value.

Bits 2:0 **MODE1[2:0]**: DAC channel1 mode

These bits can be written only when the DAC is disabled and not in the calibration mode (when bit EN1=0 and bit CEN1 =0 in the DAC\_CR register). If EN1=1 or CEN1 =1 the write operation is ignored.

They can be set and cleared by software to select the DAC channel1 mode:

- DAC channel1 in Normal mode
  - 000: DAC channel1 is connected to external pin with Buffer enabled
  - 001: DAC channel1 is connected to external pin and to on chip peripherals with Buffer enabled
  - 010: DAC channel1 is connected to external pin with Buffer disabled
  - 011: DAC channel1 is connected to on chip peripherals with Buffer disabled
- DAC channel1 in sample & hold mode
  - 100: DAC channel1 is connected to external pin with Buffer enabled
  - 101: DAC channel1 is connected to external pin and to on chip peripherals with Buffer enabled
  - 110: DAC channel1 is connected to external pin and to on chip peripherals with Buffer disabled
  - 111: DAC channel1 is connected to on chip peripherals with Buffer disabled

*Note: This register can be modified only when EN1=0.*

### 31.7.17 DAC channel1 sample and hold sample time register (DAC\_SHSR1)

Address offset: 0x40

Reset value: 0x0000 0000

|      |      |      |      |      |      |               |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|---------------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25            | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res.          | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |               |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9             | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | TSAMPLE1[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      |      | r/w           | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  | r/w  |

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **TSAMPLE1[9:0]**: DAC channel1 sample time (only valid in Sample and hold mode)

These bits can be written when the DAC channel1 is disabled or also during normal operation. in the latter case, the write can be done only when BWST1 of DAC\_SR register is low, If BWST1=1, the write operation is ignored.

**Note:** *It represents the number of LSI clocks to perform a sample phase. Sampling time = (TSAMPLE1[9:0] + 1) x LSI clock period.*

### 31.7.18 DAC channel2 sample and hold sample time register (DAC\_SHSR2)

This register is available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).

Address offset: 0x44

Reset value: 0x0000 0000

|      |      |      |      |      |      |               |      |      |      |      |      |      |      |      |      |

|      |      |      |      |      |      | rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15   | 14   | 13   | 12   | 11   | 10   | 9           | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Res. | Res. | Res. | Res. | Res. | Res. | THOLD1[9:0] |    |    |    |    |    |    |    |    |    |
|      |      |      |      |      |      | rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:16 **THOLD2[9:0]**: DAC channel2 hold time (only valid in Sample and hold mode).

Hold time= (THOLD[9:0]) x LSI clock period

*Note: This register can be modified only when EN2=0.*

*These bits are available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).*

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:0 **THOLD1[9:0]**: DAC channel1 hold time (only valid in Sample and hold mode)

Hold time= (THOLD[9:0]) x LSI clock period

*Note: This register can be modified only when EN1=0.*

*Note: These bits can be written only when the DAC channel is disabled and in Normal operating mode (when bit ENx=0 and bit CENx=0 in the DAC\_CR register). If ENx=1 or CENx=1 the write operation is ignored.*

### 31.7.20 DAC sample and hold refresh time register (DAC\_SHRR)

Address offset: 0x4C

Reset value: 0x0001 0001

|      |      |      |      |      |      |      |      |                |    |    |    |    |    |    |    |
|------|------|------|------|------|------|------|------|----------------|----|----|----|----|----|----|----|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23             | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TREFRESH2[7:0] |    |    |    |    |    |    |    |
|      |      |      |      |      |      |      |      | rw             | rw | rw | rw | rw | rw | rw | rw |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7              | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TREFRESH1[7:0] |    |    |    |    |    |    |    |
|      |      |      |      |      |      |      |      | rw             | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **TREFRESH2[7:0]**: DAC channel2 refresh time (only valid in Sample and hold mode)

Refresh time= (TREFRESH[7:0]) x LSI clock period

*Note: This register can be modified only when EN2=0.*

*These bits are available only on dual-channel DACs. Refer to [Section 31.3: DAC implementation](#).*

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **TREFRESH1[7:0]**: DAC channel1 refresh time (only valid in Sample and hold mode)

Refresh time= (TREFRESH[7:0]) x LSI clock period

*Note: This register can be modified only when EN1=0.*

*Note: These bits can be written only when the DAC channel is disabled and in Normal operating mode (when bit ENx=0 and bit CENx=0 in the DAC\_CR register). If ENx=1 or CENx=1 the write operation is ignored.*

### 31.7.21 DAC IP hardware configuration register (DAC\_HWCFGR0)

Address offset: 0x3F0

Reset value: 0x0000 1111

|             |      |      |      |               |      |      |      |             |    |    |    |           |    |    |    |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 32 Voltage reference buffer (VREFBUF)

### 32.1 Introduction

The devices embed a voltage reference buffer which can be used as voltage reference for ADCs, DACs and also as voltage reference for external components through the VREF+ pin.

### 32.2 VREFBUF functional description

The internal voltage reference buffer supports four voltages<sup>(a)</sup>, which are configured with VRS bits in the VREFBUF\_CSR register:

- VRS = 000: around 2.5 V.
- VRS = 001: around 2.048 V.
- VRS = 010: around 1.8 V.
- VRS = 011: around 1.5 V.

The internal voltage reference can be configured in four different modes depending on ENVR and HIZ bits configuration. These modes are provided in the table below:

**Table 215. VREF buffer modes**

| ENVR | HIZ | VREF buffer configuration                                                                                                                                            |
|------|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | 0   | VREFBUF buffer off:<br>– VREF+ pin pulled-down to V <sub>SSA</sub>                                                                                                   |
| 0    | 1   | External voltage reference mode (default value):<br>– VREFBUF buffer off<br>– VREF+ pin input mode                                                                   |
| 1    | 0   | Internal voltage reference mode:<br>– VREFBUF buffer ON<br>– VREF+ pin connected to VREFBUF buffer output                                                            |
| 1    | 1   | Hold mode:<br>– VREFBUF buffer off<br>– VREF+ pin floating. The voltage is held with the external capacitor<br>– VRR detection disabled and VRR bit keeps last state |

After enabling the VREFBUF by setting ENVR bit and clearing HIZ bit in the VREFBUF\_CSR register, the user must wait until VRR bit is set, meaning that the voltage reference output has reached its expected value.

a. The minimum V<sub>DDA</sub> voltage depends on VRS setting, refer to the product datasheet.

## 32.3 VREFBUF registers

### 32.3.1 VREFBUF control and status register (VREFBUF\_CSR)

Address offset: 0x00

Reset value: 0x0000 0002

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **VRS[2:0]**: Voltage reference scale

These bits select the value generated by the voltage reference buffer.

000: Voltage reference set to 2.5 V

001: Voltage reference set to 2.048 V

010: Voltage reference set to 1.8 V

011: Voltage reference set to 1.5 V

Others: Reserved

Bit 3 **VRR**: Voltage reference buffer ready

0: the voltage reference buffer output is not ready.

1: the voltage reference buffer output reached the requested level.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **HIZ**: High impedance mode

This bit controls the analog switch to connect or not the  $V_{REF+}$  pin.

0:  $V_{REF+}$  pin is internally connected to the voltage reference buffer output.

1:  $V_{REF+}$  pin is high impedance.

Refer to [Table 215: VREF buffer modes](#) for the mode descriptions depending on ENVR bit configuration.

Bit 0 **ENVR**: Voltage reference buffer mode enable

This bit is used to enable the voltage reference buffer mode.

0: Internal voltage reference mode disable (external voltage reference mode).

1: Internal voltage reference mode (reference buffer enable or hold mode) enable.

### 32.3.2 VREFBUF calibration control register (VREFBUF\_CCR)

## 33 Digital filter for sigma delta modulators (DFSDM)

### 33.1 Introduction

Digital filter for sigma delta modulators (DFSDM) is a high-performance module dedicated to interface external  $\Sigma\Delta$  modulators. It is featuring up to 8 external digital serial interfaces (channels) and up to 6 digital filters with flexible Sigma Delta stream digital processing options to offer up to 24-bit final ADC resolution. DFSDM also features optional parallel data stream input from internal ADC peripherals or from device memory.

An external  $\Sigma\Delta$  modulator provides digital data stream of converted analog values from the external  $\Sigma\Delta$  modulator analog input. This digital data stream is sent into a DFSDM input channel through a serial interface. DFSDM supports several standards to connect various  $\Sigma\Delta$  modulator outputs: SPI interface and Manchester coded 1-wire interface (both with adjustable parameters). DFSDM module supports the connection of up to 8 multiplexed input digital serial channels which are shared with up to 6 DFSDM modules. DFSDM module also supports alternative parallel data inputs from up to 8 internal 16-bit data channels (from internal ADCs or from device memory).

DFSDM is converting an input data stream into a final digital data word which represents an analog input value on a  $\Sigma\Delta$  modulator analog input. The conversion is based on a configurable digital process: the digital filtering and decimation of the input serial data stream.

The conversion speed and resolution are adjustable according to configurable parameters for digital processing: filter type, filter order, length of filter, integrator length. The maximum output data resolution is up to 24 bits. There are two conversion modes: single conversion mode and continuous mode. The data can be automatically stored in a system RAM buffer through DMA, thus reducing the software overhead.

A flexible timer triggering system can be used to control the start of conversion of DFSDM. This timing control is capable of triggering simultaneous conversions or inserting a programmable delay between conversions.

DFSDM features an analog watchdog function. Analog watchdog can be assigned to any of the input channel data stream or to final output data. Analog watchdog has its own digital filtering of input data stream to reach the required speed and resolution of watched data.

To detect short-circuit in control applications, there is a short-circuit detector. This block watches each input channel data stream for occurrence of stable data for a defined time duration (several 0's or 1's in an input data stream).

An extremes detector block watches final output data and stores maximum and minimum values from the output data values. The extremes values stored can be restarted by software.

Two power modes are supported: normal mode and stop mode.

## 33.2 DFSDM main features

- Up to 8 multiplexed input digital serial channels:
  - configurable SPI interface to connect various  $\Sigma\Delta$  modulators
  - configurable Manchester coded 1 wire interface support
  - clock output for  $\Sigma\Delta$  modulator(s)
- Alternative inputs from up to 8 internal digital parallel channels:
  - inputs with up to 16 bit resolution
  - internal sources: ADCs data or memory (CPU/DMA write) data streams
- Adjustable digital signal processing:
  - Sinc<sup>x</sup> filter: filter order/type (1..5), oversampling ratio (up to 1..1024)
  - integrator: oversampling ratio (1..256)
- Up to 24-bit output data resolution:
  - right bit-shifter on final data (0..31 bits)
- Signed output data format
- Automatic data offset correction (offset stored in register by user)
- Continuous or single conversion
- Start-of-conversion synchronization with:
  - software trigger
  - internal timers
  - external events
  - start-of-conversion synchronously with first DFSDM filter (DFSDM\_FLT0)
- Analog watchdog feature:
  - low value and high value data threshold registers
  - own configurable Sinc<sup>x</sup> digital filter (order = 1..3, oversampling ratio = 1..32)
  - input from output data register or from one or more input digital serial channels
  - continuous monitoring independently from standard conversion
- Short-circuit detector to detect saturated analog input values (bottom and top ranges):
  - up to 8-bit counter to detect 1..256 consecutive 0's or 1's on input data stream
  - monitoring continuously each channel (8 serial channel transceiver outputs)
- Break generation on analog watchdog event or short-circuit detector event
- Extremes detector:
  - store minimum and maximum values of output data values
  - refreshed by software
- Pulse skipper feature to support beamforming applications (delay line like behavior)
- DMA may be used to read the conversion data
- Interrupts: end of conversion, overrun, analog watchdog, short-circuit, channel clock absence
- “regular” or “injected” conversions:
  - “regular” conversions can be requested at any time or even in continuous mode without having any impact on the timing of “injected” conversions
  - “injected” conversions for precise timing and with high conversion priority

### 33.3 DFSDM implementation

This section describes the configuration implemented in DFSDMx.

**Table 217. DFSDM1 implementation**

| DFSDM features            | DFSDM1            |
|---------------------------|-------------------|
| Number of channels        | 8                 |
| Number of filters         | 6                 |
| Input from internal ADC   | X                 |
| Supported trigger sources | 32 <sup>(1)</sup> |
| Pulses skipper            | X                 |
| ID registers support      | X                 |

1. Refer to [Table 220: DFSDM triggers connection](#) for available trigger sources.

## 33.4 DFSDM functional description

### 33.4.1 DFSDM block diagram

Figure 265. Single DFSDM block diagram

1. This example shows 6 DFSDM filters and 8 input channels (max. configuration).

### 33.4.2 DFSDM pins and internal signals

**Table 218. DFSDM external pins**

| Name       | Signal Type             | Remarks                                                                                      |
|------------|-------------------------|----------------------------------------------------------------------------------------------|

### 33.4.3 DFSDM reset and clocks

#### DFSDM on-off control

The DFSDM interface is globally enabled by setting DFSDMEN=1 in the DFSDM\_CH0CFGR1 register. Once DFSDM is globally enabled, all input channels ( $y=0..7$ ) and digital filters DFSDM\_FLTx ( $x=0..5$ ) start to work if their enable bits are set (channel enable bit CHEN in DFSDM\_CHyCFGR1 and DFSDM\_FLTx enable bit DFEN in DFSDM\_FLTxCR1).

Digital filter  $x$  DFSDM\_FLTx ( $x=0..5$ ) is enabled by setting DFEN=1 in the DFSDM\_FLTxCR1 register. Once DFSDM\_FLTx is enabled (DFEN=1), both Sinc<sup>x</sup> digital filter unit and integrator unit are reinitialized.

By clearing DFEN, any conversion which may be in progress is immediately stopped and DFSDM\_FLTx is put into stop mode. All register settings remain unchanged except DFSDM\_FLTxAWSR and DFSDM\_FLTxISR (which are reset).

Channel  $y$  ( $y=0..7$ ) is enabled by setting CHEN=1 in the DFSDM\_CHyCFGR1 register. Once the channel is enabled, it receives serial data from the external  $\Sigma\Delta$  modulator or parallel internal data sources (ADCs or CPU/DMA wire from memory).

DFSDM must be globally disabled (by DFSDMEN=0 in DFSDM\_CH0CFGR1) before stopping the system clock to enter in the STOP mode of the device.

### DFSDM clocks

The internal DFSDM clock  $f_{\text{DFSDMCLK}}$ , which is used to drive the channel transceivers, digital processing blocks (digital filter, integrator) and next additional blocks (analog watchdog, short-circuit detector, extremes detector, control block) is generated by the RCC block and is derived from the system clock SYSCLK or peripheral clock PCLK2 (see [Section 10.7.49: RCC SAI1 Kernel Clock Selection Register \(RCC\\_SAI1CKSELR\)](#)). The DFSDM clock is automatically stopped in stop mode (if DFEN = 0 for all DFSDM\_FLTx, x=0..5).

The DFSDM serial channel transceivers can receive an external serial clock to sample an external serial data stream. The internal DFSDM clock must be at least 4 times faster than the external serial clock if standard SPI coding is used, and 6 times faster than the external serial clock if Manchester coding is used.

DFSDM can provide one external output clock signal to drive external  $\Sigma\Delta$  modulator(s) clock input(s). It is provided on CKOUT pin. This output clock signal must be in the range specified in given device datasheet and is derived from DFSDM clock or from audio clock (see CKOUTSRC bit in DFSDM\_CH0CFGR1 register) by programmable divider in the range 2 - 256 (CKOUTDIV in DFSDM\_CH0CFGR1 register). Audio clock source is SAI1 clock selected by SAI1SEL[1:0] field in RCC configuration (see ).

### 33.4.4 Serial channel transceivers

There are 8 multiplexed serial data channels which can be selected for conversion by each filter or Analog watchdog or Short-circuit detector. Those serial transceivers receive data stream from external  $\Sigma\Delta$  modulator. Data stream can be sent in SPI format or Manchester coded format (see SITP[1:0] bits in DFSDM\_CHyCFGR1 register).

The channel is enabled for operation by setting CHEN=1 in DFSDM\_CHyCFGR1 register.

#### Channel inputs selection

Serial inputs (data and clock signals) from DATINy and CKINy pins can be redirected from the following channel pins. This serial input channel redirection is set by CHINSEL bit in DFSDM\_CHyCFGR1 register.

Channel redirection can be used to collect audio data from PDM (pulse density modulation) stereo microphone type. PDM stereo microphone has one data and one clock signal. Data signal provides information for both left and right audio channel (rising clock edge samples for left channel and falling clock edge samples for right channel).

Configuration of serial channels for PDM microphone input:

- PDM microphone signals (data, clock) will be connected to DFSDM input serial channel y (DATINy, CKOUT) pins.
- Channel y will be configured: CHINSEL = 0 (input from given channel pins: DATINy, CKINy).
- Channel (y-1) (modulo 8) will be configured: CHINSEL = 1 (input from the following channel ((y-1)+1) pins: DATINy, CKINy).
- Channel y: SITP[1:0] = 0 (rising edge to strobe data) => left audio channel on channel y.
- Channel (y-1): SITP[1:0] = 1 (falling edge to strobe data) => right audio channel on channel y-1.
- Two DFSDM filters will be assigned to channel y and channel (y-1) (to filter left and right channels from PDM microphone).

Figure 266. Input channel pins redirection

MSv41632V1

### Output clock generation

A clock signal can be provided on CKOUT pin to drive external  $\Sigma\Delta$  modulator clock inputs. The frequency of this CKOUT signal is derived from DFSDM clock or from audio clock (see CKOUTSRC bit in DFSDM\_CH0CFGR1 register) divided by a predivider (see CKOUTDIV bits in DFSDM\_CH0CFGR1 register). If the output clock is stopped, then CKOUT signal is set to low state (output clock can be stopped by CKOUTDIV=0 in DFSDM\_CHyCFGR1 register or by DFSDMEN=0 in DFSDM\_CH0CFGR1 register). The output clock stopping is performed:

- 4 system clocks after DFSDMEN is cleared (if CKOUTSRC=0)
- 1 system clock and 3 audio clocks after DFSDMEN is cleared (if CKOUTSRC=1)

Before changing CKOUTSRC the software has to wait for CKOUT being stopped to avoid glitch on CKOUT pin. The output clock signal frequency must be in the range 0 - 20 MHz.

### SPI data input format operation

In SPI format, the data stream is sent in serial format through data and clock signals. Data signal is always provided from DATINy pin. A clock signal can be provided externally from CKINy pin or internally from a signal derived from the CKOUT signal source.

In case of external clock source selection (SPICKSEL[1:0]=0) data signal (on DATINy pin) is sampled on rising or falling clock edge (of CKINy pin) according to SITP[1:0] bits setting (in DFSDM\_CHyCFGR1 register).

Internal clock sources - see SPICKSEL[1:0] in DFSDM\_CHyCFGR1 register:

- CKOUT signal:
  - For connection to external  $\Sigma\Delta$  modulator which uses directly its clock input (from CKOUT) to generate its output serial communication clock.
  - Sampling point: on rising/falling edge according to SITP[1:0] setting.
- CKOUT/2 signal (generated on CKOUT rising edge):
  - For connection to external  $\Sigma\Delta$  modulator which divides its clock input (from CKOUT) by 2 to generate its output serial communication clock (and this output clock change is active on each clock input rising edge).
  - Sampling point: on each second CKOUT falling edge.
- CKOUT/2 signal (generated on CKOUT falling edge):
  - For connection to external  $\Sigma\Delta$  modulator which divides its clock input (from CKOUT) by 2 to generate its output serial communication clock (and this output clock change is active on each clock input falling edge).
  - Sampling point: on each second CKOUT rising edge.

*Note:* An internal clock source can only be used when the external  $\Sigma\Delta$  modulator uses CKOUT signal as a clock input (to have synchronous clock and data operation).

Internal clock source usage can save CKINy pin connection (CKINy pins can be used for other purpose).

The clock source signal frequency must be in the range 0 - 20 MHz for SPI coding and less than  $f_{\text{DFSDMCLK}}/4$ .

### Manchester coded data input format operation

In Manchester coded format, the data stream is sent in serial format through DATINy pin only. Decoded data and clock signal are recovered from serial stream after Manchester decoding. There are two possible settings of Manchester codings (see SITP[1:0] bits in DFSDM\_CHyCFGR1 register):

- signal rising edge = log 0; signal falling edge = log 1
- signal rising edge = log 1; signal falling edge = log 0

The recovered clock signal frequency for Manchester coding must be in the range 0 - 10 MHz and less than  $f_{\text{DFSDMCLK}}/6$ .

To correctly receive Manchester coded data, the CKOUTDIV divider (in DFSDM\_CH0CFGR1 register) must be set with respect to expected Manchester data rate according formula:

$$((\text{CKOUTDIV} + 1) \times T_{\text{SYSCLK}}) < T_{\text{Manchester clock}} < (2 \times \text{CKOUTDIV} \times T_{\text{SYSCLK}})$$

Figure 267. Channel transceiver timing diagrams

### Clock absence detection

Channels serial clock inputs can be checked for clock absence/presence to ensure the correct operation of conversion and error reporting. Clock absence detection can be enabled or disabled on each input channel  $y$  by bit CKABEN in DFSDM\_CHyCFGR1 register. If enabled, then this clock absence detection is performed continuously on a given channel. A clock absence flag is set (CKABF[ $y$ ] = 1) and an interrupt can be invoked (if CKABIE=1) in case of an input clock error (see CKABF[7:0] in DFSDM\_FLT0ISR register and CKABEN in DFSDM\_CHyCFGR1). After a clock absence flag clearing (by CLRCKABF in DFSDM\_FLT0ICR register), the clock absence flag is refreshed. Clock absence status bit CKABF[ $y$ ] is set also by hardware when corresponding channel  $y$  is disabled (if CHEN[ $y$ ] = 0 then CKABF[ $y$ ] is held in set state).

When a clock absence event has occurred, the data conversion (and/or analog watchdog and short-circuit detector) provides incorrect data. The user should manage this event and discard given data while a clock absence is reported.

The clock absence feature is available only when the system clock is used for the CKOUT signal (CKOUTSRC=0 in DFSDM\_CH0CFGR1 register).

When the transceiver is not yet synchronized, the clock absence flag is set and cannot be cleared by CLRCKABF[ $y$ ] bit (in DFSDM\_FLT0ICR register). The software sequence concerning clock absence detection feature should be:

- Enable given channel by CHEN = 1
- Try to clear the clock absence flag (by CLRCKABF = 1) until the clock absence flag is really cleared (CKABF = 0). At this time, the transceiver is synchronized (signal clock is valid) and is able to receive data.
- Enable the clock absence feature CKABEN = 1 and the associated interrupt CKABIE = 1 to detect if the SPI clock is lost or Manchester data edges are missing.

If SPI data format is used, then the clock absence detection is based on the comparison of an external input clock with an output clock generation (CKOUT signal). The external input clock signal into the input channel must be changed at least once per 8 signal periods of CKOUT signal (which is controlled by CKOUTDIV field in DFSDM\_CH0CFGR1 register).

**Figure 268. Clock absence timing diagram for SPI**

If Manchester data format is used, then the clock absence means that the clock recovery is unable to perform from Manchester coded signal. For a correct clock recovery, it is first necessary to receive data with 1 to 0 or 0 to 1 transition (see [Figure 270](#) for Manchester synchronization).

The detection of a clock absence in Manchester coding (after a first successful synchronization) is based on changes comparison of coded serial data input signal with output clock generation (CKOUT signal). There must be a voltage level change on DATINy pin during 2 periods of CKOUT signal (which is controlled by CKOUTDIV bits in DFSDM\_CH0CFGR1 register). This condition also defines the minimum data rate to be able to correctly recover the Manchester coded data and clock signals.

The maximum data rate of Manchester coded data must be less than the CKOUT signal.

So to correctly receive Manchester coded data, the CKOUTDIV divider must be set according the formula:

$$((CKOUTDIV + 1) \times T_{SYSCLK}) < T_{Manchester\ clock} < (2 \times CKOUTDIV \times T_{SYSCLK})$$

A clock absence flag is set ( $CKABF[y] = 1$ ) and an interrupt can be invoked (if  $CKABIE=1$ ) in case of an input clock recovery error (see  $CKABF[7:0]$  in DFSDM\_FLT0ISR register and  $CKABEN$  in DFSDM\_CHyCFGR1). After a clock absence flag clearing (by  $CLRCKABF$  in DFSDM\_FLT0ICR register), the clock absence flag is refreshed.

**Figure 269. Clock absence timing diagram for Manchester coding**

### Manchester/SPI code synchronization

The Manchester coded stream must be synchronized the first time after enabling the channel (CHEN=1 in DFSDM\_CHyCFGR1 register). The synchronization ends when a data transition from 0 to 1 or from 1 to 0 (to be able to detect valid data edge) is received. The end of the synchronization can be checked by polling CKABF[y]=0 for a given channel after it has been cleared by CLRCKABF[y] in DFSDM\_FLT0ICR, following the software sequence detailed hereafter:

CKABF[y] flag is cleared by setting CLRCKABF[y] bit. If channel y is not yet synchronized the hardware immediately set the CKABF[y] flag. Software is then reading back the CKABF[y] flag and if it is set then perform again clearing of this flag by setting CLRCKABF[y] bit. This software sequence (polling of CKABF[y] flag) continues until CKABF[y] flag is set (signalizing that Manchester stream is synchronized). To be able to synchronize/receive Manchester coded data the CKOUTDIV divider (in DFSDM\_CH0CFGR1 register) must be set with respect to expected Manchester data rate according the formula below.

$$((CKOUTDIV + 1) \times T_{SYSCLK}) < T_{Manchester\ clock} < (2 \times CKOUTDIV \times T_{SYSCLK})$$

SPI coded stream is synchronized after first detection of clock input signal (valid rising/falling edge).

**Note:** *When the transceiver is not yet synchronized, the clock absence flag is set and cannot be cleared by CLRCKABF[y] bit (in DFSDM\_FLT0ICR register).*

### External serial clock frequency measurement

The measuring of a channel serial clock input frequency provides a real data rate from an external  $\Sigma\Delta$  modulator, which is important for application purposes.

An external serial clock input frequency can be measured by a timer counting DFSDM clocks ( $f_{\text{DFSDMCLK}}$ ) during one conversion duration. The counting starts at the first input data clock after a conversion trigger (regular or injected) and finishes by last input data clock before conversion ends (end of conversion flag is set). Each conversion duration (time between first serial sample and last serial sample) is updated in counter CNVCNT[27:0] in register DFSDM\_FLTxCNVTIMR when the conversion finishes (JEOCF=1 or REOCF=1). The user can then compute the data rate according to the digital filter settings (FORD, FOSR, IOSR, FAST). The external serial frequency measurement is stopped only if the filter is bypassed (FOSR=0, only integrator is active, CNVCNT[27:0]=0 in DFSDM\_FLTxCNVTIMR register).

In case of parallel data input ([Section 33.4.6: Parallel data inputs](#)) the measured frequency is the average input data rate during one conversion.

**Note:** When conversion is interrupted (e.g. by disabling/enabling the selected channel) the interruption time is also counted in CNVCNT[27:0]. Therefore it is recommended to not interrupt the conversion for correct conversion duration result.

Conversion times:

**injected conversion or regular conversion with FAST = 0 (or first conversion if FAST=1):**

for Sinc<sup>x</sup> filters (x=1..5):

$$t = \text{CNVCNT} / f_{\text{DFSDMCLK}} = [F_{\text{OSR}} * (I_{\text{OSR}} - 1 + F_{\text{ORD}}) + F_{\text{ORD}}] / f_{\text{CKIN}}$$

for FastSinc filter:

$$t = \text{CNVCNT} / f_{\text{DFSDMCLK}} = [F_{\text{OSR}} * (I_{\text{OSR}} - 1 + 4) + 2] / f_{\text{CKIN}}$$

**regular conversion with FAST = 1 (except first conversion):**

for Sinc<sup>x</sup> and FastSinc filters:

$$t = \text{CNVCNT} / f_{\text{DFSDMCLK}} = [F_{\text{OSR}} * I_{\text{OSR}}] / f_{\text{CKIN}}$$

**in case if F<sub>OSR</sub> = FOSR[9:0]+1 = 1 (filter bypassed, active only integrator):**

$$t = I_{\text{OSR}} / f_{\text{CKIN}} \text{ (... but CNVCNT=0)}$$

where:

- $f_{\text{CKIN}}$  is the channel input clock frequency (on given channel CKINy pin) or input data rate (in case of parallel data input)
- $F_{\text{OSR}}$  is the filter oversampling ratio:  $F_{\text{OSR}} = \text{FOSR}[9:0] + 1$  (see DFSDM\_FLTxFRCR register)
- $I_{\text{OSR}}$  is the integrator oversampling ratio:  $I_{\text{OSR}} = \text{IOSR}[7:0] + 1$  (see DFSDM\_FLTxFRCR register)
- $F_{\text{ORD}}$  is the filter order:  $F_{\text{ORD}} = \text{FORD}[2:0]$  (see DFSDM\_FLTxFRCR register)

### Channel offset setting

Each channel has its own offset setting (in register) which is finally subtracted from each conversion result (injected or regular) from a given channel. Offset correction is performed after the data right bit shift. The offset is stored as a 24-bit signed value in OFFSET[23:0] field in DFSDM\_CHyCFGR2 register.

### Data right bit shift

To have the result aligned to a 24-bit value, each channel defines a number of right bit shifts which will be applied on each conversion result (injected or regular) from a given channel. The data bit shift number is stored in DTRBS[4:0] bits in DFSDM\_CHyCFGR2 register.

The right bit-shift is rounding the result to nearest integer value. The sign of shifted result is maintained, in order to have valid 24-bit signed format of result data.

### Pulses skipper

Purpose of the pulses skipper is to implement delay line like behavior for given input channel(s). Given number of samples from input serial data stream (serial stream only) can be discarded before they enter into the filter. This data discarding is performed by skipping given number of sampling input clock pulses (given serial data samples are then not sampled by filter). The sampling clock is gated by pulses skipper function for given number of clock pulses. When given clock pulses are skipped then the filtering continues for following input data. With comparison to non skipped data stream this operation causes that

the final output sample (and next samples) from filter will be calculated from later input data. This final sample then looks a bit in forward - because it is calculated from newer input samples than the “non-skipped” sample. The final “skipped sample” is converted later because the skipped input data samples must be replaced by followed input data samples. The final data buffers behavior (skipped and non-skipped output data buffers comparison) looks like the non-skipped data stream is a bit delayed - both data buffers will be phase shifted.

Number of clock pulses to be skipped should be written into PLSSKP[5:0] field in DFSDM\_CHyDLYR register. Once PLSSKP[5:0] field is written the execution of pulses skipping is started on given channel. PLSSKP[5:0] field can be read in order to check the progress of pulses skipper. When PLSSKP[5:0]=0 means that pulses skipping has been executed.

Up to 63 clock pulses can be skip with a single write operation into PLSSKP[5:0]. If more pulses need to be skipped, then user has to write several times into the PLSSKP[5:0] field. The application software should handle cumulative skipped clock number per each filter.

### 33.4.5 Configuring the input serial interface

The following parameters must be configured for the input serial interface:

- **Output clock predivider.** There is a programmable predivider to generate the output clock from DFSDM clock (2 - 256). It is defined by CKOUTDIV[7:0] bits in DFSDM\_CH0CFGR1 register.
- **Serial interface type and input clock phase.** Selection of SPI or Manchester coding and sampling edge of input clock. It is defined by SITP [1:0] bits in DFSDM\_CHyCFGR1 register.
- **Input clock source.** External source from CKINy pin or internal from CKOUT pin. It is defined by SPICKSEL[1:0] field in DFSDM\_CHyCFGR1 register.
- **Final data right bit-shift.** Defines the final data right bit shift to have the result aligned to a 24-bit value. It is defined by DTRBS[4:0] in DFSDM\_CHyCFGR2 register.
- **Channel offset per channel.** Defines the analog offset of a given serial channel (offset of connected external  $\Sigma\Delta$  modulator). It is defined by OFFSET[23:0] bits in DFSDM\_CHyCFGR2 register.
- **short-circuit detector and clock absence per channel enable.** To enable or disable the short-circuit detector (by SCDEN bit) and the clock absence monitoring (by CKABEN bit) on a given serial channel in register DFSDM\_CHyCFGR1.
- **Analog watchdog filter and short-circuit detector threshold settings.** To configure channel analog watchdog filter parameters and channel short-circuit detector parameters. Configurations are defined in DFSDM\_CHyAWSCDR register.

### 33.4.6 Parallel data inputs

Each input channel provides a register for 16-bit parallel data input (besides serial data input). Each 16-bit parallel input can be sourced from internal data sources only:

- internal ADC results
- direct CPU/DMA writing.

The selection for using serial or parallel data input for a given channel is done by field DATMPX[1:0] of DFSDM\_CHyCFGR1 register. In DATMPX[1:0] is also defined the parallel data source: internal ADC or direct write by CPU/DMA.

Each channel contains a 32-bit data input register DFSDM\_CHyDATINR in which it can be written a 16-bit data. Data are in 16-bit signed format. Those data can be used as input to the digital filter which is accepting 16-bit parallel data.

If serial data input is selected (DATMPX[1:0] = 0), the DFSDM\_CHyDATINR register is write protected.

### Input from internal ADC

In case of ADC data parallel input (DATMPX[1:0]=1) the ADC[y+1] result is assigned to channel y input (ADC1 is filling DFSDM\_CHDATIN0R register, ADC2 is filling DFSDM\_CHDATIN1R register, ... , ADC8 is filling DFSDM\_CHDATIN7R register). End of conversion event from ADC[y+1] causes update of channel y data (parallel data from ADC[y+1] are put as next sample to digital filter). Data from ADC[y+1] is written into DFSDM\_CHyDATINR register (field INDAT0[15:0]) when end of conversion event occurred.

The setting of data packing mode (DATPACK[1:0] in the DFSDM\_CHyCFGR1 register) has no effect in case of ADC data input.

*Note: Extension of ADC specification: in case the internal ADC is configured in interleaved mode (e.g. ADC1 together with ADC2 - see ADC specification) then each result from ADC1 or from ADC2 will come to the same 16-bit bus - to the bus of ADC1 - which is coming into DFSDM channel 0 (fixed connection). So there will be double input data rate into DFSDM channel 0 (even samples come from ADC1 and odd samples from ADC2). Channel 1 associated with ADC2 will be free.*

### Input from memory (direct CPU/DMA write)

The direct data write into DFSDM\_CHyDATINR register by CPU or DMA (DATMPX[1:0]=2) can be used as data input in order to process digital data streams from memory or peripherals.

Data can be written by CPU or DMA into DFSDM\_CHyDATINR register:

#### 1. CPU data write:

Input data are written directly by CPU into DFSDM\_CHyDATINR register.

#### 2. DMA data write:

The DMA should be configured in memory-to-memory transfer mode to transfer data from memory buffer into DFSDM\_CHyDATINR register. The destination memory address is the address of DFSDM\_CHyDATINR register. Data are transferred at DMA transfer speed from memory to DFSDM parallel input.

This DMA transfer is different from DMA used to read DFSDM conversion results. Both DMA can be used at the same time - first DMA (configured as memory-to-memory transfer) for input data writings and second DMA (configured as peripheral-to-memory transfer) for data results reading.

The accesses to DFSDM\_CHyDATINR can be either 16-bit or 32-bit wide, allowing to load respectively one or two samples in one write operation. 32-bit input data register (DFSDM\_CHyDATINR) can be filled with one or two 16-bit data samples, depending on the data packing operation mode defined in field DATPACK[1:0] of DFSDM\_CHyCFGR1 register:

#### 1. Standard mode (DATPACK[1:0]=0):

Only one sample is stored in field INDAT0[15:0] of DFSDM\_CHyDATINR register which is used as input data for channel y. The upper 16 bits (INDAT1[15:0]) are ignored and write protected. The digital filter must perform one input sampling (from INDAT0[15:0])

to empty data register after it has been filled by CPU/DMA. This mode is used together with 16-bit CPU/DMA access to DFSDM\_CHyDATINR register to load one sample per write operation.

**2. Interleaved mode (DATPACK[1:0]=1):**

DFSDM\_CHyDATINR register is used as a two sample buffer. The first sample is stored in INDAT0[15:0] and the second sample is stored in INDAT1[15:0]. The digital filter must perform two input samplings from channel y to empty DFSDM\_CHyDATINR register. This mode is used together with 32-bit CPU/DMA access to DFSDM\_CHyDATINR register to load two samples per write operation.

**3. Dual mode (DATPACK[1:0]=2):**

Two samples are written into DFSDM\_CHyDATINR register. The data INDAT0[15:0] is for channel y, the data in INDAT1[15:0] is for channel y+1. The data in INDAT1[15:0] is automatically copied INDAT0[15:0] of the following (y+1) channel data register DFSDM\_CH[y+1]DATINR). The digital filters must perform two samplings - one from channel y and one from channel (y+1) - in order to empty DFSDM\_CHyDATINR registers.

Dual mode setting (DATPACK[1:0]=2) is available only on even channel numbers (y = 0, 2, 4, 6). If odd channel (y = 1, 3, 5, 7) is set to Dual mode then both INDAT0[15:0] and INDAT1[15:0] parts are write protected for this channel. If even channel is set to Dual mode then the following odd channel must be set into Standard mode (DATPACK[1:0]=0) for correct cooperation with even channels.

See [Figure 271](#) for DFSDM\_CHyDATINR registers data modes and assignments of data samples to channels.

**Figure 271. DFSDM\_CHyDATINR registers operation modes and assignment**

| Standard mode |                | Interleaved mode |                | Dual mode      |                |              |
|---------------|----------------|------------------|----------------|----------------|----------------|--------------|
| 31            | 16 15 0        | 31               | 16 15 0        | 31             | 16 15 0        |              |
| Unused        | Ch0 (sample 0) | Ch0 (sample 1)   | Ch0 (sample 0) | Ch1 (sample 0) | Ch0 (sample 0) | <b>y = 0</b> |
| Unused        | Ch1 (sample 0) | Ch1 (sample 1)   | Ch1 (sample 0) | Unused         | Ch1 (sample 0) | <b>y = 1</b> |
| Unused        | Ch2 (sample 0) | Ch2 (sample 1)   | Ch2 (sample 0) | Ch3 (sample 0) | Ch2 (sample 0) | <b>y = 2</b> |
| Unused        | Ch3 (sample 0) | Ch3 (sample 1)   | Ch3 (sample 0) | Unused         | Ch3 (sample 0) | <b>y = 3</b> |
| Unused        | Ch4 (sample 0) | Ch4 (sample 1)   | Ch4 (sample 0) | Ch5 (sample 0) | Ch4 (sample 0) | <b>y = 4</b> |
| Unused        | Ch5 (sample 0) | Ch5 (sample 1)   | Ch5 (sample 0) | Unused         | Ch5 (sample 0) | <b>y = 5</b> |
| Unused        | Ch6 (sample 0) | Ch6 (sample 1)   | Ch6 (sample 0) | Ch7 (sample 0) | Ch6 (sample 0) | <b>y = 6</b> |
| Unused        | Ch7 (sample 0) | Ch7 (sample 1)   | Ch7 (sample 0) | Unused         | Ch7 (sample 0) | <b>y = 7</b> |

MS35354V3

The write into DFSDM\_CHyDATINR register to load one or two samples must be performed after the selected input channel (channel y) is enabled for data collection (starting conversion for channel y). Otherwise written data are lost for next processing.

For example: for single conversion and interleaved mode, do not start writing pair of data samples into DFSDM\_CHyDATINR before the single conversion is started (any data present in the DFSDM\_CHyDATINR before starting a conversion is discarded).

### 33.4.7 Channel selection

There are 8 multiplexed channels which can be selected for conversion using the injected channel group and/or using the regular channel.

The **injected channel group** is a selection of any or all of the 8 channels. JCHG[7:0] in the DFSDM\_FLTxJCHGR register selects the channels of the injected group, where JCHG[y]=1 means that channel y is selected.

Injected conversions can operate in scan mode (JSCAN=1) or single mode (JSCAN=0). In scan mode, each of the selected channels is converted, one after another. The lowest channel (channel 0, if selected) is converted first, followed immediately by the next higher channel until all the channels selected by JCHG[7:0] have been converted. In single mode (JSCAN=0), only one channel from the selected channels is converted, and the channel selection is moved to the next channel. Writing to JCHG[7:0] if JSCAN=0 resets the channel selection to the lowest selected channel.

Injected conversions can be launched by software or by a trigger. They are never interrupted by regular conversions.

The **regular channel** is a selection of just one of the 8 channels. RCH[2:0] in the DFSDM\_FLTxCR1 register indicates the selected channel.

Regular conversions can be launched only by software (not by a trigger). A sequence of continuous regular conversions is temporarily interrupted when an injected conversion is requested.

Performing a conversion on a disabled channel (CHEN=0 in DFSDM\_CHyCFGR1 register) causes that the conversion will never end - because no input data is provided (with no clock signal). In this case, it is necessary to enable a given channel (CHEN=1 in DFSDM\_CHyCFGR1 register) or to stop the conversion by DFEN=0 in DFSDM\_FLTxCR1 register.

### 33.4.8 Digital filter configuration

DFSDM contains a Sinc<sup>x</sup> type digital filter implementation. This Sinc<sup>x</sup> filter performs an input digital data stream filtering, which results in decreasing the output data rate (decimation) and increasing the output data resolution. The Sinc<sup>x</sup> digital filter is configurable in order to reach the required output data rates and required output data resolution. The configurable parameters are:

- Filter order/type: (see FORD[2:0] bits in DFSDM\_FLTxFCR register):
  - FastSinc
  - Sinc<sup>1</sup>
  - Sinc<sup>2</sup>
  - Sinc<sup>3</sup>
  - Sinc<sup>4</sup>
  - Sinc<sup>5</sup>
- Filter oversampling/decimation ratio (see FOSR[9:0] bits in DFSDM\_FLTxFCR register):
  - FOSR = 1-1024 - for FastSinc filter and Sinc<sup>x</sup> filter x = F<sub>ORD</sub> = 1..3
  - FOSR = 1-215 - for Sinc<sup>x</sup> filter x = F<sub>ORD</sub> = 4
  - FOSR = 1-73 - for Sinc<sup>x</sup> filter x = F<sub>ORD</sub> = 5

The filter has the following transfer function (impulse response in H domain):

- Sinc<sup>x</sup> filter type:  $H(z) = \left( \frac{1 - z^{-FOSR}}{1 - z^{-1}} \right)^x$
- FastSinc filter type:  $H(z) = \left( \frac{1 - z^{-FOSR}}{1 - z^{-1}} \right)^2 \cdot (1 + z^{-(2 \cdot FOSR)})$

**Figure 272. Example: Sinc<sup>3</sup> filter response**

**Table 222. Filter maximum output resolution (peak data values from filter output) for some FOSR values**

| FOSR | Sinc <sup>1</sup> | Sinc <sup>2</sup>  | FastSinc            | Sinc <sup>3</sup>  | Sinc <sup>4</sup>                                                 | Sinc <sup>5</sup>                                                 |  |
|------|-------------------|--------------------|---------------------|--------------------|-------------------------------------------------------------------|-------------------------------------------------------------------|--|
| x    | +/- x             | +/- x <sup>2</sup> | +/- 2x <sup>2</sup> | +/- x <sup>3</sup> | +/- x <sup>4</sup>                                                | +/- x <sup>5</sup>                                                |  |
| 4    | +/- 4             | +/- 16             | +/- 32              | +/- 64             | +/- 256                                                           | +/- 1024                                                          |  |

For more information about Sinc filter type properties and usage, it is recommended to study the theory about digital filters (more resources can be downloaded from internet).

### 33.4.9 Integrator unit

The integrator performs additional decimation and a resolution increase of data coming from the digital filter. The integrator simply performs the sum of data from a digital filter for a given number of data samples from a filter.

The integrator oversampling ratio parameter defines how many data counts will be summed to one data output from the integrator. IOSR can be set in the range 1-256 (see IOSR[7:0] bits description in DFSDM\_FLTxFRCR register).

**Table 223. Integrator maximum output resolution (peak data values from integrator output) for some IOSR values and FOSR = 256 and Sinc<sup>3</sup> filter type (largest data)**

| IOSR | Sinc <sup>1</sup> | Sinc <sup>2</sup>         | FastSinc                    | Sinc <sup>3</sup>         | Sinc <sup>4</sup>         | Sinc <sup>5</sup>         |

### 33.4.10 Analog watchdog

The analog watchdog purpose is to trigger an external signal (break or interrupt) when an analog signal reaches or crosses given maximum and minimum threshold values. An interrupt/event/break generation can then be invoked.

Each analog watchdog will supervise serial data receiver outputs (after the analog watchdog filter on each channel) or data output register (current injected or regular conversion result) according to AWFSEL bit setting (in DFSDM\_FLTxCr1 register). The input channels to be monitored or not by the analog watchdog x will be selected by AWDCH[7:0] in DFSDM\_FLTxCr2 register.

Analog watchdog conversions on input channels are independent from standard conversions. In this case, the analog watchdog uses its own filters and signal processing on each input channel independently from the main injected or regular conversions. Analog watchdog conversions are performed in a continuous mode on the selected input channels in order to watch channels also when main injected or regular conversions are paused (RCIP = 0, JCIP = 0).

There are high and low threshold registers which are compared with given data values (set by AWHT[23:0] bits in DFSDM\_FLTxAWHTR register and by AWLT[23:0] bits in DFSDM\_FLTxAWLTR register).

There are 2 options for comparing the threshold registers with the data values

- Option1: in this case, the input data are taken from final output data register (AWFSEL=0). This option is characterized by:
  - high input data resolution (up to 24-bits)
  - slow response time - inappropriate for fast response applications like overcurrent detection
  - for the comparison the final data are taken after bit shifting and offset data correction
  - final data are available only after main regular or injected conversions are performed
  - can be used in case of parallel input data source (DATMPX[1:0] ≠ 0 in DFSDM\_CHyCFGR1 register)
- Option2: in this case, the input data are taken from any serial data receivers output (AWFSEL=1). This option is characterized by:
  - input serial data are processed by dedicated analog watchdog Sinc<sup>x</sup> channel filters with configurable oversampling ratio (1..32) and filter order (1..3) (see AWFOSR[4:0] and AWFORD[1:0] bits setting in DFSDM\_CHyAWSCDR register)
  - lower resolution (up to 16-bit)
  - fast response time - appropriate for applications which require a fast response like overcurrent/overvoltage detection)
  - data are available in continuous mode independently from main regular or injected conversions activity

In case of input channels monitoring (AWFSEL=1), the data for comparison to threshold is taken from channels selected by AWDCH[7:0] field (DFSDM\_FLTxCR2 register). Each of the selected channels filter result is compared to one threshold value pair (AWHT[23:0] / AWLT[23:0]). In this case, only higher 16 bits (AWHT[23:8] / AWLT[23:8]) define the 16-bit threshold compared with the analog watchdog filter output because data coming from the analog watchdog filter is up to a 16-bit resolution. Bits AWHT[7:0] / AWLT[7:0] are not taken into comparison in this case (AWFSEL=1).

Parameters of the analog watchdog filter configuration for each input channel are set in DFSDM\_CHyAWSCDR register (filter order AWFORD[1:0] and filter oversampling ratio AWFOSR[4:0]).

Each input channel has its own comparator which compares the analog watchdog data (from analog watchdog filter) with analog watchdog threshold values (AWHT/AWLT). When several channels are selected (field AWDCH[7:0] field of DFSDM\_FLTxCR2 register), several comparison requests may be received simultaneously. In this case, the channel request with the lowest number is managed first and then continuing to higher selected channels. For each channel, the result can be recorded in a separate flag (fields AWHTF[7:0], AWLTF[7:0] of DFSDM\_FLTxAWSR register). Each channel request is executed in 8 DFSDM clock cycles. So, the bandwidth from each channel is limited to 8 DFSDM clock cycles (if AWDCH[7:0] = 0xFF). Because the maximum input channel sampling clock frequency is the DFSDM clock frequency divided by 4, the configuration AWFOSR = 0 (analog watchdog filter is bypassed) cannot be used for analog watchdog feature at this input clock speed. Therefore user must properly configure the number of watched channels and analog watchdog filter parameters with respect to input sampling clock speed and DFSDM frequency.

Analog watchdog filter data for given channel y is available for reading by firmware on field WDATA[15:0] in DFSDM\_CHyWDATR register. That analog watchdog filter data is converted continuously (if CHEN=1 in DFSDM\_CHyCFGR1 register) with the data rate given by the analog watchdog filter setting and the channel input clock frequency.

The analog watchdog filter conversion works like a regular Fast Continuous Conversion without the intergator. The number of serial samples needed for one result from analog watchdog filter output (at channel input clock frequency  $f_{CKIN}$ ):

first conversion:

for Sinc<sup>x</sup> filters (x=1..5): number of samples =  $[F_{OSR} * F_{ORD} + F_{ORD} + 1]$

for FastSinc filter: number of samples =  $[F_{OSR} * 4 + 2 + 1]$

next conversions:

for Sinc<sup>x</sup> and FastSinc filters: number of samples =  $[F_{OSR} * IOSR]$

where:

$F_{OSR}$  ..... filter oversampling ratio:  $F_{OSR} = AWFOSR[4:0] + 1$  (see DFSDM\_CHyAWSCDR register)

$F_{ORD}$  ..... the filter order:  $F_{ORD} = AWFORD[1:0]$  (see DFSDM\_CHyAWSCDR register)

In case of output data register monitoring (AWFSEL=0), the comparison is done after a right bit shift and an offset correction of final data (see OFFSET[23:0] and DTRBS[4:0] fields in DFSDM\_CHyCFGR2 register). A comparison is performed after each injected or regular end of conversion for the channels selected by AWDCH[7:0] field (in DFSDM\_FLTxCR2 register).

The status of an analog watchdog event is signalized in DFSDM\_FLTxAWSR register where a given event is latched. AWHTF[y]=1 flag signalizes crossing AWHT[23:0] value on channel y. AWLTF[y]=1 flag signalizes crossing AWLT[23:0] value on channel y. Latched events in DFSDM\_FLTxAWSR register are cleared by writing '1' into the corresponding clearing bit CLRAWHTF[y] or CLRAWLTF[y] in DFSDM\_FLTxAWCFR register.

The global status of an analog watchdog is signalized by the AWDF flag bit in DFSDM\_FLTxISR register (it is used for the fast detection of an interrupt source). AWDF=1 signalizes that at least one watchdog occurred (AWHTF[y]=1 or AWLTF[y]=1 for at least one channel). AWDF bit is cleared when all AWHTF[7:0] and AWLTF[7:0] are cleared.

An analog watchdog event can be assigned to break output signal. There are four break outputs to be assigned to a high or low threshold crossing event (dfsdm\_break[3:0]). The break signal assignment to a given analog watchdog event is done by BKAWH[3:0] and BKAWL[3:0] fields in DFSDM\_FLTxAWHTR and DFSDM\_FLTxAWLTR register.

### 33.4.11 Short-circuit detector

The purpose of a short-circuit detector is to signalize with a very fast response time if an analog signal reached saturated values (out of full scale ranges) and remained on this value given time. This behavior can detect short-circuit or open circuit errors (e.g. overcurrent or overvoltage). An interrupt/event/break generation can be invoked.

Input data into a short-circuit detector is taken from channel transceiver outputs.

There is an upcounting counter on each input channel which is counting consecutive 0's or 1's on serial data receiver outputs. A counter is restarted if there is a change in the data stream received - 1 to 0 or 0 to 1 change of data signal. If this counter reaches a short-circuit threshold register value (SCDT[7:0] bits in DFSDM\_CHyAWSCDR register), then a short-

circuit event is invoked. Each input channel has its short-circuit detector. Any channel can be selected to be continuously monitored by setting the SCDEN bit (in DFSDM\_CHyCFGR1 register) and it has its own short-circuit detector settings (threshold value in SCDT[7:0] bits, status bit SCDF[7:0], status clearing bits CLRSCDF[7:0]). Status flag SCDF[y] is cleared also by hardware when corresponding channel y is disabled (CHEN[y] = 0).

On each channel, a short-circuit detector event can be assigned to break output signal dfsdm\_break[3:0]. There are four break outputs to be assigned to a short-circuit detector event. The break signal assignment to a given channel short-circuit detector event is done by BKSCD[3:0] field in DFSDM\_CHyAWSCDR register.

Short circuit detector cannot be used in case of parallel input data channel selection (DATMPX[1:0] ≠ 0 in DFSDM\_CHyCFGR1 register).

Four break outputs are totally available (shared with the analog watchdog function).

### 33.4.12 Extreme detector

The purpose of an extremes detector is to collect the minimum and maximum values of final output data words (peak to peak values).

If the output data word is higher than the value stored in the extremes detector maximum register (EXMAX[23:0] bits in DFSDM\_FLTxEXMAX register), then this register is updated with the current output data word value and the channel from which the data is stored is in EXMAXCH[2:0] bits (in DFSDM\_FLTxEXMAX register).

If the output data word is lower than the value stored in the extremes detector minimum register (EXMIN[23:0] bits in DFSDM\_FLTxEXMIN register), then this register is updated with the current output data word value and the channel from which the data is stored is in EXMINCH[2:0] bits (in DFSDM\_FLTxEXMIN register).

The minimum and maximum register values can be refreshed by software (by reading given DFSDM\_FLTxEXMAX or DFSDM\_FLTxEXMIN register). After refresh, the extremes detector minimum data register DFSDM\_FLTxEXMIN is filled with 0x7FFFFFFF (maximum positive value) and the extremes detector maximum register DFSDM\_FLTxEXMAX is filled with 0x800000 (minimum negative value).

The extremes detector performs a comparison after a right bit shift and an offset data correction. For each extremes detector, the input channels to be considered into computing the extremes value are selected in EXCH[7:0] bits (in DFSDM\_FLTxCR2 register).

### 33.4.13 Data unit block

The data unit block is the last block of the whole processing path: External  $\Sigma\Delta$  modulators - Serial transceivers - Sinc filter - Integrator - Data unit block.

The output data rate depends on the serial data stream rate, and filter and integrator settings. The maximum output data rate is:

$$\text{Datarate}[\text{samples / s}] = \frac{f_{\text{CKIN}}}{F_{\text{OSR}} \cdot (I_{\text{OSR}} - 1 + F_{\text{ORD}}) + (F_{\text{ORD}} + 1)} \quad \dots \text{FAST} = 0, \text{ Sincx filter}$$

$$\text{Datarate}[\text{samples / s}] = \frac{f_{\text{CKIN}}}{F_{\text{OSR}} \cdot (I_{\text{OSR}} - 1 + 4) + (2 + 1)} \quad \dots \text{FAST} = 0, \text{ FastSinc filter}$$

or

$$\text{Datarate}[\text{samples /s}] = \frac{f_{\text{CKIN}}}{F_{\text{OSR}} \cdot I_{\text{OSR}}} \quad \dots \text{FAST} = 1$$

Maximum output data rate in case of parallel data input:

$$\text{Datarate}[\text{samples /s}] = \frac{f_{\text{DATAIN\_RATE}}}{F_{\text{OSR}} \cdot (I_{\text{OSR}} - 1 + F_{\text{ORD}}) + (F_{\text{ORD}} + 1)} \quad \dots \text{FAST} = 0, \text{Sincx filter}$$

or

$$\text{Datarate}[\text{samples /s}] = \frac{f_{\text{DATAIN\_RATE}}}{F_{\text{OSR}} \cdot (I_{\text{OSR}} - 1 + 4) + (2 + 1)} \quad \dots \text{FAST} = 0, \text{FastSinc filter}$$

or

$$\text{Datarate}[\text{samples /s}] = \frac{f_{\text{DATAIN\_RATE}}}{F_{\text{OSR}} \cdot I_{\text{OSR}}} \quad \dots \text{FAST}=1 \text{ or any filter bypass case } (F_{\text{OSR}} = 1)$$

where:  $f_{\text{DATAIN\_RATE}}$ ...input data rate from ADC or from CPU/DMA

The right bit-shift of final data is performed in this module because the final data width is 24-bit and data coming from the processing path can be up to 32 bits. This right bit-shift is configurable in the range 0-31 bits for each selected input channel (see DTRBS[4:0] bits in DFSDM\_CHyCFGR2 register). The right bit-shift is rounding the result to nearest integer value. The sign of shifted result is maintained - to have valid 24-bit signed format of result data.

In the next step, an offset correction of the result is performed. The offset correction value (OFFSET[23:0] stored in register DFSDM\_CHyCFGR2) is subtracted from the output data for a given channel. Data in the OFFSET[23:0] field is set by software by the appropriate calibration routine.

Due to the fact that all operations in digital processing are performed on 32-bit signed registers, the following conditions must be fulfilled not to overflow the result:

$$\begin{aligned} F_{\text{OSR}}^{F_{\text{ORD}}} \cdot I_{\text{OSR}} &\leq 2^{31} \quad \dots \text{for Sinc}^x \text{ filters, } x = 1..5) \\ 2 \cdot F_{\text{OSR}}^2 \cdot I_{\text{OSR}} &\leq 2^{31} \quad \dots \text{for FastSinc filter)} \end{aligned}$$

**Note:** *In case of filter and integrator bypass ( $I_{\text{OSR}}[7:0]=0$ ,  $F_{\text{OSR}}[9:0]=0$ ), the input data rate ( $f_{\text{DATAIN\_RATE}}$ ) must be limited to be able to read all output data:*

$$f_{\text{DATAIN\_RATE}} \leq f_{\text{APB}}$$

*where  $f_{\text{APB}}$  is the bus frequency to which the DFSDM peripheral is connected.*

### 33.4.14 Signed data format

Each DFSDM input serial channel can be connected to one external  $\Sigma\Delta$  modulator. An external  $\Sigma\Delta$  modulator can have 2 differential inputs (positive and negative) which can be used for a differential or single-ended signal measurement.

A  $\Sigma\Delta$  modulator output is always assumed in a signed format (a data stream of zeros and ones from a  $\Sigma\Delta$  modulator represents values -1 and +1).

**Signed data format in registers:** Data is in a signed format in registers for final output data, analog watchdog, extremes detector, offset correction. The msb of output data word represents the sign of value (two's complement format).

### 33.4.15 Launching conversions

**Injected conversions** can be launched using the following methods:

- Software: writing '1' to JSWSTART in the DFSDM\_FLTxCR1 register.
- Trigger: JEXTSEL[4:0] selects the trigger signal while JEXTEN activates the trigger and selects the active edge at the same time (see the DFSDM\_FLTxCR1 register).
- Synchronous with DFSDM\_FLT0 if JSYNC=1: for DFSDM\_FLTx ( $x > 0$ ), an injected conversion is automatically launched when in DFSDM\_FLT0; the injected conversion is started by software (JSWSTART=1 in DFSDM\_FLT0CR2 register). Each injected conversion in DFSDM\_FLTx ( $x > 0$ ) is always executed according to its local configuration settings (JSCAN, JCHG, etc.).

If the scan conversion is enabled (bit JSCAN=1) then, each time an injected conversion is triggered, all of the selected channels in the injected group (JCHG[7:0] bits in DFSDM\_FLTxJCHGR register) are converted sequentially, starting with the lowest channel (channel 0, if selected).

If the scan conversion is disabled (bit JSCAN=0) then, each time an injected conversion is triggered, only one of the selected channels in the injected group (JCHG[7:0] bits in DFSDM\_FLTxJCHGR register) is converted and the channel selection is then moved to the next selected channel. Writing to the JCHG[7:0] bits when JSCAN=0 sets the channel selection to the lowest selected injected channel.

Only one injected conversion can be ongoing at a given time. Thus, any request to launch an injected conversion is ignored if another request for an injected conversion has already been issued but not yet completed.

**Regular conversions** can be launched using the following methods:

- Software: by writing '1' to RSWSTART in the DFSDM\_FLTxCR1 register.
- Synchronous with DFSDM\_FLT0 if RSYNC=1: for DFSDM\_FLTx ( $x > 0$ ), a regular conversion is automatically launched when in DFSDM\_FLT0; a regular conversion is started by software (RSWSTART=1 in DFSDM\_FLT0CR2 register). Each regular conversion in DFSDM\_FLTx ( $x > 0$ ) is always executed according to its local configuration settings (RCONT, RCH, etc.).

Only one regular conversion can be pending or ongoing at a given time. Thus, any request to launch a regular conversion is ignored if another request for a regular conversion has already been issued but not yet completed. A regular conversion can be pending if it was interrupted by an injected conversion or if it was started while an injected conversion was in progress. This pending regular conversion is then delayed and is performed when all injected conversion are finished. Any delayed regular conversion is signaled by RPEND bit in DFSDM\_FLTxRDATAR register.

### 33.4.16 Continuous and fast continuous modes

Setting RCONT in the DFSDM\_FLTxCR1 register causes regular conversions to execute in continuous mode. RCONT=1 means that the channel selected by RCH[2:0] is converted repeatedly after '1' is written to RSWSTART.

The regular conversions executing in continuous mode can be stopped by writing '0' to RCONT. After clearing RCONT, the on-going conversion is stopped immediately.

In continuous mode, the data rate can be increased by setting the FAST bit in the DFSDM\_FLTxCR1 register. In this case, the filter does not need to be refilled by new fresh data if converting continuously from one channel because data inside the filter is valid from previously sampled continuous data. The speed increase depends on the chosen filter order. The first conversion in fast mode (FAST=1) after starting a continuous conversion by RSWSTART=1 takes still full time (as when FAST=0), then each subsequent conversion is finished in shorter intervals.

Conversion time in continuous mode:

if FAST = 0 (or first conversion if FAST=1):

for Sinc<sup>X</sup> filters:

$$t = \text{CNVCNT} / f_{\text{DFSDMCLK}} = [F_{\text{OSR}} * (I_{\text{OSR}} - 1 + F_{\text{ORD}}) + F_{\text{ORD}}] / f_{\text{CKIN}}$$

for FastSinc filter:

$$t = \text{CNVCNT} / f_{\text{DFSDMCLK}} = [F_{\text{OSR}} * (I_{\text{OSR}} - 1 + 4) + 2] / f_{\text{CKIN}}$$

if FAST = 1 (except first conversion):

for Sinc<sup>X</sup> and FastSinc filters:

$$t = \text{CNVCNT} / f_{\text{DFSDMCLK}} = [F_{\text{OSR}} * I_{\text{OSR}}] / f_{\text{CKIN}}$$

in case  $F_{\text{OSR}} = \text{FOSR}[9:0] + 1 = 1$  (filter bypassed, only integrator active):

$$t = I_{\text{OSR}} / f_{\text{CKIN}} \text{ (... but CNVCNT=0)}$$

Continuous mode is not available for injected conversions. Injected conversions can be started by timer trigger to emulate the continuous mode with precise timing.

If a regular continuous conversion is in progress (RCONT=1) and if a write access to DFSDM\_FLTxCR1 register requesting regular continuous conversion (RCONT=1) is performed, then regular continuous conversion is restarted from the next conversion cycle (like new regular continuous conversion is applied for new channel selection - even if there is no change in DFSDM\_FLTxCR1 register).

### 33.4.17 Request precedence

An injected conversion has a higher precedence than a regular conversion. A regular conversion which is already in progress is immediately interrupted by the request of an injected conversion; this regular conversion is restarted after the injected conversion finishes.

An injected conversion cannot be launched if another injected conversion is pending or already in progress: any request to launch an injected conversion (either by JSWSTART or by a trigger) is ignored as long as bit JCIP is '1' (in the DFSDM\_FLTxISR register).

Similarly, a regular conversion cannot be launched if another regular conversion is pending or already in progress: any request to launch a regular conversion (using RSWSTART) is ignored as long as bit RCIP is '1' (in the DFSDM\_FLTxISR register).

However, if an injected conversion is requested while a regular conversion is already in progress, the regular conversion is immediately stopped and an injected conversion is launched. The regular conversion is then restarted and this delayed restart is signaled in bit RPEND.

Injected conversions have precedence over regular conversions in that a injected conversion can temporarily interrupt a sequence of continuous regular conversions. When

the sequence of injected conversions finishes, the continuous regular conversions start again if RCONT is still set (and RPEND bit will signalize the delayed start on the first regular conversion result).

Precedence also matters when actions are initiated by the same write to DFSDM, or if multiple actions are pending at the end of another action. For example, suppose that, while an injected conversion is in process (JCIP=1), a single write operation to DFSDM\_FLTxCr1 writes '1' to RSWSTART, requesting a regular conversion. When the injected sequence finishes, the precedence dictates that the regular conversion is performed next and its delayed start is signalized in RPEND bit.

### 33.4.18 Power optimization in run mode

In order to reduce the consumption, the DFSDM filter and integrator are automatically put into idle when not used by conversions (RCIP=0, JCIP=0).

## 33.5 DFSDM interrupts

In order to increase the CPU performance, a set of interrupts related to the CPU event occurrence has been implemented:

- End of injected conversion interrupt:
  - enabled by JEOCIE bit in DFSDM\_FLTxCr2 register
  - indicated in JEOCF bit in DFSDM\_FLTxISR register
  - cleared by reading DFSDM\_FLTxJDATAR register (injected data)
  - indication of which channel end of conversion occurred, reported in JDATACh[2:0] bits in DFSDM\_FLTxJDATAR register
- End of regular conversion interrupt:
  - enabled by REOCIE bit in DFSDM\_FLTxCr2 register
  - indicated in REOCF bit in DFSDM\_FLTxISR register
  - cleared by reading DFSDM\_FLTxRDATAR register (regular data)
  - indication of which channel end of conversion occurred, reported in RDATACh[2:0] bits in DFSDM\_FLTxRDATAR register
- Data overrun interrupt for injected conversions:
  - occurred when injected converted data were not read from DFSDM\_FLTxJDATAR register (by CPU or DMA) and were overwritten by a new injected conversion
  - enabled by JOVRIE bit in DFSDM\_FLTxCr2 register
  - indicated in JOVRF bit in DFSDM\_FLTxISR register
  - cleared by writing '1' into CLRJOVRF bit in DFSDM\_FLTxICR register
- Data overrun interrupt for regular conversions:
  - occurred when regular converted data were not read from DFSDM\_FLTxRDATAR register (by CPU or DMA) and were overwritten by a new regular conversion
  - enabled by ROVRIE bit in DFSDM\_FLTxCr2 register
  - indicated in ROVRF bit in DFSDM\_FLTxISR register
  - cleared by writing '1' into CLRROVRF bit in DFSDM\_FLTxICR register
- Analog watchdog interrupt:

- occurred when converted data (output data or data from analog watchdog filter - according to AWFSEL bit setting in DFSDM\_FLTxCr1 register) crosses over/under high/low thresholds in DFSDM\_FLTxAWHTR / DFSDM\_FLTxAWLTR registers
- enabled by AWDIE bit in DFSDM\_FLTxCr2 register (on selected channels AWDCH[7:0])
- indicated in AWDF bit in DFSDM\_FLTxISR register
- separate indication of high or low analog watchdog threshold error by AWHTF[7:0] and AWLTF[7:0] fields in DFSDM\_FLTxAWSR register
- cleared by writing '1' into corresponding CLRAWHTF[7:0] or CLRAWLTF[7:0] bits in DFSDM\_FLTxAWCFR register
- Short-circuit detector interrupt:
  - occurred when the number of stable data crosses over thresholds in DFSDM\_CHyAWSCDR register
  - enabled by SCDIE bit in DFSDM\_FLTxCr2 register (on channel selected by SCDEN bit in DFSDM\_CHyCFGR1 register)
  - indicated in SCDF[7:0] bits in DFSDM\_FLTxISR register (which also reports the channel on which the short-circuit detector event occurred)
  - cleared by writing '1' into the corresponding CLRSCDF[7:0] bit in DFSDM\_FLTxICR register
- Channel clock absence interrupt:
  - occurred when there is clock absence on CKINy pin (see [Clock absence detection](#) in [Section 33.4.4: Serial channel transceivers](#))
  - enabled by CKABIE bit in DFSDM\_FLTxCr2 register (on channels selected by CKABEN bit in DFSDM\_CHyCFGR1 register)
  - indicated in CKABF[y] bit in DFSDM\_FLTxISR register
  - cleared by writing '1' into CLRCKABF[y] bit in DFSDM\_FLTxICR register

**Table 224. DFSDM interrupt requests**

| Interrupt event            | Event flag                         | Event/Interrupt clearing method                        | Interrupt enable control bit |
|----------------------------|------------------------------------|--------------------------------------------------------|------------------------------|
| End of injected conversion | JEOCF                              | reading DFSDM_FLTxJDATAR                               | JEOCIE                       |
| End of regular conversion  | REOCF                              | reading DFSDM_FLTxRDATAR                               | REOCIE                       |
| Injected data overrun      | JOVRF                              | writing CLRJOVRF = 1                                   | JOVRIE                       |
| Regular data overrun       | ROVRF                              | writing CLRROVRF = 1                                   | ROVRIE                       |
| Analog watchdog            | AWDF,<br>AWHTF[7:0],<br>AWLTF[7:0] | writing CLRAWHTF[7:0] = 1<br>writing CLRAWLTF[7:0] = 1 | AWDIE,<br>(AWDCH[7:0])       |
| short-circuit detector     | SCDF[7:0]                          | writing CLRSCDF[7:0] = 1                               | SCDIE,<br>(SCDEN)            |
| Channel clock absence      | CKABF[7:0]                         | writing CLRCKABF[7:0] = 1                              | CKABIE,<br>(CKABEN)          |

### 33.6 DFSDM DMA transfer

To decrease the CPU intervention, conversions can be transferred into memory using a DMA transfer. A DMA transfer for injected conversions is enabled by setting bit JDMAEN=1 in DFSDM\_FLTxCR1 register. A DMA transfer for regular conversions is enabled by setting bit RDMAEN=1 in DFSDM\_FLTxCR1 register.

*Note:* With a DMA transfer, the interrupt flag is automatically cleared at the end of the injected or regular conversion (JEOCF or REOCF bit in DFSDM\_FLTxISR register) because DMA is reading DFSDM\_FLTxJDATAR or DFSDM\_FLTxRDATAR register.

### 33.7 DFSDM channel y registers (y=0..7)

Word access (32-bit) must be used for registers write access except DFSDM\_CHyDATINR register. Write access to DFSDM\_CHyDATINR register can be either word access (32-bit) or half-word access (16-bit).

#### 33.7.1 DFSDM channel y configuration register (DFSDM\_CHyCFGR1)

This register specifies the parameters used by channel y.

Address offset:  $0x00 + 0x20 * y$ , ( $y = 0$  to  $7$ )

Reset value: 0x0000 0000

| 31           | 30        | 29          | 28   | 27   | 26   | 25   | 24       | 23            | 22      | 21    | 20   | 19            | 18 | 17        | 16 |
|--------------|-----------|-------------|------|------|------|------|----------|---------------|---------|-------|------|---------------|----|-----------|----|
| DFSDM EN     | CKOUT SRC | Res.        | Res. | Res. | Res. | Res. | Res.     | CKOUTDIV[7:0] |         |       |      |               |    |           |    |
| rw           | rw        |             |      |      |      |      |          | rw            | rw      | rw    | rw   | rw            | rw | rw        | rw |
| 15           | 14        | 13          | 12   | 11   | 10   | 9    | 8        | 7             | 6       | 5     | 4    | 3             | 2  | 1         | 0  |
| DATPACK[1:0] |           | DATMPX[1:0] |      | Res. | Res. | Res. | CHIN SEL | CHEN          | CKAB EN | SCDEN | Res. | SPICKSEL[1:0] |    | SITP[1:0] |    |
| rw           | rw        | rw          | rw   |      |      |      | rw       | rw            | rw      | rw    |      | rw            | rw | rw        | rw |

Bit 31 **DFSDMEN**: Global enable for DFSDM interface

0: DFSDM interface disabled

1: DFSDM interface enabled

If DFSDM interface is enabled, then it is started to operate according to enabled y channels and enabled x filters settings (CHEN bit in DFSDM\_CHyCFGR1 and DFEN bit in DFSDM\_FLTxCR1).

Data cleared by setting DFSDMEN=0:

–all registers DFSDM\_FLTxISR are set to reset state ( $x = 0..5$ )

–all registers DFSDM\_FLTxAWSR are set to reset state ( $x = 0..5$ )

*Note:* DFSDMEN is present only in DFSDM\_CH0CFGR1 register (channel y=0)

Bit 30 **CKOUTSRC**: Output serial clock source selection

0: Source for output clock is from system clock

1: Source for output clock is from audio clock

This value can be modified only when DFSDMEN=0 (in DFSDM\_CH0CFGR1 register).

*Note:* CKOUTSRC is present only in DFSDM\_CH0CFGR1 register (channel y=0)

Bits 29:24 Reserved, must be kept at reset value.

Bits 23:16 **CKOUTDIV[7:0]**: Output serial clock divider

0: Output clock generation is disabled (CKOUT signal is set to low state)

1- 255: Defines the division of system clock for the serial clock output for CKOUT signal in range 2 - 256 (Divider = CKOUTDIV+1).

CKOUTDIV also defines the threshold for a clock absence detection.

This value can only be modified when DFSDMEN=0 (in DFSDM\_CH0CFGR1 register).

If DFSDMEN=0 (in DFSDM\_CH0CFGR1 register) then CKOUT signal is set to low state (setting is performed one DFSDM clock cycle after DFSDMEN=0).

*Note: CKOUTDIV is present only in DFSDM\_CH0CFGR1 register (channel y=0)*

Bits 15:14 **DATPACK[1:0]**: Data packing mode in DFSDM\_CHyDATINR register.

0: Standard: input data in DFSDM\_CHyDATINR register are stored only in INDAT0[15:0]. To empty DFSDM\_CHyDATINR register one sample must be read by the DFSDM filter from channel y.

1: Interleaved: input data in DFSDM\_CHyDATINR register are stored as two samples:

–first sample in INDAT0[15:0] (assigned to channel y)

–second sample INDAT1[15:0] (assigned to channel y)

To empty DFSDM\_CHyDATINR register, two samples must be read by the digital filter from channel y (INDAT0[15:0] part is read as first sample and then INDAT1[15:0] part is read as next sample).

2: Dual: input data in DFSDM\_CHyDATINR register are stored as two samples:

–first sample INDAT0[15:0] (assigned to channel y)

–second sample INDAT1[15:0] (assigned to channel y+1)

To empty DFSDM\_CHyDATINR register first sample must be read by the digital filter from channel y and second sample must be read by another digital filter from channel y+1. Dual mode is available only on even channel numbers (y = 0, 2, 4, 6), for odd channel numbers (y = 1, 3, 5, 7) DFSDM\_CHyDATINR is write protected. If an even channel is set to dual mode then the following odd channel must be set into standard mode (DATPACK[1:0]=0) for correct cooperation with even channel.

3: Reserved

This value can be modified only when CHEN=0 (in DFSDM\_CHyCFGR1 register).

Bits 13:12 **DATMPX[1:0]**: Input data multiplexer for channel y

0: Data to channel y are taken from external serial inputs as 1-bit values. DFSDM\_CHyDATINR register is write protected.

1: Data to channel y are taken from internal analog to digital converter ADC<sub>y+1</sub> output register update as 16-bit values (if ADC<sub>y+1</sub> is available). Data from ADCs are written into INDAT0[15:0] part of DFSDM\_CHyDATINR register.

2: Data to channel y are taken from internal DFSDM\_CHyDATINR register by direct CPU/DMA write. There can be written one or two 16-bit data samples according DATPACK[1:0] bit field setting.

3: Reserved

This value can be modified only when CHEN=0 (in DFSDM\_CHyCFGR1 register).

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **CHINSEL**: Channel inputs selection

0: Channel inputs are taken from pins of the same channel y.

1: Channel inputs are taken from pins of the following channel (channel (y+1) modulo 8).

This value can be modified only when CHEN=0 (in DFSDM\_CHyCFGR1 register).

Bit 7 **CHEN**: Channel y enable

0: Channel y disabled

1: Channel y enabled

If channel y is enabled, then serial data receiving is started according to the given channel setting.

Bit 6 **CKABEN**: Clock absence detector enable on channel y

0: Clock absence detector disabled on channel y

1: Clock absence detector enabled on channel y

Bit 5 **SCDEN**: Short-circuit detector enable on channel y

0: Input channel y will not be guarded by the short-circuit detector

1: Input channel y will be continuously guarded by the short-circuit detector

Bit 4 Reserved, must be kept at reset value.

Bits 3:2 **SPICKSEL[1:0]**: SPI clock select for channel y

0: clock coming from external CKINy input - sampling point according SITP[1:0]

1: clock coming from internal CKOUT output - sampling point according SITP[1:0]

2: clock coming from internal CKOUT - sampling point on each second CKOUT falling edge.

For connection to external  $\Sigma\Delta$  modulator which divides its clock input (from CKOUT) by 2 to generate its output serial communication clock (and this output clock change is active on each clock input rising edge).

3: clock coming from internal CKOUT output - sampling point on each second CKOUT rising edge.

For connection to external  $\Sigma\Delta$  modulator which divides its clock input (from CKOUT) by 2 to generate its output serial communication clock (and this output clock change is active on each clock input falling edge).

This value can be modified only when CHEN=0 (in DFSDM\_CHyCFGR1 register).

Bits 1:0 **SITP[1:0]**: Serial interface type for channel y

00: SPI with rising edge to strobe data

01: SPI with falling edge to strobe data

10: Manchester coded input on DATINy pin: rising edge = logic 0, falling edge = logic 1

11: Manchester coded input on DATINy pin: rising edge = logic 1, falling edge = logic 0

This value can only be modified when CHEN=0 (in DFSDM\_CHyCFGR1 register).

### 33.7.2 DFSDM channel y configuration register (DFSDM\_CHyCFGR2)

This register specifies the parameters used by channel y.

Address offset:  $0x04 + 0x20 * y$ , ( $y = 0$  to  $7$ )

Reset value: 0x0000 0000

|              |    |    |    |    |    |    |    |            |    |    |    |    |      |      |      |
|--------------|----|----|----|----|----|----|----|------------|----|----|----|----|------|------|------|
| 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23         | 22 | 21 | 20 | 19 | 18   | 17   | 16   |
| OFFSET[23:8] |    |    |    |    |    |    |    |            |    |    |    |    |      |      |      |
| rw           | rw | rw | rw | rw | rw | rw | rw | rw         | rw | rw | rw | rw | rw   | rw   | rw   |
| 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7          | 6  | 5  | 4  | 3  | 2    | 1    | 0    |
| OFFSET[7:0]  |    |    |    |    |    |    |    | DTRBS[4:0] |    |    |    |    | Res. | Res. | Res. |
| rw           | rw | rw | rw | rw | rw | rw | rw | rw         | rw | rw | rw | rw |      |      |      |

Bits 31:8 **OFFSET[23:0]**: 24-bit calibration offset for channel y

For channel y, OFFSET is applied to the results of each conversion from this channel.  
This value is set by software.

Bits 7:3 **DTRBS[4:0]**: Data right bit-shift for channel y

0-31: Defines the shift of the data result coming from the integrator - how many bit shifts to the right will be performed to have final results. Bit-shift is performed before offset correction. The data shift is rounding the result to nearest integer value. The sign of shifted result is maintained (to have valid 24-bit signed format of result data).

This value can be modified only when CHEN=0 (in DFSDM\_CHyCFGR1 register).

Bits 2:0 Reserved, must be kept at reset value.

### 33.7.3 DFSDM channel y analog watchdog and short-circuit detector register (DFSDM\_CHyAWSCDR)

Short-circuit detector and analog watchdog settings for channel y.

Address offset: 0x08 + 0x20 \* y, (y = 0 to 7)

Reset value: 0x0000 0000

|            |      |      |      |      |      |      |      |             |    |      |             |    |    |    |    |
|------------|------|------|------|------|------|------|------|-------------|----|------|-------------|----|----|----|----|
| 31         | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23          | 22 | 21   | 20          | 19 | 18 | 17 | 16 |
| Res.       | Res. | Res. | Res. | Res. | Res. | Res. | Res. | AWFORD[1:0] |    | Res. | AWFOSR[4:0] |    |    |    |    |
|            |      |      |      |      |      |      |      | rw          | rw |      | rw          | rw | rw | rw | rw |
| 15         | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7           | 6  | 5    | 4           | 3  | 2  | 1  | 0  |
| BKSCD[3:0] |      |      |      | Res. | Res. | Res. | Res. | SCDT[7:0]   |    |      |             |    |    |    |    |
| rw         | rw   | rw   | rw   |      |      |      |      | rw          | rw | rw   | rw          | rw | rw | rw | rw |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:22 **AWFORD[1:0]**: Analog watchdog Sinc filter order on channel y

0: FastSinc filter type

1: Sinc<sup>1</sup> filter type

2: Sinc<sup>2</sup> filter type

3: Sinc<sup>3</sup> filter type

Sinc<sup>x</sup> filter type transfer function:

$$H(z) = \left( \frac{1 - z^{-FOSR}}{1 - z^{-1}} \right)^x$$

FastSinc filter type transfer function:

$$H(z) = \left( \frac{1 - z^{-FOSR}}{1 - z^{-1}} \right)^2 \cdot (1 + z^{-(2 \cdot FOSR)})$$

This bit can be modified only when CHEN=0 (in DFSDM\_CHyCFGR1 register).

Bit 21 Reserved, must be kept at reset value.

Bits 20:16 **AWFOSR[4:0]**: Analog watchdog filter oversampling ratio (decimation rate) on channel y

0 - 31: Defines the length of the Sinc type filter in the range 1 - 32 (AWFOSR + 1). This number is also the decimation ratio of the analog data rate.

This bit can be modified only when CHEN=0 (in DFSDM\_CHyCFGR1 register).

*Note: If AWFOSR = 0 then the filter has no effect (filter bypass).*

Bits 15:12 **BKSCD[3:0]**: Break signal assignment for short-circuit detector on channel y  
 BKSCD[i] = 0: Break i signal not assigned to short-circuit detector on channel y  
 BKSCD[i] = 1: Break i signal assigned to short-circuit detector on channel y

Bits 11:8 Reserved, must be kept at reset value.

Bits 7:0 **SCDT[7:0]**: short-circuit detector threshold for channel y  
 These bits are written by software to define the threshold counter for the short-circuit detector. If this value is reached, then a short-circuit detector event occurs on a given channel.

### 33.7.4 DFSDM channel y watchdog filter data register (DFSDM\_CHyWDATR)

This register contains the data resulting from the analog watchdog filter associated to the input channel y.

Address offset:  $0x0C + 0x20 * y$ , (y = 0 to 7)

Reset value: 0x0000 0000

|             |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|-------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31          | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.        | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|             |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15          | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| WDATA[15:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| r           | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **WDATA[15:0]**: Input channel y watchdog data  
 Data converted by the analog watchdog filter for input channel y. This data is continuously converted (no trigger) for this channel, with a limited resolution ( $OSR=1..32/\text{sinc order} = 1..3$ ).

### 33.7.5 DFSDM channel y data input register (DFSDM\_CHyDATINR)

This register contains 16-bit input data to be processed by DFSDM filter module. Write access can be either word access (32-bit) or half-word access (16-bit).

Address offset:  $0x10 + 0x20 * y$ , (y = 0 to 7)

Reset value: 0x0000 0000

|              |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| INDAT1[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **PLSSKP[5:0]**: Pulses to skip for input data skipping function

0-63: Defines the number of serial input samples that will be skipped. Skipping is applied immediately after writing to this field. Reading of PLSSKP[5:0] returns current value of pulses which will be skipped. If PLSSKP[5:0]=0 then all required data samples were already skipped.

*Note: User can update PLSSKP[5:0] also when PLSSKP[5:0] is not zero.*

## 33.8 DFSDM filter x module registers (x=0..5)

Word access (32-bit) must be used for registers write access except DFSDM\_CHyDATINR register.

### 33.8.1 DFSDM filter x control register 1 (DFSDM\_FLTxCR1)

Address offset:  $0x100 + 0x80 * x$ , ( $x = 0$  to  $5$ )

Reset value: 0x0000 0000

| 31   | 30          | 29   | 28           | 27   | 26       | 25 | 24 | 23   | 22   | 21     | 20    | 19    | 18     | 17        | 16   |
|------|-------------|------|--------------|------|----------|----|----|------|------|--------|-------|-------|--------|-----------|------|
| Res. | AWFSEL      | FAST | Res.         | Res. | RCH[2:0] |    |    | Res. | Res. | RDMAEN | Res.  | RSYNC | RCON T | RSW START | Res. |
|      | rw          | rw   |              |      | rw       | rw | rw |      |      | rw     |       | rw    | rw     | rt_w1     |      |

| Res. | JEXTEN[1:0] |      | JEXTSEL[4:0] |      |          |    |    | Res. | Res. | JDMAEN | JSCAN | JSYNC | Res.   | JSW START | DFEN |
|      | rw          | rw   | rw           | rw   | rw       | rw | rw |      |      | rw     | rw    | rw    |        | rt_w1     | rw   |

Bit 31 Reserved, must be kept at reset value.

Bit 30 **AWFSEL**: Analog watchdog fast mode select

0: Analog watchdog on data output value (after the digital filter). The comparison is done after offset correction and shift

1: Analog watchdog on channel transceivers value (after watchdog filter)

Bit 29 **FAST**: Fast conversion mode selection for regular conversions

0: Fast conversion mode disabled

1: Fast conversion mode enabled

When converting a regular conversion in continuous mode, having enabled the fast mode causes each conversion (except the first) to execute faster than in standard mode. This bit has no effect on conversions which are not continuous.

This bit can be modified only when DFEN=0 (DFSDM\_FLTxCR1).

if FAST=0 (or first conversion in continuous mode if FAST=1):

$$t = [F_{OSR} * (I_{OSR} - 1 + F_{ORD}) + F_{ORD}] / f_{CKIN} \dots \text{for Sinc}^x \text{ filters}$$

$$t = [F_{OSR} * (I_{OSR} - 1 + 4) + 2] / f_{CKIN} \dots \text{for FastSinc filter}$$

if FAST=1 in continuous mode (except first conversion):

$$t = [F_{OSR} * I_{OSR}] / f_{CKIN}$$

in case if  $F_{OSR} = F_{OSR}[9:0] + 1 = 1$  (filter bypassed, active only integrator):

$$t = I_{OSR} / f_{CKIN} \dots \text{but CNVCNT}=0$$

where:  $f_{CKIN}$  is the channel input clock frequency (on given channel CKINy pin) or input data rate in case of parallel data input.

Bits 28:27 Reserved, must be kept at reset value.

Bits 26:24 **RCH[2:0]**: Regular channel selection

0: Channel 0 is selected as the regular channel

1: Channel 1 is selected as the regular channel

...

7: Channel 7 is selected as the regular channel

Writing these bits when RCIP=1 takes effect when the next regular conversion begins. This is especially useful in continuous mode (when RCONT=1). It also affects regular conversions which are pending (due to ongoing injected conversion).

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **RDMAEN**: DMA channel enabled to read data for the regular conversion

0: The DMA channel is not enabled to read regular data

1: The DMA channel is enabled to read regular data

This bit can be modified only when DFEN=0 (DFSDM\_FLTxCR1).

Bit 20 Reserved, must be kept at reset value.

Bit 19 **RSYNC**: Launch regular conversion synchronously with DFSDM\_FLT0

0: Do not launch a regular conversion synchronously with DFSDM\_FLT0

1: Launch a regular conversion in this DFSDM\_FLTx at the very moment when a regular conversion is launched in DFSDM\_FLT0

This bit can be modified only when DFEN=0 (DFSDM\_FLTxCR1).

Bit 18 **RCONT**: Continuous mode selection for regular conversions

0: The regular channel is converted just once for each conversion request

1: The regular channel is converted repeatedly after each conversion request

Writing '0' to this bit while a continuous regular conversion is already in progress stops the continuous mode immediately.

Bit 17 **RSWSTART**: Software start of a conversion on the regular channel

0: Writing '0' has no effect

1: Writing '1' makes a request to start a conversion on the regular channel and causes RCIP to become '1'. If RCIP=1 already, writing to RSWSTART has no effect. Writing '1' has no effect if RSYNC=1.

This bit is always read as '0'.

Bits 16:15 Reserved, must be kept at reset value.

Bits 14:13 **JEXTEN[1:0]**: Trigger enable and trigger edge selection for injected conversions

00: Trigger detection is disabled

01: Each rising edge on the selected trigger makes a request to launch an injected conversion

10: Each falling edge on the selected trigger makes a request to launch an injected conversion

11: Both rising edges and falling edges on the selected trigger make requests to launch injected conversions

This bit can be modified only when DFEN=0 (DFSDM\_FLTxCR1).

Bits 12:8 **JEXTSEL[4:0]**: Trigger signal selection for launching injected conversions

0x0-0x1F: Trigger inputs selected by the following table (internal or external trigger).

This bit can be modified only when DFEN=0 (DFSDM\_FLTxCR1).

*Note: synchronous trigger has latency up to one  $f_{DFSDMCLK}$  clock cycle (with deterministic jitter), asynchronous trigger has latency 2-3  $f_{DFSDMCLK}$  clock cycles (with jitter up to 1 cycle).*

|      | DFSDM_FLTx   |
|------|--------------|
| 0x00 | dfsdm_jtrg0  |
| 0x01 | dfsdm_jtrg1  |
| ...  |              |
| 0x1E | dfsdm_jtrg30 |
| 0x1F | dfsdm_jtrg31 |

Refer to [Table 220: DFSDM triggers connection](#).

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **JDMAEN**: DMA channel enabled to read data for the injected channel group

0: The DMA channel is not enabled to read injected data

1: The DMA channel is enabled to read injected data

This bit can be modified only when DFEN=0 (DFSDM\_FLTxCR1).

Bit 4 **JSCAN**: Scanning conversion mode for injected conversions

0: One channel conversion is performed from the injected channel group and next the selected channel from this group is selected.

1: The series of conversions for the injected group channels is executed, starting over with the lowest selected channel.

This bit can be modified only when DFEN=0 (DFSDM\_FLTxCR1).

Writing JCHG if JSCAN=0 resets the channel selection to the lowest selected channel.

Bit 3 **JSYNC**: Launch an injected conversion synchronously with the DFSDM\_FLT0 JSWSTART trigger

0: Do not launch an injected conversion synchronously with DFSDM\_FLT0

1: Launch an injected conversion in this DFSDM\_FLTx at the very moment when an injected conversion is launched in DFSDM\_FLT0 by its JSWSTART trigger

This bit can be modified only when DFEN=0 (DFSDM\_FLTxCR1).

Bit 2 Reserved, must be kept at reset value.

Bit 1 **JSWSTART**: Start a conversion of the injected group of channels

0: Writing '0' has no effect.

1: Writing '1' makes a request to convert the channels in the injected conversion group, causing JCIP to become '1' at the same time. If JCIP=1 already, then writing to JSWSTART has no effect. Writing '1' has no effect if JSYNC=1.

This bit is always read as '0'.

Bit 0 **DFEN**: DFSDM\_FLTx enable

0: DFSDM\_FLTx is disabled. All conversions of given DFSDM\_FLTx are stopped immediately and all DFSDM\_FLTx functions are stopped.

1: DFSDM\_FLTx is enabled. If DFSDM\_FLTx is enabled, then DFSDM\_FLTx starts operating according to its setting.

Data which are cleared by setting DFEN=0:

–register DFSDM\_FLTxISR is set to the reset state

–register DFSDM\_FLTxAWSR is set to the reset state

### 33.8.2 DFSDM filter x control register 2 (DFSDM\_FLTxCR2)

Address offset:  $0x104 + 0x80 * x$ , ( $x = 0$  to  $5$ )

Reset value: 0x0000 0000

|           |      |      |      |      |      |      |      |            |            |       |       |            |            |            |            |
|-----------|------|------|------|------|------|------|------|------------|------------|-------|-------|------------|------------|------------|------------|

|           |      |      |      |      |      |      |      | rw         | rw         | rw    | rw    | rw         | rw         | rw         | rw         |
| 15        | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7          | 6          | 5     | 4     | 3          | 2          | 1          | 0          |
| EXCH[7:0] |      |      |      |      |      |      |      | Res.       | CKAB<br>IE | SCDIE | AWDIE | ROVR<br>IE | JOVRI<br>E | REOC<br>IE | JEOCI<br>E |
| rw        | rw   | rw   | rw   | rw   | rw   | rw   | rw   |            | rw         | rw    | rw    | rw         | rw         | rw         | rw         |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **AWDCH[7:0]**: Analog watchdog channel selection

These bits select the input channel to be guarded continuously by the analog watchdog.

AWDCH[y] = 0: Analog watchdog is disabled on channel y

AWDCH[y] = 1: Analog watchdog is enabled on channel y

Bits 15:8 **EXCH[7:0]**: Extremes detector channel selection

These bits select the input channels to be taken by the Extremes detector.

EXCH[y] = 0: Extremes detector does not accept data from channel y

EXCH[y] = 1: Extremes detector accepts data from channel y

Bit 7 Reserved, must be kept at reset value.

Bit 6 **CKABIE**: Clock absence interrupt enable

0: Detection of channel input clock absence interrupt is disabled

1: Detection of channel input clock absence interrupt is enabled

Please see the explanation of CKABF[7:0] in DFSDM\_FLTxISR.

*Note: CKABIE is present only in DFSDM\_FLT0CR2 register (filter x=0)*

Bit 5 **SCDIE**: Short-circuit detector interrupt enable

0: short-circuit detector interrupt is disabled

1: short-circuit detector interrupt is enabled

Please see the explanation of SCDF[7:0] in DFSDM\_FLTxISR.

*Note: SCDIE is present only in DFSDM\_FLT0CR2 register (filter x=0)*

Bit 4 **AWDIE**: Analog watchdog interrupt enable

0: Analog watchdog interrupt is disabled

1: Analog watchdog interrupt is enabled

Please see the explanation of AWDF in DFSDM\_FLTxISR.

Bit 3 **ROVRIE**: Regular data overrun interrupt enable

0: Regular data overrun interrupt is disabled

1: Regular data overrun interrupt is enabled

Please see the explanation of ROVRF in DFSDM\_FLTxISR.

Bit 2 **JOVRIE**: Injected data overrun interrupt enable

0: Injected data overrun interrupt is disabled

1: Injected data overrun interrupt is enabled

Please see the explanation of JOVRF in DFSDM\_FLTxISR.

Bit 1 **REOCIE**: Regular end of conversion interrupt enable

0: Regular end of conversion interrupt is disabled

1: Regular end of conversion interrupt is enabled

Please see the explanation of REOCF in DFSDM\_FLTxISR.

Bit 0 **JEOCIE**: Injected end of conversion interrupt enable

0: Injected end of conversion interrupt is disabled

1: Injected end of conversion interrupt is enabled

Please see the explanation of JEOCF in DFSDM\_FLTxISR.

### 33.8.3 DFSDM filter x interrupt and status register (DFSDM\_FLTxISR)

Address offset:  $0x108 + 0x80 * x$ , ( $x = 0$  to  $5$ )

Reset value: 0x00FF 0000

|           |      |      |      |      |      |      |      |            |      |      |      |       |       |       |       |
|-----------|------|------|------|------|------|------|------|------------|------|------|------|-------|-------|-------|-------|
| 31        | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23         | 22   | 21   | 20   | 19    | 18    | 17    | 16    |
| SCDF[7:0] |      |      |      |      |      |      |      | CKABF[7:0] |      |      |      |       |       |       |       |

| 15        | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7          | 6    | 5    | 4    | 3     | 2     | 1     | 0     |
| Res.      | RCIP | JCIP | Res. | Res. | Res. | Res. | Res. | Res.       | Res. | Res. | AWDF | ROVRF | JOVRF | REOCF | JEOCF |
|           | r    | r    |      |      |      |      |      |            |      |      | r    | r     | r     | r     | r     |

Bits 31:24 **SCDF[7:0]**: short-circuit detector flag

SDCF[y]=0: No short-circuit detector event occurred on channel y

SDCF[y]=1: The short-circuit detector counter reaches, on channel y, the value programmed in the DFSDM\_CHyAWSCDR registers

This bit is set by hardware. It can be cleared by software using the corresponding CLRSCDF[y] bit in the DFSDM\_FLTxICR register. SCDF[y] is cleared also by hardware when CHEN[y] = 0 (given channel is disabled).

*Note: SCDF[7:0] is present only in DFSDM\_FLT0ISR register (filter x=0)*

Bits 23:16 **CKABF[7:0]**: Clock absence flag

CKABF[y]=0: Clock signal on channel y is present.

CKABF[y]=1: Clock signal on channel y is not present.

Given y bit is set by hardware when clock absence is detected on channel y. It is held at CKABF[y]=1 state by hardware when CHEN=0 (see DFSDM\_CHyCFGR1 register). It is held at CKABF[y]=1 state by hardware when the transceiver is not yet synchronized. It can be cleared by software using the corresponding CLRCKABF[y] bit in the DFSDM\_FLTxICR register.

*Note: CKABF[7:0] is present only in DFSDM\_FLT0ISR register (filter x=0)*

Bit 15 Reserved, must be kept at reset value.

Bit 14 **RCIP**: Regular conversion in progress status

0: No request to convert the regular channel has been issued

1: The conversion of the regular channel is in progress or a request for a regular conversion is pending

A request to start a regular conversion is ignored when RCIP=1.

**Bit 13 JCIP:** Injected conversion in progress status

0: No request to convert the injected channel group (neither by software nor by trigger) has been issued

1: The conversion of the injected channel group is in progress or a request for a injected conversion is pending, due either to '1' being written to JSWSTART or to a trigger detection

A request to start an injected conversion is ignored when JCIP=1.

Bits 12:5 Reserved, must be kept at reset value.

**Bit 4 AWDF:** Analog watchdog

0: No Analog watchdog event occurred

1: The analog watchdog block detected voltage which crosses the value programmed in the DFSDM\_FLTxAWLTR or DFSDM\_FLTxAWHTR registers.

This bit is set by hardware. It is cleared by software by clearing all source flag bits AWHTF[7:0] and AWLTF[7:0] in DFSDM\_FLTxAWSR register (by writing '1' into the clear bits in DFSDM\_FLTxAWCFR register).

**Bit 3 ROVRF:** Regular conversion overrun flag

0: No regular conversion overrun has occurred

1: A regular conversion overrun has occurred, which means that a regular conversion finished while REOCF was already '1'. RDATAR is not affected by overruns

This bit is set by hardware. It can be cleared by software using the CLRROVRF bit in the DFSDM\_FLTxICR register.

**Bit 2 JOVRF:** Injected conversion overrun flag

0: No injected conversion overrun has occurred

1: An injected conversion overrun has occurred, which means that an injected conversion finished while JEOCF was already '1'. JDATAR is not affected by overruns

This bit is set by hardware. It can be cleared by software using the CLRJOVRF bit in the DFSDM\_FLTxICR register.

**Bit 1 REOCF:** End of regular conversion flag

0: No regular conversion has completed

1: A regular conversion has completed and its data may be read

This bit is set by hardware. It is cleared when the software or DMA reads DFSDM\_FLTxRDATAR.

**Bit 0 JEOCF:** End of injected conversion flag

0: No injected conversion has completed

1: An injected conversion has completed and its data may be read

This bit is set by hardware. It is cleared when the software or DMA reads DFSDM\_FLTxJDATAR.

**Note:** For each of the flag bits, an interrupt can be enabled by setting the corresponding bit in DFSDM\_FLTxCR2. If an interrupt is called, the flag must be cleared before exiting the interrupt service routine.

All the bits of DFSDM\_FLTxISR are automatically reset when DFEN=0.

### 33.8.4 DFSDM filter x interrupt flag clear register (DFSDM\_FLTxICR)

Address offset:  $0x10C + 0x80 * x$ , ( $x = 0$  to  $5$ )

Reset value:  $0x0000\ 0000$

|              |       |       |       |       |       |       |       |               |       |       |       |          |          |       |       |
|--------------|-------|-------|-------|-------|-------|-------|-------|---------------|-------|-------|-------|----------|----------|-------|-------|
| 31           | 30    | 29    | 28    | 27    | 26    | 25    | 24    | 23            | 22    | 21    | 20    | 19       | 18       | 17    | 16    |
| CLRSCDF[7:0] |       |       |       |       |       |       |       | CLRCKABF[7:0] |       |       |       |          |          |       |       |
| rc_w1        | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1         | rc_w1 | rc_w1 | rc_w1 | rc_w1    | rc_w1    | rc_w1 | rc_w1 |
| 15           | 14    | 13    | 12    | 11    | 10    | 9     | 8     | 7             | 6     | 5     | 4     | 3        | 2        | 1     | 0     |
| Res.         | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res.  | Res.          | Res.  | Res.  | Res.  | CLRROVRF | CLRJOVRF | Res.  | Res.  |
|              |       |       |       |       |       |       |       |               |       |       |       | rc_w1    | rc_w1    |       |       |

Bits 31:24 **CLRSCDF[7:0]**: Clear the short-circuit detector flag

CLRSCDF[y]=0: Writing '0' has no effect

CLRSCDF[y]=1: Writing '1' to position y clears the corresponding SCDF[y] bit in the DFSDM\_FLTxISR register

*Note: CLRSCDF[7:0] is present only in DFSDM\_FLT0ICR register (filter x=0)*

Bits 23:16 **CLRCKABF[7:0]**: Clear the clock absence flag

CLRCKABF[y]=0: Writing '0' has no effect

CLRCKABF[y]=1: Writing '1' to position y clears the corresponding CKABF[y] bit in the DFSDM\_FLTxISR register. When the transceiver is not yet synchronized, the clock absence flag is set and cannot be cleared by CLRCKABF[y].

*Note: CLRCKABF[7:0] is present only in DFSDM\_FLT0ICR register (filter x=0)*

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **CLRROVRF**: Clear the regular conversion overrun flag

0: Writing '0' has no effect

1: Writing '1' clears the ROVRF bit in the DFSDM\_FLTxISR register

Bit 2 **CLRJOVRF**: Clear the injected conversion overrun flag

0: Writing '0' has no effect

1: Writing '1' clears the JOVRF bit in the DFSDM\_FLTxISR register

Bits 1:0 Reserved, must be kept at reset value.

*Note: The bits of DFSDM\_FLTxICR are always read as '0'.*

### 33.8.5 DFSDM filter x injected channel group selection register (DFSDM\_FLTxJCHGR)

Address offset:  $0x110 + 0x80 * x$ , ( $x = 0$  to  $5$ )

Reset value:  $0x0000\ 0001$

|      |      |      |      |      |      |      |      |           |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|-----------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23        | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.      | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |           |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7         | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | JCHG[7:0] |      |      |      |      |      |      |      |
|      |      |      |      |      |      |      |      | rw        | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **JCHG[7:0]**: Injected channel group selection

JCHG[y]=0: channel y is not part of the injected group

JCHG[y]=1: channel y is part of the injected group

If JSCAN=1, each of the selected channels is converted, one after another. The lowest channel (channel 0, if selected) is converted first and the sequence ends at the highest selected channel.

If JSCAN=0, then only one channel is converted from the selected channels, and the channel selection is moved to the next channel. Writing JCHG, if JSCAN=0, resets the channel selection to the lowest selected channel.

At least one channel must always be selected for the injected group. Writes causing all JCHG bits to be zero are ignored.

### 33.8.6 DFSDM filter x control register (DFSDM\_FLTxFCR)

Address offset:  $0x114 + 0x80 * x$ , ( $x = 0$  to  $5$ )

Reset value:  $0x0000\ 0000$

|           |      |      |      |      |      |           |      |           |    |    |    |    |    |    |    |
|-----------|------|------|------|------|------|-----------|------|-----------|----|----|----|----|----|----|----|
| 31        | 30   | 29   | 28   | 27   | 26   | 25        | 24   | 23        | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| FORD[2:0] |      |      | Res. | Res. | Res. | FOSR[9:0] |      |           |    |    |    |    |    |    |    |
| rw        | rw   | rw   |      |      |      | rw        | rw   | rw        | rw | rw | rw | rw | rw | rw | rw |
| 15        | 14   | 13   | 12   | 11   | 10   | 9         | 8    | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Res.      | Res. | Res. | Res. | Res. | Res. | Res.      | Res. | IOSR[7:0] |    |    |    |    |    |    |    |
|           |      |      |      |      |      |           |      | rw        | rw | rw | rw | rw | rw | rw | rw |

Bits 31:29 **FORD[2:0]**: Sinc filter order

0: FastSinc filter type

1: Sinc<sup>1</sup> filter type

2: Sinc<sup>2</sup> filter type

3: Sinc<sup>3</sup> filter type

4: Sinc<sup>4</sup> filter type

5: Sinc<sup>5</sup> filter type

6-7: Reserved

Sinc<sup>x</sup> filter type transfer function:

$$H(z) = \left( \frac{1 - z^{-FOSR}}{1 - z^{-1}} \right)^x$$

FastSinc filter type transfer function:  $H(z) = \left( \frac{1 - z^{-FOSR}}{1 - z^{-1}} \right)^2 \cdot (1 + z^{-(2 \cdot FOSR)})$

This bit can only be modified when DFEN=0 (DFSDM\_FLTxCR1).

Bits 28:26 Reserved, must be kept at reset value.

Bits 25:16 **FOSR[9:0]**: Sinc filter oversampling ratio (decimation rate)

0 - 1023: Defines the length of the Sinc type filter in the range 1 - 1024 ( $F_{OSR} = FOSR[9:0] + 1$ ). This number is also the decimation ratio of the output data rate from filter.

This bit can only be modified when DFEN=0 (DFSDM\_FLTxCR1)

*Note: If FOSR = 0, then the filter has no effect (filter bypass).*

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **IOSR[7:0]**: Integrator oversampling ratio (averaging length)

0 - 255: The length of the Integrator in the range 1 - 256 ( $IOSR + 1$ ). Defines how many samples from Sinc filter will be summed into one output data sample from the integrator. The output data rate from the integrator will be decreased by this number (additional data decimation ratio).

This bit can only be modified when DFEN=0 (DFSDM\_FLTxCR1)

*Note: If IOSR = 0, then the Integrator has no effect (Integrator bypass).*

### 33.8.7 DFSDM filter x data register for injected group (DFSDM\_FLTxJDATAR)

Address offset:  $0x118 + 0x80 * x$ , ( $x = 0$  to 5)

Reset value: 0x0000 0000

|             |    |    |    |    |    |    |    |      |      |      |      |      |            |    |    |
|-------------|----|----|----|----|----|----|----|------|------|------|------|------|------------|----|----|
| 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23   | 22   | 21   | 20   | 19   | 18         | 17 | 16 |
| JDATA[23:8] |    |    |    |    |    |    |    |      |      |      |      |      |            |    |    |
| r           | r  | r  | r  | r  | r  | r  | r  | r    | r    | r    | r    | r    | r          | r  | r  |
| 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7    | 6    | 5    | 4    | 3    | 2          | 1  | 0  |
| JDATA[7:0]  |    |    |    |    |    |    |    | Res. | Res. | Res. | Res. | Res. | JDATA[2:0] |    |    |
| r           | r  | r  | r  | r  | r  | r  | r  |      |      |      |      |      | r          | r  | r  |

Bits 31:8 **JDATA[23:0]**: Injected group conversion data

When each conversion of a channel in the injected group finishes, its resulting data is stored in this field. The data is valid when JEOCF=1. Reading this register clears the corresponding JEOCF.

Bits 7:3 Reserved, must be kept at reset value.

Bits 2:0 **JDATA[2:0]**: Injected channel most recently converted

When each conversion of a channel in the injected group finishes, JDATA[2:0] is updated to indicate which channel was converted. Thus, JDATA[23:0] holds the data that corresponds to the channel indicated by JDATA[2:0].

**Note:** *DMA may be used to read the data from this register. Half-word accesses may be used to read only the MSBs of conversion data.*

*Reading this register also clears JEOCF in DFSDM\_FLTxISR. Thus, the firmware must not read this register if DMA is activated to read data from this register.*

### 33.8.8 DFSDM filter x data register for the regular channel (DFSDM\_FLTxRDATAR)

Address offset:  $0x11C + 0x80 * x$ , ( $x = 0$  to  $5$ )

Reset value: 0x0000 0000

|             |    |    |    |    |    |    |    |      |      |      |       |      |            |    |    |
|-------------|----|----|----|----|----|----|----|------|------|------|-------|------|------------|----|----|
| 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23   | 22   | 21   | 20    | 19   | 18         | 17 | 16 |
| RDATA[23:8] |    |    |    |    |    |    |    |      |      |      |       |      |            |    |    |
| r           | r  | r  | r  | r  | r  | r  | r  | r    | r    | r    | r     | r    | r          | r  | r  |
| 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7    | 6    | 5    | 4     | 3    | 2          | 1  | 0  |
| RDATA[7:0]  |    |    |    |    |    |    |    | Res. | Res. | Res. | RPEND | Res. | RDATA[2:0] |    |    |
| r           | r  | r  | r  | r  | r  | r  | r  |      |      |      | r     |      | r          | r  | r  |

Bits 31:8 **RDATA[23:0]**: Regular channel conversion data

When each regular conversion finishes, its data is stored in this register. The data is valid when REOCF=1. Reading this register clears the corresponding REOCF.

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **RPEND**: Regular channel pending data

Regular data in RDATA[23:0] was delayed due to an injected channel trigger during the conversion

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **RDATA[2:0]**: Regular channel most recently converted

When each regular conversion finishes, RDATA[2:0] is updated to indicate which channel was converted (because regular channel selection RCH[2:0] in DFSDM\_FLTxCR1 register can be updated during regular conversion). Thus RDATA[23:0] holds the data that corresponds to the channel indicated by RDATA[2:0].

**Note:** *Half-word accesses may be used to read only the MSBs of conversion data.*

*Reading this register also clears REOCF in DFSDM\_FLTxISR.*

### 33.8.9 DFSDM filter x analog watchdog high threshold register (DFSDM\_FLTxAWHTR)

Address offset:  $0x120 + 0x80 * x$ , ( $x = 0$  to  $5$ )

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |      |      |      |      |            |    |    |    |
|------------|----|----|----|----|----|----|----|------|------|------|------|------------|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23   | 22   | 21   | 20   | 19         | 18 | 17 | 16 |
| AWHT[23:8] |    |    |    |    |    |    |    |      |      |      |      |            |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw   | rw   | rw   | rw   | rw         | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7    | 6    | 5    | 4    | 3          | 2  | 1  | 0  |
| AWHT[7:0]  |    |    |    |    |    |    |    | Res. | Res. | Res. | Res. | BKAWH[3:0] |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw |      |      |      |      | rw         | rw | rw | rw |

Bits 31:8 **AWHT[23:0]**: Analog watchdog high threshold

These bits are written by software to define the high threshold for the analog watchdog.

*Note: In case channel transceivers monitor (AWFSEL=1), the higher 16 bits (AWHT[23:8]) define the 16-bit threshold as compared with the analog watchdog filter output (because data coming from the analog watchdog filter are up to a 16-bit resolution). Bits AWHT[7:0] are not taken into comparison in this case.*

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **BKAWH[3:0]**: Break signal assignment to analog watchdog high threshold event

BKAWH[i] = 0: Break i signal is not assigned to an analog watchdog high threshold event

BKAWH[i] = 1: Break i signal is assigned to an analog watchdog high threshold event

### 33.8.10 DFSDM filter x analog watchdog low threshold register (DFSDM\_FLTxAWLTR)

Address offset:  $0x124 + 0x80 * x$ , ( $x = 0$  to  $5$ )

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |      |      |      |      |            |    |    |    |
|------------|----|----|----|----|----|----|----|------|------|------|------|------------|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23   | 22   | 21   | 20   | 19         | 18 | 17 | 16 |
| AWLT[23:8] |    |    |    |    |    |    |    |      |      |      |      |            |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw   | rw   | rw   | rw   | rw         | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7    | 6    | 5    | 4    | 3          | 2  | 1  | 0  |
| AWLT[7:0]  |    |    |    |    |    |    |    | Res. | Res. | Res. | Res. | BKAWL[3:0] |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw |      |      |      |      | rw         | rw | rw | rw |

Bits 31:8 **AWLT[23:0]**: Analog watchdog low threshold

These bits are written by software to define the low threshold for the analog watchdog.

*Note: In case channel transceivers monitor (AWFSEL=1), only the higher 16 bits (AWLT[23:8]) define the 16-bit threshold as compared with the analog watchdog filter output (because data coming from the analog watchdog filter are up to a 16-bit resolution). Bits AWLT[7:0] are not taken into comparison in this case.*

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **BKAWL[3:0]**: Break signal assignment to analog watchdog low threshold event

BKAWL[i] = 0: Break i signal is not assigned to an analog watchdog low threshold event

BKAWL[i] = 1: Break i signal is assigned to an analog watchdog low threshold event

### 33.8.11 DFSDM filter x analog watchdog status register (DFSDM\_FLTxAWSR)

Address offset:  $0x128 + 0x80 * x$ , ( $x = 0$  to  $5$ )

Reset value: 0x0000 0000

|            |      |      |      |      |      |      |      |            |      |      |      |      |      |      |      |
|------------|------|------|------|------|------|------|------|------------|------|------|------|------|------|------|------|
| 31         | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23         | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.       | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.       | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|            |      |      |      |      |      |      |      |            |      |      |      |      |      |      |      |
| 15         | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7          | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| AWHTF[7:0] |      |      |      |      |      |      |      | AWLTF[7:0] |      |      |      |      |      |      |      |
| r          | r    | r    | r    | r    | r    | r    | r    | r          | r    | r    | r    | r    | r    | r    | r    |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **AWHTF[7:0]**: Analog watchdog high threshold flag

AWHTF[y]=1 indicates a high threshold error on channel y. It is set by hardware. It can be cleared by software using the corresponding CLRAWHTF[y] bit in the DFSDM\_FLTxAWCFR register.

Bits 7:0 **AWLTF[7:0]**: Analog watchdog low threshold flag

AWLTF[y]=1 indicates a low threshold error on channel y. It is set by hardware. It can be cleared by software using the corresponding CLRAWLTF[y] bit in the DFSDM\_FLTxAWCFR register.

*Note: All the bits of DFSDM\_FLTxAWSR are automatically reset when DFEN=0.*

### 33.8.12 DFSDM filter x analog watchdog clear flag register (DFSDM\_FLTxAWCFR)

Address offset:  $0x12C + 0x80 * x$ , ( $x = 0$  to  $5$ )

Reset value:  $0x0000\ 0000$

|              |       |       |       |       |       |       |       |               |       |       |       |       |       |       |       |
|--------------|-------|-------|-------|-------|-------|-------|-------|---------------|-------|-------|-------|-------|-------|-------|-------|
| 31           | 30    | 29    | 28    | 27    | 26    | 25    | 24    | 23            | 22    | 21    | 20    | 19    | 18    | 17    | 16    |

| 15           | 14    | 13    | 12    | 11    | 10    | 9     | 8     | 7             | 6     | 5     | 4     | 3     | 2     | 1     | 0     |
| CLRWHTF[7:0] |       |       |       |       |       |       |       | CLRAWLTF[7:0] |       |       |       |       |       |       |       |
| rc_w1        | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1         | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 | rc_w1 |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **CLRWHTF[7:0]**: Clear the analog watchdog high threshold flag

CLRWHTF[y]=0: Writing '0' has no effect

CLRWHTF[y]=1: Writing '1' to position y clears the corresponding AWHTF[y] bit in the DFSDM\_FLTxAWSR register

Bits 7:0 **CLRAWLTF[7:0]**: Clear the analog watchdog low threshold flag

CLRAWLTF[y]=0: Writing '0' has no effect

CLRAWLTF[y]=1: Writing '1' to position y clears the corresponding AWLTF[y] bit in the DFSDM\_FLTxAWSR register

### 33.8.13 DFSDM filter x extremes detector maximum register (DFSDM\_FLTxEXMAX)

Address offset:  $0x130 + 0x80 * x$ , ( $x = 0$  to  $5$ )

Reset value:  $0x8000\ 0000$

|             |      |      |      |      |      |      |      |      |      |      |      |      |              |      |      |
|-------------|------|------|------|------|------|------|------|------|------|------|------|------|--------------|------|------|
| 31          | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18           | 17   | 16   |
| EXMAX[23:8] |      |      |      |      |      |      |      |      |      |      |      |      |              |      |      |
| rs_r        | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r         | rc_r | rc_r |
| 15          | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2            | 1    | 0    |
| EXMAX[7:0]  |      |      |      |      |      |      |      | Res. | Res. | Res. | Res. | Res. | EXMAXCH[2:0] |      |      |
| rc_r        | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r | rc_r |      |      |      |      |      | r            | r    | r    |

Bits 31:8 **EXMAX[23:0]**: Extremes detector maximum value

These bits are set by hardware and indicate the highest value converted by DFSDM\_FLTx.  
EXMAX[23:0] bits are reset to value (0x800000) by reading of this register.

Bits 7:3 Reserved, must be kept at reset value.

Bits 2:0 **EXMAXCH[2:0]**: Extremes detector maximum data channel.

These bits contains information about the channel on which the data is stored into EXMAX[23:0].  
Bits are cleared by reading of this register.

### 33.8.14 DFSDM filter x extremes detector minimum register (DFSDM\_FLTxEXMIN)

Address offset:  $0x134 + 0x80 * x$ , ( $x = 0$  to  $5$ )

Reset value:  $0x7FFF\ FF00$

|             |      |      |      |      |      |      |      |      |      |      |      |      |              |      |      |
|-------------|------|------|------|------|------|------|------|------|------|------|------|------|--------------|------|------|
| 31          | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18           | 17   | 16   |
| EXMIN[23:8] |      |      |      |      |      |      |      |      |      |      |      |      |              |      |      |
| rs_r        | rs_r | rs_r | rs_r | rs_r | rs_r | rs_r | rs_r | rs_r | rs_r | rs_r | rs_r | rs_r | rs_r         | rs_r | rs_r |
| 15          | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2            | 1    | 0    |
| EXMIN[7:0]  |      |      |      |      |      |      |      | Res. | Res. | Res. | Res. | Res. | EXMINCH[2:0] |      |      |
| rs_r        | rs_r | rs_r | rs_r | rs_r | rs_r | rs_r | rs_r |      |      |      |      |      | r            | r    | r    |

Bits 31:8 **EXMIN[23:0]**: Extremes detector minimum value

These bits are set by hardware and indicate the lowest value converted by DFSDM\_FLTx.

EXMIN[23:0] bits are reset to value ( $0x7FFFFFFF$ ) by reading of this register.

Bits 7:3 Reserved, must be kept at reset value.

Bits 2:0 **EXMINCH[2:0]**: Extremes detector minimum data channel

These bits contain information about the channel on which the data is stored into EXMIN[23:0]. Bits are cleared by reading of this register.

### 33.8.15 DFSDM filter x conversion timer register (DFSDM\_FLTxCNVTIMR)

Address offset:  $0x138 + 0x80 * x$ , ( $x = 0$  to  $5$ )

Reset value:  $0x0000\ 0000$

|               |    |    |    |    |    |    |    |    |    |    |    |      |      |      |      |
|---------------|----|----|----|----|----|----|----|----|----|----|----|------|------|------|------|
| 31            | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19   | 18   | 17   | 16   |
| CNVCNT[27:12] |    |    |    |    |    |    |    |    |    |    |    |      |      |      |      |
| r             | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r    | r    | r    | r    |
| 15            | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3    | 2    | 1    | 0    |
| CNVCNT[11:0]  |    |    |    |    |    |    |    |    |    |    |    | Res. | Res. | Res. | Res. |
| r             | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |      |      |      |      |

Bits 31:4 **CNVCNT[27:0]**: 28-bit timer counting conversion time  $t = \text{CNVCNT}[27:0] / f_{\text{DFSDMCLK}}$

The timer has an input clock from DFSDM clock (system clock  $f_{\text{DFSDMCLK}}$ ). Conversion time measurement is started on each conversion start and stopped when conversion finishes (interval between first and last serial sample). Only in case of filter bypass ( $\text{FOSR}[9:0] = 0$ ) is the conversion time measurement stopped and  $\text{CNVCNT}[27:0] = 0$ . The counted time is:

if  $\text{FAST}=0$  (or first conversion in continuous mode if  $\text{FAST}=1$ ):

$t = [\text{F}_{\text{OSR}} * (\text{I}_{\text{OSR}} - 1 + \text{F}_{\text{ORD}}) + \text{F}_{\text{ORD}}] / f_{\text{CKIN}}$ ..... for Sinc<sup>x</sup> filters

$t = [\text{F}_{\text{OSR}} * (\text{I}_{\text{OSR}} - 1 + 4) + 2] / f_{\text{CKIN}}$ ..... for FastSinc filter

if  $\text{FAST}=1$  in continuous mode (except first conversion):

$t = [\text{F}_{\text{OSR}} * \text{I}_{\text{OSR}}] / f_{\text{CKIN}}$

in case if  $\text{F}_{\text{OSR}} = \text{FOSR}[9:0] + 1 = 1$  (filter bypassed, active only integrator):

$\text{CNVCNT} = 0$  (counting is stopped, conversion time:  $t = \text{I}_{\text{OSR}} / f_{\text{CKIN}}$ )

where:  $f_{\text{CKIN}}$  is the channel input clock frequency (on given channel CKINy pin) or input data rate in case of parallel data input (from internal ADC or from CPU/DMA write)

*Note: When conversion is interrupted (e.g. by disable/enable selected channel) the timer counts also this interruption time.*

Bits 3:0 Reserved, must be kept at reset value.

## 33.9 DFSDM version registers

### 33.9.1 DFSDM hardware configuration register (DFSDM\_HWCFGR)

This register specifies the hardware configuration of DFSDM peripheral.

Address offset: 0x7F0

Reset value: 0x0000 0608

|          |      |      |      |      |      |      |      |          |      |      |      |      |      |      |      |
|----------|------|------|------|------|------|------|------|----------|------|------|------|------|------|------|------|
| 31       | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23       | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.     | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.     | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|          |      |      |      |      |      |      |      |          |      |      |      |      |      |      |      |
| 15       | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7        | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| NBF[7:0] |      |      |      |      |      |      |      | NBT[7:0] |      |      |      |      |      |      |      |
| r        | r    | r    | r    | r    | r    | r    | r    | r        | r    | r    | r    | r    | r    | r    | r    |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **NBF[7:0]**: Number of implemented filters

Defines how many filters are implemented in DFSDM peripheral.

Bits 7:0 **NBT[7:0]**: Number of implemented transceivers

Defines how many transceivers (input channels) are implemented in DFSDM peripheral.

### 33.9.2 DFSDM version register (DFSDM\_VERR)

This register specifies the version of DFSDM peripheral.

Address offset: 0x7F4

Reset value: 0x0000 0021

|      |      |      |      |      |      |      |      |             |      |      |      |             |      |      |      |
|------|------|------|------|------|------|------|------|-------------|------|------|------|-------------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23          | 22   | 21   | 20   | 19          | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.        | Res. | Res. | Res. | Res.        | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |             |      |      |      |             |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7           | 6    | 5    | 4    | 3           | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MAJREV[3:0] |      |      |      | MINREV[3:0] |      |      |      |
|      |      |      |      |      |      |      |      | r           | r    | r    | r    | r           | r    | r    | r    |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision of the DFSDM peripheral

These bits return the DFSDM major revision (in range 0..15).

Bits 3:0 **MINREV[3:0]**: Minor revision of the DFSDM peripheral

These bits return the DFSDM minor revision (in range 0..15).

### 33.9.3 DFSDM identification register (DFSDM\_IPIDR)

This register specifies the identification of DFSDM peripheral.

Address offset: 0x7F8

Reset value: 0x0011 0031

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ID[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ID[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **ID[31:0]**: Peripheral identifier

Bits [31:0]: these bits returns the DFSDM identifier ID[31:0] = 0x0011 0031

### 33.9.4 DFSDM size identification register (DFSDM\_SIDR)

This register specifies the size allocated to DFSDM registers.

Address offset: 0x7FC

Reset value: 0xA3C5 DD02

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SID[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| SID[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **SID[31:0]**: Size identification of DFSDM peripheral

Bits [31:8]: fixed code = 0xA3C5DD

Bits [7:0]: these bits returns the size of the memory region allocated to DFSDM registers.

0x02: 2KB allocated by DFSDM peripheral (fixed value).

## 33.9.5 DFSDM register map

The following table summarizes the DFSDM registers.

Table 225. DFSDM register map and reset values

| Offset      | Register name   | 31           | 30       | 29   | 28   | 27   | 26   | 25   | 24   | 23            | 22   | 21          | 20   | 19   | 18   | 17         | 16           | 15           | 14          | 13          | 12   | 11        | 10   | 9    | 8          | 7           | 6           | 5     | 4    | 3              | 2    | 1         | 0 |  |  |  |

## 34 Digital camera interface (DCMI)

### 34.1 Introduction

The digital camera is a synchronous parallel interface able to receive a high-speed data flow from an external 8-, 10-, 12- or 14-bit CMOS camera module. It supports different data formats: YCbCr4:2:2/RGB565 progressive video and compressed data (JPEG).

### 34.2 DCMI main features

- 8-, 10-, 12- or 14-bit parallel interface
- Embedded/external line and frame synchronization
- Continuous or snapshot mode
- Crop feature
- Supports the following data formats:
  - 8/10/12/14-bit progressive video: either monochrome or raw Bayer
  - YCbCr 4:2:2 progressive video
  - RGB 565 progressive video
  - Compressed data: JPEG

### 34.3 DCMI functional description

The digital camera interface is a synchronous parallel interface that can receive high-speed data flows. It consists of up to 14 data lines (DCMI\_D[13:0]) and a pixel clock line (DCMI\_PIXCLK). The pixel clock has a programmable polarity, so that data can be captured on either the rising or the falling edge of the pixel clock.

The data are packed into a 32-bit data register (DCMI\_DR) and then transferred through a general-purpose DMA channel. The image buffer is managed by the DMA, not by the camera interface.

The data received from the camera can be organized in lines/frames (raw YUB/RGB/Bayer modes) or can be a sequence of JPEG images. To enable JPEG image reception, the JPEG bit (bit 3 of DCMI\_CR register) must be set.

The data flow is synchronized either by hardware using the optional DCMI\_HSYNC (horizontal synchronization) and DCMI\_VSYNC (vertical synchronization) signals or by synchronization codes embedded in the data flow.

34.3.1 DCMI block diagram

Figure 273 shows the DCMI block diagram.

Figure 273. DCMI block diagram

34.3.2 DCMI pins and internal signals

The following table shows DCMI pins.

Table 226. DCMI input/output pins

| Mode    | Pin name     | Signal type | Description                             |
|---------|--------------|-------------|-----------------------------------------|
| 8 bits  | DCMI_D[7:0]  | Inputs      | DCMI data                               |
| 10 bits | DCMI_D[9:0]  |             |                                         |
| 12 bits | DCMI_D[11:0] |             |                                         |
| 14 bits | DCMI_D[13:0] |             |                                         |
|         | DCMI_PIXCLK  | Input       | Pixel clock                             |
|         | DCMI_HSYNC   | Input       | Horizontal synchronization / Data valid |
|         | DCMI_VSYNC   | Input       | Vertical synchronization                |

The following table shows DCMI internal signals.

Table 227. DCMI internal input/output signals

| Internal signal name | Signal type | Description            |
|----------------------|-------------|------------------------|
| dcmi_dma             | Output      | DCMI DMA request       |
| dcmi_it              | Output      | DCMI interrupt request |
| dcmi_hclk            | Input       | DCMI interface clock   |

### 34.3.3 DCMI clocks

The digital camera interface uses two clock domains, DCMI\_PIXCLK and HCLK. The signals generated with DCMI\_PIXCLK are sampled on the rising edge of HCLK once they are stable. An enable signal is generated in the HCLK domain, to indicate that data coming from the camera are stable and can be sampled. The maximum DCMI\_PIXCLK period must be higher than 2.5 HCLK periods.

### 34.3.4 DCMI DMA interface

The DMA interface is active when the CAPTURE bit of the DCMI\_CR register is set. A DMA request is generated each time the camera interface receives a complete 32-bit data block in its register.

### 34.3.5 DCMI physical interface

The interface is composed of 11/13/15/17 inputs. Only the Slave mode is supported.

The camera interface can capture 8-bit, 10-bit, 12-bit or 14-bit data depending on the EDM[1:0] bits of the DCMI\_CR register. If less than 14 bits are used, the unused input pins must be connected to ground.

DCMI pins are shown in [Table 226](#).

The data are synchronous with DCMI\_PIXCLK and change on the rising/falling edge of the pixel clock depending on the polarity.

The DCMI\_HSYNC signal indicates the start/end of a line.

The DCMI\_VSYNC signal indicates the start/end of a frame

**Figure 274. DCMI signal waveforms**

1. The capture edge of DCMI\_PIXCLK is the falling edge, the active state of DCMI\_HSYNC and DCMI\_VSYNC is 1.
2. DCMI\_HSYNC and DCMI\_VSYNC can change states at the same time.

#### 8-bit data

When EDM[1:0] = 00 in DCMI\_CR the interface captures 8 LSBs at its input (DCMI\_D[7:0]) and stores them as 8-bit data. The DCMI\_D[13:8] inputs are ignored. In this case, to capture a 32-bit word, the camera interface takes four pixel clock cycles.

The first captured data byte is placed in the LSB position in the 32-bit word and the 4<sup>th</sup> captured data byte is placed in the MSB position in the 32-bit word. The table below gives an example of the positioning of captured data bytes in two 32-bit words.

**Table 228. Positioning of captured data bytes in 32-bit words (8-bit width)**

| Byte address | 31:24          | 23:16          | 15:8           | 7:0            |
|--------------|----------------|----------------|----------------|----------------|
| 0            | $D_{n+3}[7:0]$ | $D_{n+2}[7:0]$ | $D_{n+1}[7:0]$ | $D_n[7:0]$     |
| 4            | $D_{n+7}[7:0]$ | $D_{n+6}[7:0]$ | $D_{n+5}[7:0]$ | $D_{n+4}[7:0]$ |

**10-bit data**

When  $EDM[1:0] = 01$  in DCMI\_CR, the camera interface captures 10-bit data at its input DCMI\_D[9:0] and stores them as the 10 least significant bits of a 16-bit word. The remaining most significant bits of the DCMI\_DR register (bits 11 to 15) are cleared to zero. So, in this case, a 32-bit data word is made up every two pixel clock cycles.

The first captured data are placed in the LSB position in the 32-bit word and the 2<sup>nd</sup> captured data are placed in the MSB position in the 32-bit word as shown in the table below.

**Table 229. Positioning of captured data bytes in 32-bit words (10-bit width)**

| Byte address | 31:26 | 25:16          | 15:10 | 9:0            |
|--------------|-------|----------------|-------|----------------|
| 0            | 0     | $D_{n+1}[9:0]$ | 0     | $D_n[9:0]$     |
| 4            | 0     | $D_{n+3}[9:0]$ | 0     | $D_{n+2}[9:0]$ |

**12-bit data**

When  $EDM[1:0] = 10$  in DCMI\_CR, the camera interface captures the 12-bit data at its input DCMI\_D[11:0] and stores them as the 12 least significant bits of a 16-bit word. The remaining most significant bits are cleared to zero. So, in this case a 32-bit data word is made up every two pixel clock cycles.

The first captured data are placed in the LSB position in the 32-bit word and the 2<sup>nd</sup> captured data are placed in the MSB position in the 32-bit word as shown in the table below.

**Table 230. Positioning of captured data bytes in 32-bit words (12-bit width)**

| Byte address | 31:28 | 27:16           | 15:12 | 11:0            |
|--------------|-------|-----------------|-------|-----------------|
| 0            | 0     | $D_{n+1}[11:0]$ | 0     | $D_n[11:0]$     |
| 4            | 0     | $D_{n+3}[11:0]$ | 0     | $D_{n+2}[11:0]$ |

**14-bit data**

When  $EDM[1:0] = 11$  in DCMI\_CR, the camera interface captures the 14-bit data at its input DCMI\_D[13:0] and stores them as the 14 least significant bits of a 16-bit word. The remaining most significant bits are cleared to zero. So, in this case a 32-bit data word is made up every two pixel clock cycles.

The first captured data are placed in the LSB position in the 32-bit word and the 2<sup>nd</sup> captured data are placed in the MSB position in the 32-bit word as shown in the table below.

**Table 231. Positioning of captured data bytes in 32-bit words (14-bit width)**

| Byte address | 31:30 | 29:16           | 15:14 | 13:0            |
|--------------|-------|-----------------|-------|-----------------|
| 0            | 0     | $D_{n+1}[13:0]$ | 0     | $D_n[13:0]$     |
| 4            | 0     | $D_{n+3}[13:0]$ | 0     | $D_{n+2}[13:0]$ |

### 34.3.6 DCMI synchronization

The digital camera interface supports embedded or hardware (DCMI\_HSYNC and DCMI\_VSYNC) synchronization. When embedded synchronization is used, it is up to the digital camera module to make sure that the 0x00 and 0xFF values are used ONLY for synchronization (not in data). Embedded synchronization codes are supported only for the 8-bit parallel data interface width (that is, in the DCMI\_CR register, the EDM[1:0] bits must be cleared).

For compressed data, the DCMI supports only the hardware synchronization mode. In this case, DCMI\_VSYNC is used as a start/end of the image, and DCMI\_HSYNC is used as a Data Valid signal. [Figure 275](#) shows the corresponding timing diagram.

**Figure 275. Timing diagram**

#### Hardware synchronization mode

In hardware synchronization mode, the two synchronization signals (DCMI\_HSYNC/DCMI\_VSYNC) are used.

Depending on the camera module/mode, data may be transmitted during horizontal/vertical synchronization periods. The DCMI\_HSYNC/DCMI\_VSYNC signals act like blanking signals since all the data received during DCMI\_HSYNC/DCMI\_VSYNC active periods are ignored.

In order to correctly transfer images into the DMA/RAM buffer, data transfer is synchronized with the DCMI\_VSYNC signal. When the hardware synchronization mode is selected, and

capture is enabled (CAPTURE bit set in DCMI\_CR), data transfer is synchronized with the deactivation of the DCMI\_VSYNC signal (next start of frame).

Transfer can then be continuous, with successive frames transferred by DMA to successive buffers or the same/circular buffer. To allow the DMA management of successive frames, a VSIF (Vertical synchronization interrupt flag) is activated at the end of each frame.

### Embedded data synchronization mode

In this synchronization mode, the data flow is synchronized using 32-bit codes embedded in the data flow. These codes use the 0x00/0xFF values that are *not* used in data anymore. There are 4 types of codes, all with a 0xFF0000XY format. The embedded synchronization codes are supported only in 8-bit parallel data width capture (in the DCMI\_CR register, the EDM[1:0] bits must be cleared). For other data widths, this mode generates unpredictable results and must not be used.

*Note: Camera modules can have 8 such codes (in interleaved mode). For this reason, the interleaved mode is not supported by the camera interface (otherwise, every other half-frame would be discarded).*

- Mode 2

Four embedded codes signal the following events

- Frame start (FS)
- Frame end (FE)
- Line start (LS)
- Line end (LE)

The XY values in the 0xFF0000XY format of the four codes are programmable (see [Section 34.5.7: DCMI embedded synchronization code register \(DCMI\\_ESCR\)](#)).

A 0xFF value programmed as a “frame end” means that all the unused codes are interpreted as valid frame end codes.

In this mode, once the camera interface has been enabled, the frame capture starts after the first occurrence of the frame end (FE) code followed by a frame start (FS) code.

- Mode 1

An alternative coding is the camera mode 1. This mode is ITU656 compatible.

The codes signal another set of events:

- SAV (active line) - line start
- EAV (active line) - line end
- SAV (blanking) - end of line during interframe blanking period
- EAV (blanking) - end of line during interframe blanking period

This mode can be supported by programming the following codes:

- FS ≤ 0xFF
- FE ≤ 0xFF
- LS ≤ SAV (active)
- LE ≤ EAV (active)

An embedded unmask code is also implemented for frame/line start and frame/line end codes. Using it, it is possible to compare only the selected unmasked bits with the programmed code. A bit can therefore be selected to compare in the embedded code and

detect a frame/line start or frame/line end. This means that there can be different codes for the frame/line start and frame/line end with the unmasked bit position remaining the same.

### Example

FS = 0xA5

Unmask code for FS = 0x10

In this case the frame start code is embedded in the bit 4 of the frame start code.

## 34.3.7 DCMI capture modes

This interface supports two types of capture: snapshot (single frame) and continuous grab.

### Snapshot mode (single frame)

In this mode, a single frame is captured (CM = 1 of the DCMI\_CR register). After the CAPTURE bit is set in DCMI\_CR, the interface waits for the detection of a start of frame before sampling the data. The camera interface is automatically disabled (CAPTURE bit cleared in DCMI\_CR) after receiving the first complete frame. An interrupt is generated (IT\_FRAME) if it is enabled.

In case of an overrun, the frame is lost and the CAPTURE bit is cleared.

**Figure 276. Frame capture waveforms in snapshot mode**

1. Here, the active state of DCMI\_HSYNC and DCMI\_VSYNC is 1.
2. DCMI\_HSYNC and DCMI\_VSYNC can change states at the same time.

### Continuous grab mode

In this mode (CM bit = 0 in DCMI\_CR), once the CAPTURE bit has been set in DCMI\_CR, the grabbing process starts on the next DCMI\_VSYNC or embedded frame start depending on the mode. The process continues until the CAPTURE bit is cleared in DCMI\_CR. Once the CAPTURE bit has been cleared, the grabbing process continues until the end of the current frame.

Figure 277. Frame capture waveforms in continuous grab mode

1. Here, the active state of DCMI\_HSYNC and DCMI\_VSYNC is 1.
2. DCMI\_HSYNC and DCMI\_VSYNC can change states at the same time.

In continuous grab mode, the FCRC[1:0] bits in DCMI\_CR can be configured to grab all pictures, every second picture or one out of four pictures to decrease the frame capture rate.

**Note:** *In the hardware synchronization mode (ESS = 0 in DCMI\_CR), the IT\_VSYNC interrupt is generated (if enabled) even when CAPTURE = 0 in DCMI\_CR so, to reduce the frame capture rate even further, the IT\_VSYNC interrupt can be used to count the number of frames between 2 captures in conjunction with the Snapshot mode. This is not allowed by embedded data synchronization mode.*

### 34.3.8 DCMI crop feature

With the crop feature, the camera interface can select a rectangular window from the received image. The start (upper left corner) coordinates and size (horizontal dimension in number of pixel clocks and vertical dimension in number of lines) are specified using two 32-bit registers (DCMI\_CWSTRT and DCMI\_CWSIZE). The size of the window is specified in number of pixel clocks (horizontal dimension) and in number of lines (vertical dimension).

Figure 278. Coordinates and size of the window after cropping

These registers specify the coordinates of the starting point of the capture window as a line number (in the frame, starting from 0) and a number of pixel clocks (on the line, starting from 0), and the size of the window as a line number and a number of pixel clocks. The CAPCNT value can only be a multiple of 4 (two least significant bits are forced to 0) to allow the correct transfer of data through the DMA.

If the DCMI\_VSYNC signal goes active before the number of lines is specified in the DCMI\_CWSIZE register, then the capture stops and an IT\_FRAME interrupt is generated when enabled.

**Figure 279. Data capture waveforms**

1. Here, the active state of DCMI\_HSYNC and DCMI\_VSYNC is 1.
2. DCMI\_HSYNC and DCMI\_VSYNC can change states at the same time.

### 34.3.9 DCMI JPEG format

To allow JPEG image reception, it is necessary to set the JPEG bit of the DCMI\_CR register. JPEG images are not stored as lines and frames, so the DCMI\_VSYNC signal is used to start the capture while DCMI\_HSYNC serves as a data enable signal. The number of bytes in a line may not be a multiple of 4. This case must be carefully handled since a DMA request is generated each time a complete 32-bit word has been constructed from the captured data. When an end of frame is detected and the 32-bit word to be transferred has not been completely received, the remaining data are padded with zeros and a DMA request is generated.

The crop feature and embedded synchronization codes cannot be used in JPEG format.

### 34.3.10 DCMI FIFO

A 8-word FIFO is implemented to manage data rate transfers on the AHB. The DCMI features a simple FIFO controller with a read pointer incremented each time the camera interface reads from the AHB, and a write pointer incremented each time the camera interface writes to the FIFO. There is no overrun protection to prevent the data from being overwritten if the AHB interface does not sustain the data transfer rate.

In case of overrun or errors in the synchronization signals, the FIFO is reset and the DCMI interface waits for a new start of frame.

### 34.3.11 DCMI data format description

#### Data formats

Three types of data are supported:

- 8/10/12/14-bit progressive video: either monochrome or raw Bayer format
- YCbCr 4:2:2 progressive video
- RGB565 progressive video. A pixel coded in 16 bits (5 bits for blue, 5 bits for red, 6 bits for green) takes two clock cycles to be transferred.

Compressed data: JPEG

For B&W (black and white), YCbCr or RGB data, the maximum input size is  $2048 \times 2048$  pixels. No limit in JPEG compressed mode.

For monochrome, RGB and YCbCr, the frame buffer is stored in raster mode. 32-bit words are used. Only the little-endian format is supported.

**Figure 280. Pixel raster scan order**

#### Monochrome format

Characteristics:

- Raster format
- 8 bits per pixel

The table below shows how the data are stored.

**Table 232. Data storage in monochrome progressive video format**

| Byte address | 31:24   | 23:16   | 15:8    | 7:0     |
|--------------|---------|---------|---------|---------|
| 0            | $n + 3$ | $n + 2$ | $n + 1$ | $n$     |
| 4            | $n + 7$ | $n + 6$ | $n + 5$ | $n + 4$ |

#### RGB format

Characteristics:

- Raster format
- RGB
- Interleaved: one buffer: R, G and B interleaved (such as BRGBRBRG)
- Optimized for display output

The RGB planar format is compatible with standard OS frame buffer display formats.

Only 16 BPP (bits per pixel): RGB565 (2 pixels per 32-bit word) is supported.

The 24 BPP (palletized format) and gray-scale formats are not supported. Pixels are stored in a raster scan order, that is from top to bottom for pixel rows, and from left to right within a pixel row. Pixel components are R (red), G (green) and B (blue). All components have the same spatial resolution (4:4:4 format). A frame is stored in a single part, with the components interleaved on a pixel basis.

The table below shows how the data are stored.

**Table 233. Data storage in RGB progressive video format**

| Byte address | 31:27     | 26:21       | 20:16      | 15:11     | 10:5        | 4:0        |
|--------------|-----------|-------------|------------|-----------|-------------|------------|
| 0            | Red n + 1 | Green n + 1 | Blue n + 1 | Red n     | Green n     | Blue n     |
| 4            | Red n + 4 | Green n + 3 | Blue n + 3 | Red n + 2 | Green n + 2 | Blue n + 2 |

### YCbCr format

Characteristics:

- Raster format
- YCbCr 4:2:2
- Interleaved: one buffer: Y, Cb and Cr interleaved (such as CbYCrYCbYCr)

Pixel components are Y (luminance or “luma”), Cb and Cr (chrominance or “chroma” blue and red). Each component is encoded in 8 bits. Luma and chroma are stored together (interleaved) as shown in the table below.

**Table 234. Data storage in YCbCr progressive video format**

| Byte address | 31:24   | 23:16    | 15:8    | 7:0      |
|--------------|---------|----------|---------|----------|
| 0            | Y n + 1 | Cr n     | Y n     | Cb n     |
| 4            | Y n + 3 | Cr n + 2 | Y n + 2 | Cb n + 2 |

### YCbCr format - Y only

Characteristics:

- Raster format
- YCbCr 4:2:2
- The buffer only contains Y information - monochrome image

Pixel components are Y (luminance or “luma”), Cb and Cr (chrominance or “chroma” blue and red). In this mode, the chroma information is dropped. Only the luma component of each pixel, encoded in 8 bits, is stored as shown in [Table 235](#).

The result is a monochrome image having the same resolution as the original YCbCr data.

**Table 235. Data storage in YCbCr progressive video format - Y extraction mode**

| Byte address | 31:24     | 23:16     | 15:8      | 7:0       |
|--------------|-----------|-----------|-----------|-----------|
| 0            | $Y_{n+3}$ | $Y_{n+2}$ | $Y_{n+1}$ | $Y_n$     |
| 4            | $Y_{n+7}$ | $Y_{n+6}$ | $Y_{n+5}$ | $Y_{n+4}$ |

### Half resolution image extraction

This is a modification of the previous reception modes, being applicable to monochrome, RGB or Y extraction modes.

This mode is used to only store a half resolution image. It is selected through OELS and LSM control bits.

## 34.4 DCMI interrupts

Five interrupts are generated. All interrupts are maskable by software. The global interrupt (dcmi\_it) is the OR of all the individual interrupts. The table below gives the list of all interrupts.

**Table 236. DCMI interrupts**

| Interrupt acronym | Interrupt event                                                       | Event flag | Enable control bit | Interrupt clear method | Exits Sleep mode | Exists Stop and Standby modes |
|-------------------|-----------------------------------------------------------------------|------------|--------------------|------------------------|------------------|-------------------------------|
| dcmi_it           | End of line                                                           | LINE_RIS   | LINE_IE            | Set LINE_ISC           | Yes              | No                            |
|                   | End of frame capture                                                  | FRAME_RIS  | FRAME_IE           | Set FRAME_ISC          | Yes              | No                            |
|                   | Overrun of data reception                                             | OVR_RIS    | OVR_IE             | Set OVR_ISC            | Yes              | No                            |
|                   | Synchronization frame                                                 | VSYNC_RIS  | VSYNC_IE           | Set VSYNC_ISC          | Yes              | No                            |
|                   | Detection of an error in the embedded synchronization frame detection | ERR_RIS    | ERR_IE             | Set ERR_ISC            | Yes              | No                            |

## 34.5 DCMI registers

Refer to [Section 1.2 on page 119](#) for list of abbreviations used in register descriptions. All DCMI registers must be accessed as 32-bit words, otherwise a bus error occurs.

### 34.5.1 DCMI control register (DCMI\_CR)

Address offset: 0x00

Reset value: 0x0000 0000

|      |        |      |      |          |      |           |      |       |       |        |      |      |      |          |         |

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **OELS**: Odd/Even Line Select (Line Select Start)

This bit works in conjunction with the LSM field (LSM = 1).

0: Interface captures first line after the frame start, second one being dropped.

1: Interface captures second line from the frame start, first one being dropped.

Bit 19 **LSM**: Line Select mode

0: Interface captures all received lines.

1: Interface captures one line out of two.

Bit 18 **OEBS**: Odd/Even Byte Select (Byte Select Start)

This bit works in conjunction with BSM field (BSM ≠ 00).

0: Interface captures first data (byte or double byte) from the frame/line start, second one being dropped.

1: Interface captures second data (byte or double byte) from the frame/line start, first one being dropped.

Bits 17:16 **BSM[1:0]**: Byte Select mode

00: Interface captures all received data.

01: Interface captures every other byte from the received data.

10: Interface captures one byte out of four.

11: Interface captures two bytes out of four.

*Note: This mode only works for EDM[1:0] = 00. For all other EDM values, this field must be programmed to the reset value.*

Bit 15 Reserved, must be kept at reset value.

Bit 14 **ENABLE**: DCMI enable

0: DCMI disabled

1: DCMI enabled

*Note: The DCMI configuration registers must be programmed correctly before enabling this bit.*

Bits 13:12 Reserved, must be kept at reset value.

Bits 11:10 **EDM[1:0]**: Extended data mode

- 00: Interface captures 8-bit data on every pixel clock.
- 01: Interface captures 10-bit data on every pixel clock.
- 10: Interface captures 12-bit data on every pixel clock.
- 11: Interface captures 14-bit data on every pixel clock.

Bits 9:8 **FCRC[1:0]**: Frame capture rate control

These bits define the frequency of frame capture. They are meaningful only in Continuous grab mode. They are ignored in snapshot mode.

- 00: All frames are captured.
- 01: Every alternate frame captured (50% bandwidth reduction)
- 10: One frame out of four captured (75% bandwidth reduction)
- 11: reserved

Bit 7 **VSPOL**: Vertical synchronization polarity

This bit indicates the level on the DCMI\_VSYNC pin when the data are not valid on the parallel interface.

- 0: DCMI\_VSYNC active low
- 1: DCMI\_VSYNC active high

Bit 6 **HSPOL**: Horizontal synchronization polarity

This bit indicates the level on the DCMI\_HSYNC pin when the data are not valid on the parallel interface.

- 0: DCMI\_HSYNC active low
- 1: DCMI\_HSYNC active high

Bit 5 **PCKPOL**: Pixel clock polarity

This bit configures the capture edge of the pixel clock.

- 0: Falling edge active
- 1: Rising edge active

Bit 4 **ESS**: Embedded synchronization select

- 0: Hardware synchronization data capture (frame/line start/stop) is synchronized with the DCMI\_HSYNC/DCMI\_VSYNC signals.
- 1: Embedded synchronization data capture is synchronized with synchronization codes embedded in the data flow.

*Note: Valid only for 8-bit parallel data. HSPOL/VSPOL are ignored when the ESS bit is set.*

This bit is disabled in JPEG mode.

Bit 3 **JPEG**: JPEG format

- 0: Uncompressed video format
- 1: This bit is used for JPEG data transfers. The DCMI\_HSYNC signal is used as data enable. The crop and embedded synchronization features (ESS bit) cannot be used in this mode.

Bit 2 **CROP**: Crop feature

- 0: The full image is captured. In this case the total number of bytes in an image frame must be a multiple of four.
- 1: Only the data inside the window specified by the crop register is captured. If the size of the crop window exceeds the picture size, then only the picture size is captured.

Bit 1 **CM**: Capture mode

- 0: Continuous grab mode - The received data are transferred into the destination memory through the DMA. The buffer location and mode (linear or circular buffer) is controlled through the system DMA.
- 1: Snapshot mode (single frame) - Once activated, the interface waits for the start of frame and then transfers a single frame through the DMA. At the end of the frame, the CAPTURE bit is automatically reset.

Bit 0 **CAPTURE**: Capture enable

0: Capture disabled

1: Capture enabled

The camera interface waits for the first start of frame, then a DMA request is generated to transfer the received data into the destination memory.

In snapshot mode, the CAPTURE bit is automatically cleared at the end of the first frame received.

In continuous grab mode, if the software clears this bit while a capture is ongoing, the bit is effectively cleared after the frame end.

*Note: The DMA controller and all DCMI configuration registers must be programmed correctly before enabling this bit.*

### 34.5.2 DCMI status register (DCMI\_SR)

Address offset: 0x04

Reset value: 0x0000 0000

| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17    | 16    |

|      |      |      |      |      |      |      |      |      |      |      |      |      | r    | r     | r     |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **FNE**: FIFO not empty

This bit gives the status of the FIFO.

1: FIFO contains valid data.

0: FIFO empty

Bit 1 **VSYNC**: Vertical synchronization

This bit gives the state of the DCMI\_VSYNC pin with the correct programmed polarity. When embedded synchronization codes are used, the meaning of this bit is the following:

0: active frame

1: synchronization between frames

In case of embedded synchronization, this bit is meaningful only if the CAPTURE bit in DCMI\_CR is set.

Bit 0 **HSYNC**: Horizontal synchronization

This bit gives the state of the DCMI\_HSYNC pin with the correct programmed polarity. When embedded synchronization codes are used, the meaning of this bit is the following:

0: active line

1: synchronization between lines

In case of embedded synchronization, this bit is meaningful only if the CAPTURE bit in DCMI\_CR is set.

### 34.5.3 DCMI raw interrupt status register (DCMI\_RIS)

DCMI\_RIS gives the raw interrupt status and is accessible in read only. When read, this register returns the status of the corresponding interrupt before masking with the DCMI\_IER register value.

Address offset: 0x08

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |          |           |         |         |           |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LINE_RIS | VSYNC_RIS | ERR_RIS | OVR_RIS | FRAME_RIS |
|      |      |      |      |      |      |      |      |      |      |      | r        | r         | r       | r       | r         |

Bits 31:5 Reserved, must be kept at reset value.

**Bit 4 LINE\_RIS:** Line raw interrupt status

This bit gets set when the DCMI\_HSYNC signal changes from the inactive state to the active state. It goes high even if the line is not valid.

In the case of embedded synchronization, this bit is set only if the CAPTURE bit in DCMI\_CR is set.

It is cleared by setting the LINE\_ISC bit of the DCMI\_ICR register.

**Bit 3 VSYNC\_RIS:** DCMI\_VSYNC raw interrupt status

This bit is set when the DCMI\_VSYNC signal changes from the inactive state to the active state.

In the case of embedded synchronization, this bit is set only if the CAPTURE bit is set in DCMI\_CR.

It is cleared by setting the VSYNC\_ISC bit of the DCMI\_ICR register.

**Bit 2 ERR\_RIS:** Synchronization error raw interrupt status

0: No synchronization error detected

1: Embedded synchronization characters are not received in the correct order.

This bit is valid only in the embedded synchronization mode. It is cleared by setting the ERR\_ISC bit of the DCMI\_ICR register.

*Note: This bit is available only in embedded synchronization mode.*

**Bit 1 OVR\_RIS:** Overrun raw interrupt status

0: No data buffer overrun occurred

1: A data buffer overrun occurred and the data FIFO is corrupted.

The bit is cleared by setting the OVR\_ISC bit of the DCMI\_ICR register.

**Bit 0 FRAME\_RIS:** Capture complete raw interrupt status

0: No new capture

1: A frame has been captured.

This bit is set when a frame or window has been captured.

In case of a cropped window, this bit is set at the end of line of the last line in the crop. It is set even if the captured frame is empty (e.g. window cropped outside the frame).

The bit is cleared by setting the FRAME\_ISC bit of the DCMI\_ICR register.

### 34.5.4 DCMI interrupt enable register (DCMI\_IER)

The DCMI\_IER register is used to enable interrupts. When one of the DCMI\_IER bits is set, the corresponding interrupt is enabled. This register is accessible in both read and write.

Address offset: 0x0C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |             |              |            |            |              |

|      |      |      |      |      |      |      |      |      |      |      | rw          | rw           | rw         | rw         | rw           |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **LINE\_IE**: Line interrupt enable

0: No interrupt generation when the line is received

1: An interrupt is generated when a line has been completely received.

Bit 3 **VSYN\_C\_IE**: DCMI\_VSYNC interrupt enable

0: No interrupt generation

1: An interrupt is generated on each DCMI\_VSYNC transition from the inactive to the active state.

The active state of the DCMI\_VSYNC signal is defined by the VSPOL bit.

Bit 2 **ERR\_IE**: Synchronization error interrupt enable

0: No interrupt generation

1: An interrupt is generated if the embedded synchronization codes are not received in the correct order.

*Note: This bit is available only in embedded synchronization mode.*

Bit 1 **OVR\_IE**: Overrun interrupt enable

0: No interrupt generation

1: An interrupt is generated if the DMA was not able to transfer the last data before new data (32-bit) are received.

Bit 0 **FRAME\_IE**: Capture complete interrupt enable

0: No interrupt generation

1: An interrupt is generated at the end of each received frame/crop window (in crop mode).

### 34.5.5 DCMI masked interrupt status register (DCMI\_MIS)

This DCMI\_MIS register is a read-only register. When read, it returns the current masked status value (depending on the value in DCMI\_IER) of the corresponding interrupt. A bit in this register is set if the corresponding enable bit in DCMI\_IER is set and the corresponding bit in DCMI\_RIS is set.

Address offset: 0x10

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |          |           |         |         |           |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LINE_MIS | VSYNC_MIS | ERR_MIS | OVR_MIS | FRAME_MIS |
|      |      |      |      |      |      |      |      |      |      |      | r        | r         | r       | r       | r         |

Bits 31:5 Reserved, must be kept at reset value.

**Bit 4 LINE\_MIS:** Line masked interrupt status

This bit gives the status of the masked line interrupt.

0: No interrupt generation when the line is received

1: An Interrupt is generated when a line has been completely received and the LINE\_IE bit is set in DCMI\_IER.

**Bit 3 VSYNC\_MIS:** VSYNC masked interrupt status

This bit gives the status of the masked VSYNC interrupt.

0: No interrupt is generated on DCMI\_VSYNC transitions.

1: An interrupt is generated on each DCMI\_VSYNC transition from the inactive to the active state and the VSYNC\_IE bit is set in DCMI\_IER.

The active state of the DCMI\_VSYNC signal is defined by the VSPOL bit.

**Bit 2 ERR\_MIS:** Synchronization error masked interrupt status

This bit gives the status of the masked synchronization error interrupt.

0: No interrupt is generated on a synchronization error.

1: An interrupt is generated if the embedded synchronization codes are not received in the correct order and the ERR\_IE bit in DCMI\_IER is set.

*Note: This bit is available only in embedded synchronization mode.*

**Bit 1 OVR\_MIS:** Overrun masked interrupt status

This bit gives the status of the masked overflow interrupt.

0: No interrupt is generated on overrun.

1: An interrupt is generated if the DMA was not able to transfer the last data before new data (32-bit) are received and the OVR\_IE bit is set in DCMI\_IER.

**Bit 0 FRAME\_MIS:** Capture complete masked interrupt status

This bit gives the status of the masked capture complete interrupt

0: No interrupt is generated after a complete capture.

1: An interrupt is generated at the end of each received frame/crop window (in crop mode) and the FRAME\_IE bit is set in DCMI\_IER.

### 34.5.6 DCMI interrupt clear register (DCMI\_ICR)

The DCMI\_ICR register is write-only. Setting a bit of this register clears the corresponding flag in the DCMI\_RIS and DCMI\_MIS registers. Writing 0 has no effect.

Address offset: 0x14

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |          |           |         |         |           |

|      |      |      |      |      |      |      |      |      |      |      | w        | w         | w       | w       | w         |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **LINE\_ISC**: line interrupt status clear

Setting this bit clears the LINE\_RIS flag in the DCMI\_RIS register.

Bit 3 **VSYNC\_ISC**: Vertical Synchronization interrupt status clear

Setting this bit clears the VSYNC\_RIS flag in the DCMI\_RIS register.

Bit 2 **ERR\_ISC**: Synchronization error interrupt status clear

Setting this bit clears the ERR\_RIS flag in the DCMI\_RIS register.

*Note: This bit is available only in embedded synchronization mode.*

Bit 1 **OVR\_ISC**: Overrun interrupt status clear

Setting this bit clears the OVR\_RIS flag in the DCMI\_RIS register.

Bit 0 **FRAME\_ISC**: Capture complete interrupt status clear

Setting this bit clears the FRAME\_RIS flag in the DCMI\_RIS register.

### 34.5.7 DCMI embedded synchronization code register (DCMI\_ESCR)

Address offset: 0x18

Reset value: 0x0000 0000

|          |    |    |    |    |    |    |    |          |    |    |    |    |    |    |    |
|----------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|
| 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23       | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| FEC[7:0] |    |    |    |    |    |    |    | LEC[7:0] |    |    |    |    |    |    |    |
| rw       | rw | rw | rw | rw | rw | rw | rw | rw       | rw | rw | rw | rw | rw | rw | rw |
| 15       | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7        | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| LSC[7:0] |    |    |    |    |    |    |    | FSC[7:0] |    |    |    |    |    |    |    |
| rw       | rw | rw | rw | rw | rw | rw | rw | rw       | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 **FEC[7:0]**: Frame end delimiter code

This byte specifies the code of the frame end delimiter. The code consists of 4 bytes in the form of 0xFF, 0x00, 0x00, FEC.

If FEC is programmed to 0xFF, all the unused codes (0xFF0000XY) are interpreted as frame end delimiters.

Bits 23:16 **LEC[7:0]**: Line end delimiter code

This byte specifies the code of the line end delimiter. The code consists of 4 bytes in the form of 0xFF, 0x00, 0x00, LEC.

Bits 15:8 **LSC[7:0]**: Line start delimiter code

This byte specifies the code of the line start delimiter. The code consists of 4 bytes in the form of 0xFF, 0x00, 0x00, LSC.

Bits 7:0 **FSC[7:0]**: Frame start delimiter code

This byte specifies the code of the frame start delimiter. The code consists of 4 bytes in the form of 0xFF, 0x00, 0x00, FSC.

If FSC is programmed to 0xFF, no frame start delimiter is detected. But, the first occurrence of LSC after an FEC code is interpreted as a start of frame delimiter.

### 34.5.8 DCMI embedded synchronization unmask register (DCMI\_ESUR)

Address offset: 0x1C

Reset value: 0x0000 0000

|          |    |    |    |    |    |    |    |          |    |    |    |    |    |    |    |

| LSU[7:0] |    |    |    |    |    |    |    | FSU[7:0] |    |    |    |    |    |    |    |
| rw       | rw | rw | rw | rw | rw | rw | rw | rw       | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 **FEU[7:0]**: Frame end delimiter unmask

This byte specifies the mask to be applied to the code of the frame end delimiter.

0: The corresponding bit in the FEC byte in DCMI\_ESCR is masked while comparing the frame end delimiter with the received data.

1: The corresponding bit in the FEC byte in DCMI\_ESCR is compared while comparing the frame end delimiter with the received data.

Bits 23:16 **LEU[7:0]**: Line end delimiter unmask

This byte specifies the mask to be applied to the code of the line end delimiter.

0: The corresponding bit in the LEC byte in DCMI\_ESCR is masked while comparing the line end delimiter with the received data.

1: The corresponding bit in the LEC byte in DCMI\_ESCR is compared while comparing the line end delimiter with the received data.

Bits 15:8 **LSU[7:0]**: Line start delimiter unmask

This byte specifies the mask to be applied to the code of the line start delimiter.

0: The corresponding bit in the LSC byte in DCMI\_ESCR is masked while comparing the line start delimiter with the received data.

1: The corresponding bit in the LSC byte in DCMI\_ESCR is compared while comparing the line start delimiter with the received data.

Bits 7:0 **FSU[7:0]**: Frame start delimiter unmask

This byte specifies the mask to be applied to the code of the frame start delimiter.

0: The corresponding bit in the FSC byte in DCMI\_ESCR is masked while comparing the frame start delimiter with the received data.

1: The corresponding bit in the FSC byte in DCMI\_ESCR is compared while comparing the frame start delimiter with the received data.

### 34.5.9 DCMI crop window start (DCMI\_CWSTRT)

Address offset: 0x20

Reset value: 0x0000 0000

|      |      |               |           |    |    |    |    |    |    |    |    |    |    |    |    |
|------|------|---------------|-----------|----|----|----|----|----|----|----|----|----|----|----|----|

|      |      | rw            | rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:16 **VST[12:0]**: Vertical start line count

The image capture starts with this line number. Previous line data are ignored.

0x0000: line 1

0x0001: line 2

0x0002: line 3

....

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **HOFFCNT[13:0]**: Horizontal offset count

This value gives the number of pixel clocks to count before starting a capture.

### 34.5.10 DCMI crop window size (DCMI\_CWSIZE)

Address offset: 0x24

Reset value: 0x0000 0000

|      |      |              |    |    |    |    |    |    |    |    |    |    |    |    |    |

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:16 **VLINE[13:0]**: Vertical line count

This value gives the number of lines to be captured from the starting point.

0x0000: 1 line

0x0001: 2 lines

0x0002: 3 lines

....

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **CAPCNT[13:0]**: Capture count

This value gives the number of pixel clocks to be captured from the starting point on the same line. It value must corresponds to word-aligned data for different widths of parallel interfaces.

0x0000 => 1 pixel

0x0001 => 2 pixels

0x0002 => 3 pixels

....

### 34.5.11 DCMI data register (DCMI\_DR)

Address offset: 0x28

Reset value: 0x0000 0000

The digital camera Interface packages all the received data in 32-bit format before requesting a DMA transfer. A 8-word deep FIFO is available to leave enough time for DMA transfers and avoid DMA overrun conditions.

Refer to [Section 2.5](#) for the register boundary addresses.

## 35 LCD-TFT display controller (LTDC)

### 35.1 Introduction

The LCD-TFT (liquid crystal display - thin film transistor) display controller provides a parallel digital RGB (red, green, blue) and signals for horizontal, vertical synchronization, pixel clock and data enable as output to interface directly to a variety of LCD and TFT panels.

### 35.2 LTDC main features

- 24-bit RGB parallel pixel output; 8 bits-per-pixel (RGB888)
- 2 display layers with dedicated FIFO (64x64-bit)
- Color look-up table (CLUT) up to 256 color (256x24-bit) per layer
- Programmable timings for different display panels
- Programmable background color
- Programmable polarity for HSYNC, VSYNC and data enable
- Up to 8 input color formats selectable per layer:
  - ARGB8888
  - RGB888
  - RGB565
  - ARGB1555
  - ARGB4444
  - L8 (8-bit luminance or CLUT)
  - AL44 (4-bit alpha + 4-bit luminance)
  - AL88 (8-bit alpha + 8-bit luminance)
- Pseudo-random dithering output for low bits per channel
  - Dither width 2 bits for red, green, blue
- Flexible blending between two layers using alpha value (per pixel or constant)
- Color keying (transparency color)
- Programmable window position and size
- Supports thin film transistor (TFT) color displays
- AXI master interface with burst of 16
- Up to 4 programmable interrupt events

## 35.3 LTDC functional description

### 35.3.1 LTDC block diagram

The block diagram of the LTDC is shown in the figure below.

**Figure 281. LTDC block diagram**

Layer FIFO: One FIFO 64x64-bit per layer.

PFC: pixel format converter, performing the pixel format conversion from the selected input pixel format of a layer to words.

AXI interface: for data transfer from memories to the FIFO.

Blending, dithering unit and timings generator: Refer to [Section 35.4.1](#) and [Section 35.4.2](#).

### 35.3.2 LTDC pins and external signal interface

The table below summarizes the LTDC signal interface.

**Table 238. LTDC pins and signal interface**

| LCD-TFT signals | I/O | Description                |
|-----------------|-----|----------------------------|
| LCD_CLK         | O   | Clock output               |
| LCD_HSYNC       | O   | Horizontal synchronization |
| LCD_VSYNC       | O   | Vertical synchronization   |
| LCD_DE          | O   | Not data enable            |
| LCD_R[7:0]      | O   | Data: 8-bit red data       |

**Table 238. LTDC pins and signal interface (continued)**

| LCD-TFT signals | I/O | Description            |
|-----------------|-----|------------------------|
| LCD_G[7:0]      | O   | Data: 8-bit green data |
| LCD_B[7:0]      | O   | Data: 8-bit blue data  |

The LTDC-TFT controller pins must be configured by the user application. The unused pins can be used for other purposes.

For LTDC outputs up to 24 bits (RGB888), if less than 8 bpp are used to output for example RGB565 or RGB666 to interface on 16- or 18-bit displays, the RGB display data lines must be connected to the MSB of the LCD-TFT controller RGB data lines. As an example, in the case of an LCD-TFT controller interfacing with a RGB565 16-bit display, the LCD display R[4:0], G[5:0] and B[4:0] data lines pins must be connected to LCD-TFT controller LCD\_R[7:3], LCD\_G[7:2] and LCD\_B[7:3].

### 35.3.3 LTDC reset and clocks

The LCD-TFT controller peripheral uses the following clock domains:

- AXI clock domain (ltdc\_aclk)  
This domain contains the LCD-TFT AXI master interface for data transfer from the memories to the Layer FIFO and the frame buffer configuration register
- APB clock domain (ltdc\_pclk):  
This domain contains the global configuration registers and the interrupt register.
- Pixel clock domain (LCD\_CLK)  
This domain contains the pixel data generation, the layer configuration register as well as the LCD-TFT interface signal generator. The LCD\_CLK output should be configured following the panel requirements. The LCD\_CLK is generated from a specific PLL output (refer to the reset and clock control section).

The table below summarizes the clock domain for each register.

**Table 239. Clock domain for each register**

| LTDC register | Clock domain |
|---------------|--------------|
| LTDC_LxCR     | ltdc_aclk    |
| LTDC_LxCFBAR  |              |
| LTDC_LxCFBLR  |              |
| LTDC_LxCFBLNR |              |
| LTDC_SRCR     | ltdc_pclk    |
| LTDC_IER      |              |
| LTDC_ISR      |              |
| LTDC_ICR      |              |

Table 239. Clock domain for each register (continued)

| LTDC register | Clock domain          |
|---------------|-----------------------|
| LTDC_SSCR     | Pixel clock (LCD_CLK) |
| LTDC_BPCR     |                       |
| LTDC_AWCR     |                       |
| LTDC_TWCR     |                       |
| LTDC_GCR      |                       |
| LTDC_BCCR     |                       |
| LTDC_LIPCR    |                       |
| LTDC_CPSR     |                       |
| LTDC_CDSR     |                       |
| LTDC_LxWHPCR  |                       |
| LTDC_LxWVPCR  |                       |
| LTDC_LxCCKCR  |                       |
| LTDC_LxPFCR   |                       |
| LTDC_LxCACR   |                       |
| LTDC_LxDCCR   |                       |
| LTDC_LxBFCR   |                       |
| LTDC_LxCLUTWR |                       |

Care must be taken while accessing the LTDC registers, the APB bus is stalled during the access for a given time period (refer to [Table 240](#)).

Table 240. LTDC register access and update durations

|                                | Register clock domain                                      |                               |                                                                 |
|--------------------------------|------------------------------------------------------------|-------------------------------|-----------------------------------------------------------------|
|                                | AXI domain                                                 | APB domain                    | Pixel clock domain                                              |
| Register read access duration  | $7 \times \text{lt dc\_pclk} + 5 \times \text{lt dc\_ack}$ | $7 \times \text{lt dc\_pclk}$ | $7 \times \text{lt dc\_pclk} + 5 \times \text{lt dc\_ker\_clk}$ |
| Register write access duration | $6 \times \text{lt dc\_pclk} + 5 \times \text{lt dc\_ack}$ | $6 \times \text{lt dc\_pclk}$ | $6 \times \text{lt dc\_pclk} + 5 \times \text{lt dc\_ker\_clk}$ |

The LCD controller can be reset by setting the corresponding bit in the RCC\_APBRRSTR register. It resets the three clock domains.

## 35.4 LTDC programmable parameters

The LCD-TFT controller provides flexible configurable parameters. It can be enabled or disabled through the LTDC\_GCR register.

### 35.4.1 LTDC global configuration parameters

#### Synchronous timings

Figure 282 presents the configurable timing parameters generated by the synchronous timings generator block presented in the block diagram Figure 281. It generates the horizontal and vertical synchronization timings panel signals, the pixel clock and the data enable signals.

Figure 282. LCD-TFT synchronous timings

**Note:** The HBP and HFP are respectively the horizontal back porch and front porch period.  
The VBP and the VFP are respectively the vertical back porch and front porch period.

The LCD-TFT programmable synchronous timings are the following:

- HSYNC and VSYNC width: horizontal and vertical synchronization width, configured by programming a value of HSYNC width - 1 and VSYNC width - 1 in the LTDC\_SSCR register
- HBP and VBP: horizontal and vertical synchronization back porch width, configured by programming the accumulated value HSYNC width + HBP - 1 and the accumulated value VSYNC width + VBP - 1 in the LTDC\_BPCR register.
- Active width and active height: the active width and active height are configured by programming the accumulated value HSYNC width + HBP + active width - 1 and the

accumulated value VSYNC width + VBP + active height - 1 in the LTDC\_AWCR register.

- Total width: the total width is configured by programming the accumulated value HSYNC width + HBP + active width + HFP - 1 in the LTDC\_TWCR register. The HFP is the horizontal front porch period.
- Total height: the total height is configured by programming the accumulated value VSYNC height + VBP + active height + VFP - 1 in the LTDC\_TWCR register. The VFP is the vertical front porch period.

**Note:** *When the LTDC is enabled, the timings generated start with X/Y=0/0 position as the first horizontal synchronization pixel in the vertical synchronization area and following the back porch, active data display area and the front porch.*

When the LTDC is disabled, the timing generator block is reset to  $X = \text{total width} - 1$ ,  $Y = \text{total height} - 1$  and held the last pixel before the vertical synchronization phase and the FIFO are flushed. Therefore only blanking data is output continuously.

### Example of synchronous timings configuration

LCD-TFT timings (must be extracted from panel datasheet):

- horizontal and vertical synchronization width: 0xA pixels and 0x2 lines
- horizontal and vertical back porch: 0x14 pixels and 0x2 lines
- active width and active height: 0x140 pixels, 0xF0 lines (320x240)
- horizontal front porch: 0xA pixels
- vertical front porch: 0x4 lines

The programmed values in the LTDC timings registers are:

- LTDC\_SSCR register: to be programmed to 0x00090001. (HSW[11:0] is 0x9 and VSH[11:0] is 0x1)
- LTDC\_BPCR register: to be programmed to 0x001D0003 (AHBP[11:0] is 0x1D(0xA+0x13) and AVBP[11:0] is 0x3(0x2 + 0x1)).
- LTDC\_AWCR register: to be programmed to 0x015D00F3 (AAW[11:0] is 0x15D(0xA+0x14+0x13F) and AAH[11:0] is 0xF3(0x2+0x2+0xEF).
- LTDC\_TWCR register: to be programmed to 0x00000167 (TOTALW[11:0] is 0x167(0xA+0x14+0x140+0x9).
- LTDC\_THCR register: to be programmed to 0x000000F7 (TOTALH[11:0] is 0xF7(0x2+0x2+0xF0+3)

### Programmable polarity

The horizontal and vertical synchronization, data enable and pixel clock output signals polarity can be programmed to active high or active low through the LTDC\_GCR register.

### Background color

A constant background color (RGB888) can be programmed through the LTDC\_BCCR register. It is used for blending with the bottom layer.

### Dithering

The dithering pseudo-random technique using an LFSR is used to add a small random value (threshold) to each pixel color channel (R, G or B) value, thus rounding up the MSB in

some cases when displaying a 24-bit data on 18-bit display. Thus the dithering technique is used to round data which is different from one frame to the other.

The dithering pseudo-random technique is the same as comparing LSBs against a threshold value and adding a 1 to the MSB part only, if the LSB part is  $\geq$  the threshold. The LSBs are typically dropped once dithering was applied.

The width of the added pseudo-random value is two bits for each color channel: two bits for red, two bits for green and two bits for blue.

Once the LCD-TFT controller is enabled, the LFSR starts running with the first active pixel and it is kept running even during blanking periods and when dithering is switched off. If the LTDC is disabled, the LFSR is reset.

The dithering can be switched on and off on the fly through the LTDC\_GCR register.

### Reload shadow registers

Some configuration registers are shadowed. The shadow registers values can be reloaded immediately to the active registers when writing to these registers or at the beginning of the vertical blanking period following the configuration in the LTDC\_SRCR register. If the immediate reload configuration is selected, the reload must be activated only when all new registers have been written.

The shadow registers must not be modified again before the reload is done. Reading from the shadow registers returns the actual active value. The new written value can only be read after the reload has taken place.

A register reload interrupt can be generated if enabled in the LTDC\_IER register.

The shadowed registers are all layer1 and layer2 registers except LTDC\_LxCLUTWR.

### Interrupt generation event

Refer to [Section 35.5: LTDC interrupts](#) for the interrupt configuration.

## 35.4.2 Layer programmable parameters

Up to two layers can be enabled, disabled and configured separately. The layer display order is fixed and it is bottom up. If two layers are enabled, the layer2 is the top displayed window.

### Windowing

Every layer can be positioned and resized and it must be inside the active display area.

The window position and size are configured through the top-left and bottom-right X/Y positions and the internal timing generator that includes the synchronous, back porch size and the active data area. Refer to LTDC\_LxWHPCR and LTDC\_WVPCR registers.

The programmable layer position and size defines the first/last visible pixel of a line and the first/last visible line in the window. It allows to display either the full image frame or only a part of the image frame (see the figure below):

- The first and the last visible pixel in the layer are set by configuring the WHSTPOS[11:0] and WHSPPOS[11:0] in the LTDC\_LxWHPCR register.
- The first and the last visible lines in the layer are set by configuring the WVSTPOS[11:0] and WVSPPOS[11:0] in the LTDC\_LxWVPCR register.

**Figure 283. Layer window programmable parameters**

### Pixel input format

The programmable pixel format is used for the data stored in the frame buffer of a layer.

Up to height input pixel formats can be configured for every layer through the LTDC\_LxPFCR register

The pixel data is read from the frame buffer and then transformed to the internal 8888 (ARGB) format as follows: components having a width of less than 8 bits get expanded to 8 bits by bit replication. The selected bit range is concatenated multiple times until it is longer than 8 bits. Of the resulting vector, the 8 MSB bits are chosen. Example: 5 bits of an RGB565 red channel become (bit positions) 43210432 (the three LSBs are filled with the three MSBs of the five bits)

The table below describes the pixel data mapping depending on the selected format.

**Table 241. Pixel data mapping versus color format**

| ARGB8888              |                       |                       |                       |
|-----------------------|-----------------------|-----------------------|-----------------------|

### Color look-up table (CLUT)

The CLUT can be enabled at run-time for every layer through the LTDC\_LxCR register and it is only useful in case of indexed color when using the L8, AL44 and AL88 input pixel format.

First, the CLUT must be loaded with the R, G and B values that replace the original R, G, B values of that pixel (indexed color). Each color (RGB value) has its own address that is the position within the CLUT.

The R, G and B values and their own respective address are programmed through the LTDC\_LxCLUTWR register:

- In case of L8 and AL88 input pixel format, the CLUT must be loaded by 256 colors. The address of each color is configured in the CLUTADD bits in the LTDC\_LxCLUTWR register.
- In case of AL44 input pixel format, the CLUT must be loaded by only 16 colors. The address of each color must be filled by replicating the 4-bit L channel to 8-bit as follows:
  - L0 (indexed color 0), at address 0x00
  - L1, at address 0x11
  - L2, at address 0x22
  - .....
  - L15, at address 0xFF

### Color frame buffer address

Every layer has a start address for the color frame buffer configured through the LTDC\_LxCFBAR register.

When a layer is enabled, the data is fetched from the color frame buffer.

### Color frame buffer length

Every layer has a total line length setting for the color frame buffer in bytes and a number of lines in the frame buffer configurable in the LTDC\_LxCFBLR and LTDC\_LxCFBLNR register respectively.

The line length and the number of lines settings are used to stop the prefetching of data to the layer FIFO at the end of the frame buffer:

- If it is set to less bytes than required, a FIFO underrun interrupt is generated if it has been previously enabled.
- If it is set to more bytes than actually required, the useless data read from the FIFO is discarded. The useless data is not displayed.

### Color frame buffer pitch

Every layer has a configurable pitch for the color frame buffer, that is the distance between the start of one line and the beginning of the next line in bytes. It is configured through the LTDC\_LxCFBLR register.

## Layer blending

The blending is always active and the two layers can be blended following the blending factors configured through the LTDC\_LxBFCR register.

The blending order is fixed and it is bottom up. If two layers are enabled, first the Layer1 is blended with the Background color, then the layer2 is blended with the result of blended color of layer1 and the background. Refer to the figure below.

**Figure 284. Blending two layers with background**

## Default color

Every layer can have a default color in the format ARGB which is used outside the defined layer window or when a layer is disabled.

The default color is configured through the LTDC\_LxDCCR register.

The blending is always performed between the two layers even when a layer is disabled. To avoid displaying the default color when a layer is disabled, keep the blending factors of this layer in the LTDC\_LxBFCR register to their reset value.

## Color keying

A color key (RGB) can be configured to be representative for a transparent pixel.

If the color keying is enabled, the current pixels (after format conversion and before CLUT respectively blending) are compared to the color key. If they match for the programmed RGB value, all channels (ARGB) of that pixel are set to 0.

The color key value can be configured and used at run-time to replace the pixel RGB value.

The color keying is enabled through the LTDC\_LxCKCR register.

The color keying is configured through the LTDC\_LxCKCR register. The programmed value depends on the pixel format as it is compared to current pixel after pixel format conversion to ARGB888.

Example: if the a mid-yellow color (50 % red + 50 % green) is used as the transparent color key:

- In RGB565, the mid-yellow color is 0x8400. Set the LTDC\_LxCKCR to 0x848200.
- In ARGB8888, the mid-yellow color is 0x808000. Set LTDC\_LxCKCR to 0x808000.
- In all CLUT-based color modes (L8, AL88, AL44), set one of the palette entry to the mid-yellow color 0x808000 and set the LTDC\_LxCKCR to 0x808000.

## 35.5 LTDC interrupts

The LTDC provides four maskable interrupts logically ORed to two interrupt vectors.

The interrupt sources can be enabled or disabled separately through the LTDC\_IER register. Setting the appropriate mask bit to 1 enables the corresponding interrupt.

The two interrupts are generated on the following events:

- Line interrupt: generated when a programmed line is reached. The line interrupt position is programmed in the LTDC\_LIPCR register
- Register reload interrupt: generated when the shadow registers reload is performed during the vertical blanking period
- FIFO underrun interrupt: generated when a pixel is requested from an empty layer FIFO
- Transfer error interrupt: generated when an AXI bus error occurs during data transfer

Those interrupts events are connected to the NVIC controller as described in the figure below.

**Figure 285. Interrupt events**

**Table 242. LTDC interrupt requests**

| Interrupt event | Event flag | Enable control bit |
|-----------------|------------|--------------------|
| Line            | LIF        | LIE                |
| Register reload | RRIF       | RRIEN              |
| FIFO underrun   | FUDERRIF   | FUDERRIE           |
| Transfer error  | TERRIF     | TERRIE             |

## 35.6 LTDC programming procedure

The steps listed below are needed to program the LTDC:

1. Enable the LTDC clock in the RCC register.
2. Configure the required pixel clock following the panel datasheet.
3. Configure the synchronous timings: VSYNC, HSYNC, vertical and horizontal back porch, active data area and the front porch timings following the panel datasheet as described in the [Section 35.4.1: LTDC global configuration parameters](#).
4. Configure the synchronous signals and clock polarity in the LTDC\_GCR register.
5. If needed, configure the background color in the LTDC\_BCCR register.
6. Configure the needed interrupts in the LTDC\_IER and LTDC\_LIPCR register.
7. Configure the layer1/2 parameters by:
  - programming the layer window horizontal and vertical position in the LTDC\_LxWHPCR and LTDC\_WVPCR registers. The layer window must be in the active data area.
  - programming the pixel input format in the LTDC\_LxPFCR register
  - programming the color frame buffer start address in the LTDC\_LxCFBAR register
  - programming the line length and pitch of the color frame buffer in the LTDC\_LxCFBLR register
  - programming the number of lines of the color frame buffer in the LTDC\_LxCFBLNR register
  - if needed, loading the CLUT with the RGB values and its address in the LTDC\_LxCLUTWR register
  - If needed, configuring the default color and the blending factors respectively in the LTDC\_LxDCCR and LTDC\_LxBFCR registers
8. Enable layer1/2 and if needed the CLUT in the LTDC\_LxCR register.
9. If needed, enable dithering and color keying respectively in the LTDC\_GCR and LTDC\_LxCKCR registers. They can be also enabled on the fly.
10. Reload the shadow registers to active register through the LTDC\_SRCR register.
11. Enable the LCD-TFT controller in the LTDC\_GCR register.
12. All layer parameters can be modified on the fly except the CLUT. The new configuration must be either reloaded immediately or during vertical blanking period by configuring the LTDC\_SRCR register.

**Note:** *All layer's registers are shadowed. Once a register is written, it must not be modified again before the reload has been done. Thus, a new write to the same register overrides the previous configuration if not yet reloaded.*

## 35.7 LTDC registers

### 35.7.1 LTDC identification register (LTDC\_IDR)

Address offset: 0x00

Reset value: 0x0001 0300

|             |      |      |      |      |      |      |      |             |    |    |    |    |    |    |    |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **LNBR[7:0]**: number of layers

### 35.7.3 LTDC synchronization size configuration register (LTDC\_SSCR)

This register defines the number of horizontal synchronization pixels minus 1 and the number of vertical synchronization lines minus 1. Refer to [Figure 282](#) and [Section 35.4: LTDC programmable parameters](#) for an example of configuration.

Address offset: 0x08

Reset value: 0x0000 0000

|      |      |      |      |           |    |    |    |    |    |    |    |    |    |    |    |
|------|------|------|------|-----------|----|----|----|----|----|----|----|----|----|----|----|
| 31   | 30   | 29   | 28   | 27        | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | HSW[11:0] |    |    |    |    |    |    |    |    |    |    |    |
|      |      |      |      | rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15   | 14   | 13   | 12   | 11        | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Res. | Res. | Res. | Res. | VSH[11:0] |    |    |    |    |    |    |    |    |    |    |    |
|      |      |      |      | rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **HSW[11:0]**: horizontal synchronization width (in units of pixel clock period)

These bits define the number of Horizontal Synchronization pixel minus 1.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **VSH[11:0]**: vertical synchronization height (in units of horizontal scan line)

These bits define the vertical Synchronization height minus 1. It represents the number of horizontal synchronization lines.

### 35.7.4 LTDC back porch configuration register (LTDC\_BPCR)

This register defines the accumulated number of horizontal synchronization and back porch pixels minus 1 (HSYNC width + HBP - 1) and the accumulated number of vertical synchronization and back porch lines minus 1 (VSYNC height + VBP - 1). Refer to [Figure 282](#) and [Section 35.4: LTDC programmable parameters](#) for an example of configuration.

Address offset: 0x0C

Reset value: 0x0000 0000

|      |      |      |      |            |    |    |    |    |    |    |    |    |    |    |    |
|------|------|------|------|------------|----|----|----|----|----|----|----|----|----|----|----|
| 31   | 30   | 29   | 28   | 27         | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | AHBP[11:0] |    |    |    |    |    |    |    |    |    |    |    |
|      |      |      |      | rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15   | 14   | 13   | 12   | 11         | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Res. | Res. | Res. | Res. | AVBP[11:0] |    |    |    |    |    |    |    |    |    |    |    |
|      |      |      |      | rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **AHBP[11:0]**: accumulated horizontal back porch (in units of pixel clock period)

These bits define the accumulated horizontal back porch width that includes the horizontal synchronization and horizontal back porch pixels minus 1.

The horizontal back porch is the period between horizontal synchronization going inactive and the start of the active display part of the next scan line.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **AVBP[11:0]**: accumulated Vertical back porch (in units of horizontal scan line)

These bits define the accumulated vertical back porch width that includes the vertical synchronization and vertical back porch lines minus 1.

The vertical back porch is the number of horizontal scan lines at a start of frame to the start of the first active scan line of the next frame.

### 35.7.5 LTDC active width configuration register (LTDC\_AWCR)

This register defines the accumulated number of horizontal synchronization, back porch and active pixels minus 1 (HSYNC width + HBP + active width - 1) and the accumulated number of vertical synchronization, back porch lines and active lines minus 1

(VSYNC height + BVBP + active height - 1). Refer to [Figure 282](#) and [Section 35.4: LTDC programmable parameters](#) for an example of configuration.

Address offset: 0x10

Reset value: 0x0000 0000

|      |      |      |      | rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **AAW[11:0]**: accumulated active width (in units of pixel clock period)

These bits define the accumulated active width which includes the horizontal synchronization, horizontal back porch and active pixels minus 1.

The active width is the number of pixels in active display area of the panel scan line.

Refer to device datasheet for maximum active width supported following maximum pixel clock.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **AAH[11:0]**: accumulated active height (in units of horizontal scan line)

These bits define the accumulated height which includes the vertical synchronization, vertical back porch and the active height lines minus 1. The active height is the number of active lines in the panel.

Refer to device datasheet for maximum active height supported following maximum pixel clock.

### 35.7.6 LTDC total width configuration register (LTDC\_TWCR)

This register defines the accumulated number of horizontal synchronization, back porch, active and front porch pixels minus 1 (HSYNC width + HBP + active width + HFP - 1) and the accumulated number of vertical synchronization, back porch lines, active and front lines minus 1 (VSYNC height + BVBP + active height + VFP - 1). Refer to [Figure 282](#) and [Section 35.4: LTDC programmable parameters](#) for an example of configuration.

Address offset: 0x14

Reset value: 0x0000 0000

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **TOTALW[11:0]**: total width (in units of pixel clock period)

These bits defines the accumulated total width which includes the horizontal synchronization, horizontal back porch, active width and horizontal front porch pixels minus 1.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **TOTALH[11:0]**: total height (in units of horizontal scan line)

These bits defines the accumulated height which includes the vertical synchronization, vertical back porch, the active height and vertical front porch height lines minus 1.

### 35.7.7 LTDC global control register (LTDC\_GCR)

This register defines the global configuration of the LCD-TFT controller.

Address offset: 0x18

Reset value: 0x0000 2220

|       |          |       |       |      |          |      |      |      |          |      |      |      |      |      |        |

- Bit 31 **HSPOL**: horizontal synchronization polarity  
This bit is set and cleared by software.  
0: horizontal synchronization polarity is active low.  
1: horizontal synchronization polarity is active high.
- Bit 30 **VSPOL**: vertical synchronization polarity  
This bit is set and cleared by software.  
0: vertical synchronization is active low.  
1: vertical synchronization is active high.
- Bit 29 **DEPOL**: not data enable polarity  
This bit is set and cleared by software.  
0: not data enable polarity is active low.  
1: not data enable polarity is active high.
- Bit 28 **PCPOL**: pixel clock polarity  
This bit is set and cleared by software.  
0: pixel clock polarity is active low.  
1: pixel clock is active high.
- Bits 27:17 Reserved, must be kept at reset value.
- Bit 16 **DEN**: dither enable  
This bit is set and cleared by software.  
0: dither disable  
1: dither enable
- Bit 15 Reserved, must be kept at reset value.
- Bits 14:12 **DRW[2:0]**: dither red width  
These bits return the Dither Red Bits.
- Bit 11 Reserved, must be kept at reset value.
- Bits 10:8 **DGW[2:0]**: dither green width  
These bits return the dither green bits.
- Bit 7 Reserved, must be kept at reset value.
- Bits 6:4 **DBW[2:0]**: dither blue width  
These bits return the dither blue bits.
- Bits 3:1 Reserved, must be kept at reset value.
- Bit 0 **LTDCEN**: LCD-TFT controller enable  
This bit is set and cleared by software.  
0: LTDC disable  
1: LTDC enable

### 35.7.8 LTDC global configuration 1 register (LTDC\_GC1R)

Address offset: 0x1C

Reset value: 0x6BE2 D888

|         |      |       |       |           |     |    |      |           |     |       |      |           |    |    |      |

Bit 31 **BMEN**: blind mode enabled

Bit 30 Reserved, must be kept at reset value.

Bit 29 **STREN**: status register enabled

Bit 28 **DWP**: dither width programmable

Bit 27 **SPP**: sync polarity programmable

Bit 26 **IPP**: IRQ polarity programmable

Bit 25 **TP**: timing programmable

Bit 24 **LNIP**: line IRQ position

Bit 23 **BBEN**: background blending enabled

Bit 22 **BCP**: background color programmable

Bit 21 **SHREN**: shadow registers enabled

Bit 20 Reserved, must be kept at reset value.

Bits 19:17 **GCT[2:0]**: gamma correction technique

Bit 16 Reserved, must be kept at reset value.

Bits 15:14 **DT[1:0]**: dithering technique

Bit 13 Reserved, must be kept at reset value.

Bit 12 **PRBEN**: precise blending enabled

Bits 11:8 **WRCH[3:0]**: width of red channel output

Bits 7:4 **WGCH[3:0]**: width of green channel output

Bits 3:0 **WBCH[3:0]**: width of blue channel output

### 35.7.9 LTDC global configuration 2 register (LTDC\_GC2R)

Address offset: 0x20

Reset value: 0x0000 0030

|      |      |      |      |      |      |      |      |      |         |      |      |       |       |        |       |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **EDCA**: external display control ability

Bits 6:4 **BW[2:0]**: bus width (log2 of number of bytes)

Bit 3 **DPAEN**: secondary RGB output port enabled

Bit 2 **DVAEN**: dual-view ability enabled

Bit 1 **STSAEN**: slave timings synchronization ability enabled

Bit 0 **EDCEN**: background layer ability enabled

### 35.7.10 LTDC shadow reload configuration register (LTDC\_SRCR)

This register allows to reload either immediately or during the vertical blanking period, the shadow registers values to the active registers. The shadow registers are all Layer1 and Layer2 registers except the LTDC\_L1CLUTWR and the LTDC\_L2CLUTWR.

Address offset: 0x24

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | VBR  | IMR  |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      | rw   | rw   |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **VBR**: vertical blanking reload

This bit is set by software and cleared only by hardware after reload (it cannot be cleared through register write once it is set).

0: no effect

1: The shadow registers are reloaded during the vertical blanking period (at the beginning of the first line after the active display area).

Bit 0 **IMR**: immediate reload

This bit is set by software and cleared only by hardware after reload.

0: no effect

1: The shadow registers are reloaded immediately.

**Note:** *The shadow registers read back the active values. Until the reload has been done, the 'old' value is read.*

### 35.7.11 LTDC background color configuration register (LTDC\_BCCR)

This register defines the background color (RGB888).

Address offset: 0x2C

Reset value: 0x0000 0000

|              |      |      |      |      |      |      |      |             |    |    |    |    |    |    |    |
|--------------|------|------|------|------|------|------|------|-------------|----|----|----|----|----|----|----|
| 31           | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23          | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res.         | Res. | Res. | Res. | Res. | Res. | Res. | Res. | BCRED[7:0]  |    |    |    |    |    |    |    |

| 15           | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7           | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| BCGREEN[7:0] |      |      |      |      |      |      |      | BCBLUE[7:0] |    |    |    |    |    |    |    |
| rw           | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw          | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **BCRED[7:0]**: background color red value

These bits configure the background red value.

Bits 15:8 **BCGREEN[7:0]**: background color green value

These bits configure the background green value.

Bits 7:0 **BCBLUE[7:0]**: background color blue value

These bits configure the background blue value.

### 35.7.12 LTDC interrupt enable register (LTDC\_IER)

This register determines which status flags generate an interrupt request by setting the corresponding bit to 1.

Address offset: 0x34

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |        |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|--------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18     | 17   | 16   |

|      |      |      |      |      |      |      |      |      |      |      |      | rw   | rw     | rw   | rw   |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **RRIE**: register reload interrupt enable

This bit is set and cleared by software.

0: register reload interrupt disable

1: register reload interrupt enable

Bit 2 **TERRIE**: transfer error interrupt enable

This bit is set and cleared by software.

0: transfer error interrupt disable

1: transfer error interrupt enable

Bit 1 **FUIE**: FIFO underrun interrupt enable

This bit is set and cleared by software.

0: FIFO underrun interrupt disable

1: FIFO underrun Interrupt enable

Bit 0 **LIE**: line interrupt enable

This bit is set and cleared by software.

0: line interrupt disable

1: line interrupt enable

### 35.7.13 LTDC interrupt status register (LTDC\_ISR)

This register returns the interrupt status flag.

Address offset: 0x38

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |        |      |      |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **RRIF**: register reload interrupt flag

0: no register reload interrupt generated

1: register reload interrupt generated when a vertical blanking reload occurs (and the first line after the active area is reached)

Bit 2 **TERRIF**: transfer error interrupt flag

0: no transfer error interrupt generated

1: transfer error interrupt generated when a bus error occurs

Bit 1 **FUIF**: FIFO underrun interrupt flag

0: no FIFO underrun interrupt generated.

1: FIFO underrun interrupt generated, if one of the layer FIFOs is empty and pixel data is read from the FIFO

Bit 0 **LIF**: line interrupt flag

0: no line interrupt generated

1: line interrupt generated when a programmed line is reached

### 35.7.14 LTDC Interrupt Clear Register (LTDC\_ICR)

Address offset: 0x3C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |       |         |       |      |
|------|------|------|------|------|------|------|------|------|------|------|------|-------|---------|-------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19    | 18      | 17    | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.  | Res.    | Res.  | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |       |         |       |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3     | 2       | 1     | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CRRIF | CTERRIF | CFUIF | CLIF |
|      |      |      |      |      |      |      |      |      |      |      |      | w     | w       | w     | w    |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **CRRIF**: clears register reload interrupt flag

0: no effect

1: clears the RRIF flag in the LTDC\_ISR register

Bit 2 **CTERRIF**: clears the transfer error interrupt flag

0: no effect

1: clears the TERRIF flag in the LTDC\_ISR register.

Bit 1 **CFUIF**: clears the FIFO underrun interrupt flag

0: no effect

1: clears the FUDERRIF flag in the LTDC\_ISR register.

Bit 0 **CLIF**: clears the line interrupt flag

0: no effect

1: clears the LIF flag in the LTDC\_ISR register.

### 35.7.15 LTDC line interrupt position configuration register (LTDC\_LIPCR)

This register defines the position of the line interrupt. The line value to be programmed depends on the timings parameters. Refer to [Figure 282](#).

Address offset: 0x40

Reset value: 0x0000 0000

|      |      |      |      |             |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|-------------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27          | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |

|      |      |      |      | rw          | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **LIPOS[11:0]**: line interrupt position

These bits configure the line interrupt position.

### 35.7.16 LTDC current position status register (LTDC\_CPSR)

Address offset: 0x44

Reset value: 0x0000 0000

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| CXPOS[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r           | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CYPOS[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r           | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:16 **CXPOS[15:0]**: current X position

These bits return the current X position.

Bits 15:0 **CYPOS[15:0]**: current Y position

These bits return the current Y position.

### 35.7.17 LTDC current display status register (LTDC\_CDSR)

This register returns the status of the current display phase which is controlled by the HSYNC, VSYNC, and horizontal/vertical DE signals.

Example: if the current display phase is the vertical synchronization, the VSYNCS bit is set (active high). If the current display phase is the horizontal synchronization, the HSYNCS bit is active high.

Address offset: 0x48

Reset value: 0x0000 000F

|      |      |      |      |      |      |      |      |      |      |      |      |        |        |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|--------|--------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19     | 18     | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.   | Res.   | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |        |        |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3      | 2      | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | HSYNCS | VSYNCS | HDES | VDES |
|      |      |      |      |      |      |      |      |      |      |      |      | r      | r      | r    | r    |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **HSYNCS**: horizontal synchronization display status

0: active low

1: active high

Bit 2 **VSYNCS**: vertical synchronization display status

0: active low

1: active high

Bit 1 **HDES**: horizontal data enable display status

0: active low

1: active high

Bit 0 **VDES**: vertical data enable display status

0: active low

1: active high

**Note:** The returned status does not depend on the configured polarity in the **LTDC\_GCR** register, instead it returns the current active display phase.

### 35.7.18 LTDC layer x control register (LTDC\_LxCR)

Address offset: 0x84 + 0x80 \* (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |        |      |      |        |      |
|------|------|------|------|------|------|------|------|------|------|------|--------|------|------|--------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20     | 19   | 18   | 17     | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.   | Res. | Res. | Res.   | Res. |

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4      | 3    | 2    | 1      | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CLUTEN | Res. | Res. | COLKEN | LEN  |
|      |      |      |      |      |      |      |      |      |      |      | rw     |      |      | rw     | rw   |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CLUTEN**: color look-up table enable

This bit is set and cleared by software.

0: color look-up table disable

1: color look-up table enable

The CLUT is only meaningful for L8, AL44 and AL88 pixel format. Refer to [Color look-up table \(CLUT\)](#)

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **COLKEN**: color keying enable

This bit is set and cleared by software.

0: color keying disable

1: color keying enable

Bit 0 **LEN**: layer enable

This bit is set and cleared by software.

0: layer disable

1: layer enable

### 35.7.19 LTDC layer x window horizontal position configuration register (LTDC\_LxWHPCR)

This register defines the horizontal position (first and last pixel) of the layer 1 or 2 window.

The first visible pixel of a line is the programmed value of AHBP[11:0] bits + 1 in the LTDC\_BPCR register.

The last visible pixel of a line is the programmed value of AAW[11:0] bits in the LTDC\_AWCR register.

Address offset:  $0x88 + 0x80 * (x - 1)$ , ( $x = 1$  to 2)

Reset value: 0x0000 0000

|      |      |      |      |               |    |    |    |    |    |    |    |    |    |    |    |
|------|------|------|------|---------------|----|----|----|----|----|----|----|----|----|----|----|
| 31   | 30   | 29   | 28   | 27            | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | WHSPPOS[11:0] |    |    |    |    |    |    |    |    |    |    |    |
|      |      |      |      | rw            | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15   | 14   | 13   | 12   | 11            | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Res. | Res. | Res. | Res. | WHSTPOS[11:0] |    |    |    |    |    |    |    |    |    |    |    |
|      |      |      |      | rw            | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **WHSPPOS[11:0]**: window horizontal stop position

These bits configure the last visible pixel of a line of the layer window.

WHSPPOS[11:0] must be  $\geq \mathbf{AHBP[11:0] \text{ bits} + 1}$  (programmed in LTDC\_BPCR register).

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **WHSTPOS[11:0]**: window horizontal start position

These bits configure the first visible pixel of a line of the layer window.

WHSTPOS[11:0] must be  $\leq \mathbf{AAW[11:0] \text{ bits}}$  (programmed in LTDC\_AWCR register).

#### Example:

The LTDC\_BPCR register is configured to 0x000E0005 (AHBP[11:0] is 0xE) and the LTDC\_AWCR register is configured to 0x028E01E5 (AAW[11:0] is 0x28E). To configure the horizontal position of a window size of 630x460, with horizontal start offset of 5 pixels in the active data area:

1. layer window first pixel, WHSTPOS[11:0], must be programmed to 0x14 (0xE+1+0x5)
2. layer window last pixel, WHSPPOS[11:0], must be programmed to 0x28A.

### 35.7.20 LTDC layer x window vertical position configuration register (LTDC\_LxWVPCR)

This register defines the vertical position (first and last line) of the layer1 or 2 window.

The first visible line of a frame is the programmed value of AVBP[11:0] bits + 1 in the register LTDC\_BPCR register.

The last visible line of a frame is the programmed value of AAH[11:0] bits in the LTDC\_AWCR register.

Address offset:  $0x8C + 0x80 * (x - 1)$ , ( $x = 1$  to  $2$ )

Reset value: 0x0000 0000

|      |      |      |      |               |    |    |    |    |    |    |    |    |    |    |    |
|------|------|------|------|---------------|----|----|----|----|----|----|----|----|----|----|----|
| 31   | 30   | 29   | 28   | 27            | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | WVSPPOS[11:0] |    |    |    |    |    |    |    |    |    |    |    |
|      |      |      |      | rw            | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15   | 14   | 13   | 12   | 11            | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Res. | Res. | Res. | Res. | WVSTPOS[11:0] |    |    |    |    |    |    |    |    |    |    |    |
|      |      |      |      | rw            | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **WVSPPOS[11:0]**: window vertical stop position

These bits configure the last visible line of the layer window.

WVSPPOS[11:0] must be  $\geq \mathbf{AVBP[11:0] \text{ bits} + 1}$  (programmed in LTDC\_BPCR register).

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **WVSTPOS[11:0]**: window vertical start position

These bits configure the first visible line of the layer window.

WVSTPOS[11:0] must be  $\leq \mathbf{AAH[11:0] \text{ bits}}$  (programmed in LTDC\_AWCR register).

Example:

The LTDC\_BPCR register is configured to 0x000E0005 (AVBP[11:0] is 0x5) and the LTDC\_AWCR register is configured to 0x028E01E5 (AAH[11:0] is 0x1E5).

To configure the vertical position of a window size of 630x460, with vertical start offset of 8 lines in the active data area:

1. layer window first line: WVSTPOS[11:0] must be programmed to 0xE (0x5 + 1 + 0x8).
2. layer window last line: WVSTPOS[11:0] must be programmed to 0x1DA.

### 35.7.21 LTDC layer x color keying configuration register (LTDC\_LxCKCR)

This register defines the color key value (RGB), that is used by the color keying.

Address offset: 0x90 + 0x80 \* (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

|              |      |      |      |      |      |      |      |             |    |    |    |    |    |    |    |
|--------------|------|------|------|------|------|------|------|-------------|----|----|----|----|----|----|----|
| 31           | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23          | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res.         | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CKRED[7:0]  |    |    |    |    |    |    |    |
|              |      |      |      |      |      |      |      | rw          | rw | rw | rw | rw | rw | rw | rw |
| 15           | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7           | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CKGREEN[7:0] |      |      |      |      |      |      |      | CKBLUE[7:0] |    |    |    |    |    |    |    |
| rw           | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw          | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **CKRED[7:0]**: color key red value

Bits 15:8 **CKGREEN[7:0]**: color key green value

Bits 7:0 **CKBLUE[7:0]**: color key blue value

### 35.7.22 LTDC layer x pixel format configuration register (LTDC\_LxPFCR)

This register defines the pixel format that is used for the stored data in the frame buffer of a layer. The pixel data is read from the frame buffer and then transformed to the internal format 8888 (ARGB).

Address offset: 0x94 + 0x80 \* (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |         |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|---------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18      | 17   | 16   |

|      |      |      |      |      |      |      |      |      |      |      |      |      | rw      | rw   | rw   |

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **PF[2:0]**: pixel format

These bits configure the pixel format

000: ARGB8888

001: RGB888

010: RGB565

011: ARGB1555

100: ARGB4444

101: L8 (8-bit luminance)

110: AL44 (4-bit alpha, 4-bit luminance)

111: AL88 (8-bit alpha, 8-bit luminance)

### 35.7.23 LTDC layer x constant alpha configuration register (LTDC\_LxCACR)

This register defines the constant alpha value (divided by 255 by hardware), that is used in the alpha blending. Refer to LTDC\_LxBFCR register.

Address offset:  $0x98 + 0x80 * (x - 1)$ , ( $x = 1$  to  $2$ )

Reset value: 0x0000 00FF

|      |      |      |      |      |      |      |      |             |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|-------------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23          | 22   | 21   | 20   | 19   | 18   | 17   | 16   |

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7           | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CONSTA[7:0] |      |      |      |      |      |      |      |
|      |      |      |      |      |      |      |      | rw          | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **CONSTA[7:0]**: constant alpha

These bits configure the constant alpha used for blending. The constant alpha is divided by 255 by hardware.

Example: if the programmed constant alpha is 0xFF, the constant alpha value is  $255 / 255 = 1$ .

### 35.7.24 LTDC layer x default color configuration register (LTDC\_LxDCCR)

This register defines the default color of a layer in the format ARGB. The default color is used outside the defined layer window or when a layer is disabled. The reset value of 0x00000000 defines a transparent black color.

Address offset:  $0x9C + 0x80 * (x - 1)$ , ( $x = 1$  to  $2$ )

Reset value: 0x0000 0000

|              |    |    |    |    |    |    |    |             |    |    |    |    |    |    |    |
|--------------|----|----|----|----|----|----|----|-------------|----|----|----|----|----|----|----|
| 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23          | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DCALPHA[7:0] |    |    |    |    |    |    |    | DCRED[7:0]  |    |    |    |    |    |    |    |
| rw           | rw | rw | rw | rw | rw | rw | rw | rw          | rw | rw | rw | rw | rw | rw | rw |
| 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7           | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| DCGREEN[7:0] |    |    |    |    |    |    |    | DCBLUE[7:0] |    |    |    |    |    |    |    |
| rw           | rw | rw | rw | rw | rw | rw | rw | rw          | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 **DCALPHA[7:0]**: default color alpha  
These bits configure the default alpha value.

Bits 23:16 **DCRED[7:0]**: default color red  
These bits configure the default red value.

Bits 15:8 **DCGREEN[7:0]**: default color green  
These bits configure the default green value.

Bits 7:0 **DCBLUE[7:0]**: default color blue  
These bits configure the default blue value.

### 35.7.25 LTDC layer x blending factors configuration register (LTDC\_LxBFCR)

This register defines the blending factors F1 and F2.

The general blending formula is:  $BC = BF1 \times C + BF2 \times Cs$

- BC = blended color
- BF1 = blend factor 1
- C = current layer color
- BF2 = blend factor 2
- Cs = subjacent layers blended color

Address offset:  $0xA0 + 0x80 \times (x - 1)$ , ( $x = 1$  to  $2$ )

Reset value: 0x0000 0607

|      |      |      |      |      |          |      |      |      |      |      |      |      |          |      |      |
|------|------|------|------|------|----------|------|------|------|------|------|------|------|----------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26       | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18       | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res.     | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.     | Res. | Res. |
|      |      |      |      |      |          |      |      |      |      |      |      |      |          |      |      |
| 15   | 14   | 13   | 12   | 11   | 10       | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2        | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | BF1[2:0] |      |      | Res. | Res. | Res. | Res. | Res. | BF2[2:0] |      |      |
|      |      |      |      |      | rw       | rw   | rw   |      |      |      |      |      | rw       | rw   | rw   |

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:8 **BF1[2:0]**: blending factor 1

These bits select the blending factor F1.

000: reserved

001: reserved

010: reserved

011: reserved

100: constant alpha

101: reserved

110: pixel alpha x constant alpha

111: reserved

Bits 7:3 Reserved, must be kept at reset value.

Bits 2:0 **BF2[2:0]**: blending factor 2

These bits select the blending factor F2

000: reserved

001: reserved

010: reserved

011: reserved

100: reserved

101: 1 - constant alpha

110: reserved

111: 1 - (pixel alpha x constant alpha)

**Note:** The constant alpha value, is the programmed value in the LxCACR register divided by 255 by hardware.

**Example:** Only layer1 is enabled, BF1 configured to constant alpha. BF2 configured to 1 - constant alpha. The constant alpha programmed in the LxCACR register is 240 (0xF0). Thus, the constant alpha value is  $240/255 = 0.94$ . C: current layer color is 128.

Cs: background color is 48. Layer1 is blended with the background color.

$BC = \text{constant alpha} \times C + (1 - \text{Constant Alpha}) \times Cs = 0.94 \times 128 + (1 - 0.94) \times 48 = 123$ .

### 35.7.26 LTDC layer x color frame buffer address register (LTDC\_LxCFBAR)

This register defines the color frame buffer start address which has to point to the address where the pixel data of the top left pixel of a layer is stored in the frame buffer.

Address offset:  $0xAC + 0x80 \times (x - 1)$ , ( $x = 1$  to  $2$ )

Reset value: 0x0000 0000

|               |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31            | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| CFBADD[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW            | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |
| 15            | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CFBADD[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW            | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 31:0 **CFBADD[31:0]**: color frame buffer start address

These bits define the color frame buffer start address.

### 35.7.27 LTDC layer x color frame buffer length register (LTDC\_LxCFBLR)

This register defines the color frame buffer line length and pitch.

Address offset:  $0xB0 + 0x80 \times (x - 1)$ , ( $x = 1$  to  $2$ )

Reset value: 0x0000 0000

|      |      |             |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------|------|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31   | 30   | 29          | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | CFBPP[13:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |
|      |      | rW          | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |
| 15   | 14   | 13          | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Res. | Res. | CFBLL[13:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |
|      |      | rW          | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:16 **CFBPP[13:0]**: color frame buffer pitch in bytes

These bits define the pitch that is the increment from the start of one line of pixels to the start of the next line in bytes.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **CFBLL[13:0]**: color frame buffer line length

These bits define the length of one line of pixels in bytes + 7.

The line length is computed as follows:

active high width \* number of bytes per pixel + 7.

Example:

- A frame buffer having the format RGB565 (2 bytes per pixel) and a width of 256 pixels (total number of bytes per line is  $256 * 2 = 512$ ), where pitch = line length requires a value of 0x02000207 to be written into this register.
- A frame buffer having the format RGB888 (3 bytes per pixel) and a width of 320 pixels (total number of bytes per line is  $320 * 3 = 960$ ), where pitch = line length requires a value of 0x03C003C7 to be written into this register.

### 35.7.28 LTDC layer x color frame buffer line number register (LTDC\_LxCFBLNR)

This register defines the number of lines in the color frame buffer.

Address offset:  $0xB4 + 0x80 * (x - 1)$ , ( $x = 1$  to 2)

Reset value: 0x0000 0000

|      |      |      |      |               |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|---------------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27            | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res.          | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |               |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11            | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | CFBLNBR[11:0] |      |      |      |      |      |      |      |      |      |      |      |
|      |      |      |      | rw            | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **CFBLNBR[11:0]**: frame buffer line number

These bits define the number of lines in the frame buffer that corresponds to the active high width.

**Note:** *The number of lines and line length settings define how much data is fetched per frame for every layer. If it is configured to less bytes than required, a FIFO underrun interrupt will be generated if enabled.*

*The start address and pitch settings on the other hand define the correct start of every line in memory.*

### 35.7.29 LTDC layer x CLUT write register (LTDC\_LxCLUTWR)

This register defines the CLUT address and the RGB value.

Address offset:  $0xC4 + 0x80 * (x - 1)$ , ( $x = 1$  to  $2$ )

Reset value: 0x0000 0000

|              |    |    |    |    |    |    |    |           |    |    |    |    |    |    |    |
|--------------|----|----|----|----|----|----|----|-----------|----|----|----|----|----|----|----|
| 31           | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23        | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| CLUTADD[7:0] |    |    |    |    |    |    |    | RED[7:0]  |    |    |    |    |    |    |    |
| w            | w  | w  | w  | w  | w  | w  | w  | w         | w  | w  | w  | w  | w  | w  | w  |
| 15           | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7         | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| GREEN[7:0]   |    |    |    |    |    |    |    | BLUE[7:0] |    |    |    |    |    |    |    |
| w            | w  | w  | w  | w  | w  | w  | w  | w         | w  | w  | w  | w  | w  | w  | w  |

Bits 31:24 **CLUTADD[7:0]**: CLUT address

These bits configure the CLUT address (color position within the CLUT) of each RGB value.

Bits 23:16 **RED[7:0]**: red value

These bits configure the red value.

Bits 15:8 **GREEN[7:0]**: green value

These bits configure the green value.

Bits 7:0 **BLUE[7:0]**: blue value

These bits configure the blue value.

**Note:** *The CLUT write register must be configured only during blanking period or if the layer is disabled. The CLUT can be enabled or disabled in the LTDC\_LxCR register.  
The CLUT is only meaningful for L8, AL44 and AL88 pixel format.*

### 35.7.30 LTDC register map

The following table summarizes the LTDC registers.

**Table 243. LTDC register map and reset values**

| Offset | Register name | 31    | 30    | 29    | 28    | 27           | 26  | 25   | 24   | 23          | 22    | 21  | 20       | 19  | 18  | 17  | 16           | 15      | 14       | 13  | 12           | 11        | 10       | 9           | 8         | 7    | 6        | 5         | 4   | 3     | 2     | 1      | 0      |     |  |  |  |  |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 36 DSI Host (DSI)

### 36.1 Introduction

Portions Copyright (c) Synopsys, Inc. All rights reserved. Used with permission.

The display serial interface (DSI) is part of a group of communication protocols defined by the MIPI® Alliance. The MIPI® DSI Host controller is a digital core that implements all protocol functions defined in the MIPI® DSI Specification.

It provides an interface between the system and the MIPI® D-PHY, allowing the user to communicate with a DSI-compliant display.

### 36.2 Standard and references

### 36.3 DSI Host main features

- Compliant with MIPI® Alliance standards (see [Section 36.2: Standard and references](#))
- Interface with MIPI® D-PHY
- Supports all commands defined in the MIPI® Alliance specification for DCS:
  - Transmission of all command mode packets through the APB interface
  - Transmission of commands in low-power and high-speed during video mode
- Supports up to two D-PHY data lanes
- Bidirectional communication and escape mode support through data lane 0
- Supports non-continuous clock in D-PHY clock lane for additional power saving
- Supports Ultra low-power mode with PLL disabled
- ECC and checksum capabilities
- Support for end of transmission packet (EoTp)
- Fault recovery schemes
- Configurable selection of system interfaces:
  - AMBA APB for control and optional support for generic and DCS commands
  - Video mode interface through LTDC
  - Adapted command mode interface through LTDC
  - Independently programmable virtual channel ID in video mode, adapted command mode and APB slave
- Video mode interfaces features:
  - LTDC interface color coding mappings into 24-bit interface:
    - 16-bit RGB, configurations 1, 2, and 3
    - 18-bit RGB, configurations 1 and 2
    - 24-bit RGB
  - Programmable polarity of all LTDC interface signals
  - Extended resolutions beyond the DPI standard maximum resolution of 800x480 pixels:
  - Maximum resolution is limited by available DSI physical link bandwidth:
    - Number of lanes: 2
    - Maximum speed per lane: 1 Gbps
    - See examples in [Section 36.4.2: Supported resolutions and frame rates](#)
- Adapted interface features:
  - Support for sending large amounts of data through the *memory\_write\_start* (WMS) and *memory\_write\_continue* (WMC) DCS commands
  - LTDC interface color coding mappings into 24-bit interface:
    - 16-bit RGB, configurations 1, 2, and 3
    - 18-bit RGB, configurations 1 and 2
    - 24-bit RGB
- Video mode pattern generator:
  - Vertical and horizontal color bar generation without LTDC stimuli
  - BER pattern without LTDC stimuli

## 36.4 DSI Host functional description

### 36.4.1 General description

The MIPI® DSI Host includes dedicated video interfaces internally connected to the LTDC and a generic APB interface that can be used to transmit information to the display. More in detail:

- LTDC interface:
  - Used to transmit information in video mode, in which the transfers from the host processor to the peripheral take the form of a real-time pixel stream (DPI).
  - Through a customized mode, this interface can be used to transmit information in full bandwidth in the adapted command mode (DBI).
- APB slave interface: This interface allows the transmission of generic information in command mode, and follows a proprietary register interface. This interface can operate concurrently with either LTDC interface in either video mode or adapted command mode.
- Video mode pattern generator: This interface allows the transmission of horizontal/vertical color bar and D-PHY BER testing pattern without any kind of stimuli.

The block diagram of the DSI Host is shown in [Figure 286](#).

**Figure 286. DSI block diagram**

### 36.4.2 Supported resolutions and frame rates

The DSI specification does not define supported standard resolutions or frame rates. Display resolution, blanking periods, synchronization events duration, frame rates, and pixel color depth play a fundamental role in the required bandwidth. In addition, other link related attributes can influence the ability of the link to support a DSI-specific device. These attributes can be: display input buffering capabilities, video transmission mode (burst or non-burst), bus Turn-Around (BTA) time, concurrent command mode traffic in a video mode transmission, or display device specifics. All these variables make it difficult to define a

standard procedure to estimate the minimum lane rate and the minimum number of lanes that support a specific display device.

The basic assumptions for estimates are:

- clock lane frequency is 500 MHz, resulting in a bandwidth of 1 Gbps for each data lane
- the display should be capable of buffering the pixel data at the speed at which it is delivered in the DSI link
- no significant control traffic is present on the link when the pixel data is being transmitted.

### 36.4.3 System level architecture

Figure 287 shows the architecture of the DSI Host

Figure 287. DSI Host architecture

The different parts have the following functions:

- The DSI wrapper ensures the interfacing between the LTDC and the DSI Host kernel. It can adapt the color mode, the signal polarity and manages the tearing effect (TE) management for automatic frame buffer update in adapted command mode. The DSI wrapper also control the DSI regulator, the DSI PLL and specific functions of the MIPI® D-PHY.
- The LTDC interface captures the data and control signals from the LTDC and conveys them to a FIFO for video control signals and another one for the pixel data. This data is then used to build one of the following:
  - Video packets, when in video mode (see [Section 36.5](#))
  - The *memory\_write\_start* and *memory\_write\_continue* DCS commands, when in adapted command mode (see [Section 36.6](#))
- The register bank is accessible through a standard AMBA-APB slave interface, providing access to the DSI Host registers for configuration and control. There is also a fully programmable interrupt generator to inform the system about certain events.
- The PHY interface control is responsible for managing the D-PHY interface. It acknowledges the current operation and enables low-power transmission/reception or

a high-speed transmission. It also performs data splitting between available D-PHY lanes for high-speed transmission.

- The packet handler schedules the activities inside the link. It performs several functions based on the interfaces that are currently operational and the video transmission mode that is used (burst mode or non-burst mode with sync pulses or sync events). It builds long or short packet generating correspondent ECC and CRC codes. This block also performs the following functions:
  - packet reception
  - validation of packet header by checking the ECC
  - header correction and notification for single-bit errors
  - termination of reception
  - multiple header error notification
  - depending on the virtual channel of the incoming packet, the handler routes the output data to the respective port.
- The APB-to-generic block bridges the APB operations into FIFOs holding the generic commands. The block interfaces with the following FIFOs:
  - Command FIFO
  - Write payload FIFO
  - Read payload FIFO
- The error Management notifies and monitors the error conditions on the DSI link. It controls the timers used to determine if a timeout condition occurred, performing an internal soft reset and triggering an interruption notification.

## 36.5 Functional description: video mode on LTDC interface

The LTDC interface captures the data and control signals and conveys them to the FIFO interfaces that transmit them to the DSI link.

Two different streams of data are present at the interface, namely video control signals and pixel data. Depending on the interface color coding, the pixel data is disposed differently throughout the LTDC bus.

Interface pixel color coding is summarized in [Table 244](#).

**Table 244. Location of color components in the LTDC interface**

| Location | 16 bits  |          |          | 18 bits  |          | 24 bits |
|----------|----------|----------|----------|----------|----------|---------|

| D7       | G[2]     | -        | -        | G[1]     | -        | B[7]    |
| D6       | G[1]     | -        | -        | G[0]     | -        | B[6]    |
| D5       | G[0]     | -        | B[4]     | B[5]     | B[5]     | B[5]    |
| D4       | B[4]     | B[4]     | B[3]     | B[4]     | B[4]     | B[4]    |
| D3       | B[3]     | B[3]     | B[2]     | B[3]     | B[3]     | B[3]    |
| D2       | B[2]     | B[2]     | B[1]     | B[2]     | B[2]     | B[2]    |
| D1       | B[1]     | B[1]     | B[0]     | B[1]     | B[1]     | B[1]    |
| D0       | B[0]     | B[0]     | -        | B[0]     | B[0]     | B[0]    |

The LTDC interface can be configured to increase flexibility and promote correct use of this interface for several systems. The following configuration options are available:

- Polarity control: All the control signals are programmable to change the polarity depending on the LTDC configuration.
- After the core reset, DSI Host waits for the first VSYNC active transition to start signal sampling, including pixel data, thus avoiding starting the transmission of the image data in the middle of a frame.
- If interface pixel color coding is 18 bits and the 18-bit loosely packed stream is disabled, the number of pixels programmed in the VPSIZE field must be a multiple of four. This means that in this mode, the two LSBs in the configuration are always inferred as zero. The specification states that in this mode, the pixel line size should be a multiple of four.
- To avoid FIFO underflows and overflows, the configured number of pixels is assumed to be received from the LTDC at all times.
- To keep the memory organized with respect to the packet scheduling, the number of pixels per packet parameter is used to separate the memory space of different video packets.

For SHTDN and COLM sampling and transmission, the video streaming from the LTDC must be active. This means that if the LTDC is not actively generating the video signals like VSYNC and HSYNC, these signals are not transmitted through the DSI link. Because of such constraints and for commands to be correctly transmitted, the first VSYNC active pulse should occur for the command sampling and transmission. When shutting down the display, it is necessary for the LTDC to be kept active for one frame after the command being issued. This ensures that the commands are correctly transmitted before actually disabling the video generation at the LTDC interface.

The SHTDN and COLM values can be programmed in the DSI wrapper control register (DSI\_WCR).

For all of the data types, one entire pixel is received per each clock cycle. The number of pixels of payload is restricted to a multiple of a value, as shown in [Table 245](#).

**Table 245. Multiplicity of the payload size in pixels for each data type**

| Value | Data types                                |
|-------|-------------------------------------------|
| 1     | 16-bit<br>18-bit loosely packed<br>24-bit |
| 2     | Loosely packed pixel stream               |
| 4     | 18-bit non-loosely packed                 |

### 36.5.1 Video transmission mode

There are different video transmission modes, namely:

- Burst mode
- Non-burst mode
  - Non-burst mode with sync pulse
  - Non-burst mode with sync event.

### Burst mode

In this mode, the entire active pixel line is buffered into a FIFO and transmitted in a single packet with no interruptions. This transmission mode requires that the DPI Pixel FIFO has the capacity to store a full line of active pixel data inside it. This mode is optimally used when the difference between the pixel required bandwidth and DSI link bandwidth is significant, it enables the DSI Host to quickly dispatch the entire active video line in a single burst of data and then return to low-power mode.

### Non-burst mode

In this mode, the processor uses the partitioning properties of the DSI Host to divide the video line transmission into several DSI packets. This is done to match the pixel required bandwidth with the DSI link bandwidth. With this mode, the controller configuration does not require a full line of pixel data to be stored inside the LTDC interface pixel FIFO. It requires only the content of one video packet.

### Guidelines for selecting the burst or non-burst mode

Selecting the burst and non-burst mode is mainly dependent on the system configuration and the device requirements. Choose the video transmission mode that suits the application scenario. The burst mode is more beneficial because it increases the probability of the link spending more time in the low-power mode, decreasing power consumption. However, the following conditions should be met for availing the maximum benefits from the burst mode of operation:

- The DSI Host core should have sufficient pixel memory to store an entire pixel line to avoid the overflow of the internal FIFOs.
- The display device should support receiving a full pixel line in a single packet burst to avoid the overflow on the reception buffer.
- The DSI output bandwidth should be higher than the LTDC interface input bandwidth in a relation that enables the link to go to low-power once per line.

If the system cannot meet these requirements, it is likely that the pixel data will be lost causing the malfunctioning of the display device while using the burst mode. These errors are related to the capabilities of the system to store the temporary pixel data.

If all the conditions for using the burst mode cannot be met, use the non-burst mode to avoid the errors caused by the burst mode. The non-burst mode provides a better matching of rates for pixel transmission, enabling:

- Only a certain amount of pixels to be stored in the memory and not requiring a full pixel line (lesser LTDC interface RAM requirements in the DSI Host).
- Operation with devices that support only a small amount of pixel buffering (less than a full pixel line).

The DSI non-burst mode should be configured in such way that the DSI output pixel ratio matches with the LTDC interface input pixel ratio, reducing the memory requirements on both host and/or device side. This is achieved by dividing a pixel line into several chunks of pixels and optionally interleaving them with null packets.

The following equations show how the DSI Host core transmission parameters should be programmed in non-burst mode to match the DSI link pixel output ratio (left hand side of the "=" sign) and LTDC interface pixel input (right hand side of the "=" sign).

When the null packets are enabled:

$$\text{lanebyteclkperiod} * \text{NUMC} (\text{VPSIZE} * \text{bytes\_per\_pixel} + 12 + \text{NPSIZE}) / \text{number\_of\_lanes} \\ = \text{pixels\_per\_line} * \text{LTDC\_Clock\_period}$$

When the null packets are disabled:

$$\text{lanebyteclkperiod} * \text{NUMC} (\text{VPSIZE} * \text{bytes\_per\_pixel} + 6) / \text{number\_of\_lanes} \\ = \text{pixels\_per\_line} * \text{LTDC\_Clock\_period}$$

### 36.5.2 Updating the LTDC interface configuration in video mode

It is possible to update the LTDC interface configuration on the fly without impacting the current frame. It is done with the help of shadow registers. This feature is controlled by the DSI Host video shadow control register (DSI\_VSCR).

The new configuration is only used when the system requests for it. To update the video configuration during the transmission of a video frame, the configuration of that frame needs to be stored in the auxiliary registers. This way, the new frame configurations can be set through the APB interface without corrupting the current frame.

By default, this feature is disabled. To enable this feature, set the enable (EN) bit of the DSI Host video shadow control register (DSI\_VSCR) to 1.

When this feature is enabled, the system supplies the configuration stored in the auxiliary registers.

[Figure 288](#) shows the necessary steps to update the LTDC interface configuration.

**Figure 288. Flow to update the LTDC interface configuration using shadow registers**

#### Immediate update

When the shadow register feature is active, the auxiliary registers requires the LTDC configuration before the video engine starts. This means that, after a reset, update register (UR) bit is immediately granted.

In situations when it is required to immediately update the active registers without the reset (as illustrated in [Figure 289](#)), ensure that the enable (EN) and update register (UR) bits of the DSI Host video shadow control register (DSI\_VSCR) are set to 0.

**Figure 289. Immediate update procedure**

### Updating the configuration during the transmission of a frame using APB

To update the LTDC interface configuration, follow the steps shown in [Figure 290](#):

1. Ensure that the enable (EN) bit of the DSI Host video shadow control register (DSI\_VSCR) register is set to 1.
2. Set the update register (UR) bit of DSI Host video shadow control register (DSI\_VSCR) to 1.
3. Monitor the update register (UR) bit. This bit is set to 0 when the update is complete.

**Figure 290. Configuration update during the transmission of a frame**

### Requesting a configuration update

It is possible to request for the LTDC interface configuration update at any part of the frame. DSI Host waits until the end of the frame to change the configuration. However, avoid sending the update request during the first line of the frame because the data must propagate between clock domains.

## 36.6 Functional description – adapted command mode on LTDC interface

The adapted command mode, enables the system to input a stream of pixel from the LTDC that is conveyed by DSI Host using the command mode transmission (using the DCS packets). The adapted command mode also supports pixel input control rate signaling and tearing effect report mechanism.

The adapted command mode allows to send large amounts of data through the *memory\_write\_start* (WMS) and *memory\_write\_continue* (WMC) DCS commands. It helps in delivering a wider data bandwidth for the memory write operations sent in command mode to MIPI® displays and to refresh large areas of pixels in high resolution displays. If additional commands such as display configuration commands, read back commands, and tearing effect initialization are to be transferred, then the APB slave generic interface should be used to complement the adapted command mode functionality.

Adapted command mode of operation supports 16 bpp, 18 bpp, and 24 bpp RGB.

To transmit the image data in adapted command mode:

- Set command mode (CMDM) bit of the DSI Host mode configuration register (DSI\_MCR) to 1.
- Set DSI mode (DSIM) bit in the DSI wrapper configuration register (DSI\_WCFGR) to 1.

To transmit the image data, follow these steps:

- Define the image area to be refreshed, by using the *set\_column\_address* and *set\_page\_address* DCS commands. The image area needs to be defined only once and remains effective until different values are defined.
- Define the pixel color coding to be used by using the color coding (COLC) field in the DSI Host LTDC color coding register (DSI\_LCOLCR).
- Define the virtual channel ID of the LTDC interface generated packets using the virtual channel ID (VCID) field in the DSI Host LTDC VCID register (DSI\_LVCIDR). These also need to be defined only once.
- Start transmitting the data from the LTDC setting the LTDC enable (LTDCEN) bit of the DSI\_WCR register.

[Figure 291](#) shows the adapted command mode usage flow.

Figure 291. Adapted command mode usage flow

When the command mode (CMDM) bit of the DSI Host mode configuration register (DSI\_CFGR) is set to 1, the LTDC interface assume the behavior corresponding to the adapted command mode.

In this mode, the host processor can use the LTDC interface to transmit a continuous stream of pixels to be written in the local frame buffer of the peripheral. It uses a pixel input bus to receive the pixels and controls the flow automatically to limit the stream of continuous pixels. When the first pixel is received, the current value of the command size (CMDSIZE) field of the DSI Host LTDC command configuration register (DSI\_LCCR), is shadowed to the internal interface function. The interface increments a counter on every valid pixel that is input through the interface. When this pixel counter reaches command size (CMDSIZE), a command is written into the command FIFO and the packet is ready to be transmitted through the DSI link.

If the last pixel arrives before the counter reaches the value of shadowed command size (CMDSIZE), a WMS command is issued to the command FIFO with word count (WC) set to the amount of bytes that correspond to the value of the counter. If more than CMDSIZE number of pixels are received (shadowed value), a WMS command is sent to the command FIFO with WC set to the number of bytes that correspond to command size (CMDSIZE) and the counter is restarted.

After the first WMS command has been written to the FIFO, the circuit behaves in a similar way, but issues WMC commands instead of WMS commands. The process is repeated until the last pixel of the image is received. The core automatically starts sending a new packet

when the last pixel of the image is received falls or command size (CMD\_SIZE) limit is reached.

### Synchronization with the LTDC

The DSI wrapper performs the synchronization of the transfer process by :

- controlling the start/halt of the LTDC.
- making the data flow control between LTDC and DSI Host.

The transfer to refresh the display frame buffer can be triggered

- manually, setting the LTDC enable (LTDCEN) bit of the DSI Wrapper control register (DSI\_WCR).
- automatically when a tearing effect (TEIF) event occurs and automatic refresh (AR) is enabled.

The selection between manual and automatic mode is done through the automatic refresh (AR) bit of the DSI Wrapper configuration register (DSI\_WCFGR). In automatic refresh mode, the LTDC enable (LTDCEN) bit of the DSI Wrapper control register (DSI\_WCR) is set automatically by a tearing effect (TEIF) event.

Once the transfer of one frame is done whatever in manual or automatic refresh mode, the DSI wrapper is halting the TFT display controller (LTDC) resetting the LTDC enable (LTDCEN) bit of the DSI Wrapper control register (DSI\_WCR) and set the end of refresh interrupt flag (ERIF) flag of the DSI wrapper status register (DSI\_WSR). If the end of refresh interrupt enable (ERIE) bit of the DSI Wrapper configuration register (DSI\_WCFGR) is set, an interrupt is generated.

The end of refresh interrupt flag (ERIF) flag of the DSI wrapper status register (DSI\_WSR) can be reset setting the clear end of refresh interrupt flag (CERIF) bit of the DSI wrapper clear interrupt flag register (DSI\_WCIFR).

The halting of the TFT display controller (LTDC) by the DSI wrapper is done synchronously on a rising edge or a falling edge of VSync according to the VSync polarity (VSPOL) bit of the DSI Wrapper configuration register (DSI\_WCFGR).

### Support of tearing effect

The DSI specification supports tearing effect function in command mode displays. It enables the Host Processor to receive timing accurate information about where the display peripheral is in the process of reading the content of its frame buffer.

The tearing effect can be managed through

- a separate pin which is not covered in the DSI specification
- the DSI tearing effect functionality: a *set\_tear\_on* DCS command should be issued through the APB interface using the generic interface registers.

### Tearing effect through a GPIO

When the tearing effect source (TESRC) bit of the DSI wrapper configuration register (DSI\_WCFGR) is set, the tearing effect is signaled through a GPIO.

The polarity of the input signal can be configured by the tearing effect polarity (TEPOL) bit of the DSI wrapper configuration register (DSI\_WCFGR).

When the programmed edge is detected, the tearing effect interrupt flag (TEIF) bit of the DSI wrapper interrupt and status register (DSI\_WISR) is set.

If the tearing effect interrupt enable (TEIE) bit of the DSI wrapper interrupt enable register (DSI\_WIER) is set, an interrupt is generated.

### Tearing effect through DSI link

When the TESRC bit of the DSI wrapper configuration register (DSI\_WCFGR) is reset, the tearing effect is managed through the DSI link:

The DSI Host performs a double bus Turn-Around (BTA) after sending the *set\_tear\_on* command granting the ownership of the link to the DSI display. The display holds the ownership of the bus until the tear event occurs, which is indicated to the DSI Host by a D-PHY trigger event. The DSI Host then decodes the trigger and reports the event setting the tearing effect interrupt flag (TEIF) bit of the DSI wrapper interrupt and status register (DSI\_WISR).

If the tearing effect interrupt enable (TEIE) bit of the DSI wrapper interrupt enable register (DSI\_WIER) is set, an interrupt is generated.

To use this function, it is necessary to issue a *set\_tear\_on* command after the update of the display using the WMS and WMC DCS commands. This procedure halts the DSI link until the display is ready to receive a new frame update.

The DSI Host does not automatically generate the tearing effect request (double BTA) after a WMS/WMC sequence for flexibility purposes. This way several regions of the display can be updated improving DSI bandwidth usage. Tearing effect request must always be triggered by a *set\_tear\_on* command in the DSI Host implementation.

Configure the following registers to activate the tearing effect:

- DSI Host command mode configuration register (DSI\_CMCR): TEARE
- DSI Host protocol configuration register (DSI\_PCR): BTAE.

## 36.7 Functional description: APB slave generic interface

The APB slave interface allows the transmission of generic information in command mode, and follows a proprietary register interface. Commands sent through this interface are not constrained to comply with the DCS specification, and can include generic commands described in the DSI specification as manufacturer-specific.

The DSI Host supports the transmission of write and read command mode packets as described in the DSI specification. These packets are built using the APB register access. The DSI Host generic payload data register (DSI\_GPDR) has two distinct functions based on the operation. Writing to this register sends the data as payload when sending a command mode packet. Reading this register returns the payload of a read back operation. The DSI Host generic header configuration register (DSI\_GHCR) contains the command mode packet header type and header data. Writing to this register triggers the transmission of the packet implying that for a long command mode packet, the packet's payload needs to be written in advance in the DSI Host generic payload data register (DSI\_GPDR).

The valid packets that can be transmitted through the generic interface are the following ones:

- Generic write short packet 0 parameters
- Generic write short packet 1 parameters
- Generic write short packet 2 parameters
- Generic read short packet 0 parameters
- Generic read short packet 1 parameters
- Generic read short packet 2 parameters
- Maximum read packet configuration
- Generic long write packet
- DCS write short packet 0 parameters
- DCS write short packet 1 parameters
- DCS read short packet 0 parameters
- DCS write long packet.

A set of bits in the DSI Host generic packet status register (DSI\_GPSR) reports the status of the FIFO associated with APB interface support.

Generic interface packets are always transported using one of the DSI transmission modes, i.e. video mode or command mode. If neither of these modes is selected, the packets are not transmitted through the link and the related FIFO eventually becomes overflown.

### 36.7.1 Packet transmission using the generic interface

The transfer of packets through the APB bus is based on the following conditions:

- The APB protocol defines that the write and read procedure takes two clock cycles each to be executed. This means that the maximum input data rate through the APB interface is always half the speed of the APB clock.
- The data input bus has a maximum width of 32 bits. This allows for a relation to be defined between the input APB clock frequency and the maximum bit rate achievable by the APB interface.
- The DSI link pixel bit rate when using solely APB is (APB clock frequency) \* 16 Mbps.
- When using only the APB interface, the theoretical DSI link maximum bit rate can be expressed as DSI link maximum bit rate = APB clock frequency (in MHz) \* 32 / 2 Mbps. In this formula, the number 32 represents the APB data bus width, and the division by two is present because each APB write procedure takes two clock cycles to be executed.
- The bandwidth is dependent on the APB clock frequency; the available bandwidth increases with the clock frequency.

To drive the APB interface to achieve high bandwidth command mode traffic transported by the DSI link, the DSI Host should operate in the command mode only and the APB interface should be the only data source that is currently in use. Thus, the APB interface has the entire bandwidth of the DSI link and does not share it with any another input interface source.

The memory write commands require maximum throughput from the APB interface, because they contain the most amount of data conveyed by the DSI link. While writing the packet information, first write the payload of a given packet into the payload FIFO using the DSI Host generic payload data register (DSI\_GPDR). When the payload data is for the command parameters, place the first byte to be transmitted in the least significant byte position of the APB data bus.

After writing the payload, write the packet header into the command FIFO. For more information about the packet header organization on the 32-bit APB data bus, so that it is correctly stored inside the command FIFO.

When the payload data is for a memory write command, it contains pixel information and it should follow the pixel to byte conversion organization referred in the Annexe A of the DCS specification.

Figures 292 to 296 show how the pixel data should be organized in the APB data write bus.

The memory write commands are conveyed in DCS long packets, encapsulated in a DSI packet. The DSI specifies that the DCS command should be present in the first payload byte of the packet. This is also included in the diagrams. In figures 292 to 296, the *write memory* command can be replaced by the DCS command *write memory Start* and *write memory Continue*.

## 36.8 Functional description: timeout counters

The DSI Host includes counters to manage timeout during the various communication phases. The duration of each timeout can be configured by the six DSI Host timeout counter configuration register (DSI\_TCCR0..5).

There are two types of counters:

- contention error detection timeout counters ([Section 36.8.1](#))
- peripheral response timeout counters ([Section 36.8.2](#)).

### 36.8.1 Contention error detection timeout counters

The DSI Host implements a set of counters and conditions to notify the errors. It features a set of registers to control the timers used to determine if a timeout has occurred, and also contains a set of interruption status registers that are cleared upon a read operation (detailed in [Table 246](#)). Optionally, these registers also trigger an interrupt signal that can be used by the system to be activated when an error occurs within the DSI connection.

**Table 246. Contention detection timeout counters configuration**

| Timeout counter         | Value register | Value field | Flag register | Flag field |
|-------------------------|----------------|-------------|---------------|------------|
| High-speed transmission | DSI_TCCR0      | TOHSTX      | DSI_ISR1      | TOHSTX     |
| Low-power reception     | DSI_TCCR0      | TOLPRX      | DSI_ISR1      | TOLPRX     |

Time units for these 16-bit counters are configured in cycles defined in the timeout clock division (TCKDIV) field in the DSI Host clock control register (DSI\_CCR).

The value written to the timeout clock division (TCKDIV) field in the DSI Host clock control register (DSI\_CCR) defines the time unit for the timeout limits using the lane byte clock as input.

This mechanism increases the range to define these limits.

#### High-speed transmission contention detection

The timeout duration is configured in the high-speed transmission timeout count (HSTX\_TOCNT) field of the DSI Host timeout counter configuration register 1 (DSI\_TCCR0). A 16-bit counter measures the time during which the high-speed mode is active.

If that counter reaches the value defined by the high-speed transmission timeout count (HSTX\_TOCNT) field of the DSI Host timeout counter configuration register 1 (DSI\_TCCR0), the timeout high-speed transmission (TOHSTX) bit in the DSI Host interrupt and status register 1 (DSI\_ISR1) is asserted and an internal soft reset is generated to the DSI Host.

If the timeout high-speed transmission interrupt enable (TOHSTXIE) bit of the DSI Host interrupt enable register 1 (DSI\_IER1) is set, an interrupt is generated.

#### Low-power reception contention detection

The timeout is configured in the low-power reception timeout counter (LPRX\_TOCNT) field of the DSI Host timeout counter configuration register 1 (DSI\_TCCR1). A 16-bit counter measures the time during which the low-power reception is active.

If that counter reaches the value defined by the low-power reception timeout counter (LPRX\_TOCNT) field of the DSI Host timeout counter configuration register 1 (DSI\_TCCR0), the timeout low-power reception (TOLPRX) bit in the DSI Host interrupt and status register 1 (DSI\_ISR1) is asserted and an internal soft reset is generated to the DSI Host.

If the timeout low-power reception interrupt enable (TOLPRXIE) bit of the DSI Host interrupt enable register 1 (DSI\_IER1) is set, an interrupt is generated. Once the software gets notified by the interrupt, it must reset the D-PHY by de-asserting and asserting the Digital enable (DEN) bit of the DSI Host PHY control register (DSI\_PCTLR).

### 36.8.2 Peripheral response timeout counters

A peripheral may not immediately respond correctly to some received packets. For example, a peripheral receives a read request, but due to its architecture cannot access the RAM for a while. It may be because the panel is being refreshed and takes some time to respond. In this case, set a timeout to ensure that the host waits long enough so that the device is able to process the previous data before receiving the new data or responding correctly to new requests.

[Table 247](#) lists the events belonging to various categories having an associated timeout for peripheral response.

**Table 247. List of events of different categories of the PRESP\_TO counter**

| Category                                                        | Event                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Items implying a BTA PRESP_TO                                   | Bus-turn-around                                                                                                                                                                                                                                                                                                                                                                   |
| READ requests indicating a PRESP_TO (replicated for HS and LP)  | (0x04) Generic read, no parameters short<br>(0x14) Generic read, 1 parameter short<br>(0x24) Generic read, 2 parameters short<br>(0x06) DCS read, no parameters short                                                                                                                                                                                                             |
| WRITE requests indicating a PRESP_TO (replicated for HS and LP) | (0x03) Generic short write, no parameters short<br>(0x13) Generic short write, 1 parameter short<br>(0x23) Generic short write, 2 parameters short<br>(0x29) Generic long write long<br>(0x05) DCS short write, no parameters short<br>(0x15) DCS short write, 1 parameter short<br>(0x39) DCS long write/write_LUT, command packet long<br>(0x37) Set maximum return packet size |

The DSI Host ensures that, on sending an event that triggers a timeout, the D-PHY switches to the Stop state and a counter starts running until it reaches the value of that timeout. The link remains in the LP-11 state and unused until the timeout ends, even if there are other events ready to be transmitted.

Figures [297](#) to [299](#) illustrate the flow of counting in the PRESP\_TO counter for the three categories listed in [Table 247](#).

Figure 297. Timing of PRESP\_TO after a bus-turn-around

**Figure 299. Timing of PRESP\_TO after a write request (HS or LP)**

Table 248 describes the fields used for the configuration of the PRESP\_TO counter.

**Table 248. PRESP\_TO counter configuration**

| Description                                           |                                            | Register  | Field      |
|-------------------------------------------------------|--------------------------------------------|-----------|------------|
| Period for which the DSI Host keeps the link still    | After sending a High-speed read operation  | DSI_TCCR1 | HSRD_TOCNT |
|                                                       | After sending a Low-power read operation   | DSI_TCCR2 | LPRD_TOCNT |
|                                                       | After completing a Bus-turn-around (BTA)   | DSI_TCCR5 | BTA_TOCNT  |
| Period for which the DSI Host keeps the link inactive | After sending a High-speed write operation | DSI_TCCR3 | HSWR_TOCNT |
|                                                       | After sending a Low-power write operation  | DSI_TCCR4 | LPWR_TOCNT |

The values in these registers are measured in number of cycles of the lane byte clock. These registers are only used in command mode because in video mode, there is a rigid timing schedule to be met to keep the display properly refreshed and it must not be broken by these or any other timeouts. Setting a given timeout to 0 disables going into LP-11 state and timeout for events of that category.

The read and the write requests in high-speed mode are distinct from the read and the write requests in low-power mode. For example, if HSRD\_TOCNT is set to zero and LPRD\_TOCNT is set to a non-zero value, a generic read with no parameters does not activate the PRESP\_TO counter in high-speed, but it activates the PRESP\_TO in low-power.

The DSI Host timeout counter configuration register 4 (DSI\_TCCR3) includes a special Presp mode (PM) bit to change the normal behavior of PRESP\_TO in Adaptive command

mode for high-speed write operation timeout. When set to 1, this bit allows the PRESP\_TO from HSWR\_TOCNT to be used only once, when both of the following conditions are met:

- the LTDC VSYNC signal rises and falls
- the packets originated from the LTDC interface in adapted command mode are transmitted and its FIFO is empty again.

In this scenario, non-adapted command mode requests are not sent to the D-PHY, even if there is traffic from the generic interface ready to be sent, returning them to the Stop state. When it happens, the PRESP\_TO counter is activated and only when it is completed, the DSI Host sends any other traffic that is ready, as illustrated in [Figure 300](#).

**Figure 300. Effect of prep mode at 1**

## 36.9 Functional description: transmission of commands

### 36.9.1 Transmission of commands in video mode

The DSI Host supports the transmission of commands, both in high-speed and low-power, while in video mode. The DSI Host uses Blanking or low-power (BLLP) periods to transmit commands inserted through the APB generic interface. Those periods correspond to the gray areas of [Figure 301](#).

**Figure 301. Command transmission periods within the image area**

Commands are transmitted in the blanking periods after the following packets/states:

- Vertical Sync Start (VSS) packets, if the video sync pulses are not enabled
- Horizontal sync end (HSE) packets, in the VSA, VBP, and VFP regions
- Horizontal sync Start (HSS) packets, if the video sync pulses are not enabled in the VSA, VBP, and VFP regions
- Horizontal active (HACT) state

Besides the areas corresponding to BLLP, large commands can also be sent during the last line of a frame. In that case, the line time for the video mode is violated and the `edpihalt` signal is set to request the DPI video timing signals to remain inactive. Only if a command does not fit into any BLLP area, it is postponed to the last line, causing the violation of the line time for the video mode, as illustrated in [Figure 302](#).

Figure 302. Transmission of commands on the last line of a frame

Only one command is transmitted per line, even in the case of the last line of a frame but one command is possible for each line.

There can be only one command sent in low-power per line. However, one low-power command is possible for each line. In high-speed, the DSI Host can send more than one command, as many as it determines to fit in the available time.

The DSI Host avoids sending commands in the last line because it is possible that the last line is shorter than the other ones. For instance, the line time ( $t_L$ ) could be half a cycle longer than the  $t_L$  on the LTDC interface, that is, each line in the frame taking half a cycle from time for the last line. This results in the last line being  $(\frac{1}{2} \text{ cycle}) \times (\text{number of lines} - 1)$  shorter than  $t_L$ .

The COLM and SHTDN bits of the DSI wrapper control register (DSI\_WCR) are also able to trigger the sending of command packets. The commands are:

- Color mode ON
- Color mode OFF
- Shut down peripheral
- Turn on peripheral

These commands are not sent in the VACT region. If the low-power command enable (LPCE) bit of the DSI Host video mode configuration register (DSI\_VMCR) is set, these commands are sent in low-power mode.

In low-power mode, the largest packet size (LPSIZE) field of the DSI Host low-power mode configuration register (DSI\_LPMCR) is used to determine if these commands can be transmitted. It is assumed that largest packet size (LPSIZE) is greater than or equal to four bytes (number of bytes in a short packet), because the DSI Host does not transmit these commands on the last line.

If the frame bus-turn-around acknowledge enable (FBTAAE) bit is set in the DSI Host low-power mode configuration register (DSI\_LPMCR), a BTA is generated by DSI Host after the last line of a frame. This may coincide with a write command or a read command. In either case, the LTDC interface is halted until an acknowledge is received (control of the DSI bus is returned to the host).

### 36.9.2 Transmission of commands in low-power mode

DSI Host can be configured to send the low-power commands during the high-speed video mode transmission.

To enable this feature, set the Low Power command enable (LPCE) bit of the DSI Host video mode configuration register (DSI\_VMCR) to 1. In this case, it is necessary to calculate the time available, in bytes, to transmit a command in low-power mode to horizontal front-porch (HFP), vertical sync active (VSA), vertical back-porch (VBP), and vertical front-porch (VFP) regions.

Bits 8 to 13 of the video mode configuration register (DSI\_VMCR) register indicates if DSI Host can go to LP when in idle. If the low-power command enable (LPCE) bit is set and non-video packets are in queue, DSI Host ignores the low-power configuration and transmits low-power commands, even if it is not allowed to enter low-power mode in a specific region. After the low-power commands transmission, DSI Host remains in low-power until a sync event occurs.

For example, consider that the VFP is selected as high-speed region (LPVFPE = 1'b0) with LPCE set as a command to transmit in low-power in the VPF region. This command is transmitted in low-power, and the line stays in low-power mode until a new HSS arrives.

#### Calculating the time to transmit commands in LP mode in the VSA, VBP, and VFP Regions

The largest packet size (LPSIZE) field of the DSI Host low-power mode configuration register (DSI\_LPMCR) indicates the time available (in bytes) to transmit a command in low-power mode (based on the escape clock) on a line during the VSA, VBP, and the VFP regions.

Calculation of largest packet size (LPSIZE) depends on the used video mode.

[Figure 303](#) illustrates the timing intervals for the video mode in non-burst with sync pulses, while [Figure 304](#) refers to video mode in burst and non-burst with sync events.

**Figure 303. LPSIZE for non-burst with sync pulses**

**Figure 304. LPSIZE for burst or non-burst with sync events**

This time is calculated as follows:

$$LPSIZE = (t_L - (t_{H1} + t_{HS \rightarrow LP} + t_{LPHS} + t_{LPDT} + 2 t_{ESCCLK})) / (2 \times 8 \times t_{ESCCLK}), \text{ where}$$

- $t_L$  = line time
- $t_{H1}$  = time of the HSA pulse for sync pulses mode ([Figure 303](#)) or time to send the HSS packet, including EoTp ([Figure 304](#))
- $t_{HS \rightarrow LP}$  = time to enter the low-power mode
- $t_{LP \rightarrow HS}$  = time to leave the low-power mode
- $t_{LPDT}$  = D-PHY timing related with escape mode entry, LPDT command, and escape exit. According to the D-PHY specification, this value is always 11 bits in LP (or 22 TX escape clock cycles)
- $t_{ESCCLK}$  = escape clock period as programmed in the TXECKDIV field of the DSI\_CCR register
- $t_{ESCCLK}$  = delay imposed by the DSI Host implementation.

In the above equation, division by eight is done to convert the available time to bytes. Division by two is done because one bit is transmitted every two escape clock cycles. The largest packet size (LPSIZE) field can be compared directly with the size of the command to be transmitted to determine if there is enough time to transmit the command. The maximum size of a command that can be transmitted in low-power mode is limited to 255 bytes by this field. You must program this register to a value greater than or equal to 4 bytes for the transmission of the DCTRL commands, such as shutdown and color in low-power mode.

Consider an example of a frame with 12.4  $\mu$ s per line and assume an escape clock frequency of 20 MHz and a lane bit rate of 800 Mbits. In this case, it is possible to send 124 bits in escape mode (that is, 124 bit = 12.4  $\mu$ s \* 20 MHz / 2). Still, you need to take into consideration the D-PHY protocol and PHY timings.

The following assumptions are made:

- lane byte clock period is 10 ns (800 Mbits per lane)
- escape clock period is 50 ns (DSI\_CCR.TXECKDIV = 5)
- video is transmitted in non-burst mode with sync pulses bounded by HSS and HSE packets
- DSI is configured for two lanes
- D-PHY takes 180 ns to transit from low-power to high-speed mode (DSI\_DLTCR.LS2HS\_TIME = 18)
- D-PHY takes 200 ns to transit from high-speed to low-power mode (DSI\_DLTCR.HS2LP\_TIME = 20)
- $t_{HSA} = 420$  ns.

In this example, a 13-byte command can be transmitted as follows:

$$LPSIZE = (12.4 \mu s - (420 \text{ ns} + 180 \text{ ns} + 200 \text{ ns} + (22 \times 50 \text{ ns} + 2 \times 50 \text{ ns}))) / (2 \times 8 \times 50 \text{ ns}) = 13 \text{ bytes.}$$

### Calculating the time to transmit commands in low-power mode in HFP region

The VACT largest packet size (VLPSIZE) field of the DSI low-power mode configuration register (DSI\_LPMCR) indicates the time available (in bytes) to transmit a command in low-power mode (based on the escape clock) in the vertical active (VACT) region.

To calculate the value of VACT largest packet size (VLPSIZE), consider the video mode being used. [Figure 305](#) shows the timing intervals for video mode in non-burst with sync

pulses, [Figure 306](#) those for video mode in non-burst with sync events, and [Figure 307](#) refers to the burst video mode.

**Figure 305. VLPSIZE for non-burst with sync pulses**

**Figure 306. VLPSIZE for non-burst with sync events**

**Figure 307. VLPSIZE for burst mode**

This time is calculated as follows:

$$VLPSIZE = (t_L - (t_{HSA} + t_{HBP} + t_{HACT} + t_{HS \rightarrow LP} + t_{LP \rightarrow HS} + t_{LPDT} + 2 t_{ESCCLK})) / (2 \times 8 \times t_{ESCCLK})$$

where

- $t_L$  = line time
- $t_{HSA}$  = time of the HSA pulse (DSI\_VHSACR.HSA)
- $t_{HBP}$  = time of horizontal back-porch (DSI\_VHBPCR.HBP)
- $t_{HACT}$  = time of video active. For burst mode, the video active is time compressed and is calculated as  $t_{HACT} = VPSIZE * Bytes\_per\_Pixel / Number\_Lanes * t_{Lane\_byte\_clk}$
- $t_{ESCCLK}$  = escape clock period as programmed in TXECKDIV field of the DSI\_CCR register.

The VLPSIZE field can be compared directly with the size of the command to be transmitted to determine if there is time to transmit the command.

Consider an example of a frame with 16.4  $\mu$ s per line and assume an escape clock frequency of 20 MHz and a lane bit rate of 800 Mbits/s. In this case, it is possible to send 420 bits in escape mode (that is, 164 bits = 16.4  $\mu$ s \* 20 MHz / 2). Still, since it is the vertical active region of the frame, take into consideration the HSA, HBP, and HACT timings apart from the D-PHY protocol and PHY timings. The following assumptions are made:

- number of active lanes is 4
- Lane byte clock period (lanebyteclkperiod) is 10 ns (800 Mbits per lane)
- escape clock period is 50 ns (DSI\_CCR.TXECKDIV = 5)
- D-PHY takes 180 ns to pass from low-power to high-speed mode (DSI\_DLTCLP2HS\_TIME = 18)
- D-PHY takes 200 ns to pass from high-speed to low-power mode (DSI\_DLTCLP2HS\_TIME = 20)
- $t_{HSA} = 420$  ns
- $t_{HBP} = 800$  ns
- $t_{HACT} = 12800$  ns to send 1280 pixel at 24 bpp
- video is transmitted in non-burst mode
- DSI Host is configured for four lanes.

In this example, consider that you send video in non-burst mode. The VLPSIZE is calculated as follows:

$$VLPSIZE = (16.4 \mu s - (420 \text{ ns} + 800 \text{ ns} + 12.8 \mu s + 180 \text{ ns} + 200 \text{ ns} + (22 \times 50 \text{ ns} + 2 \times 50 \text{ ns}))) / (2 \times 8 \times 50 \text{ ns}) = 1 \text{ byte}$$

Only one byte can be transmitted in this period. A short packet (for example, generic short write) requires a minimum of four bytes. Therefore, in this example, commands are not sent in the VACT region.

If burst mode is enabled, more time is available to transmit the commands in the VACT region, because HACT is time compressed.

$$VLPSIZE = (16.4 \mu s - (420 \text{ ns} + 800 \text{ ns} + (1280 \times 3 / 4 \times 10 \text{ ns}) + 180 \text{ ns} + 200 \text{ ns} + (22 \times 50 \text{ ns} + 2 \times 50 \text{ ns}))) / (2 \times 8 \times 50 \text{ ns}) = 5 \text{ bytes}$$

For burst mode, the VLPSIZE is 5 bytes and then a 4-byte short packet can be sent.

### Transmission of commands in different periods

The LPSIZE and VLPSIZE fields allow a simple comparison to determine if a command can be transmitted in any of the BLLP periods.

[Figure 308](#) illustrates the meaning of VLPSIZE and LPSIZE, matching them with the shaded areas and the VACT region.

Figure 308. Location of LPSIZE and VLPSIZE in the image area

### 36.9.3 Transmission of commands in high-speed

If the LPCE bit of the DSI\_VMCRR register is 0, the commands are sent in high-speed in video mode. In this case, the DSI Host automatically determines the area where each command can be sent and no programming or calculation is required.

### 36.9.4 Read command transmission

The MRD\_TIME field of the DSI\_DLTRCR register configures the maximum amount of time required to perform a read command in lane byte clock cycles, it is calculated as:

MRD\_TIME = time to transmit the read command in low-power mode + time to enter and leave low-power mode + time to return the read data packet from the peripheral device.

The time to return the read data packet from the peripheral depends on the number of bytes read and the escape clock frequency of the peripheral, not the escape clock of the host. The MRD\_TIME field is used in both high-speed and low-power mode to determine if there is time to complete a read command in a BLLP period.

In high-speed mode (LPCE = 0), MRD\_TIME is calculated as follows:

$$\text{MRD\_TIME} = (t_{\text{HS} \rightarrow \text{LP}} + t_{\text{LP} \rightarrow \text{HS}} + t_{\text{read}} + 2 \times t_{\text{BTA}}) / \text{lanebyteclkperiod}$$

In low-power mode (LPCE = 1), MRD\_TIME is calculated as follows:

$$\text{MRD\_TIME} = (t_{\text{HS} \rightarrow \text{LP}} + t_{\text{LP} \rightarrow \text{HS}} + t_{\text{LPDT}} + t_{\text{lpd}} + t_{\text{read}} + 2 \times t_{\text{BTA}}) / \text{lanebyteclkperiod}, \text{ where:}$$

- $t_{\text{HS} \rightarrow \text{LP}}$  = time to enter the low-power mode
- $t_{\text{LP} \rightarrow \text{HS}}$  = time to leave the low-power mode
- $t_{\text{LPDT}}$  = D-PHY timing related to escape mode entry, LPDT command, and escape mode exit (according to the D-PHY specification, this value is always 11 bits in LP, or 22 TX escape clock cycles)
- $t_{\text{lpd}}$  = read command time in low-power mode (64 \* TX esc clock)
- $t_{\text{read}}$  = time to return the read data packet from the peripheral
- $t_{\text{BTA}}$  = time to perform a bus-turn-around (D-PHY dependent).

It is recommended to keep the maximum number of bytes read from the peripheral to a minimum to have sufficient time available to issue the read commands in a line time. Ensure that  $MRD\_TIME \times \text{lane byte clock period}$  is less than  $LPSIZE \times 16 \times \text{escape clock period}$  of the host, otherwise, the read commands are dispatched on the last line of a frame. If it is necessary to read a large number of parameters ( $> 16$ ), increase the  $MRD\_TIME$  while the read command is being executed. When the read has completed, decrease the  $MRD\_TIME$  to a lower value.

If a read command is issued on the last line of a frame, the LTDC interface is halted and stays halted until the read command is in progress. The video transmission should be stopped during this period.

### 36.9.5 Clock lane in low-power mode

To reduce the power consumption of the D-PHY, the DSI Host, when not transmitting in the high-speed mode, allows the clock lane to enter into the low-power mode. The controller automatically handles the transition of the clock lane from HS (clock lane active sending clock) to LP state without direct intervention by the software. This feature can be enabled by configuring the DPCC and the ACR bits of the DSI\_CLCR register.

In the command mode, the DSI Host can place the clock lane in the low-power mode when it does not have any HS packets to transmit.

In the video mode (LTDC interface), the DSI Host controller uses its internal video and PHY timing configurations to determine if there is time available for the clock line to enter the low-power mode and not compromise the video data transmission of pixel data and sync events.

Along with a correct configuration of the video mode (see [Section 36.5: Functional description: video mode on LTDC interface](#)), the DSI Host needs to know the time required by the clock lane to go from high-speed to low-power mode and viceversa. The values required can be obtained from the D-PHY specification: program the DSI\_CLTCCR register with the following values:

- $HS2LP\_TIME$  = time from HS to LP in clock lane / byte clock period in HS (lanebyteclk)
- $LP2HS\_TIME$  = time from LP to HS in clock lane / byte clock period in HS (lanebyteclk)

Based on the programmed values, the DSI Host calculates if there is enough time for the clock lane to enter the low-power mode during inactive regions of the video frame.

The DSI Host decides the best approach to follow regarding power saving out of the three possible scenarios:

- there is no enough time to go to the low-power mode. Therefore, blanking period is added as shown in [Figure 309](#)
- there is enough time for the data lanes to go to the low-power mode but not enough time for the clock lane to enter the low-power mode, see [Figure 310](#).
- there is enough time for both data lanes and clock lane to go to the low-power mode, as in [Figure 311](#).

**Figure 309. Clock lane and data lane in HS**

Figure 310. Clock lane in HS and data lanes in LP

Figure 311. Clock lane and data lane in LP

## 36.10 Functional description: virtual channels

The DSI Host supports choosing the virtual channel (VC) for use for each interface. Using multiple virtual channels, the system can address multiples displays at the same time, when each display has a different virtual channel identifier.

When the LTDC interface is configured for a particular virtual channel, it is possible to use the APB slave generic interface to issue the commands while the video stream is being transmitted. With this, it is possible to send the commands through the ongoing video stream, addressing different virtual channels and thus enable the interface with multiple displays. During the video mode, the video stream transmission has the maximum priority. Therefore, the transmission of sideband packets such as the ones from the generic interface are only transported when there is time available within the video stream transmission. The DSI Host identifies the available time periods and uses them to transport the generic interface packets. [Figure 312](#) illustrates where the DSI Host inserts the packets from the APB generic interface within the video stream transmitted by the LTDC interface.

**Figure 312. Command transmission by the generic interface**

It is also possible to address the multiple displays with only the generic interface using different virtual channels. Because the generic interface is not restricted to any particular virtual channel through configuration, it is possible to issue the packets with different virtual channels. This enables the interface to time multiplex the packets to be provided to the displays with different virtual channels.

You can use the following configuration registers to select the virtual channel ID associated with transmissions over the LTDC and APB slave generic interfaces:

- DSI\_LVCID.VCID field configures the virtual channel ID that is indexed to the video mode packets using the LTDC interface.
- DSI\_GHCR register configures the packet header (which includes the virtual channel ID to be used) for transmissions using APB slave generic interface.
- DSI\_GVIDR.VCID field configures the virtual channel ID of the read responses to store and return to the generic interface.

## 36.11 Functional description: video mode pattern generator

The video mode pattern generator allows the transmission of horizontal/vertical color bar and D-PHY BER testing pattern without any stimuli.

The frame requirements must be defined in video registers that are listed in [Table 249](#).

**Table 249. Frame requirement configuration registers**

| Register name                            | Description                 |
|------------------------------------------|-----------------------------|
| DSI Host video mode configuration        | Video mode configuration    |
| DSI Host video packet configuration      | Video packet size           |
| DSI Host video chunks configuration      | Number of chunks            |
| DSI Host video null packet configuration | Null packet size            |
| DSI Host video HSA configuration         | Horizontal sync active time |
| DSI Host video HBP configuration         | Horizontal back-porch time  |
| DSI Host video line configuration        | Line time                   |
| DSI Host video VSA configuration         | Vertical sync active period |
| DSI Host video VBP configuration         | Vertical back-porch period  |
| DSI Host video VFP configuration         | Vertical front-porch period |
| DSI Host video VA configuration          | Vertical resolution         |

### 36.11.1 Color bar pattern

The color bar pattern comprises eight bars for white, yellow, cyan, green, magenta, red, blue, and black colors.

Each color width is calculated by dividing the line pixel size (vertical pattern) or the number of lines (horizontal pattern) by eight. In the vertical color bar mode ([Figure 313](#)), each single color bar has a width of the number of pixels in a line divided by eight. In case the number of pixels in a line is not divisible by eight, the last color (black) contains the remaining.

In the horizontal color bar mode ([Figure 314](#)), each color line has a color width of the number of lines in a frame divided by eight. In case the number of lines in a frame is not divisible by eight, the last color (black) contains the remaining lines.

Figure 313. Vertical color bar mode

Figure 314. Horizontal color bar mode

36.11.2 Color coding

*Table 250* shows the RGB components used.

Table 250. RGB components

|   | White | Yellow | Cyan | Green | Magenta | Red  | Blue | Black |
|---|-------|--------|------|-------|---------|------|------|-------|
| R | High  | High   | Low  | Low   | High    | High | Low  | Low   |
| G | High  | High   | High | High  | Low     | Low  | Low  | Low   |
| B | High  | Low    | High | Low   | High    | Low  | High | Low   |

### 36.11.3 BER testing pattern

The BER testing pattern simplifies conformance testing. This pattern tests the RX D-PHY capability to receive the data correctly. The following data patterns are required:

- X bytes of 0xAA (high-frequency pattern, inverted)
- X bytes of 0x33 (mid-frequency pattern)
- X bytes of 0xF0 (low-frequency pattern, inverted)
- X bytes of 0x7F (lone 0 pattern)
- X bytes of 0x55 (high-frequency pattern)
- X bytes of 0xCC (mid-frequency pattern, inverted)
- X bytes of 0x0F (low-frequency pattern)
- Y bytes of 0x80 (lone 1 pattern).

In most cases, Y is equal to X. However, depending on line length and the color coding used, Y may be different from X. With RGB888 color coding and horizontal resolution in multiples of eight, the pattern shown in [Figure 315](#) appears on the DSI display.

Figure 315. RGB888 BER testing pattern

### 36.11.4 Video mode pattern generator resolution

Depending on the orientation, BER mode, and color coding, the smallest resolutions accepted by the video mode pattern generator are:

- BER mode: 8x8
- horizontal color bar mode: 8x8
- vertical color bar mode: 8x8.

#### Vertical pattern

The width of each color bar is determined by the division of horizontal resolution (pixels) for eight test pattern colors. If the horizontal resolution is not divisible by eight, the last color (black) is extended to fill the resolution.

In the example in [Figure 316](#), the horizontal resolution is 103.

**Figure 316. Vertical pattern (103x15)**

#### Horizontal pattern

The width of each color bar is determined by the division of the number of vertical resolution (lines) for eight test pattern colors. If the vertical resolution is not divisible by eight, the last color (black) will be extended to fill the resolution, as shown in [Figure 317](#).

**Figure 317. Horizontal pattern (103x15)**

## 36.12 Functional description: D-PHY management

The embedded MIPI® D-PHY is control directly by the DSI Host and is configured through the DSI wrapper.

A dedicated PLL and a dedicated 1.2 V regulator are also embedded to supply the clock and the power supply to the DSI Host and D-PHY.

### 36.12.1 D-PHY configuration

The D-PHY configuration is carried out through the DSI wrapper thanks to the DSI\_WPCR<sub>x</sub> registers.

#### Timing definition

The MIPI® D-PHY manages all the communication timing with dedicated timers. As all the timings are specified in nanoseconds (ns), it is mandatory to configure the unit interval field to ensure the good duration of all the timings.

Unit interval is configure through the DSI\_WPCR0.UIX4 field. This value defines the bit period in high-speed mode in unit of 0.25 ns. If this period is not a multiple of 0.25 ns, the value driven must be rounded down.

As an example, for a 300 Mbit/s link, the unit interval is 3.33 ns, so UIX4 shall be 13.33. In this case a value of 13 (0x0D) has to be written.

#### Slew-rate and skew tuning on pins

To fine tune DSI communication, slew-rates and skew can be adjusted:

- slew-rate in high-speed transmission on data lane and clock lane
- slew-rate in low-power transmission on data lane and clock lane
- skew on data lane and clock lane

**Table 251. Slew-rate and delay tuning**

| Function                             | Lane(s)     | Value field in DSI_WPCR1 |
|--------------------------------------|-------------|--------------------------|
| Slew-rate in high-speed transmission | Clock lane  | HSTXSRUCL<br>HSTXSRDCL   |
|                                      | Data lanes  | HSTXSRUDL<br>HSTXSRDDL   |
| Slew-rate in low-power transmission  | Clock lanes | LPTXSRCL                 |
|                                      | Data lanes  | LPTXSRCDL                |
| Skew                                 | Clock lane  | SKEWCL                   |
|                                      | Data lanes  | SKEWDL                   |

The default values for all this parameters is 2'h00. All these values can be programmed only when the DSI is stopped (DSI\_WCR.DSIEN = 0 and CR.EN = 0).

#### Special Sdd control

An additional current path can be activated on both clock lane and data lane to meet the Sdd<sub>TX</sub> parameter defined in the MIPI® D-PHY Specification.

This activation is done setting the TSTD and TSTCL bits of the DSI\_WPCR1 register.

### Custom lane configuration

To ease DSI integration, lane pins can be swapped and/or high-speed signal can be inverted on a lane as described in [Table 252](#).

**Table 252. Custom lane configuration**

| Function                         | Lane        | Enable bit in DSI_WPCR0 |
|----------------------------------|-------------|-------------------------|
| Swap lane pins                   | Clock lane  | SWCL                    |
|                                  | Data lane 0 | SWDL0                   |
|                                  | Data lane 1 | SWDL1                   |
| Invert high-speed signal on lane | Clock lane  | HSICL                   |
|                                  | Data lane 0 | HSIDL0                  |
|                                  | Data lane 1 | HSIDL1                  |

## 36.12.2 Special D-PHY operations

The DSI wrapper features some control bits to force the D-PHY in some particular state and/or behavior.

### Forcing lane state

It's possible to force the data lane and/or the clock lane in TX Stop mode through the bits FTXSMDL and FTXSMCL of the DSI\_WPCR0 register.

Setting this bits causes the respective lane module to immediately jump in transmit control mode and to begin transmitting a stop state (LP-11).

This feature can be used to go back in TX mode after a wrong BTA sequence.

### Disabling turn of data lane

When set, the TDDL bit of the DSI\_WPCR0 register forces the data lane to remain in reception mode even if a bus-turn-around request (BTA) is received from the other side.

## 36.12.3 Special low-power D-PHY functions

The embedded D-PHY offers specific features to optimize consumption.

### Disabling contention detection on data lanes

The contention detector on the data lane can be turned off to lower the overall D-PHY consumption.

When set, the CDOFFDL bit of the DSI\_WPCR0 register disables the contention detection on data lanes.

This can be used in forward escape mode to reduce the static power consumption.

### 36.12.4 DSI PLL control

The dedicated DSI PLL is controlled through the DSI wrapper, as shown in [Figure 318](#) (analog blocks and signals in red, digital signals in black, digital blocks in light blue).

**Figure 318. PLL block diagram**

The PLL output frequency is configured through the DSI\_WRPCR register fields. The VCO frequency and the PLL output frequency are calculated as follows:

$$F_{VCO} = (CLK_{IN} / IDF) * 2 * NDIV,$$

$$PHI = F_{VCO} / (2 * ODF)$$

where:

- CLK<sub>IN</sub> is in the range of 8 to 200 MHz
- DSI\_WRPCR.NDIV is in the range of 10 to 125
- DSI\_WRPCR.IDF is in the range of 1 to 7
- INFIN is in the range of 8 to 50 MHz
- F<sub>VCO</sub> is in the range of 1 GHz to 2 GHz
- DSI\_WRPCR.ODF can be 1, 2, 4 or 8
- PHI is in the range of 62.5 MHz to 1 GHz

The PLL is enabled by setting the PLEN bit in the DSI\_WRPCR register.

Once the PLL is locked, the PLLIF bit is set in the DSI\_WISR. If the PLLIE bit is set in the DSI\_WIER, an interrupt is generated.

The PLL status (lock or unlock) can be monitored with the PLLLS flag in the DSI\_WISR register.

If the PLL gets unlocked, the PLLUIF bit of the DSI\_WISR is set. If the PLLUIE bit of the DSI\_WIER register is set, an interrupt is generated.

The DSI PLL setting can be changed only when the PLL is disabled.

### 36.12.5 Regulator control

The DSI regulator providing the 1.2 V is controlled through the DSI wrapper.

The regulator is enabled setting the REGEN bit of the DSI\_WRPCR register.

Once the regulator is ready, the RRIF bit of the DSI\_WISR register is set. If the RRIE bit of the DSI\_WIER register is set, an interrupt is generated.

The regulator status (ready or not) can be monitored with the RRS flag in the DSI\_WISR register.

Note that the D-PHY has no separated Power ON control bit. The power ON/OFF of the D-PHY is done directly enabling the 1.2 V regulator.

When the 1.2 V regulator is disabled, the 3.3 V part of the D-PHY is automatically powered OFF.

### 36.12.6 D-PHY band-gap control

The band-gap providing the voltage reference to the D-PHY is controller through the DSI wrapper.

The band-gap is enabled setting the BGREN bit of the DSI\_WRPCR register.

## 36.13 Functional description: interrupts and errors

The interrupts can be generated either by the DSI Host or by the DSI wrapper.

All the interrupts are merged in one interrupt lane going to the interrupt controller.

### 36.13.1 DSI wrapper interrupts

An interrupt can be produced on the following events:

- tearing effect event
- end of refresh
- PLL locked
- PLL unlocked
- regulator ready

Separate interrupt enable bits are available for flexibility.

**Table 253. DSI wrapper interrupt requests**

| Interrupt event | Event flag in DSI_WISR | Enable control bit in DSI_WIER |
|-----------------|------------------------|--------------------------------|
| Tearing effect  | TEIF                   | TEIE                           |
| End of refresh  | ERIF                   | ERIE                           |
| PLL locked      | PLLLIF                 | PLLLIE                         |
| PLL unlocked    | PLLUIF                 | PLLUIE                         |
| Regulator ready | RRIF                   | RRIE                           |

### 36.13.2 DSI Host interrupts and errors

The DSI\_ISR0 and DSI\_ISR1 registers are associated with error condition reporting. These registers can trigger an interrupt to inform the system about the occurrence of errors.

The DSI Host has one interrupt line that is set high when an error occurs in either the DSI\_ISR0 or the DSI\_ISR1 register.

The triggering of the interrupt can be masked by programming the mask registers DSI\_IER0 and DSI\_IER1. By default all errors are masked. When any bit of these registers is set to 1, it enables the interrupt for a specific error. The error bit is always set in the respective DSI\_ISR register. The DSI\_ISR0 and DSI\_ISR1 registers are always cleared after a read operation. The interrupt line is cleared if all registers that caused the interrupt are read.

The interrupt force registers (DSI\_FIR0 and DSI\_FIR1) are used for test purposes, and they allow triggering the interrupt events individually without the need to activate the conditions that trigger the interrupt sources; this is because it is extremely complex to generate the stimuli for that purpose. This feature also facilitates the development and testing of the software associated with the interrupt events. Setting any bit of these registers to 1 triggers the corresponding interrupt.

The light yellow boxes in [Figure 319](#) illustrate the location of some of the errors.

**Figure 319. Error sources**

[Table 254](#) explains the reasons that set off these interrupts and also explains how to recover from these interrupts.

**Table 254. Error causes and recovery**

| DSI Host interrupt and status register | Bit | Name | Cause of the error                                                                                                        | Recommended method of handling the error                                                                                                                                                 |
|----------------------------------------|-----|------|---------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0                                      | 20  | PE4  | The D-PHY reports the LP1 contention error.<br>The D-PHY host detects the contention while trying to drive the line high. | Recover the D-PHY from contention.<br>Reset the DSI Host and transmit the packets again. If this error is recurrent, carefully analyze the connectivity between the Host and the device. |
| 0                                      | 19  | PE3  | D-PHY reports the LP0 contention error.<br>The D-PHY Host detects the contention while trying to drive the line low.      | Recover the D-PHY from contention.<br>Reset the DSI Host and transmit the packets again. If this error is recurrent, carefully analyze the connectivity between the Host and the device. |

Table 254. Error causes and recovery (continued)

| DSI Host interrupt and status register | Bit | Name | Cause of the error                                                                                                                             | Recommended method of handling the error                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------|-----|------|------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0                                      | 18  | PE2  | The D-PHY reports the false control error.<br>The D-PHY detects an incorrect line state sequence in lane 0 lines.                              | Device does not behave as expected, communication with the device is not properly established. This is an unrecoverable error.<br>Reset the DSI Host and the D-PHY. If this error is recurrent, analyze the behavior of the device.                                                                                                                                           |
| 0                                      | 17  | PE1  | The D-PHY reports the LPDT error.<br>The D-PHY detects that the LDPT did not match a multiple of 8 bits.                                       | The data reception is not reliable. The D-PHY recovers but the received data from the device might not be reliable.<br>It is recommended to reset the DSI Host and repeat the RX transmission.                                                                                                                                                                                |
| 0                                      | 16  | PE0  | The D-PHY reports the escape entry error.<br>The D-PHY does not recognize the received escape entry code.                                      | The D-PHY Host does not recognize the escape entry code. The transmission is ignored. The D-PHY Host recovers but the system should repeat the RX reception.                                                                                                                                                                                                                  |
| 0                                      | 15  | AE15 | This error is directly retrieved from acknowledge with error packet.<br>The device detected a protocol violation in the reception.             | Refer to the display documentation. When this error is active, the device should have another read-back command that reports additional information about this error.<br>Read the additional information and take appropriate actions.                                                                                                                                        |
| 0                                      | 14  | AE14 | The acknowledge with error packet contains this error.<br>The device chooses to use this bit for error report.                                 | Refer to the device documentation regarding possible reasons for this error and take appropriate actions.                                                                                                                                                                                                                                                                     |
| 0                                      | 13  | AE13 | The acknowledge with error packet contains this error.<br>The device reports that the transmission length does not match the packet length.    | Possible reason for this is multiple errors present in the packet header (more than 2), so the error detection fails and the device does not discard the packet. In this case, the packet header is corrupt and can cause decoding mismatches.<br>Transmit the packets again. If this error is recurrent, carefully analyze the connectivity between the Host and the device. |
| 0                                      | 12  | AE12 | The acknowledge with error packet contains this error.<br>The device does not recognize the VC ID in at least one of the received packets.     | Possible reason for this is multiple errors present in the packet header (more than 2), so the error detection fails and the device does not discard the packet. In this case, the packet header is corrupt and can cause decoding mismatches.<br>Transmit the packets again. If this error is recurrent, carefully analyze the connectivity between the Host and the device. |
| 0                                      | 11  | AE11 | The acknowledge with error packet contains this error.<br>The device does not recognize the data type of at least one of the received packets. | Check the device capabilities. It is possible that there are some packets not supported by the device.<br>Repeat the transmission.                                                                                                                                                                                                                                            |

Table 254. Error causes and recovery (continued)

| DSI Host interrupt and status register | Bit | Name | Cause of the error                                                                                                                                  | Recommended method of handling the error                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------|-----|------|-----------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0                                      | 10  | AE10 | The acknowledge with error packet contains this error. The device detects the CRC errors in at least one of the received packets.                   | Some of the long packets, transmitted after the last acknowledge request, might contain the CRC errors in the payload. If the payload content is critical, transmit the packets again. If this error is recurrent, carefully analyze the connectivity between the Host and the device.                                                                                                                                                      |
| 0                                      | 9   | AE9  | The acknowledge with error packet contains this error. The device detects multi-bit ECC errors in at least one of the received packets.             | The device does not interpret the packets transmitted after the last acknowledge request. If the packets are critical, transmit the packets again. If this error is recurrent, carefully analyze the connectivity between the Host and the device.                                                                                                                                                                                          |
| 0                                      | 8   | AE8  | The acknowledge with error packet contains this error. The device detects and corrects the 1 bit ECC error in at least one of the received packets. | No action is required. The device acknowledges the packet. If this error is recurrent, analyze the signal integrity or the noise conditions of the link.                                                                                                                                                                                                                                                                                    |
| 0                                      | 7   | AE7  | The acknowledge with error packet contains this error. The device detects the line Contention through LP0/LP1 detection.                            | This error might corrupt the low-power data reception and transmission. Ignore the packets and transmit them again. The device recovers automatically. If this error is recurrent, check the device capabilities and the connectivity between the Host and device. Refer to section 7.2.1 of the DSI Specification 1.1.                                                                                                                     |
| 0                                      | 6   | AE6  | The acknowledge with error packet contains this error. The device detects the false control error.                                                  | The device detects one of the following: <ul style="list-style-type: none"> <li>– The LP-10 (LP request) is not followed by the remainder of a valid escape or turnaround sequence.</li> <li>– The LP-01 (HS request) is not followed by a bridge state (LP-00).</li> </ul> The D-PHY communications are corrupted. This error is unrecoverable. Reset the DSI Host and the D-PHY. Refer to the section 7.1.6 of the DSI Specification 1.1. |

Table 254. Error causes and recovery (continued)

| DSI Host interrupt and status register | Bit | Name | Cause of the error                                                                                                                                                    | Recommended method of handling the error                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------|-----|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0                                      | 5   | AE5  | The acknowledge with error packet contains this error.<br>The display timeout counters for a HS reception and LP transmission expire.                                 | It is possible that the Host and device timeout counters are not correctly configured. The device HS_TX timeout should be shorter than the Host HS_RX timeout. Host LP_RX timeout should be longer than the device LP_TX timeout. Check and confirm that the Host configuration is consistent with the device specifications. This error is automatically recovered, although there is no guarantee that all the packets in the transmission or reception are complete. For additional information about this error, see section 7.2.2 of the DSI Specification 1.1. |
| 0                                      | 4   | AE4  | The acknowledge with error packet contains this error.<br>The device reports that the LPDT is not aligned in an 8-bit boundary                                        | There is no guarantee that the device properly receives the packets. Transmit the packets again. For additional information about this error, see section 7.1.5 of the DSI Specification.                                                                                                                                                                                                                                                                                                                                                                            |
| 0                                      | 3   | AE3  | The acknowledge with error packet contains this error.<br>The device does not recognize the escape mode entry command.                                                | The device does not recognize the escape mode entry code.<br>Check the device capability. For additional information about this error, see section 7.1.4 of the DSI Specification.<br>Repeat the transmission to the device.                                                                                                                                                                                                                                                                                                                                         |
| 0                                      | 2   | AE2  | The acknowledge with error packet contains this error.<br>The device detects the HS transmission did not end in an 8-bit boundary when the EoT sequence is detected.  | There is no guarantee that the device properly received the packets. Re-transmission should be performed. Transmit the packets again. For additional information about this error, see section 7.1.3 of the DSI Specification 1.1.                                                                                                                                                                                                                                                                                                                                   |
| 0                                      | 1   | AE1  | The acknowledge with error packet contains this error.<br>The device detects that the SoT leader sequence is corrupted.                                               | The device discards the incoming transmission. Re-transmission should be performed by the Host. For additional information about this error, see section 7.1.2 of the DSI Specification 1.1.                                                                                                                                                                                                                                                                                                                                                                         |
| 0                                      | 0   | AE0  | The acknowledge with error packet contains this error.<br>The device reports that the SoT sequence is received with errors but synchronization can still be achieved. | The device is tolerant to single bit and some multi-bit errors in the SoT sequence but the packet correctness is compromised. If the packet content was important, transmit the packets again. For additional information about this error, see section 7.1.1 of the DSI Specification 1.1.                                                                                                                                                                                                                                                                          |

Table 254. Error causes and recovery (continued)

| DSI Host interrupt and status register | Bit | Name  | Cause of the error                                                                 | Recommended method of handling the error                                                                                                                                                                                                                                                                                       |

| DSI Host interrupt and status register | Bit | Name   | Cause of the error                                                                            | Recommended method of handling the error                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------|-----|--------|-----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1                                      | 5   | PSE    | Host receives a transmission that does not end in the expected by boundaries.                 | The integrity of the received data cannot be guaranteed.<br>Reset the DSI Host and repeat the read procedure.                                                                                                                                                                                                                                                                |
| 1                                      | 4   | CRCE   | Host reports that a received long packet has a CRC error in its payload.                      | The received payload data is corrupted.<br>Reset the DSI Host and repeat the read procedure. If this error is recurrent, check the DSI connectivity link for the noise levels.                                                                                                                                                                                               |
| 1                                      | 3   | ECCME  | Host reports that a received packet contains multiple ECC errors.                             | The received packet is corrupted. The DSI Host ignores all the following packets. The DSI Host should repeat the read procedure.                                                                                                                                                                                                                                             |
| 1                                      | 2   | ECCSE  | Host reports that a received packet contains a single bit error.                              | This error is not critical because the DSI Host can correct the error and properly decode the packet.<br>If this error is recurrent, check the DSI connectivity link for signal integrity and noise levels.                                                                                                                                                                  |
| 1                                      | 1   | TOLPRX | Host reports that the configured timeout counter for the low-power reception has expired.     | Once the configured timeout counter ends, the DSI Host automatically resets the controller side and recovers to normal operation. Packet transmissions happening during this event are lost.<br>If this error is recurrent, check the timer configuration for any issue. This timer should be greater than the maximum low-power transmission generated by the device.       |
| 1                                      | 0   | TOHSTX | Host reports that the configured timeout counter for the high-speed transmission has expired. | Once the configured timeout counter ends, the DSI Host automatically resets the controller side and recovers to normal operation. Packet transmissions happening during this event are lost.<br>If this error is recurrent, check the timer configuration for any issue. This timer should be greater than the maximum high-speed transmission bursts generated by the Host. |
| DSI wrapper                            | 10  | PLLUF  | The PLL of the D-PHY has unlocked.                                                            | This error can be critical.<br>The graphical subsystem shall be reconfigured and restarted.                                                                                                                                                                                                                                                                                  |

## 36.14 Programing procedure

To operate DSI Host, you must be familiar with the MIPI® DSI specification. Every software programmable register is accessible through the APB interface.

### 36.14.1 Programing procedure overview

The programming procedure for video mode or adapted command mode must respect the following order:

1. Configure the RCC (refer to the RCC chapter)
  - Enable clock for DSI and LTDC
  - Configure LTDC PLL, turn it ON and wait for its lock
2. Optionally configure the GPIO (if tearing effect requires GPIO usage for example)
3. Optionally valid the ISR
4. Configure the LTDC (refer to the LTDC chapter)
  - Program the panel timings
  - Enable the relevant layers
5. Turn on the DSI regulator and wait for the regulator ready as described in [Section 36.12.5](#)
6. Configure the DSI PLL, turn it ON and wait for its lock as described in [Section 36.12.4](#)
7. Configure the D-PHY parameters in the DSI Host and the DSI wrapper to define D-PHY configuration and timing as detailed in [Section 36.14.2](#)
8. Configure the DSI Host timings as detailed in [Section 36.14.3](#)
9. Configure the DSI Host flow control and DBI interface as detailed in [Section 36.14.4](#)
10. Configure the DSI Host LTDC interface as detailed in [Section 36.14.5](#)
11. Configure the DSI Host for video mode as detailed in [Section 36.14.6](#) or adapted command mode as detailed in [Section 36.14.7](#)
12. Enable the D-PHY setting the DEN bit of the DSI\_PCTLR
13. Enable the D-PHY clock lane setting the CKEN bit of the DSI\_PCTLR
14. Enable the DSI Host setting the EN bit of the DSI\_CR
15. Enable the DSI wrapper setting the DSIEN bit of the DSI\_WCR
16. Optionally send DCS commands through the APB generic interface to configure the display
17. Enable the LTDC in the LTDC
18. Start the LTDC flow through the DSI wrapper (CR.LTDCEN = 1)

In video mode, the data streaming starts as soon as the LTDC is enabled.

In adapted command mode, the frame buffer update is launched as soon as the CR.LTDCEN bit is set.

### 36.14.2 Configuring the D-PHY parameters

The D-PHY requires a specific configuration prior starting any communications. The configuration parameters are stored either in the DSI Host or the DSI wrapper.

### Configuring the D-PHY parameters in the DSI wrapper

The DSI wrapper can be used to fine tune either timing or physical parameters of the D-PHY. This operation is not required for a standard usage of the D-PHY. All the fields and parameters are described in the register description of the DSI wrapper.

Only one field is mandatory to properly start the D-PHY: the unit interval multiplied by 4 (UIX4) field of the DSI wrapper PHY configuration register 1 (DSI\_WPCR0).

This field defines the bit period in high-speed mode in unit of 0.25 ns, and is used as a timebase for all the timings managed by the D-PHY.

If the link is working at 600 Mbit/s, the unit interval shall be 1.667 ns, that becomes 6.667 ns when multiplied by four. When rounded down, a value of 6 must be written in the UIX4 field of the DSI\_WPCR0 register.

### Configuring the D-PHY parameters in the DSI Host

The DSI Host stores the configuration of D-PHY timing parameters and number of lanes.

The following fields must be configured prior to any startup:

- Number of data lanes in the DSI\_PCONFR register
- Automatic clock lane control (ACR) in the DSI\_CLCR register
- Clock control (DPCC) in the DSI\_CLCR register
- Time for LP/HS and HS/LP transitions for both clock lane and data lanes in DSI\_CLTCR and DSI\_DLTCR registers
- Stop wait time in the DSI\_PCONFR register

### 36.14.3 Configuring the DSI Host timing

All the protocol timing shall be configured in the DSI Host.

#### Clock divider configuration

Two clocks are generated internally

- Timeout clock
- TX escape clock.

The timeout clock is used as the timing unit in the configuration of HS to LP and LP to HS transition error. Its division factor is configured by the timeout clock division (TOCKDIV) field of the DSI Host clock control register (DSI\_CCR).

The TX escape clock is used in low-power transmission. Its division factor is configured by the TX escape clock division (TXECKDIV) field of the DSI Host clock control register (DSI\_CCR) relatively to the lanebyteclock. Its typical value shall be around 20MHz.

#### Timeout configuration

The timings for timeout management as described in [Section 36.8](#) are configured in the DSI Host timeout counter configuration registers (DSI\_TCCR0 to DSI\_TCCR5).

### 36.14.4 Configuring flow control and DBI interface

The flow control is configured thanks to the DSI Host protocol configuration register (DSI\_PCR). The configuration parameters are the following

- CRC reception enable (CRCRXE bit)
- ECC reception enable (ECCRXE bit)
- BTA enable (BTAE bit)
- EoTp reception enable (ETRXE bit)
- EoTp transmission enable (ETTXE bit)

Their values depends on the protocol to be used for the communication with the DSI display.

The virtual channel ID used for the generic DBI interface shall be configured by the virtual channel ID (VCID) field of the DSI Host generic VCID register (DSI\_GVCIDR).

All the DCS command, depending on their type, can be transmitted or received either in high-speed or low-power. For each of them, a dedicated configuration bit shall be programmed in the DSI Host command mode configuration register (DSI\_CMCR).

Acknowledge request for packet or tearing effect event shall also be configured in the DSI Host command mode configuration register (DSI\_CMCR).

### 36.14.5 Configuring the DSI Host LTDC interface

As the DSI Host is interface to the system through the LTDC for video mode or adapted command mode, the DSI wrapper perform a low level interfacing in between.

The parameter programmed into the DSI wrapper must be aligned with the parameters programmed into the LTDC and the DSI Host.

The following fields must be configured:

- Virtual channel ID in the virtual channel ID (VCID) field of the DSI Host LTDC VCID register (DSI\_LVCIDR).
- Color coding (COLC) field of the DSI Host LTDC color coding register (DSI\_LCOLCR) and the color multiplexing (COLMUX) in the DSI wrapper configuration register (DSI\_WCFGR).
- If loose packets are used for 18-bit mode, the loosely packet enable (LPE) bit of the DSI Host LTDC color coding register (DSI\_LCOLCR) must be set.
- The HSYNC polarity in the HSync polarity (HSP) bit of the DSI Host LTDC polarity configuration register (DSI\_LPCR).
- The VSYNC polarity in the VSync polarity (VSP) bit of the DSI Host LTDC polarity configuration register (DSI\_LPCR) and in the VSync polarity (VSPOL) bit of the DSI wrapper configuration register (DSI\_WCFGR).
- The DATA ENABLE polarity data enable polarity (DEP) bit of the DSI Host LTDC polarity configuration register (DSI\_LPCR).

### 36.14.6 Configuring the video mode

The video mode configuration shall defines the behavior of the controller in low-power for command transmission, the type of video transmission (burst or non-burst mode) and the panel horizontal and vertical timing:

- Select the video transmission mode to define how the processor requires the video line to be transported through the DSI link.
  - Configure the low-power transitions in the DSI\_VMCR to define the video periods which are permitted to go to low-power if there is time available to do so.
  - Configure if the controller should request the peripheral acknowledge message at the end of frames (DSI\_VMCR.FBTAAE).
  - Configure if commands are to be transmitted in low-power (DSI\_VMCR.LPE).
- Select the video mode type
  - Burst mode:
 

Configure the video mode type (DSI\_VMCR.VMT) with value 2'b1x.

Configure the video packet size (DSI\_VPCR.VPSIZE) with the size of the active line period, measured in pixels.

The registers DSI\_VCCR and DSI\_VNPCR are ignored by the DSI Host.
  - Non-burst mode:
 

Configure the video mode type (DSI\_VMCR.VMT) with 2'b00 to enable the transmission of sync pulses or with 2'b01 to enable the transmission of sync events.

Configure the video packet size (DSI\_VPCR.VPSIZE) with the number of pixels to be transmitted in a single packet. Selecting this value depends on the available memory of the attached peripheral, if the data is first stored, or on the memory you want to select for the FIFO in DSI Host.

Configure the number of chunks (DSI\_VCCR.NUMC) with the number of packets to be transmitted per video line. The value of VPSIZE \* NUMC is the number of pixels per line of video, except if NUMC is 0, which disables the multi-packets. If you set it to 1, there is still only one packet per line, but it can be part of a chunk, followed by a null packet.

Configure the null packet size (DSI\_VNPCR.NPSIZE) with the size of null packets to be inserted as part of the chunks. Setting it to 0 disables null packets.
- Define the video horizontal timing configuration as follows:
  - Configure the horizontal line time (DSI\_VLCR.HLINE) with the time taken by a LTDC video line measured in cycles of lane byte clock (for a clock lane at 500 MHz the lane byte clock period is 8 ns). When the periods of LTDC clock and lane byte clock are not multiples, the value to program the DSI\_VLCR.HLINE needs to be rounded. A timing mismatch is introduced between the lines due to the rounding of configuration values. If the DSI Host is configured not to go to low-power, this timing divergence accumulates on every line, introducing a significant amount of mismatch towards the end of the frame. The reason for this is that the DSI Host cannot re-synchronize on every new line because it transmits the blanking packets when the horizontal sync event occurs on the LTDC interface. However, the accumulated mismatch should become extinct on the last line of a frame, where, according to the DSI specification, the link should always return to low-power regaining synchronization, when a new frame starts on a vertical sync event. If the accumulated timing mismatch is greater than the time in low-power on the last

- line, a malfunction occurs. This phenomenon can be avoided by configuring the DSI Host to go to low-power once per line.
- Configure the horizontal sync duration (DSI\_VHSACR.HSA) with the time taken by a LTDC horizontal sync active period measured in cycles of lane byte clock (normally a period of 8 ns).
  - Configure the horizontal back-porch duration (DSI\_VHBPCR.HBP) with the time taken by the LTDC horizontal back-porch period measured in cycles of lane byte clock (normally a period of 8 ns). Special attention should be given to the calculation of this parameter.
  - Define the vertical line configuration:
    - Configure the vertical sync duration (DSI\_VVSACR.VSA) with the number of lines existing in the LTDC vertical sync active period.
    - Configure the vertical back-porch duration (DSI\_VVBPCR.VBP) with the number of lines existing in the LTDC vertical back-porch period.
    - Configure the vertical front-porch duration (DSI\_VVFPCR.VFP) with the number of lines existing in the LTDC vertical front-porch period.
    - Configure the vertical active duration (DSI\_VVACR.VA) with the number of lines existing in the LTDC vertical active period.

*Figure 320* illustrates the steps for configuring the DPI packet transmission.

Figure 320. Video packet transmission configuration flow diagram

### Example of video configuration

The following is an example of video packet transmission configuration:

Video resolution:

- PCLK period = 50 ns
- HSA = 8 PCLK
- HBP = 8 PCLK
- HACT = 480 PCLK
- HFP = 24 PCLK
- VSA = 2 lines
- VBP = 2 lines
- VACT = 640 lines
- VFP = 4 lines

Configuration steps:

- Video transmission mode configuration:
  - a) Configure the low-power transitions:  
 $\text{DSI\_VMCR}[13:8] = 6'b111111$ , to enable LP in all video period.
  - b)  $\text{DSI\_VMCR.FBTAAE} = 1$ , for the DSI Host to request an acknowledge response message from the peripheral at the end of each frame.
- To use the burst mode, follow these steps:  
 $\text{DSI\_VMCR.VMT} = 2'b1x$   
 $\text{DSI\_VPCR.VPSIZE} = 480$
- Horizontal timing configuration:
  - $\text{DSI\_VLCR.HLINE} = (\text{HSA} + \text{HBP} + \text{HACT} + \text{HFP}) * (\text{PCLK period} / \text{Clk lane byte period}) = (8 + 8 + 480 + 24) * (50 / 8) = 3250$
  - $\text{DSI\_VHSACR.HSA} = \text{HSA} * (\text{PCLK period} / \text{Clk lane byte period}) = 8 * (50 / 8) = 50$
  - $\text{DSI\_VHBPCR.HBP} = \text{HBP} * (\text{PCLK period} / \text{Clk lane byte period}) = 8 * (50 / 8) = 50$
- Vertical line configuration:
  - $\text{DSI\_VVSACR.VSA} = 2$
  - $\text{DSI\_VVBPCR.VBP} = 2$
  - $\text{DSI\_VVFPCR.VFP} = 4$
  - $\text{DSI\_VVACR.VA} = 640$

### 36.14.7 Configuring the adapted command mode

The adapted command mode requires the following parameters to be configured:

- Command size (CMD\_SIZE) field of the DSI Host LTDC command configuration register (DSI\_LCCR) to define the maximum allowed size for a write memory command.
- The tearing effect source (TESRC) and optionally tearing effect polarity (TEPOL) bits of the DSI wrapper configuration register (DSI\_WCFGR).
- The automatic refresh (AR) bit of the DSI wrapper configuration register (DSI\_WCFGR) if the display needs to be updated automatically each time a tearing effect event is received.

### 36.14.8 Configuring the video mode pattern generator

DSI Host can transmit a color bar pattern without horizontal/vertical color bar and D-PHY BER testing pattern without any kind of stimuli.

*Figure 321* shows the programming sequence to send a test pattern:

1. Configure the DSI\_MCR register to enable video mode. Configure the video mode type using DSI\_VMCR.VMT.
2. Configure the DSI\_LCOLCR register.
3. Configure the frame using registers shown in *Figure 322*, where the gray area indicated the transferred pixels).
4. Configure the pattern generation mode (DSI\_VMCR.PGM) and the pattern orientation (DSI\_VMCR.PGO), and enable it (DSI\_VMCR.PGE).

**Figure 321. Programming sequence to send a test pattern**

Figure 322. Frame configuration registers

Note: The number of pixels of payload is restricted to a multiple of a value provided in [Table 245](#).

### 36.14.9 Managing ULPM

There are two ways to configure the software to enter and exit the ULPM:

- Enter and exit the ULPM with the D-PHY PLL running. This is a faster process.
- Enter and exit the ULPM with the D-PHY PLL turned off. This is a more efficient process in terms of power consumption.

#### Clock management for ULPM sequence

The ULPM management state machine is working on the lanebytclock provided by the D-PHY.

Because the D-PHY is providing the lanebytclock only when the clock lane is not in ULPM state, it is mandatory to switch the lanebytclock source of the DSI Host before starting the ULPM mode entry sequence.

The lanebytclock source is controlled by the RCC. It can be

- the lanebytclock provided by the D-PHY (for all modes except ULPM)
- a clock generated by the system PLL (for ULPM)

#### Process flow to enter the ULPM

Implement the process described in detail in the following procedure to enter the ULPM on both clock lane and data lanes:

1. Verify the initial status of the DSI Host:
  - DSI\_PCTLR[2:1] = 2'h3
  - DSI\_WRPCR.PLEN = 1'h1 and DSI\_WRPCR.REGEN = 1'h1
  - DSI\_PUCR[3:0] = 4'h0
  - DSI\_PTTTCR[3:0] = 4'h0
  - Verify that all active lanes are in Stop state and the D-PHY PLL is locked:  
 One-lane configuration: DSI\_PSR[6:4] = 3'h3 and DSI\_PSR[1] = 1'h0 and DSI\_WISR.PLLS = 1'h1  
 Two-lanes configuration: DSI\_PSR[8:4] = 5'h1B and DSI\_PSR[1] = 1'h0 and DSI\_WISR.PLLS = 1'h1
2. Switch the lanebytclock source in the RCC from D-PHY to system PLL
3. Set DSI\_PUCR[3:0] = 4'h5 to enter ULPM in the data and the clock lanes.
4. Wait until the D-PHY active lanes enter into ULPM:
  - One-lane configuration: DSI\_PSR[6:1] = 6'h00
  - Two-lanes configuration: DSI\_PSR[8:1] = 8'h00

The DSI Host is now in ULPM.
5. Turn off the D-PHY PLL by setting DSI\_WRPCR.PLEN = 1'b0

**Process flow to exit the ULPM**

Implement the process flow described in the following procedure to exit the ULPM on both clock lane and data lanes:

1. Verify that all active lanes are in ULPM:
  - One-lane configuration: DSI\_PSR[6:1] = 6'h00
  - Two-lanes configuration: DSI\_PSR[8:1] = 8'h00
2. Turn on the D-PHY PLL by setting DSI\_WRPCR.PLLEN = 1'b1.
3. Wait until D-PHY PLL locked
  - DSI\_WISR.PLLS = 1'b1
4. Without de-asserting the ULPM request bits, assert the exit ULPM bits by setting DSI\_PUCR[3:0] = 4'hF.
5. Wait until all active lanes exit ULPM:
  - One-lane configuration:  
DSI\_PSR[5] = 1'b1  
DSI\_PSR[3] = 1'b1
  - Two-lanes configuration:  
DSI\_PSR[8] = 1'b1  
DSI\_PSR[5] = 1'b1  
DSI\_PSR[3] = 1'b1
6. Wait for 1 ms.
7. De-assert the ULPM requests and the ULPM exit bits by setting DSI\_PUCR [3:0] = 4'h0.
8. Switch the lanbyteclock source in the RCC from system PLL to D-PHY
9. The DSI Host is now in Stop state and the D-PHY PLL is locked:
  - One-lane configuration:  
DSI\_PSR[6:4] = 3'h3  
DSI\_PSR[1] = 1'h0  
DSI\_WRPCR.PLLEN = 1'b1
  - Two-lanes configuration:  
DSI\_PSR[8:4] = 5'h1B  
DSI\_PSR[1] = 1'h0  
DSI\_WRPCR.PLLEN = 1'b1

## 36.15 DSI Host registers

### 36.15.1 DSI Host version register (DSI\_VR)

Address offset: 0x0000

Reset value: 0x3133 312A

|                |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31             | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| VERSION[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r              | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15             | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| VERSION[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r              | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **VERSION[31:0]**: Version of the DSI Host

This read-only register contains the version of the DSI Host

### 36.15.2 DSI Host control register (DSI\_CR)

Address offset: 0x0004

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | EN   |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      | rw   |

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **EN**: Enable

This bit configures the DSI Host in either power-up mode or to reset.

0: DSI Host is disabled (under reset).

1: DSI Host is enabled.

### 36.15.3 DSI Host clock control register (DSI\_CCR)

Address offset: 0x0008

Reset value: 0x0000 0000

|              |      |      |      |      |      |      |      |               |      |      |      |      |      |      |      |
|--------------|------|------|------|------|------|------|------|---------------|------|------|------|------|------|------|------|
| 31           | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23            | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res.         | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.          | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|              |      |      |      |      |      |      |      |               |      |      |      |      |      |      |      |
| 15           | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7             | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| TOCKDIV[7:0] |      |      |      |      |      |      |      | TXECKDIV[7:0] |      |      |      |      |      |      |      |
| rw           | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw            | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **TOCKDIV[7:0]**: Timeout clock division

This field indicates the division factor for the timeout clock used as the timing unit in the configuration of HS to LP and LP to HS transition error.

Bits 7:0 **TXECKDIV[7:0]**: TX escape clock division

This field indicates the division factor for the TX escape clock source (lanebyteclk). The values 0 and 1 stop the TX\_ESC clock generation.

### 36.15.4 DSI Host LTDC VCID register (DSI\_LVCIDR)

Address offset: 0x000C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |           |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|-----------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17        | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.      | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |           |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1         | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | VCID[1:0] |      |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      | rw        | rw   |

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **VCID[1:0]**: Virtual channel ID

These bits configure the virtual channel ID for the LTDC interface traffic.

### 36.15.5 DSI Host LTDC color coding register (DSI\_LCOLCR)

Address offset: 0x0010

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |           |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|-----------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19        | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.      | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |           |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3         | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | LPE  | Res. | Res. | Res. | Res. | COLC[3:0] |      |      |      |
|      |      |      |      |      |      |      | rw   |      |      |      |      | rw        | rw   | rw   | rw   |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **LPE**: Loosely packet enable

This bit enables the loosely packed variant to 18-bit configuration

0: Loosely packet variant disabled

1: Loosely packet variant enabled

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **COLC[3:0]**: Color coding

This field configures the DPI color coding

0000: 16-bit configuration 1

0001: 16-bit configuration 2

0010: 16-bit configuration 3

0011: 18-bit configuration 1

0100: 18-bit configuration 2

0101: 24-bit

Others: Reserved

### 36.15.6 DSI Host LTDC polarity configuration register (DSI\_LPCR)

Address offset: 0x0014

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | HSP  | VSP  | DEP  |
|      |      |      |      |      |      |      |      |      |      |      |      |      | rw   | rw   | rw   |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **HSP**: HSYNC polarity

This bit configures the polarity of HSYNC pin.

0: HSYNC pin active high (default).

1: VSYNC pin active low.

Bit 1 **VSP**: VSYNC polarity

This bit configures the polarity of VSYNC pin.

0: Shutdown pin active high (default).

1: Shutdown pin active low.

Bit 0 **DEP**: Data enable polarity

This bit configures the polarity of data enable pin.

0: Data enable pin active high (default).

1: Data enable pin active low.

### 36.15.7 DSI Host low-power mode configuration register (DSI\_LPMCR)

Address offset: 0x0018

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |              |    |    |    |    |    |    |    |
|------|------|------|------|------|------|------|------|--------------|----|----|----|----|----|----|----|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23           | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | LPSIZE[7:0]  |    |    |    |    |    |    |    |
|      |      |      |      |      |      |      |      | rw           | rw | rw | rw | rw | rw | rw | rw |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7            | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | VLPSIZE[7:0] |    |    |    |    |    |    |    |
|      |      |      |      |      |      |      |      | rw           | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **LPSIZE[7:0]**: Largest packet size

This field is used for the transmission of commands in low-power mode. It defines the size, in bytes, of the largest packet that can fit in a line during VSA, VBP and VFP regions.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **VLPSIZE[7:0]**: VACT largest packet size

This field is used for the transmission of commands in low-power mode. It defines the size, in bytes, of the largest packet that can fit in a line during VACT regions.

### 36.15.8 DSI Host protocol configuration register (DSI\_PCR)

Address offset: 0x002C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |        |        |      |       |       |
|------|------|------|------|------|------|------|------|------|------|------|--------|--------|------|-------|-------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20     | 19     | 18   | 17    | 16    |

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4      | 3      | 2    | 1     | 0     |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CRCRXE | ECCRXE | BTAE | ETRXE | ETTXE |
|      |      |      |      |      |      |      |      |      |      |      | rw     | rw     | rw   | rw    | rw    |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CRCRXE**: CRC reception enable

This bit enables the CRC reception and error reporting.

0: CRC reception is disabled.

1: CRC reception is enabled.

Bit 3 **ECCRXE**: ECC reception enable

This bit enables the ECC reception, error correction, and reporting.

0: ECC reception is disabled.

1: ECC reception is enabled.

Bit 2 **BTAE**: Bus-turn-around enable

This bit enables the bus-turn-around (BTA) request.

0: Bus-turn-around request is disabled.

1: Bus-turn-around request is enabled.

Bit 1 **ETRXE**: EoTp reception enable

This bit enables the EoTp reception.

0: EoTp reception is disabled.

1: EoTp reception is enabled.

Bit 0 **ETTXE**: EoTp transmission enable

This bit enables the EoTP transmission.

0: EoTp transmission is disabled.

1: EoTp transmission is enabled.

### 36.15.9 DSI Host generic VCID register (DSI\_GVCIDR)

Address offset: 0x0030

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |           |      |

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **CMDM**: Command mode

This bit configures the DSI Host in either video or command mode.

0: DSI Host is configured in video mode.

1: DSI Host is configured in command mode.

### 36.15.11 DSI Host video mode configuration register (DSI\_VMCR)

Address offset: 0x0038

Reset value: 0x0000 0000

| LPCE | FBTAAE | LPHFPE | LPHBPE | LPVAE | LPVFPE | LPVBPE | LPVSAE | Res. | Res. | Res. | Res. | Res. | Res. | VMT[1:0] |     |
| rw   | rw     | rw     | rw     | rw    | rw     | rw     | rw     |      |      |      |      |      |      | rw       | rw  |

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **PGO**: Pattern generator orientation

This bit configures the color bar orientation.

0: Vertical color bars.

1: Horizontal color bars.

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **PGM**: Pattern generator mode

This bit configures the pattern generator mode.

0: Color bars (horizontal or vertical).

1: BER pattern (vertical only).

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **PGE**: Pattern generator enable

This bit enables the video mode pattern generator.

0: Pattern generator is disabled.

1: Pattern generator is enabled.

Bit 15 **LPCE**: Low-power command enable

This bit enables the command transmission only in low-power mode.

0: Command transmission in low-power mode is disabled.

1: Command transmission in low-power mode is enabled.

Bit 14 **FBTAAE**: Frame bus-turn-around acknowledge enable

This bit enables the request for an acknowledge response at the end of a frame.

0: Acknowledge response at the end of a frame is disabled.

1: Acknowledge response at the end of a frame is enabled.

Bit 13 **LPHFPE**: Low-power horizontal front-porch enable

This bit enables the return to low-power inside the horizontal front-porch (HFP) period when timing allows.

0: Return to low-power inside the HFP period is disabled.

1: Return to low-power inside the HFP period is enabled.

Bit 12 **LPHBPE**: Low-power horizontal back-porch enable

This bit enables the return to low-power inside the horizontal back-porch (HBP) period when timing allows.

0: Return to low-power inside the HBP period is disabled.

1: Return to low-power inside the HBP period is enabled.

Bit 11 **LPVAE**: Low-power vertical active enable

This bit enables to return to low-power inside the vertical active (VACT) period when timing allows.

0: Return to low-power inside the VACT is disabled.

1: Return to low-power inside the VACT is enabled.

Bit 10 **LPVFPE**: Low-power vertical front-porch enable

This bit enables to return to low-power inside the vertical front-porch (VFP) period when timing allows.

0: Return to low-power inside the VFP is disabled.

1: Return to low-power inside the VFP is enabled.

Bit 9 **LPVBPE**: Low-power vertical back-porch enable

This bit enables to return to low-power inside the vertical back-porch (VBP) period when timing allows.

0: Return to low-power inside the VBP is disabled.

1: Return to low-power inside the VBP is enabled.

Bit 8 **LPVSAE**: Low-power vertical sync active enable

This bit enables to return to low-power inside the vertical sync time (VSA) period when timing allows.

0: Return to low-power inside the VSA is disabled.

1: Return to low-power inside the VSA is enabled

Bits 7:2 Reserved, must be kept at reset value.

Bits 1:0 **VMT[1:0]**: Video mode type

This field configures the video mode transmission type :

00: Non-burst with sync pulses.

01: Non-burst with sync events.

1x: Burst mode

### 36.15.12 DSI Host video packet configuration register (DSI\_VPCR)

Address offset: 0x003C

Reset value: 0x0000 0000

|      |      |              |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|--------------|------|------|------|------|------|------|------|------|------|------|------|------|------|

| Res. | Res. | VPSIZE[13:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |
|      |      | rw           | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:0 **VPSIZE[13:0]**: Video packet size

This field configures the number of pixels in a single video packet.

For 18-bit not loosely packed data types, this number must be a multiple of 4.

For YCbCr data types, it must be a multiple of 2 as described in the DSI specification.

### 36.15.13 DSI Host video chunks configuration register (DSI\_VCCR)

Address offset: 0x0040

Reset value: 0x0000 0000

|      |      |      |            |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28         | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res.       | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |            |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12         | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | NUMC[12:0] |      |      |      |      |      |      |      |      |      |      |      |      |
|      |      |      | rw         | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:0 **NUMC[12:0]**: Number of chunks

This register configures the number of chunks to be transmitted during a line period (a chunk consists of a video packet and a null packet).

If set to 0 or 1, the video line is transmitted in a single packet.

If set to 1, the packet is part of a chunk, so a null packet follows it if NPSIZE > 0.

Otherwise, multiple chunks are used to transmit each video line.

### 36.15.14 DSI Host video null packet configuration register (DSI\_VNPCR)

Address offset: 0x0044

Reset value: 0x0000 0000

|      |      |      |              |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|--------------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28           | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res.         | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |              |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12           | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | NPSIZE[12:0] |      |      |      |      |      |      |      |      |      |      |      |      |
|      |      |      | rw           | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:0 **NPSIZE[12:0]**: Null packet size

This field configures the number of bytes inside a null packet.

Setting to 0 disables the null packets.

### 36.15.15 DSI Host video HSA configuration register (DSI\_VHSACR)

Address offset: 0x0048

Reset value: 0x0000 0000

|      |      |      |      |           |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|-----------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27        | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res.      | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **MRDPS**: Maximum read packet size

This bit configures the maximum read packet size command transmission type:

0: High-speed.

1: Low-power.

Bits 23:20 Reserved, must be kept at reset value.

Bit 19 **DLWTX**: DCS long write transmission

This bit configures the DCS long write packet command transmission type:

0: High-speed.

1: Low-power.

Bit 18 **DSR0TX**: DCS short read zero parameter transmission

This bit configures the DCS short read packet with zero parameter command transmission type:

0: High-speed.

1: Low-power.

Bit 17 **DSW1TX**: DCS short read one parameter transmission

This bit configures the DCS short read packet with one parameter command transmission type:

0: High-speed.

1: Low-power.

Bit 16 **DSW0TX**: DCS short write zero parameter transmission

This bit configures the DCS short write packet with zero parameter command transmission type:

0: High-speed.

1: Low-power.

Bit 15 Reserved, must be kept at reset value.

Bit 14 **GLWTX**: Generic long write transmission

This bit configures the generic long write packet command transmission type :

0: High-speed.

1: Low-power.

Bit 13 **GSR2TX**: Generic short read two parameters transmission

This bit configures the generic short read packet with two parameters command transmission type:

0: High-speed.

1: Low-power.

- Bit 12 **GSR1TX**: Generic short read one parameters transmission  
This bit configures the generic short read packet with one parameters command transmission type:  
0: High-speed.  
1: Low-power.
- Bit 11 **GSR0TX**: Generic short read zero parameters transmission  
This bit configures the generic short read packet with zero parameters command transmission type:  
0: High-speed.  
1: Low-power.
- Bit 10 **GSW2TX**: Generic short write two parameters transmission  
This bit configures the generic short write packet with two parameters command transmission type:  
0: High-speed.  
1: Low-power.
- Bit 9 **GSW1TX**: Generic short write one parameters transmission  
This bit configures the generic short write packet with one parameters command transmission type:  
0: High-speed.  
1: Low-power.
- Bit 8 **GSW0TX**: Generic short write zero parameters transmission  
This bit configures the generic short write packet with zero parameters command transmission type:  
0: High-speed.  
1: Low-power.
- Bits 7:2 Reserved, must be kept at reset value.
- Bit 1 **ARE**: Acknowledge request enable  
This bit enables the acknowledge request after each packet transmission:  
0: Acknowledge request is disabled.  
1: Acknowledge request is enabled.
- Bit 0 **TEARE**: Tearing effect acknowledge request enable  
This bit enables the tearing effect acknowledge request:  
0: Tearing effect acknowledge request is disabled.  
1: Tearing effect acknowledge request is enabled.

### 36.15.24 DSI Host generic header configuration register (DSI\_GHCR)

Address offset: 0x006C

Reset value: 0x0000 0000

|            |      |      |      |      |      |      |      |            |    |         |    |    |    |    |    |

| rw         | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw         | rw | rw      | rw | rw | rw | rw | rw |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **WCMSB[7:0]**: WordCount MSB

This field configures the most significant byte of the header packet's word count for long packets, or data 1 for short packets.

Bits 15:8 **WCLSB[7:0]**: WordCount LSB

This field configures the less significant byte of the header packet word count for long packets, or data 0 for short packets.

Bits 7:6 **VCID[1:0]**: Channel

This field configures the virtual channel ID of the header packet.

Bits 5:0 **DT[5:0]**: Type

This field configures the packet data type of the header packet.

### 36.15.25 DSI Host generic payload data register (DSI\_GPDR)

Address offset: 0x0070

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |            |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23         | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DATA4[7:0] |    |    |    |    |    |    |    | DATA3[7:0] |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw         | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7          | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| DATA2[7:0] |    |    |    |    |    |    |    | DATA1[7:0] |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw         | rw | rw | rw | rw | rw | rw | rw |

Bits 31:24 **DATA4[7:0]**: Payload byte 4

This field indicates the byte 4 of the packet payload.

Bits 23:16 **DATA3[7:0]**: Payload byte 3

This field indicates the byte 3 of the packet payload.

Bits 15:8 **DATA2[7:0]**: Payload byte 2

This field indicates the byte 2 of the packet payload.

Bits 7:0 **DATA1[7:0]**: Payload byte 1

This field indicates the byte 1 of the packet payload.

### 36.15.26 DSI Host generic packet status register (DSI\_GPSR)

Address offset: 0x0074

Reset value: 0x0000 0015

|      |      |      |      |      |      |      |      |      |      |       |       |       |       |       |       |

|      |      |      |      |      |      |      |      |      | r    | r     | r     | r     | r     | r     | r     |

Bits 31:7 Reserved, must be kept at reset value.

**Bit 6 RCB:** Read command busy

This bit is set when a read command is issued and cleared when the entire response is stored in the FIFO:

- 0: No read command on going.
- 1: Read command on going.

**Bit 5 PRDFF:** Payload read FIFO full

This bit indicates the full status of the generic read payload FIFO:

- 0: Read payload FIFO not full.
- 1: Read payload FIFO full.

**Bit 4 PRDFE:** Payload read FIFO empty

This bit indicates the empty status of the generic read payload FIFO:

- 0: Read payload FIFO not empty.
- 1: Read payload FIFO empty.

**Bit 3 PWRFF:** Payload write FIFO full

This bit indicates the full status of the generic write payload FIFO:

- 0: Write payload FIFO not full.
- 1: Write payload FIFO full.

**Bit 2 PWRFE:** Payload write FIFO empty

This bit indicates the empty status of the generic write payload FIFO:

- 0: Write payload FIFO not empty.
- 1: Write payload FIFO empty.

**Bit 1 CMDFF:** Command FIFO full

This bit indicates the full status of the generic command FIFO:

- 0: Write payload FIFO not full.
- 1: Write payload FIFO full.

**Bit 0 CMDFE:** Command FIFO empty

This bit indicates the empty status of the generic command FIFO:

- 0: Write payload FIFO not empty.
- 1: Write payload FIFO empty.

**36.15.27 DSI Host timeout counter configuration register 0 (DSI\_TCCR0)**

Address offset: 0x0078

| rW               | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 31:16 **HSTX\_TOCNT[15:0]**: High-speed transmission timeout counter

This field configures the timeout counter that triggers a high-speed transmission timeout contention detection (measured in TOCKDIV cycles).

If using the non-burst mode and there is no sufficient time to switch from high-speed to low-power and back in the period which is from one line data finishing to the next line sync start, the DSI link returns the low-power state once per frame, then you should configure the TOCKDIV and HSTX\_TOCNT to be in accordance with:

$\text{HSTX\_TOCNT} * \text{lanebyteclkperiod} * \text{TOCKDIV} \geq \text{the time of one FRAME data transmission} * (1 + 10\%)$

In burst mode, RGB pixel packets are time-compressed, leaving more time during a scan line. Therefore, if in burst mode and there is sufficient time to switch from high-speed to low-power and back in the period of time from one line data finishing to the next line sync start, the DSI link can return low-power mode and back in this time interval to save power. For this, configure the TOCKDIV and HSTX\_TOCNT to be in accordance with:

$\text{HSTX\_TOCNT} * \text{lanebyteclkperiod} * \text{TOCKDIV} \geq \text{the time of one LINE data transmission} * (1 + 10\%)$

Bits 15:0 **LPRX\_TOCNT[15:0]**: Low-power reception timeout counter

This field configures the timeout counter that triggers a low-power reception timeout contention detection (measured in TOCKDIV cycles).

|                  |      |      |      |      |      |      | rW |      |      |      |      |      |      |      |      |
| 15               | 14   | 13   | 12   | 11   | 10   | 9    | 8  | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| HSWR_TOCNT[15:0] |      |      |      |      |      |      |    |      |      |      |      |      |      |      |      |
| rW               | rW   | rW   | rW   | rW   | rW   | rW   | rW | rW   | rW   | rW   | rW   | rW   | rW   | rW   | rW   |

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **PM**: Presp mode

When set to 1, this bit ensures that the peripheral response timeout caused by HSWR\_TOCNT is used only once per LTDC frame in command mode, when both the following conditions are met:

- dpivsync\_edpiwms has risen and fallen.
- Packets originated from LTDC in command mode have been transmitted and its FIFO is empty again.

In this scenario no non-LTDC command requests are sent to the D-PHY, even if there is traffic from generic interface ready to be sent, making it return to stop state. When it does so, PRES\_PTO counter is activated and only when it finishes does the controller send any other traffic that is ready.

Bits 23:16 Reserved, must be kept at reset value.

Bits 15:0 **HSWR\_TOCNT[15:0]**: High-speed write timeout counter

This field sets a period for which the DSI Host keeps the link inactive after sending a high-speed write operation. This period is measured in cycles of lanebyteclk. The counting starts when the D-PHY enters the Stop state and causes no interrupts.

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:16 **HS2LP\_TIME[9:0]**: High-speed to low-power time

This field configures the maximum time that the D-PHY clock lane takes to go from high-speed to low-power transmission measured in lane byte clock cycles.

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:0 **LP2HS\_TIME[9:0]**: Low-power to high-speed time

This field configures the maximum time that the D-PHY clock lane takes to go from low-power to high-speed transmission measured in lane byte clock cycles.

### 36.15.35 DSI Host data lane timer configuration register (DSI\_DLTCCR)

Address offset: 0x009C

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      | rw   | rw   |      |

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CKE**: Clock enable

This bit enables the D-PHY clock lane module:

0: D-PHY clock lane module is disabled.

1: D-PHY clock lane module is enabled.

Bit 1 **DEN**: Digital enable

When set to 0, this bit places the digital section of the D-PHY in the reset state

0: The digital section of the D-PHY is in the reset state.

1: The digital section of the D-PHY is enabled.

Bit 0 Reserved, must be kept at reset value.

### 36.15.37 DSI Host PHY configuration register (DSI\_PCONFR)

Address offset: 0x00A4

Reset value: 0x0000 0001

|              |      |      |      |      |      |      |      |      |      |      |      |      |      |         |      |
|--------------|------|------|------|------|------|------|------|------|------|------|------|------|------|---------|------|
| 31           | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17      | 16   |

| SW_TIME[7:0] |      |      |      |      |      |      |      | Res. | Res. | Res. | Res. | Res. | Res. | NL[1:0] |      |
| rw           | rw   | rw   | rw   | rw   | rw   | rw   | rw   |      |      |      |      |      |      | rw      | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **SW\_TIME[7:0]**: Stop wait time

This field configures the minimum wait period to request a high-speed transmission after the Stop state.

Bits 7:2 Reserved, must be kept at reset value.

Bits 1:0 **NL[1:0]**: Number of lanes

This field configures the number of active data lanes:

00: One data lane (lane 0)

01: Two data lanes (lanes 0 and 1) - Reset value

Others: Reserved

### 36.15.38 DSI Host PHY ULPS control register (DSI\_PUCR)

Address offset: 0x00A8

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **UEDL**: ULPS exit on data lane

ULPS mode exit on all active data lanes.

0: No exit request

1: Exit ULPS mode on all active data lane URDL

Bit 2 **URDL**: ULPS request on data lane

ULPS mode request on all active data lanes.

0: No ULPS request

1: Request ULPS mode on all active data lane UECL

Bit 1 **UECL**: ULPS exit on clock lane

ULPS mode exit on clock lane.

0: No exit request

1: Exit ULPS mode on clock lane

Bit 0 **URCL**: ULPS request on clock lane

ULPS mode request on clock lane.

0: No ULPS request

1: Request ULPS mode on clock lane

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **UAN1**: ULPS active not lane 1

This bit indicates the status of ulpsactivenot1lane D-PHY signal.

Bit 7 **PSS1**: PHY stop state lane 1

This bit indicates the status of phystopstate1lane D-PHY signal.

Bit 6 **RUE0**: RX ULPS escape lane 0

This bit indicates the status of rxulpsesc0lane D-PHY signal.

Bit 5 **UAN0**: ULPS active not lane 0

This bit indicates the status of ulpsactivenot0lane D-PHY signal.

Bit 4 **PSS0**: PHY stop state lane 0

This bit indicates the status of phystopstate0lane D-PHY signal.

Bit 3 **UANC**: ULPS active not clock lane

This bit indicates the status of ulpsactivenotclk D-PHY signal.

Bit 2 **PSSC**: PHY stop state clock lane

This bit indicates the status of phystopstatecklane D-PHY signal.

Bit 1 **PD**: PHY direction

This bit indicates the status of phydirection D-PHY signal.

Bit 0 Reserved, must be kept at reset value.

### 36.15.41 DSI Host interrupt and status register 0 (DSI\_ISR0)

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **PE4**: PHY error 4

This bit indicates the LP1 contention error ErrContentionLP1 from lane 0.

Bit 19 **PE3**: PHY error 3

This bit indicates the LP0 contention error ErrContentionLP0 from lane 0.

Bit 18 **PE2**: PHY error 2

This bit indicates the ErrControl error from lane 0.

Bit 17 **PE1**: PHY error 1

This bit indicates the ErrSyncEsc low-power transmission synchronization error from lane 0.

Bit 16 **PE0**: PHY error 0

This bit indicates the ErrEsc escape entry error from lane 0.

Bit 15 **AE15**: Acknowledge error 15

This bit retrieves the DSI protocol violation from the acknowledge error report.

Bit 14 **AE14**: Acknowledge error 14

This bit retrieves the reserved (specific to the device) from the acknowledge error report.

Bit 13 **AE13**: Acknowledge error 13

This bit retrieves the invalid transmission length from the acknowledge error report.

Bit 12 **AE12**: Acknowledge error 12

This bit retrieves the DSI VC ID Invalid from the acknowledge error report.

Bit 11 **AE11**: Acknowledge error 11

This bit retrieves the not recognized DSI data type from the acknowledge error report.

Bit 10 **AE10**: Acknowledge error 10

This bit retrieves the checksum error (long packet only) from the acknowledge error report.

Bit 9 **AE9**: Acknowledge error 9

This bit retrieves the ECC error, multi-bit (detected, not corrected) from the acknowledge error report.

Bit 8 **AE8**: Acknowledge error 8

This bit retrieves the ECC error, single-bit (detected and corrected) from the acknowledge error report.

Bit 7 **AE7**: Acknowledge error 7

This bit retrieves the reserved (specific to the device) from the acknowledge error report.

Bit 6 **AE6**: Acknowledge error 6

This bit retrieves the false control error from the acknowledge error report.

Bit 5 **AE5**: Acknowledge error 5

This bit retrieves the peripheral timeout error from the acknowledge error report.

Bit 4 **AE4**: Acknowledge error 4

This bit retrieves the LP transmit sync error from the acknowledge error report.

Bit 3 **AE3**: Acknowledge error 3

This bit retrieves the escape mode entry command error from the acknowledge error report.

Bit 2 **AE2**: Acknowledge error 2

This bit retrieves the EoT sync error from the acknowledge error report.

Bit 1 **AE1**: Acknowledge error 1

This bit retrieves the SoT sync error from the acknowledge error report.

Bit 0 **AE0**: Acknowledge error 0

This bit retrieves the SoT error from the acknowledge error report.

### 36.15.42 DSI Host interrupt and status register 1 (DSI\_ISR1)

| Res. | Res. | Res. | GPRXE | GPRDE | GPTXE | GPWRE | GCWRE | LPWRE | EOTPE | PSE | CRCE | ECCME | ECCSE | TOLPRX | TOHSTX |
|      |      |      | r     | r     | r     | r     | r     | r     | r     | r   | r    | r     | r     | r      | r      |

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **GPRXE**: Generic payload receive error

This bit indicates that during a generic interface packet read back, the payload FIFO becomes full and the received data is corrupted.

Bit 11 **GPRDE**: Generic payload read error

This bit indicates that during a DCS read data, the payload FIFO becomes empty and the data sent to the interface is corrupted.

Bit 10 **GPTXE**: Generic payload transmit error

This bit indicates that during a generic interface packet build, the payload FIFO becomes empty and corrupt data is sent.

Bit 9 **GPWRE**: Generic payload write error

This bit indicates that the system tried to write a payload data through the generic interface and the FIFO is full. Therefore, the payload is not written.

Bit 8 **GCWRE**: Generic command write error

This bit indicates that the system tried to write a command through the generic interface and the FIFO is full. Therefore, the command is not written.

Bit 7 **LPWRE**: LTDC payload write error

This bit indicates that during a DPI pixel line storage, the payload FIFO becomes full and the data stored is corrupted.

Bit 6 **EOTPE**: EoTp error

This bit indicates that the EoTp packet is not received at the end of the incoming peripheral transmission.

Bit 5 **PSE**: Packet size error

This bit indicates that the packet size error is detected during the packet reception.

Bit 4 **CRCE**: CRC error

This bit indicates that the CRC error is detected in the received packet payload.

Bit 3 **ECCME**: ECC multi-bit error

This bit indicates that the ECC multiple error is detected in a received packet.

Bit 2 **ECCSE**: ECC single-bit error

This bit indicates that the ECC single error is detected and corrected in a received packet.

Bit 1 **TOLPRX**: Timeout low-power reception

This bit indicates that the low-power reception timeout counter reached the end and contention is detected.

Bit 0 **TOHSTX**: Timeout high-speed transmission

This bit indicates that the high-speed transmission timeout counter reached the end and contention is detected.

**36.15.43 DSI Host interrupt enable register 0 (DSI\_IER0)**

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **PE4IE**: PHY error 4 interrupt enable

This bit enables the interrupt generation on PHY error 4.

0: Interrupt on PHY error 4 disabled.

1: Interrupt on PHY error 4 enabled.

Bit 19 **PE3IE**: PHY error 3 interrupt enable

This bit enables the interrupt generation on PHY error 4.

0: Interrupt on PHY error 3 disabled.

1: Interrupt on PHY error 3 enabled.

Bit 18 **PE2IE**: PHY error 2 interrupt enable

This bit enables the interrupt generation on PHY error 2.

0: Interrupt on PHY error 2 disabled.

1: Interrupt on PHY error 2 enabled.

Bit 17 **PE1IE**: PHY error 1 interrupt enable

This bit enables the interrupt generation on PHY error 1.

0: Interrupt on PHY error 1 disabled.

1: Interrupt on PHY error 1 enabled.

Bit 16 **PE0IE**: PHY error 0 interrupt enable

This bit enables the interrupt generation on PHY error 0.

0: Interrupt on PHY error 0 disabled.

1: Interrupt on PHY error 0 enabled.

Bit 15 **AE15IE**: Acknowledge error 15 interrupt enable

This bit enables the interrupt generation on acknowledge error 15.

0: Interrupt on acknowledge error 15 disabled.

1: Interrupt on acknowledge error 15 enabled.

Bit 14 **AE14IE**: Acknowledge error 14 interrupt enable

This bit enables the interrupt generation on acknowledge error 14.

0: Interrupt on acknowledge error 14 disabled.

1: Interrupt on acknowledge error 14 enabled.

Bit 13 **AE13IE**: Acknowledge error 13 interrupt enable

This bit enables the interrupt generation on acknowledge error 13.

0: Interrupt on acknowledge error 13 disabled.

1: Interrupt on acknowledge error 13 enabled.

- Bit 12 **AE12IE**: Acknowledge error 12 interrupt enable  
This bit enables the interrupt generation on acknowledge error 12.  
0: Interrupt on acknowledge error 12 disabled.  
1: Interrupt on acknowledge error 12 enabled.
- Bit 11 **AE11IE**: Acknowledge error 11 interrupt enable  
This bit enables the interrupt generation on acknowledge error 11.  
0: Interrupt on acknowledge error 11 disabled.  
1: Interrupt on acknowledge error 11 enabled.
- Bit 10 **AE10IE**: Acknowledge error 10 interrupt enable  
This bit enables the interrupt generation on acknowledge error 10.  
0: Interrupt on acknowledge error 10 disabled.  
1: Interrupt on acknowledge error 10 enabled.
- Bit 9 **AE9IE**: Acknowledge error 9 interrupt enable  
This bit enables the interrupt generation on acknowledge error 9.  
0: Interrupt on acknowledge error 9 disabled.  
1: Interrupt on acknowledge error 9 enabled.
- Bit 8 **AE8IE**: Acknowledge error 8 interrupt enable  
This bit enables the interrupt generation on acknowledge error 8.  
0: Interrupt on acknowledge error 8 disabled.  
1: Interrupt on acknowledge error 8 enabled.
- Bit 7 **AE7IE**: Acknowledge error 7 interrupt enable  
This bit enables the interrupt generation on acknowledge error 7.  
0: Interrupt on acknowledge error 7 disabled.  
1: Interrupt on acknowledge error 7 enabled.
- Bit 6 **AE6IE**: Acknowledge error 6 interrupt enable  
This bit enables the interrupt generation on acknowledge error 6.  
0: Interrupt on acknowledge error 6 disabled.  
1: Interrupt on acknowledge error 6 enabled.
- Bit 5 **AE5IE**: Acknowledge error 5 interrupt enable  
This bit enables the interrupt generation on acknowledge error 5.  
0: Interrupt on acknowledge error 5 disabled.  
1: Interrupt on acknowledge error 5 enabled.
- Bit 4 **AE4IE**: Acknowledge error 4 interrupt enable  
This bit enables the interrupt generation on acknowledge error 4.  
0: Interrupt on acknowledge error 4 disabled.  
1: Interrupt on acknowledge error 4 enabled.
- Bit 3 **AE3IE**: Acknowledge error 3 interrupt enable  
This bit enables the interrupt generation on acknowledge error 3.  
0: Interrupt on acknowledge error 3 disabled.  
1: Interrupt on acknowledge error 3 enabled.

Bit 2 **AE2IE**: Acknowledge error 2 interrupt enable

This bit enables the interrupt generation on acknowledge error 2.

0: Interrupt on acknowledge error 2 disabled.

1: Interrupt on acknowledge error 2 enabled.

Bit 1 **AE1IE**: Acknowledge error 1 interrupt enable

This bit enables the interrupt generation on acknowledge error 1.

0: Interrupt on acknowledge error 1 disabled.

1: Interrupt on acknowledge error 1 enabled.

Bit 0 **AE0IE**: Acknowledge error 0 interrupt enable

This bit enables the interrupt generation on acknowledge error 0.

0: Interrupt on acknowledge error 0 disabled.

1: Interrupt on acknowledge error 0 enabled.

### 36.15.44 DSI Host interrupt enable register 1 (DSI\_IER1)

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **GPRXEIE**: Generic payload receive error interrupt enable

This bit enables the interrupt generation on generic payload receive error.

0: Interrupt on generic payload receive error disabled.

1: Interrupt on generic payload receive error enabled.

Bit 11 **GPRDEIE**: Generic payload read error interrupt enable

This bit enables the interrupt generation on generic payload read error.

0: Interrupt on generic payload read error disabled.

1: Interrupt on generic payload read error enabled.

Bit 10 **GPTXEIE**: Generic payload transmit error interrupt enable

This bit enables the interrupt generation on generic payload transmit error.

0: Interrupt on generic payload transmit error disabled.

1: Interrupt on generic payload transmit error enabled.

Bit 9 **GPWREIE**: Generic payload write error interrupt enable

This bit enables the interrupt generation on generic payload write error.

0: Interrupt on generic payload write error disabled.

1: Interrupt on generic payload write error enabled.

- Bit 8 **GCWREIE**: Generic command write error interrupt enable  
This bit enables the interrupt generation on generic command write error.  
0: Interrupt on generic command write error disabled.  
1: Interrupt on generic command write error enabled.
- Bit 7 **LPWREIE**: LTDC payload write error interrupt enable  
This bit enables the interrupt generation on LTDC payload write error.  
0: Interrupt on LTDC payload write error disabled.  
1: Interrupt on LTDC payload write error enabled.
- Bit 6 **EOTPEIE**: EoTp error interrupt enable  
This bit enables the interrupt generation on EoTp error.  
0: Interrupt on EoTp error disabled.  
1: Interrupt on EoTp error enabled.
- Bit 5 **PSEIE**: Packet size error interrupt enable  
This bit enables the interrupt generation on packet size error.  
0: Interrupt on packet size error disabled.  
1: Interrupt on packet size error enabled.
- Bit 4 **CRCEIE**: CRC error interrupt enable  
This bit enables the interrupt generation on CRC error.  
0: Interrupt on CRC error disabled.  
1: Interrupt on CRC error enabled.
- Bit 3 **ECCMEIE**: ECC multi-bit error interrupt enable  
This bit enables the interrupt generation on ECC multi-bit error.  
0: Interrupt on ECC multi-bit error disabled.  
1: Interrupt on ECC multi-bit error enabled.
- Bit 2 **ECCSEIE**: ECC single-bit error interrupt enable  
This bit enables the interrupt generation on ECC single-bit error.  
0: Interrupt on ECC single-bit error disabled.  
1: Interrupt on ECC single-bit error enabled.
- Bit 1 **TOLPRXIE**: Timeout low-power reception interrupt enable  
This bit enables the interrupt generation on timeout low-power reception.  
0: Interrupt on timeout low-power reception disabled.  
1: Interrupt on timeout low-power reception enabled.
- Bit 0 **TOHSTXIE**: Timeout high-speed transmission interrupt enable  
This bit enables the interrupt generation on timeout high-speed transmission .  
0: Interrupt on timeout high-speed transmission disabled.  
1: Interrupt on timeout high-speed transmission enabled.

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **FPE4**: Force PHY error 4

Writing one to this bit forces a PHY error 4.

Bit 19 **FPE3**: Force PHY error 3

Writing one to this bit forces a PHY error 3.

Bit 18 **FPE2**: Force PHY error 2

Writing one to this bit forces a PHY error 2.

Bit 17 **FPE1**: Force PHY error 1

Writing one to this bit forces a PHY error 1.

Bit 16 **FPE0**: Force PHY error 0

Writing one to this bit forces a PHY error 0.

Bit 15 **FAE15**: Force acknowledge error 15

Writing one to this bit forces an acknowledge error 15.

Bit 14 **FAE14**: Force acknowledge error 14

Writing one to this bit forces an acknowledge error 14.

Bit 13 **FAE13**: Force acknowledge error 13

Writing one to this bit forces an acknowledge error 13.

Bit 12 **FAE12**: Force acknowledge error 12

Writing one to this bit forces an acknowledge error 12.

Bit 11 **FAE11**: Force acknowledge error 11

Writing one to this bit forces an acknowledge error 11.

Bit 10 **FAE10**: Force acknowledge error 10

Writing one to this bit forces an acknowledge error 10.

Bit 9 **FAE9**: Force acknowledge error 9

Writing one to this bit forces an acknowledge error 9.

Bit 8 **FAE8**: Force acknowledge error 8

Writing one to this bit forces an acknowledge error 8.

Bit 7 **FAE7**: Force acknowledge error 7

Writing one to this bit forces an acknowledge error 7.

Bit 6 **FAE6**: Force acknowledge error 6

Writing one to this bit forces an acknowledge error 6.

- Bit 5 **FAE5**: Force acknowledge error 5  
Writing one to this bit forces an acknowledge error 5.
- Bit 4 **FAE4**: Force acknowledge error 4  
Writing one to this bit forces an acknowledge error 4.
- Bit 3 **FAE3**: Force acknowledge error 3  
Writing one to this bit forces an acknowledge error 3.
- Bit 2 **FAE2**: Force acknowledge error 2  
Writing one to this bit forces an acknowledge error 2.
- Bit 1 **FAE1**: Force acknowledge error 1  
Writing one to this bit forces an acknowledge error 1.
- Bit 0 **FAE0**: Force acknowledge error 0  
Writing one to this bit forces an acknowledge error 0.

Bits 31:13 Reserved, must be kept at reset value.

- Bit 12 **FGPRXE**: Force generic payload receive error  
Writing one to this bit forces a generic payload receive error.
- Bit 11 **FGPRDE**: Force generic payload read error  
Writing one to this bit forces a generic payload read error.
- Bit 10 **FGPTXE**: Force generic payload transmit error  
Writing one to this bit forces a generic payload transmit error.
- Bit 9 **FGPWRE**: Force generic payload write error  
Writing one to this bit forces a generic payload write error.
- Bit 8 **FGCWRE**: Force generic command write error  
Writing one to this bit forces a generic command write error.
- Bit 7 **FLPWRE**: Force LTDC payload write error  
Writing one to this bit forces a LTDC payload write error.
- Bit 6 **FEOTPE**: Force EoTp error  
Writing one to this bit forces a EoTp error.
- Bit 5 **FPSE**: Force packet size error  
Writing one to this bit forces a packet size error.

Bit 4 **FCRCE**: Force CRC error

Writing one to this bit forces a CRC error.

Bit 3 **FECCME**: Force ECC multi-bit error

Writing one to this bit forces a ECC multi-bit error.

Bit 2 **FECCSE**: Force ECC single-bit error

Writing one to this bit forces a ECC single-bit error.

Bit 1 **FTOLPRX**: Force timeout low-power reception

Writing one to this bit forces a timeout low-power reception.

Bit 0 **FTOHSTX**: Force timeout high-speed transmission

Writing one to this bit forces a timeout high-speed transmission.

### 36.15.47 DSI Host data lane timer read configuration register (DSI\_DLTRCR)

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **UR**: Update register

When set to 1, the LTDC registers are copied to the auxiliary registers. After copying, this bit is auto cleared.

0: No update requested.

1: Register update requested.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **EN**: Enable

When set to 1, DSI Host LTDC interface receives the active configuration from the auxiliary registers.

When this bit is set along with the UR bit, the auxiliary registers are automatically updated.

0: Register update is disabled.

1: Register update is enabled.

### 36.15.49 DSI Host LTDC current VCID register (DSI\_LCVCIDR)

Address offset: 0x010C

Reset value: 0x0000 0000

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | LPE  | Res. | Res. | Res. | Res. | COLC[3:0] |      |      |      |
|      |      |      |      |      |      |      | r    |      |      |      |      | r         | r    | r    | r    |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **LPE**: Loosely packed enable

This bit returns the current state of the loosely packed variant to 18-bit configurations.

0: Loosely packed variant disabled.

1: Loosely packed variant enabled.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **COLC[3:0]**: Color coding

This field returns the current LTDC interface color coding

0000: 16-bit configuration 1

0001: 16-bit configuration 2

0010: 16-bit configuration 3

0011: 18-bit configuration 1

0100: 18-bit configuration 2

0101: 24-bit

0110 - 1111: reserved

If LTDC interface in command mode is chosen and currently works in the command mode (CMDM=1), then 0110-1111: 24-bit

### 36.15.51 DSI Host low-power mode current configuration register (DSI\_LPMCCR)

Address offset: 0x0118

Reset value: 0x0000 0000

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **LPSIZE[7:0]**: Largest packet size

This field is returns the current size, in bytes, of the largest packet that can fit in a line during VSA, VBP and VFP regions, for the transmission of commands in low-power mode.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **VLPSIZE[7:0]**: VACT largest packet size

This field returns the current size, in bytes, of the largest packet that can fit in a line during VACT regions, for the transmission of commands in low-power mode.

### 36.15.52 DSI Host video mode current configuration register (DSI\_VMCCR)

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **LPCE**: Low-power command enable

This bit returns the current command transmission state in low-power mode.

0: Command transmission in low-power mode is disabled.

1: Command transmission in low-power mode is enabled.

Bit 8 **FBTAAE**: Frame BTA acknowledge enable

This bit returns the current state of request for an acknowledge response at the end of a frame.

0: Acknowledge response at the end of a frame is disabled.

1: Acknowledge response at the end of a frame is enabled.

Bit 7 **LPHFE**: Low-power horizontal front-porch enable

This bit returns the current state of return to low-power inside the horizontal front-porch (HFP) period when timing allows.

0: Return to low-power inside the HFP period is disabled.

1: Return to low-power inside the HFP period is enabled.

Bit 6 **LPHBPE**: Low-power horizontal back-porch enable

This bit returns the current state of return to low-power inside the horizontal back-porch (HBP) period when timing allows.

0: Return to low-power inside the HBP period is disabled.

1: Return to low-power inside the HBP period is enabled.

Bit 5 **LPVAE**: Low-power vertical active enable

This bit returns the current state of return to low-power inside the vertical active (VACT) period when timing allows.

0: Return to low-power inside the VACT is disabled.

1: Return to low-power inside the VACT is enabled.

Bit 4 **LPVFPE**: Low-power vertical front-porch enable

This bit returns the current state of return to low-power inside the vertical front-porch (VFP) period when timing allows.

0: Return to low-power inside the VFP is disabled.

1: Return to low-power inside the VFP is enabled.

Bit 3 **LPVBPE**: Low-power vertical back-porch enable

This bit returns the current state of return to low-power inside the vertical back-porch (VBP) period when timing allows.

0: Return to low-power inside the VBP is disabled.

1: Return to low-power inside the VBP is enabled.

Bit 2 **LPVSAE**: Low-power vertical sync time enable

This bit returns the current state of return to low-power inside the vertical sync time (VSA) period when timing allows.

0: Return to low-power inside the VSA is disabled.

1: Return to low-power inside the VSA is enabled

Bits 1:0 **VMT[1:0]**: Video mode type

This field returns the current video mode transmission type:

00: Non-burst with sync pulses.

01: Non-burst with sync events.

1x: Burst mode

### 36.15.53 DSI Host video packet current configuration register (DSI\_VPCCR)

Address offset: 0x013C

Reset value: 0x0000 0000

|      |      |              |      |      |      |      |      |      |      |      |      |      |      |      |      |

| Res. | Res. | Res. | Res. | HBP[11:0] |      |      |      |      |      |      |      |      |      |      |      |
|      |      |      |      | r         | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **HBP[11:0]**: Horizontal back-porch duration

This fields returns the horizontal back-porch period in lane byte clock cycles.

### 36.15.58 DSI Host video line current configuration register (DSI\_VLCCR)

Address offset: 0x0150

Reset value: 0x0000 0000

|      |             |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|-------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30          | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res.        | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |             |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14          | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | HLINE[14:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|      | r           | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:0 **HLINE[14:0]**: Horizontal line duration

This fields return the current total of the horizontal line period (HSA+HBP+HACT+HFP) counted in lane byte clock cycles.

### 36.15.59 DSI Host video VSA current configuration register (DSI\_VVSACCR)

Address offset: 0x0154

Reset value: 0x0000 0000

|      |      |      |      |      |      |          |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|----------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25       | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res.     | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |          |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9        | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | VSA[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      |      | r        | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **VSA[9:0]**: Vertical synchronism active duration

This fields return the current vertical synchronism active period measured in number of horizontal lines.

### 36.15.60 DSI Host video VBP current configuration register (DSI\_VVBPCR)

Address offset: 0x0158

Reset value: 0x0000 0000

|      |      |      |      |      |      |          |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|----------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25       | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res.     | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |          |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9        | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | VBP[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      |      | r        | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **VBP[9:0]**: Vertical back-porch duration

This fields returns the current vertical back-porch period measured in number of horizontal lines.

### 36.15.61 DSI Host video VFP current configuration register (DSI\_VVFPCCR)

Address offset: 0x015C

Reset value: 0x0000 0000

|      |      |      |      |      |      |          |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|----------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25       | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res.     | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |          |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9        | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | VFP[9:0] |      |      |      |      |      |      |      |      |      |
|      |      |      |      |      |      | r        | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **VFP[9:0]**: Vertical front-porch duration

This fields returns the current vertical front-porch period measured in number of horizontal lines.

### 36.15.62 DSI Host video VA current configuration register (DSI\_VVACCR)

Address offset: 0x0160

Reset value: 0x0000 0000

|      |      |          |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|----------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29       | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res.     | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |          |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13       | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | VA[13:0] |      |      |      |      |      |      |      |      |      |      |      |      |      |
|      |      | r        | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    | r    |

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:0 **VA[13:0]**: Vertical active duration

This fields returns the current vertical active period measured in number of horizontal lines.

## 36.16 DSI wrapper registers

### 36.16.1 DSI wrapper configuration register (DSI\_WCFGR)

Address offset: 0x0400

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |       |      |       |       |             |      |      |      |
|------|------|------|------|------|------|------|------|-------|------|-------|-------|-------------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23    | 22   | 21    | 20    | 19          | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.  | Res. | Res.  | Res.  | Res.        | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |       |      |       |       |             |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7     | 6    | 5     | 4     | 3           | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | VSPOL | AR   | TEPOL | TESRC | COLMUX[2:0] |      |      | DSIM |
|      |      |      |      |      |      |      |      | rw    | rw   | rw    | rw    | rw          | rw   | rw   | rw   |

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **VSPOL**: VSync polarity

Select the VSync edge on which the LTDC is halted

0: LTDC halted on a falling edge.

1: LTDC halted on a rising edge.

This bit shall only be changed when DSI is stopped (DSI\_WCR.DSIEN = 0 and DSI\_CR.EN = 0).

Bit 6 **AR**: Automatic refresh

Selects the refresh mode in DBI mode

0: automatic refresh mode disabled.

1: automatic refresh mode enabled.

This bit shall only be changed when DSI Host is stopped (DSI\_CR.EN = 0).

Bit 5 **TEPOL**: TE polarity

Selects the polarity of the external pin tearing effect (TE) source

0: rising edge.

1: falling edge.

This bit shall only be changed when DSI Host is stopped (DSI\_CR.EN = 0).

Bit 4 **TESRC**: TE source

Selects the tearing effect (TE) source

0: DSI Link.

1: External pin.

This bit shall only be changed when DSI Host is stopped (DSI\_CR.EN = 0).

Bits 3:1 **COLMUX[2:0]**: Color multiplexing

Selects the color multiplexing used by DSI Host

000: 16-bit configuration 1

001: 16-bit configuration 2

010: 16-bit configuration 3

011: 18-bit configuration 1

100: 18-bit configuration 2

101: 24-bit

This field shall only be changed when DSI is stopped (DSI\_WCR.DSIEN = 0 and DSI\_CR.EN = 0).

Bit 0 **DSIM**: DSI mode

Selects the mode for the video transmission

0: Video mode.

1: Adapted command mode.

This bit shall only be changed when DSI Host is stopped (DSI\_CR.EN = 0).

**36.16.2 DSI wrapper control register (DSI\_WCR)**

Address offset: 0x0404

Reset value: 0x0000 0000

| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19    | 18      | 17    | 16   |
|------|------|------|------|------|------|------|------|------|------|------|------|-------|---------|-------|------|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.  | Res.    | Res.  | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |       |         |       |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3     | 2       | 1     | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DSIEN | LTDCEEN | SHTDN | COLM |
|      |      |      |      |      |      |      |      |      |      |      |      | rw    | rs      | rw    | rw   |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **DSIEN**: DSI enable

Enables the DSI wrapper

0: DSI is disabled.

1: DSI is enabled.

Bit 2 **LTDCEEN**: LTDC enable

Enables the LTDC for a frame transfer in adapted command mode

0: LTDC is disabled.

1: LTDC is enabled.

Bit 1 **SHTDN**: Shutdown

Controls the display shutdown in video mode:

0: display ON.

1: display OFF.

Bit 0 **COLM**: Color mode

Controls the display color mode in video mode:

0: Full color mode.

1: Eight color mode.

### 36.16.3 DSI wrapper interrupt enable register (DSI\_WIER)

Address offset: 0x0408

Reset value: 0x0000 0000

|      |      |      |      |      |        |        |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|--------|--------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26     | 25     | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res.   | Res.   | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |        |        |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10     | 9      | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | RRIE | Res. | Res. | PLLUIE | PLLLIE | Res. | Res. | Res. | Res. | Res. | Res. | Res. | ERIE | TEIE |
|      |      | rw   |      |      | rw     | rw     |      |      |      |      |      |      |      | rw   | rw   |

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **RRIE**: Regulator ready interrupt enable

Enables the regulator ready interrupt

0: Regulator ready interrupt disabled.

1: Regulator ready interrupt enabled.

Bits 12:11 Reserved, must be kept at reset value.

Bit 10 **PLLUIE**: PLL unlock interrupt enable

Enables the PLL unlock interrupt

0: PLL unlock interrupt disabled.

1: PLL unlock interrupt enabled.

Bit 9 **PLLLIE**: PLL lock interrupt enable

Enables the PLL lock interrupt

0: PLL lock interrupt disabled.

1: PLL lock interrupt enabled.

Bits 8:2 Reserved, must be kept at reset value.

Bit 1 **ERIE**: End of refresh interrupt enable

Enables the end of refresh interrupt

0: End of refresh interrupt disabled.

1: End of refresh interrupt enabled.

Bit 0 **TEIE**: Tearing effect interrupt enable

Enables the tearing effect interrupt

0: Tearing effect interrupt disabled.

1: Tearing effect interrupt enabled.

### 36.16.4 DSI wrapper interrupt and status register (DSI\_WISR)

Address offset: 0x040C

Reset value: 0x0000 0000

|      |      |      |      |      |        |       |       |      |      |      |      |      |      |      |      |

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **RRIF**: Regulator ready interrupt flag

This bit is set when the regulator becomes ready:

0: No regulator ready event occurred.

1: Regulator ready event occurred.

Bit 12 **RRS**: Regulator ready status

This bit gives the status of the regulator:

0: Regulator is not ready.

1: Regulator is ready.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **PLLUIF**: PLL unlock interrupt flag

This bit is set when the PLL becomes unlocked:

0: No PLL unlock event occurred.

1: PLL unlock event occurred.

Bit 9 **PLLIF**: PLL lock interrupt flag

This bit is set when the PLL becomes locked:

0: No PLL lock event occurred.

1: PLL lock event occurred.

Bit 8 **PLLIS**: PLL lock status

This bit is set when the PLL is locked and cleared when it is unlocked:

0: PLL is unlocked.

1: PLL is locked.

Bits 7:3 Reserved, must be kept at reset value.

Bit 2 **BUSY**: Busy flag

This bit is set when the transfer of a frame in adapted command mode is ongoing:

0: No transfer on going

1: Transfer on going

Bit 1 **ERIF**: End of refresh interrupt flag

This bit is set when the transfer of a frame in adapted command mode is finished:

0: No end of refresh event occurred.

1: End of refresh event occurred.

Bit 0 **TEIF**: Tearing effect interrupt flag

This bit is set when a tearing effect event occurs

0: No tearing effect event occurred.

1: Tearing effect event occurred.

### 36.16.5 DSI wrapper interrupt flag clear register (DSI\_WIFCR)

Address offset: 0x0410

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **CRRIF**: Clear regulator ready interrupt flag

Write 1 clears the RRIF flag in the DSI\_WSR register

Bits 12:11 Reserved, must be kept at reset value.

Bit 10 **CPLLUIF**: Clear PLL unlock interrupt flag

Write 1 clears the PLLUIF flag in the DSI\_WSR register

Bit 9 **CPLLIF**: Clear PLL lock interrupt flag

Write 1 clears the PLLIF flag in the DSI\_WSR register

Bits 8:2 Reserved, must be kept at reset value.

Bit 1 **CERIF**: Clear end of refresh interrupt flag

Write 1 clears the ERIF flag in the DSI\_WSR register

Bit 0 **CTEIF**: Clear tearing effect interrupt flag

Write 1 clears the TEIF flag in the DSI\_WSR register

### 36.16.6 DSI wrapper PHY configuration register 0 (DSI\_WPCR0)

Address offset: 0x0418

Reset value: 0x0000 0000

|      | rw          | rw          | rw          | rw     | rw     | rw    | rw    | rw    | rw   | rw        | rw   | rw   | rw   | rw   | rw   |

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **TDDL**: Turn disable data lanes

This bit forces the data lane to remain in RX event if it receives a bus-turn-around request from the other side:

0: No effect.

1: Force data lanes in RX mode after a BTA.

Bit 15 Reserved, must be kept at reset value.

Bit 14 **CDOFFDL**: Contention detection OFF on data lanes

When only forward escape mode is used, this signal can be made high to switch off the contention detector and reduce static power consumption:

0: Contention detection on data lane ON.

1: Contention detection on data lane OFF.

Bit 13 **FTXSMDL**: Force in TX Stop mode the data lanes

This bit forces the data lanes in TX stop mode. It is used to initialize a lane module in transmit mode. It causes the lane module to immediately jump to transmit control mode and to begin transmitting a stop state (LP-11). It can be used to go back in TX mode after a wrong BTA sequence:

0: No effect.

1: Force the data lanes in TX Stop mode.

Bit 12 **FTXSMCL**: Force in TX Stop mode the clock lane

This bit forces the clock lane in TX stop mode. It is used to initialize a lane module in transmit mode. It causes the lane module to immediately jump to transmit control mode and to begin transmitting a stop state (LP-11). It can be used to go back in TX mode after a wrong BTA sequence:

0: No effect.

1: Force the clock lane in TX Stop mode.

Bit 11 **HSIDL1**: Invert the high-speed data signal on data lane 1

This bit invert the high-speed data signal on data lane 1:

0: Normal data signal configuration.

1: Inverted data signal configuration.

Bit 10 **HSIDL0**: Invert the high-speed data signal on data lane 0

This bit invert the high-speed data signal on clock lane:

0: Normal data signal configuration.

1: Inverted data signal configuration.

Bit 9 **HSICL**: Invert high-speed data signal on clock lane

This bit invert the high-speed data signal on clock lane:

0: Normal data configuration.

1: Inverted data configuration.

Bit 8 **SWDL1**: Swap data lane 1 pins

This bit swap the pins on clock lane

0: Regular clock lane pin configuration.

1: Swapped clock lane pin.

Bit 7 **SWDL0**: Swap data lane 0 pins

This bit swap the pins on data lane 0:

0: Regular clock lane pin configuration.

1: Swapped clock lane pin.

Bit 6 **SWCL**: Swap clock lane pins

This bit swap the pins on clock lane:

0: Regular clock lane pin configuration.

1: Swapped clock lane pin.

Bits 5:0 **UIX4[5:0]**: Unit interval multiplied by 4

This field defines the bit period in high-speed mode in unit of 0.25 ns.

As an example, if the unit interval is 3ns, a value of twelve (0x0C) should be driven to this input. This value is used to generate delays. If the period is not a multiple of 0.25ns, the value driven should be rounded down. For example, a 600Mbit/s link uses a unit interval of 1.667 ns. Multiplying by four results in 6.667. In this case, a value of 6 (not 7) should be driven onto the ui\_x4 input.

### 36.16.7 DSI wrapper PHY configuration register 1 (DSI\_WPCR1)

Address offset: 0x041C

Reset value: 0x0000 0000

**Note:** *This register shall be programmed only when DSI is stopped (CR.DSIEN=0 and CR.EN = 0).*

|      |      |         |         |      |      |               |      |               |      |      |      |             |            |             |            |

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **HSTXSRDDL**: High-speed TX slew-rate down data lane  
Decreases the slew-rate for high-speed transmitter for data lane.  
0: Standard slew-rate on clock lane  
1: Decreased slew-rate on clock lane

Bit 18 **HSTXSRUDL**: High-speed TX slew-rate up data lane  
Increases the slew-rate for high-speed transmitter for data lane.  
0: Standard slew-rate on clock lane  
1: Increased slew-rate on clock lane

Bit 17 **HSTXSRDCL**: High-speed TX slew-rate down clock lane  
Decreases the slew-rate for high-speed transmitter for clock lane.  
0: Standard slew-rate on clock lane  
1: Decreased slew-rate on clock lane

Bit 16 **HSTXSRUCL**: High-speed TX slew-rate up clock lane  
Increases the slew-rate for high-speed transmitter for clock lane.  
0: Standard slew-rate on clock lane  
1: Increased slew-rate on clock lane

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **SDDCDL**: SDD control data lanes  
Current injection on data lane for SDDTx improvements.  
A 2mA extra current per lane is consumed on the 1.2V DSI power supply  
0: No current injection  
1: Current injection to improve SDDTx

Bit 12 **SDDCCL**: SDD control clock lane  
Reduces the impedance on clock lane for SDDTx improvements.  
0: Standard impedance  
1: Reduced impedance to improve SDDTx

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:8 **LPTXSRDL[1:0]**: Low-power TX slew-rate on data lanes  
Can be used to change slew-rate of clock lane LP transitions.  
Default value should be '00'.

Bits 7:6 **LPTXSRCL[1:0]**: Low-power TX slew-rate on clock lanes  
Can be used to change slew-rate of clock lane LP transitions.  
Default value should be '00'.

Bits 5:4 Reserved, must be kept at reset value.

Bits 3:2 **SKEWDL[1:0]**: Skew on data lanes  
Delay tuner control to change delay (up to DP/DN) in data path. Can be used to change data edge transition positions with respect to clock edge on DP/DN.  
Default value should be '000'.

Bits 1:0 **SKEWCL[1:0]**: Skew on clock lanes  
Delay tuner control to change delay (upto DP/DN) in clock path. Can be used to change clock edge position with respect to data bit transitions on DP/DN.  
Default value should be '000'.

### 36.16.8 DSI wrapper regulator and PLL control register (DSI\_WRPCR)

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **BGREN**: Band gap reference enable

This bit enables the DPHY band gap reference:

0: band gap reference disabled

1: band gap reference enabled

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **REGEN**: Regulator enable

This bit enables the DPHY regulator:

0: regulator disabled

1: regulator enabled

Bits 23:18 Reserved, must be kept at reset value.

Bits 17:16 **ODF[1:0]**: PLL output division factor

This field configures the PLL output division factor:

00: PLL output divided by 1

01: PLL output divided by 2

10: PLL output divided by 4

11: PLL output divided by 8

Bit 15 Reserved, must be kept at reset value.

Bits 14:11 **IDF[3:0]**: PLL input division factor

This field configures the PLL input division factor:

000: PLL input divided by 1

001: PLL input divided by 1

010: PLL input divided by 2

011: PLL input divided by 3

100: PLL input divided by 4

101: PLL input divided by 5

110: PLL input divided by 6

111: PLL input divided by 7

Bits 10:9 Reserved, must be kept at reset value.

Bits 8:2 **NDIV[6:0]**: PLL loop division factor

This field configures the PLL loop division factor:

10 to 125: Allowed loop division factor values.

Others: Reserved.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **PLEN**: PLL enable

This bit enables the D-PHY PLL:

0: PLL disable.

1: PLL enable.

### 36.16.9 DSI Host hardware configuration register (DSI\_HWCFGR)

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision

This field returns the major revision of the DSI Host.

Bits 3:0 **MINREV[3:0]**: Minor revision

This field returns the minor revision of the DSI Host.

### 36.16.11 DSI Host identification register (DSI\_IPIDR)

Address offset: 0x07F8

Reset value: 0x0016 0071

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Bits 31:0 **SID[31:0]**: Size and ID

This field returns size and ID of the DSI Host.

## 36.17 DSI Host register map

The following table summarizes the DSI Host registers. Refer to the register boundary addresses table for the DSI Host register base address.

**Table 255. DSI register map and reset values**

| Offset        | Register                         | 31            | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   | 15            | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1         | 0         |

## 37 True random number generator (RNG)

### 37.1 Introduction

The RNG is a true random number generator that provides full entropy outputs to the application as 32-bit samples. It is composed of a live entropy source (analog) and an internal conditioning component.

The RNG can be used to construct a NIST compliant Deterministic Random Bit Generator (DRBG), acting as a live entropy source.

The RNG true random number generator has been tested using German BSI statistical tests of AIS-31 (T0 to T8).

### 37.2 RNG main features

- The RNG delivers 32-bit true random numbers, produced by an analog entropy source processed by a high quality conditioning stage.
- It produces four 32-bit random samples every  $16 \times \frac{f_{AHB}}{f_{RNG}}$  AHB clock cycles, if value is higher than 213 cycles (213 cycles otherwise).
- It allows embedded continuous basic health tests with associated error management
  - Includes too low sampling clock detection and repetition count tests.
- It can be disabled to reduce power consumption.
- It has an AMBA AHB slave peripheral, accessible through 32-bit word single accesses only (else an AHB bus error is generated, and the write accesses are ignored).

# 37.3 RNG functional description

## 37.3.1 RNG block diagram

Figure 323 shows the RNG block diagram.

Figure 323. RNG block diagram

## 37.3.2 RNG internal signals

Table 256 describes a list of useful-to-know internal signals available at the RNG level, not at the STM32 product level (on pads).

Table 256. RNG internal input/output signals

| Signal name | Signal type    | Description                                   |
|-------------|----------------|-----------------------------------------------|
| rng_it      | Digital output | RNG global interrupt request                  |
| rng_hclk    | Digital input  | AHB clock                                     |
| rng_clk     | Digital input  | RNG dedicated clock, asynchronous to rng_hclk |

### 37.3.3 Random number generation

The true random number generator (RNG) delivers truly random data through its AHB interface at deterministic intervals. Within its boundary the RNG implements the entropy source model pictured on [Figure 324](#).

It includes an analog noise source, a digitization stage with post-processing, a conditioning algorithm, a health monitoring block and two interfaces that are used to interact with the entropy source: GetEntropy and HealthTest.

**Figure 324. Entropy source model**

The components pictured above are detailed hereafter:

#### Noise source

The noise source is the component that contains the non-deterministic, entropy-providing activity that is ultimately responsible for the uncertainty associated with the bitstring output by the entropy source. It is composed of:

- Two analog noise sources, each based on three XORed free-running ring oscillator outputs. It is possible to disable those analog oscillators to save power, as described in [Section 37.3.8: RNG low-power usage](#).
- A sampling stage of these outputs clocked by a dedicated clock input (**rng\_clk**), delivering a 2-bit raw data output.

This noise source sampling is independent to the AHB interface clock frequency (**rng\_hclk**).

*Note:* In [Section 37.6: RNG entropy source validation](#) recommended RNG clock frequencies are given.

### Post processing

The sample values obtained from a true random noise source consist of 2-bit bitstrings. Because this noise source output is biased, the RNG implements a post-processing component that reduces that bias to a tolerable level.

More specifically, for each of the two noise source bits the RNG takes half of the bits from the sampled noise source, and half of the bits from inverted sampled noise source. Thus, if the source generates more '1' than '0' (or the opposite), it is filtered

### Conditioning

The conditioning component in the RNG is a deterministic function that increases the entropy rate of the resulting fixed-length bitstrings output (128-bit).

Also note that post-processing computations are triggered when at least 32 bits of raw data has been received and when output FIFO needs a refill. Thus the RNG output entropy is maximum when the RNG 128-bit FIFO is emptied by application after 64 RNG clock cycles.

The times required between two random number generations, and between the RNG initialization and availability of first sample are described in [Section 37.5: RNG processing time](#).

The conditioning component is clocked by the faster AHB clock.

### Output buffer

A data output buffer can store up to four 32-bit words which have been output from the conditioning component. When four words have been read from the output FIFO through the RNG\_DR register, the content of the 128-bit conditioning output register is pushed into the output FIFO, and a new conditioning round is automatically started. Four new words are added to the conditioning output register 213 AHB clock cycles later.

Whenever a random number is available through the RNG\_DR register the DRDY flag transitions from "0" to "1". This flag remains high until output buffer becomes empty after reading four words from the RNG\_DR register.

*Note: When interrupts are enabled an interrupt is generated when this data ready flag transitions from "0" to "1". Interrupt is then cleared automatically by the RNG as explained above.*

### Health checks

This component ensures that the entire entropy source (with its noise source) starts then operates as expected, obtaining assurance that failures are caught quickly and with a high probability and reliability.

The RNG implements the following health check features.

1. Continuous health tests, running indefinitely on the output of the noise source
  - Repetition count test, flagging an error when:
    - a) One of the noise source has provided more than 64 consecutive bits at a constant value ("0" or "1"), or more than 32 consecutive occurrence of two bits patterns ("01" or "10")
    - b) Both noise sources have delivered more than 32 consecutive bits at a constant value ("0" or "1"), or more than 16 consecutive occurrence of two bits patterns ("01" or "10")
2. Vendor specific continuous test
  - Real-time "too slow" sampling clock detector, flagging an error when one RNG clock cycle is smaller than AHB clock cycle divided by 32.

The CECS and SECS status bits in the RNG\_SR register indicate when an error condition is detected, as detailed in [Section 37.3.7: Error management](#).

*Note:* An interrupt can be generated when an error is detected.

### 37.3.4 RNG initialization

The RNG simplified state machine is pictured on [Figure 325](#)

After enabling the RNG (RNGEN=1 in RNG\_CR) the following chain of events occurs:

1. The analog noise source is enabled, and logic immediately starts sampling the analog output, filling 128-bit conditioning shift register
2. The conditioning logic is enabled and post-processing context is initialized using two 128 noise source bits.
3. The conditioning stage internal input data buffer is filled again with 128-bit and one conditioning round is performed. The output buffer is then filled with post processing result.
4. The output buffer is refilled automatically according to the RNG usage.

The associated initialization time can be found in [Section 37.5: RNG processing time](#).

**Figure 325. RNG initialization overview**

### 37.3.5 RNG operation

#### Normal operations

To run the RNG using interrupts the following steps are recommended:

1. Enable the interrupts by setting the IE bit in the RNG\_CR register. At the same time enable the RNG by setting the bit RNGEN=1.
2. An interrupt is now generated when a random number is ready or when an error occurs. Therefore at each interrupt, check that:
  - No error occurred. The SEIS and CEIS bits should be set to 0 in the RNG\_SR register.
  - A random number is ready. The DRDY bit must be set to 1 in the RNG\_SR register.
  - If above two conditions are true the content of the RNG\_DR register can be read up to four consecutive times. If valid data is available in the conditioning output buffer, four additional words can be read by the application (in this case the DRDY bit is still high). If one or both of above conditions are false, the RNG\_DR register must not be read. If an error occurred error recovery sequence described in [Section 37.3.7](#) shall be used.

To run the RNG in polling mode following steps are recommended:

1. Enable the random number generation by setting the RNGEN bit to "1" in the RNG\_CR register.
2. Read the RNG\_SR register and check that:
  - No error occurred (the SEIS and CEIS bits should be set to 0)
  - A random number is ready (the DRDY bit should be set to 1)
3. If above conditions are true read the content of the RNG\_DR register up to four consecutive times. If valid data is available in the conditioning output buffer four additional words can be read by the application (in this case the DRDY bit is still high). If one or both of above conditions are false, the RNG\_DR register must not be read. If an error occurred error recovery sequence described in [Section 37.3.7](#) shall be used.

**Note:** *When data is not ready (DRDY="0") RNG\_DR returns zero. It is recommended to always verify that RNG\_DR is different from zero. Because when it is the case a seed error occurred between RNG\_SR polling and RND\_DR output reading (rare event).*

### Low-power operations

If the power consumption is a concern to the application, low-power strategies can be used, as described in [Section 37.3.8: RNG low-power usage](#).

### Software post-processing

If a NIST approved DRBG with 128 bits of security strength is required an approved random generator software must be built around the RNG true random number generator.

Built-in health check functions are described in [Section 37.3.3: Random number generation](#).

## 37.3.6 RNG clocking

The RNG runs on two different clocks: the AHB bus clock and a dedicated RNG clock.

The AHB clock is used to clock the AHB banked registers and conditioning component. The RNG clock is used for noise source sampling. Recommended clock configurations are detailed in [Section 37.6: RNG entropy source validation](#).

**Note:** *When the CED bit in the RNG\_CR register is set to "0", the RNG clock frequency **should be higher** than AHB clock frequency divided by 32, otherwise the clock checker always flags a clock error (CECS=1 in the RNG\_SR register).*

See [Section 37.3.1: RNG block diagram](#) for details (AHB and RNG clock domains).

## 37.3.7 Error management

In parallel to random number generation an health check block verifies the correct noise source behavior and the frequency of the RNG source clock as detailed in this section. Associated error state is also described.

### Clock error detection

When the clock error detection is enabled (CED = 0) and if the RNG clock frequency is too low, the RNG sets to "1" both the **CEIS** and **CECS** bits to indicate that a clock error occurred. In this case, the application should check that the RNG clock is configured

correctly (see [Section 37.3.6: RNG clocking](#)) and then it must clear the CEIS bit interrupt flag. The CECS bit is automatically cleared when clocking condition is normal.

*Note: The clock error has no impact on generated random numbers, i.e. application can still read RNG\_DR register.*

*CEIS is set only when CECS is set to "1" by RNG.*

### Noise source error detection

When a noise source (or seed) error occurs, the RNG stops generating random numbers and sets to "1" both **SEIS** and **SECS** bits to indicate that a seed error occurred. If a value is available in the RNG\_DR register, it must not be used as it may not have enough entropy. If the error was detected during the initialization phase the whole initialization sequence will be automatically restarted by the RNG.

The following sequence shall be used to fully recover from a seed error after the RNG initialization:

1. Clear the SEIS bit by writing it to "0".
2. Read out 12 words from the RNG\_DR register, and discard each of them in order to clean the pipeline.
3. Confirm that SEIS is still cleared. Random number generation is back to normal.

### 37.3.8 RNG low-power usage

If power consumption is a concern, the RNG can be disabled as soon as the DRDY bit is set to "1" by setting the RNGEN bit to "0" in the RNG\_CR register. As the post-processing logic and the output buffer remain operational while RNGEN='0' following features are available to software:

- If there are valid words in the output buffer four random numbers can still be read from the RNG\_DR register.
- If there are valid bits in the conditioning output internal register four additional random numbers can be still be read from the RNG\_DR register. If it is not the case the RNG must be re-enabled by the application until at least 32 new bits have been collected from the noise source and a complete conditioning round has been done. It corresponds to 16 RNG clock cycles to sample new bits, and 216 AHB clock cycles to run a conditioning round.

When disabling the RNG the user deactivates all the analog seed generators, whose power consumption is given in the datasheet electrical characteristics section. The user also gates all the logic clocked by the RNG clock. Note that this strategy is adding latency before a random sample is available on the RNG\_DR register, because of the RNG initialization time.

If the RNG block is disabled during initialization (i.e. well before the DRDY bit rises for the first time), the initialization sequence resumes from where it was stopped when RNGEN bit is set to "1".

## 37.4 RNG interrupts

In the RNG an interrupt can be produced on the following events:

- Data ready flag
- Seed error, see [Section 37.3.7: Error management](#)
- Clock error, see [Section 37.3.7: Error management](#)

Dedicated interrupt enable control bits are available as shown in [Table 257](#).

**Table 257. RNG interrupt requests**

| Interrupt acronym | Interrupt event  | Event flag | Enable control bit | Interrupt clear method |
|-------------------|------------------|------------|--------------------|------------------------|
| RNG               | Data ready flag  | DRDY       | IE                 | None (automatic)       |
|                   | Seed error flag  | SEIS       | IE                 | Write 0 to SEIS        |
|                   | Clock error flag | CEIS       | IE                 | Write 0 to CEIS        |

The user can enable or disable the above interrupt sources individually by changing the mask bits or the general interrupt control bit IE in the RNG\_CR register. The status of the individual interrupt sources can be read from the RNG\_SR register.

*Note:* Interrupts are generated only when RNG is enabled.

## 37.5 RNG processing time

The conditioning stage can produce four 32-bit random numbers every  $16 \times \frac{f_{\text{AHB}}}{f_{\text{RNG}}}$  clock cycles, if the value is higher than 213 cycles (213 cycles otherwise).

More time is needed for the first set of random numbers after the device exits reset (see [Section 37.3.4: RNG initialization](#)). Indeed, after enabling the RNG for the first time, random data is first available after either:

- 128 RNG clock cycles + 426 AHB cycles, if  $f_{\text{AHB}} < f_{\text{threshold}}$
- 192 RNG clock cycles + 213 AHB cycles, if  $f_{\text{AHB}} \geq f_{\text{threshold}}$

With  $f_{\text{threshold}} = (213 \times f_{\text{RNG}}) / 64$

## 37.6 RNG entropy source validation

### 37.6.1 Introduction

In order to assess the amount of entropy available from the RNG, STMicroelectronics has tested the peripheral using German BSI AIS-31 statistical tests (T0 to T8). The results can be provided on demand or the customer can reproduce the tests.

### 37.6.2 Validation conditions

STMicroelectronics has tested the RNG true random number generator in the following conditions:

- RNG clock rng\_clk = 48 MHz (CED bit = '0' in RNG\_CR register) and rng\_clk = 400 kHz (CED bit = '1' in RNG\_CR register).

### 37.6.3 Data collection

In order to run statistical tests it is required to collect samples from the entropy source at raw data level as well as at the output of the entropy source.

Contact STMicroelectronics if above samples need to be retrieved for your product.

## 37.7 RNG registers

The RNG is associated with a control register, a data register and a status register.

### 37.7.1 RNG control register (RNG\_CR)

Address offset: 0x000

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |       |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|-------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18    | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.  | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |       |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2     | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CED  | Res. | IE   | RNGEN | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      | rw   |      | rw   | rw    |      |      |

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **CED**: Clock error detection

0: Clock error detection is enable

1: Clock error detection is disable

The clock error detection cannot be enabled nor disabled on-the-fly when the RNG is enabled, i.e. to enable or disable CED the RNG must be disabled.

Bit 4 Reserved, must be kept at reset value.

Bit 3 **IE**: Interrupt Enable

0: RNG Interrupt is disabled

1: RNG Interrupt is enabled. An interrupt is pending as soon as DRDY='1', SEIS='1' or CEIS=1 in the RNG\_SR register.

Bit 2 **RNGEN**: True random number generator enable

0: True random number generator is disabled. Analog noise sources are powered off and logic clocked by the RNG clock is gated.

1: True random number generator is enabled.

Bits 1:0 Reserved, must be kept at reset value.

### 37.7.2 RNG status register (RNG\_SR)

Address offset: 0x004

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |       |       |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|-------|-------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22    | 21    | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.  | Res.  | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |       |       |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6     | 5     | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | SEIS  | CEIS  | Res. | Res. | SECS | CECS | DRDY |
|      |      |      |      |      |      |      |      |      | rc_w0 | rc_w0 |      |      | r    | r    | r    |

Bits 31:7 Reserved, must be kept at reset value.

**Bit 6 SEIS:** Seed error interrupt status

This bit is set at the same time as SECS. It is cleared by writing 0. Writing 1 has no effect.

0: No faulty sequence detected

1: At least one faulty sequence has been detected. See **SECS** bit description for details.

An interrupt is pending if IE = 1 in the RNG\_CR register.

**Bit 5 CEIS:** Clock error interrupt status

This bit is set at the same time as CECS. It is cleared by writing 0. Writing 1 has no effect.

0: The RNG clock is correct ( $f_{RNGCLK} > f_{HCLK}/32$ )

1: The RNG has been detected too slow ( $f_{RNGCLK} < f_{HCLK}/32$ )

An interrupt is pending if IE = 1 in the RNG\_CR register.

Bits 4:3 Reserved, must be kept at reset value.

**Bit 2 SECS:** Seed error current status

0: No faulty sequence has currently been detected. If the SEIS bit is set, this means that a faulty sequence was detected and the situation has been recovered.

1: At least one of the following faulty sequence has been detected:

- One of the noise source has provided more than 64 consecutive bits at a constant value ("0" or "1"), or more than 32 consecutive occurrence of two bit patterns ("01" or "10")
- Both noise sources have delivered more than 32 consecutive bits at a constant value ("0" or "1"), or more than 16 consecutive occurrence of two bit patterns ("01" or "10")

**Bit 1 CECS:** Clock error current status

0: The RNG clock is correct ( $f_{RNGCLK} > f_{HCLK}/32$ ). If the CEIS bit is set, this means that a slow clock was detected and the situation has been recovered.

1: The RNG clock is too slow ( $f_{RNGCLK} < f_{HCLK}/32$ ).

*Note: CECS bit is valid only if the CED bit in the RNG\_CR register is set to 0.*

**Bit 0 DRDY:** Data Ready

0: The RNG\_DR register is not yet valid, no random data is available.

1: The RNG\_DR register contains valid random data.

Once the output buffer becomes empty (after reading the RNG\_DR register), this bit returns to 0 until a new random value is generated.

*Note: The DRDY bit can rise when the peripheral is disabled (RNGEN=0 in the RNG\_CR register).*

If IE=1 in the RNG\_CR register, an interrupt is generated when DRDY=1.

### 37.7.3 RNG data register (RNG\_DR)

Address offset: 0x008

Reset value: 0x0000 0000

The RNG\_DR register is a read-only register that delivers a 32-bit random value when read. After being read this register delivers a new random value after 216 periods of AHB clock if the output FIFO is empty.

The content of this register is valid when DRDY=1 and value is not 0x0, even if RNGEN=0.

|               |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31            | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| RNDATA[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r             | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15            | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| RNDATA[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r             | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **RNDATA[31:0]**: Random data

32-bit random data which are valid when DRDY=1. When DRDY=0 RNDATA value is zero.

It is recommended to always verify that RNG\_DR is different from zero. Because when it is the case a seed error occurred between RNG\_SR polling and RND\_DR output reading (rare event).

### 37.7.4 RNG hardware configuration register (RNG\_HWCFGR)

Address offset: 0x3F0

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:0 Reserved, must be kept at reset value.

### 37.7.5 RNG version register (RNG\_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0021

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

|      |      |      |      |      |      |      |      |             |   |   |   |             |   |   |   |
|------|------|------|------|------|------|------|------|-------------|---|---|---|-------------|---|---|---|
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7           | 6 | 5 | 4 | 3           | 2 | 1 | 0 |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | MAJREV[3:0] |   |   |   | MINREV[3:0] |   |   |   |
|      |      |      |      |      |      |      |      | r           | r | r | r | r           | r | r | r |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision

This bitfield returns the RNG peripheral major version.

Bits 3:0 **MINREV[3:0]**: Minor revision

This bitfield returns the RNG peripheral minor version.

### 37.7.6 RNG identification register (RNG\_IPIDR)

Address offset: 0x3F8

Reset value: 0x0017 0041

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ID[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ID[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **ID[31:0]**: Identification code of the peripheral

This bitfield returns the identification code of the RNG peripheral.

### 37.7.7 RNG size ID register (RNG\_SIDR)

Address offset: 0x3FC

Reset value: 0xA3C5 DD01

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SID[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| SID[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **SID[31:0]**: Size identification code

This bitfield returns the size identification code of the RNG peripheral as defined below:

Bits[31:8] = 0xA3C5DD (fixed code)

Bits[7:0] = 0x01 (1 Kbyte address decoding)

### 37.7.8 RNG register map

Table 258 gives the RNG register map and reset values.

Table 258. RNG register map and reset map

| Offset         | Register name | 31           | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   | 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6               | 5    | 4    | 3               | 2    | 1     | 0    |      |

## 38 Hash processor (HASH)

### 38.1 Introduction

The hash processor is a fully compliant implementation of the secure hash algorithm (SHA-1, SHA-224, SHA-256), the MD5 (message-digest algorithm 5) hash algorithm and the HMAC (keyed-hash message authentication code) algorithm. HMAC is suitable for applications requiring message authentication.

The hash processor computes FIPS (Federal Information Processing Standards) approved digests of length of 160, 224, 256 bits, for messages of up to  $(2^{64} - 1)$  bits. It also computes 128-bit digests for the MD5 algorithm.

### 38.2 HASH main features

- Suitable for data authentication applications, compliant with:
  - Federal Information Processing Standards Publication FIPS PUB 180-4, *Secure Hash Standard* (SHA-1 and SHA-2 family)
  - Federal Information Processing Standards Publication FIPS PUB 186-4, *Digital Signature Standard (DSS)*
  - Internet Engineering Task Force (IETF) Request For Comments RFC 1321, *MD5 Message-Digest Algorithm*
  - Internet Engineering Task Force (IETF) Request For Comments RFC 2104, *HMAC: Keyed-Hashing for Message Authentication* and Federal Information Processing Standards Publication FIPS PUB 198-1, *The Keyed-Hash Message Authentication Code (HMAC)*
- Fast computation of SHA-1, SHA-224, SHA-256, and MD5
  - 82 (respectively 66) clock cycles for processing one 512-bit block of data using SHA-1 (respectively SHA-256) algorithm
  - 66 clock cycles for processing one 512-bit block of data using MD5 algorithm
- Corresponding 32-bit words of the digest from consecutive message blocks are added to each other to form the digest of the whole message
  - Automatic 32-bit words swapping to comply with the internal little-endian representation of the input bit-string
  - Word swapping supported: bits, bytes, half-words and 32-bit words
- Automatic padding to complete the input bit string to fit digest minimum block size of 512 bits ( $16 \times 32$  bits)
- Single 32-bit input register associated to an internal input FIFO, corresponding to one block size
- AHB slave peripheral, accessible through 32-bit word accesses only (else an AHB error is generated)
- $8 \times 32$ -bit words (H0 to H7) for output message digest
- Automatic data flow control with support of direct memory access (DMA) using one channel.
- Fixed DMA burst transfers of four words supported

- Interruptible message digest computation, on a per-block basis
  - Re-loadable digest registers
  - Hashing computation suspend/resume mechanism, including DMA

### 38.3 HASH implementation

Table 259. HASH features

| HASH modes/features         | HASH1                      | HASH2                                          |
|-----------------------------|----------------------------|------------------------------------------------|
| Supported DMA type          | Master DMA (MDMA)          | Standard DMA                                   |
| DMA transfer type           | Fixed bursts of four words | Single transfers or fixed bursts of four words |
| DMAA bit (HASH_CR register) | Yes                        | No                                             |

### 38.4 HASH functional description

#### 38.4.1 HASH block diagram

Figure 326 shows the block diagram of the hash processor.

Figure 326. HASH block diagram

### 38.4.2 HASH internal signals

*Table 260* describes a list of useful to know internal signals available at HASH level, not at product level (on pads).

**Table 260. HASH internal input/output signals**

| Signal name | Signal type          | Description                             |
|-------------|----------------------|-----------------------------------------|
| hash_hclk   | digital input        | AHB bus clock                           |
| hash_it     | digital output       | Hash processor global interrupt request |
| hash_dma    | digital input/output | DMA transfer request/ acknowledge       |

### 38.4.3 About secure hash algorithms

The hash processor is a fully compliant implementation of the secure hash algorithm defined by FIPS PUB 180-4 standard and the IETF RFC1321 publication (MD5).

With each algorithm, the HASH computes a condensed representation of a message or data file. More specifically, when a message of any length below  $2^{64}$  bits is provided on input, the HASH processing core produces respectively a fixed-length output string called a message digest, defined as follows:

- For MD5 digest size is 128-bit
- For SHA-1 digest size is 160-bit
- For SHA-224 and SHA-256, the digest size is 224 bits and 256 bits, respectively

The message digest can then be processed with a digital signature algorithm in order to generate or verify the signature for the message.

Signing the message digest rather than the message often improves the efficiency of the process because the message digest is usually much smaller in size than the message. The verifier of a digital signature has to use the same hash algorithm as the one used by the creator of the digital signature.

The SHA-2 functions supported by the hash processor are qualified as “secure” by NIST because it is computationally infeasible to find a message that corresponds to a given message digest, or to find two different messages that produce the same message digest (SHA-1 does not qualify as secure since February 2017). Any change to a message in transit will, with very high probability, result in a different message digest, and the signature will fail to verify.

### 38.4.4 Message data feeding

The message (or data file) to be processed by the HASH should be considered as a bit string. Per FIPS PUB 180-4 standard this message bit string grows from left to right, with hexadecimal words expressed in “big-endian” convention, so that within each word, the most significant bit is stored in the left-most bit position. For example message string “abc” with a bit string representation of “01100001 01100010 01100011” is represented by a 32-bit word 0x00636261, and 8-bit words 0x61626300.

Data are entered into the HASH one 32-bit word at a time, by writing them into the HASH\_DIN register. The current contents of the HASH\_DIN register are transferred to the 16 words input FIFO each time the register is written with new data. Hence HASH\_DIN and the FIFO form a seventeen 32-bit words length FIFO (named the IN buffer).

In accordance to the kind of data to be processed (e.g. byte swapping when data are ASCII text stream) there must be a bit, byte, half-word or no swapping operation to be performed on data from the input FIFO before entering the little-endian hash processing core.

Figure 327 shows how the hash processing core 32-bit data block M0...31 is constructed from one 32-bit words popped into input FIFO by the driver, according to the DATATYPE bitfield in the HASH control register (HASH\_CR).

HASH\_DIN data endianness when bit swapping is disabled (DATATYPE=00) can be described as following: the least significant bit of the message has to be at MSB position in the first word entered into the hash processor, the 32nd bit of the bit string has to be at MSB position in the second word entered into the hash processor and so on.

Figure 327. Message data swapping feature

### 38.4.5 Message digest computing

The hash processor sequentially processes several blocks when computing the message digest. For MD5, SHA1 and SHA2, the block size is 512 bits.

Each time the DMA or the CPU writes a block to the hash processor, the HASH automatically starts computing the message digest. This operation is known as partial digest computation.

As described in [Section 38.4.4: Message data feeding](#), the message to be processed is entered into the HASH 32-bit word at a time, writing to the HASH\_DIN register to fill the input FIFO.

In order to perform the hash computation on this data below sequence shall be used by the application:

1. Initialize the hash processor using the HASH\_CR register:
  - a) Select the right algorithm using ALGO field. If needed program the correct swapping operation on the message input words using DATATYPE bitfield in HASH\_CR.
  - b) Set MODE=1 and select the key length using LKEY if HMAC mode has been selected.
  - c) Update NBLW to define the number of valid bits in last word if it is different from 32 bits. If it is the case automatic padding is applied by the hash processor.
2. Complete the initialization by setting to 1 the INIT bit in HASH\_CR. Also set the bit DMAE to 1 if data are transferred via DMA.

**Caution:** When programming step 2, it is important to set up before or at the same time the correct configuration values (ALGO, DATATYPE, HMAC mode, key length, NBLW).

3. Start filling data by writing to HASH\_DIN register, unless data are automatically: transferred via DMA. Note that the processing of a block can start only once the last value of the block has entered the input FIFO. The way the partial or final digest computation is managed depends on the way data are fed into the processor:
  - a) When data are filled by software:
    - The partial digest computation is triggered when the application writes the first word of the next block. Once the processor is ready again (DINIS=1 in HASH\_SR), the software can write new data to HASH\_DIN. This mechanism avoids the introduction of wait states by the HASH.
    - The final digest computation is triggered when the last block is entered and the software writes the DCAL bit to 1. If the message length is not an exact multiple of the block size, the NBLW field in HASH\_STR register must be written prior to writing DCAL bit (see [Section 38.4.6](#) for details).
  - b) When data are filled by DMA as a single DMA transfer (MDMAT bit=0):
    - The partial digest computation is triggered automatically each time the FIFO is full.
    - The final digest computation is triggered automatically when the last block has been transferred to the HASH\_DIN register (DCAL bit is set to 1 by hardware). If the message length is not an exact multiple of the block size, the NBLW field in

HASH\_STR register must be written prior to enabling the DMA (see [Section 38.4.6](#) for details).

- c) When data are filled using multiple DMA transfers (MDMAT bit=1) and HASH\_HWCFCGR register equals 0x0 (no MDMA):
    - The partial digest computations are triggered as for single DMA transfers. However the final digest computation is not triggered automatically when the last block has been transferred to the HASH\_DIN register (DCAL bit is not set to 1 by hardware). It allows the hash processor to receive a new DMA transfer as part of this digest computation. To launch the final digest computation, the software must set MDMAT bit to 0 before the last DMA transfer in order to trigger the final digest computation as it is done for single DMA transfers (see description before).
  - d) When data are filled by MDMA (HASH\_HWCFCGR register is equal to 0x1):
    - The partial digest computation is triggered automatically each time the FIFO is full.
    - The final digest computation is not triggered automatically when the last block has been transferred to the HASH\_DIN register. When the second last block transfer of 4 words is performed by the DMA, the software must set the DMA Abort bit (DMAA) to 1 before completing the last transfer of 4 words or less into HASH\_DIN (the actual number of words depends on the message total length). Once the last word has been entered, the software sets DCAL bit to 1 to start the final digest computation process. If the message length is not an exact multiple of 512 bits, the NBLW field in HASH\_STR register must be written prior to writing DCAL bit (see [Section 38.4.6](#) for details).
4. Once the digest computation is complete (DCIS= 1), the resulting digest can be read from the output registers as described in [Table 261](#).

**Table 261. Hash processor outputs**

| Algorithm | Valid output registers | Most significant bit | Digest size (in bits) |
|-----------|------------------------|----------------------|-----------------------|
| MD5       | HASH_H0 to HASH_H3     | HASH_H0[31]          | 128                   |
| SHA-1     | HASH_H0 to HASH_H4     | HASH_H0[31]          | 160                   |
| SHA-224   | HASH_H0 to HASH_H6     | HASH_H0[31]          | 224                   |
| SHA-256   | HASH_H0 to HASH_H7     |                      | 256                   |

For more information about HMAC detailed instructions, refer to [Section 38.4.7: HMAC operation](#).

### 38.4.6 Message padding

#### Overview

When computing a condensed representation of a message, the process of feeding data into the hash processor (with automatic partial digest computation every block transfer) loops until the last bits of the original message are written to the HASH\_DIN register.

As the length (number of bits) of a message can be any integer value, the last word written to the hash processor may have a valid number of bits between 1 and 32. This number of valid bits in the last word, NBLW, has to be written to the HASH\_STR register, so that message padding is correctly performed before the final message digest computation.

## Padding processing

Detailed padding sequences with DMA enabled or disabled are described in [Section 38.4.5: Message digest computing](#).

## Padding example

As specified by Federal Information Processing Standards PUB 180-4, the message padding consists in appending a “1” followed by  $k$  “0”s, itself followed by a 64-bit integer that is equal to the length  $L$  in bits of the message. These three padding operations generate a padded message of length  $L + 1 + k + 64$ , which by construction is a multiple of 512 bits.

For the hash processor, the “1” is added to the last word written to the HASH\_DIN register at the bit position defined by the NBLW bitfield, and the remaining upper bits are cleared (“0”s).

### Example from FIPS PUB180-4

Let us assume that the original message is the ASCII binary-coded form of “abc”, of length  $L = 24$ :

```
byte 0 byte 1 byte 2 byte 3
01100001 01100010 01100011 UUUUUUUU
<-- 1st word written to HASH_DIN -->
```

NBLW has to be loaded with the value 24: a “1” is appended at bit location 24 in the bit string (starting counting from left to right in the above bit string), which corresponds to bit 31 in the HASH\_DIN register (little-endian convention):

```
01100001 01100010 01100011 1UUUUUUU
```

Since  $L = 24$ , the number of bits in the above bit string is 25, and 423 “0” bits are appended, making now 448 bits.

This gives in hexadecimal (byte words in big-endian format):

```
61626380 00000000 00000000 00000000
00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000018
```

The message length value,  $L$ , in two-word format (that is 00000000 00000018) is appended. Hence the final padded message in hexadecimal (byte words in big-endian format):

```
61626380 00000000 00000000 00000000
00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000018
```

If the hash processor is programmed to swap byte within HASH\_DIN input register (DATATYPE=10 in HASH\_CR), the above message has to be entered by following the below sequence:

1. `0xUU636261` is written to the HASH\_DIN register (where ‘U’ means don’t care).
2. `0x18` is written to the HASH\_STR register (the number of valid bits in the last word written to the HASH\_DIN register is 24, as the original message length is 24 bits).
3. `0x10` is written to the HASH\_STR register to start the message padding (described above) and then perform the digest computation.

4. The hash computing is complete with the message digest available in the HASH\_HRx registers (x = 0...4) for the SHA-1 algorithm. For this FIPS example, the expected value is as follows:

```

HASH_HR0 = 0xA9993E36
HASH_HR1 = 0x4706816A
HASH_HR2 = 0xBA3E2571
HASH_HR3 = 0x7850C26C
HASH_HR4 = 0x9CD0D89D

```

### 38.4.7 HMAC operation

#### Overview

As specified by Internet Engineering Task Force RFC2104 and NIST FIPS PUB 198-1, the HMAC algorithm is used for message authentication by irreversibly binding the message being processed to a key chosen by the user. The algorithm consists of two nested hash operations:

$$\text{HMAC}(\text{message}) = \text{Hash}((\text{Key} \mid \text{pad}) \text{ XOR } \text{opad} \mid \text{Hash}((\text{Key} \mid \text{pad}) \text{ XOR } \text{ipad} \mid \text{message}))$$

where:

- $\text{opad} = [0x5C]_n$  (outer pad) and  $\text{ipad} = [0x36]_n$  (inner pad)
- $[X]_n$  represents a repetition of X n times, where n equal to the size of the underlying hash function data block (n = 64 for 512-bit blocks).
- pad is a sequence of zeroes needed to extend the key to the length n defined above. If the key length is greater than n, the application shall first hash the key using Hash() function and then use the resultant byte string as the actual key to HMAC.
- $\mid$  represents the concatenation operator.

#### HMAC processing

Four different steps are required to compute the HMAC:

1. The block is initialized by writing the INIT bit to 1 with the MODE bit at 1 and the ALGO bits set to the value corresponding to the desired algorithm. The LKEY bit must also be set to 1 if the key being used is longer than 64 bytes. In this case, as required by HMAC specifications, the hash processor will use the hash of the key instead of the real key.
2. The key to be used for the inner hash function must be provided to the hash processor. The key loading operation follows the same mechanism as the message bit string loading, i.e. write key data into HASH\_DIN and complete the transfer by writing to HASH\_STR register.

*Note:* Endianness details can be found in [Section 38.4.4: Message data feeding](#).

3. Once the last key word has been entered and computation has started, the hash processor elaborates the inner key material. Once this operation has completed, it is ready to accept the message bit string as described in [Section 38.4.4: Message data feeding](#).
4. After the final hash round, the hash processor returns "ready" to indicate that it is ready to receive the key to be used for the outer hash function (normally, this key is the same as the one used for the inner hash function). When the last word of the key is entered and the computation has started, the HMAC result can be found in the HASH\_HR0 to HASH\_HR7 registers as soon as DCIS = 1.

*Note:* The computation latency of the HMAC primitive depends on the lengths of the keys and message, as described in [Section 38.6: HASH processing time](#).

### HMAC example

Below is an example of HMAC SHA-1 algorithm (ALGO=00 and MODE=1 in HASH\_CR) as specified by NIST.

Let us assume that the original message is the ASCII binary-coded form of “Sample message for keylen=blocklen”, of length L = 34 bytes. If the HASH is programmed in no swapping mode (DATATYPE=00 in HASH\_CR), the following data must be loaded sequentially into HASH\_DIN register:

1. **Inner hash key** input (length=64, i.e. no padding), specified by NIST. As key length=64, LKEY bit is set to 0 in HASH\_CR register  

```
00010203 04050607 08090A0B 0C0D0E0F 10111213 14151617
18191A1B 1C1D1E1F 20212223 24252627 28292A2B 2C2D2E2F
30313233 34353637 38393A3B 3C3D3E3F
```
2. **Message** input (length=34, i.e. padding required). HASH\_STR must be set to 0x20 to start message padding and inner hash computation (see ‘U’ as don’t care)  

```
53616D70 6C65206D 65737361 67652066 6F72206B 65796C65
6E3D626C 6F636B6C 656EUUUU
```
3. **Outer hash key** input (length=64, i.e. no padding). A key identical to the inner hash key is entered here.
4. **Final outer hash computing** is then performed by the HASH. The HMAC-SHA1 digest result is available in the HASH\_HRx registers (x = 0 to 4), as shown below:

```
HASH_HR0 = 0x5FD596EE
HASH_HR1 = 0x78D5553C
HASH_HR2 = 0x8FF4E72D
HASH_HR3 = 0x266DFD19
HASH_HR4 = 0x2366DA29
```

### 38.4.8 HASH suspend/resume operations

#### Overview

It is possible to interrupt a hash/HMAC operation to perform another processing with a higher priority. The interrupted process completes later when the higher-priority task has been processed, as shown in [Figure 328](#).

**Figure 328. HASH suspend/resume mechanism**

To do so, the context of the interrupted task must be saved from the HASH registers to memory, and then be restored from memory to the HASH registers.

The procedures where the data flow is controlled by software or by DMA are described below.

### Data loaded by software

When the DMA is not used to load the message into the hash processor, the context can be saved only when no block processing is ongoing.

**To suspend the processing of a message**, proceed as follows after writing 16 words 32-bit (plus one if it is the first block):

1. In Polling mode, wait for BUSY = 0, then poll if the DINIS status bit is set to 1.  
In Interrupt mode, implement the next step in DINIS interrupt handler (recommended).
2. Store the contents of the following registers into memory:
  - HASH\_IMR
  - HASH\_STR
  - HASH\_CR
  - HASH\_CSR0 to HASH\_CSR37. HASH\_CSR38 to HASH\_CSR53 registers must also be saved if an HMAC operation was ongoing.

**To resume the processing of a message**, proceed as follows:

1. Write the following registers with the values saved in memory: HASH\_IMR, HASH\_STR and HASH\_CR.
2. Initialize the hash processor by setting the INIT bit in the HASH\_CR register.
3. Write the HASH\_CSRx registers with the values saved in memory.
4. Restart the processing from the point where it has been interrupted.

*Note:* To optimize the resume process when NBW[3:0]=0x0, HASH\_CSR22 to HASH\_CSR37 registers do not need to be saved then restored as the FIFO is empty.

### Data loaded by DMA

When the DMA is used to load the message into the hash processor, it is recommended to suspend and then restore a secure digest computing is described below.

**To suspend the processing of a message using DMA**, proceed as follows:

1. In Polling mode, wait for BUSY = 0. If DCIS is set in HASH\_SR, the hash result is available and the context swapping is useless. Else go to step 2.
2. In Polling mode, wait for BUSY = 1.
3. Disable the DMA channel. Then clear DMAE bit in HASH\_CR register.
4. In Polling mode, wait for BUSY = 0. If DCIS is set in HASH\_SR, the hash result is available and the context swapping is useless. Else go to step 5.
5. Save HASH\_IMR, HASH\_STR, HASH\_CR, and HASH\_CSR0 to HASH\_CSR37 registers. HASH\_CSR38 to HASH\_CSR53 registers must also be saved if an HMAC operation was ongoing.

**To resume the processing of a message using DMA**, proceed as follows:

1. Reconfigure the DMA controller so that it proceeds with the transfer of the message up to the end if it is not interrupted again. Do not forget to take into account the words that have been already pushed into the FIFO if NBW[3:0] is higher than 0x0.
2. Program the values saved in memory to HASH\_IMR, HASH\_STR and HASH\_CR registers.
3. Initialize the hash processor by setting the INIT bit in the HASH\_CR register.
4. Program the values saved in memory to the HASH\_CSRx registers.
5. Restart the processing from the point where it was interrupted by setting the DMAE bit.

*Note:* To optimize the resume process when NBW[3:0]=0x0, HASH\_CSR22 to HASH\_CSR37 registers do not need to be saved then restored as the FIFO is empty.

### 38.4.9 HASH DMA interface

The HASH only supports fixed DMA burst transfers of four words (if indicated in [Section 38.3: HASH implementation](#)).

The hash processor provides an interface to connect to the DMA controller. This DMA can be used to write data to the HASH by setting the DMAE bit in the HASH\_CR register. When this bit is set, the HASH initiates a DMA request each time a block has to be written to the HASH\_DIN register.

When the HASH\_HWCFGR register is equal to 0x1, only burst transfers of four words are supported.

Once four 32-bit words have been received, the HASH automatically triggers a new request to the DMA. For more information refer to [Section 38.4.5: Message digest computing](#).

Before starting the DMA transfer, the software must program the number of valid bits in the last word that will be copied into HASH\_DIN register. This is done by writing in HASH\_STR register the following value:

$NBLW = \text{Len}(\text{Message}) \% 32$  where “x%32” gives the remainder of x divided by 32.

The DMAS bit of the HASH\_SR register provides information on the DMA interface activity. This bit is set with DMAE and cleared when DMAE is cleared and no DMA transfer is ongoing.

*Note:* No interrupt is associated to DMAS bit.  
When MDMAT is set, the size of the transfer must be a multiple of four words.

### 38.4.10 HASH error management

No error flags are generated by the hash processor.

## 38.5 HASH interrupts

Two individual maskable interrupt sources are generated by the hash processor to signal the following events:

- Digest calculation completion (DCIS)
- Data input buffer ready (DINIS)

Both interrupt sources are connected to the same global interrupt request signal (hash\_it), which is in turn connected to the NVIC (nested vectored interrupt controller). Each interrupt source can individually be enabled or disabled by changing the mask bits in the HASH\_IMR register. Setting the appropriate mask bit to 1 enables the interrupt.

The status of each maskable interrupt source can be read from the HASH\_SR register.

[Table 262](#) gives a summary of the available features.

**Table 262. HASH interrupt requests**

| Interrupt acronym | Interrupt event                            | Event flag | Enable control bit | Interrupt clear method           |
|-------------------|--------------------------------------------|------------|--------------------|----------------------------------|
| HASH              | Digest computation completed               | DCIS       | DCIE               | Clear DCIS or set INIT           |
|                   | Data input buffer ready to get a new block | DINIS      | DINIE              | Clear DINIS or write to HASH_DIN |

## 38.6 HASH processing time

[Table 263](#) summarizes the time required to process an intermediate block for each mode of operation.

**Table 263. Processing time (in clock cycle)**

| Mode of operation | FIFO load <sup>(1)</sup> | Computation phase | Total     |
|-------------------|--------------------------|-------------------|-----------|
| MD5               | 16                       | 50                | <b>66</b> |
| SHA-1             | 16                       | 66                | <b>82</b> |
| SHA-224           | 16                       | 50                | <b>66</b> |
| SHA-256           |                          |                   |           |

1. Add the time required to load the block into the processor.

The time required to process the last block of a message (or of a key in HMAC) can be longer. This time depends on the length of the last block and the size of the key (in HMAC mode).

Compared to the processing of an intermediate block, it can be increased by the factor below:

- **1 to 2.5** for a hash message
- **~2.5** for an HMAC input-key
- **1 to 2.5** for an HMAC message
- **~2.5** for an HMAC output key in case of a short key
- **3.5 to 5** for an HMAC output key in case of a long key

## 38.7 HASH registers

The HASH core is associated with several control and status registers and several message digest registers. All these registers are accessible through 32-bit word accesses only, else an AHB error is generated.

### 38.7.1 HASH control register (HASH\_CR)

Address offset: 0x00

Reset value: 0x0000 0000

| 31   | 30   | 29    | 28    | 27       | 26   | 25   | 24   | 23    | 22   | 21            | 20   | 19   | 18    | 17   | 16   |
|------|------|-------|-------|----------|------|------|------|-------|------|---------------|------|------|-------|------|------|
| Res. | Res. | Res.  | Res.  | Res.     | Res. | Res. | Res. | Res.  | Res. | Res.          | Res. | Res. | ALGO1 | Res. | LKEY |
|      |      |       |       |          |      |      |      |       |      |               |      |      | rw    |      | rw   |
| 15   | 14   | 13    | 12    | 11       | 10   | 9    | 8    | 7     | 6    | 5             | 4    | 3    | 2     | 1    | 0    |
| Res. | DMAA | MDMAT | DINNE | NBW[3:0] |      |      |      | ALGO0 | MODE | DATATYPE[1:0] |      | DMAE | INIT  | Res. | Res. |
|      | rw   | rw    | r     | r        | r    | r    | r    | rw    | rw   | rw            | rw   | rw   | w     |      |      |

Bits 31:19 Reserved, must be kept at reset value.

Bit 17 Reserved, must be kept at reset value.

Bit 16 **LKEY**: Long key selection

This bit selects between short key ( $\leq 64$  bytes) or long key ( $> 64$  bytes) in HMAC mode.

0: Short key ( $\leq 64$  bytes)

1: Long key ( $> 64$  bytes)

This selection is only taken into account when the INIT bit is set and MODE= 1. Changing this bit during a computation has no effect.

Bit 15 Reserved, must be kept at reset value.

Bit 14 **DMAA**: DMA Abort

This bit is used to abort the usage of DMA to compute a digest. When DMAA is set DMA requests are no more issued toward the DMA, with DMAE in control register and DMAS in status register both cleared.

If DMAA is read, will always return 0. Writing 0 has no effect.

*Note: The availability of DMAA depends on peripheral implementation. Refer to [Section 38.3: HASH implementation](#).*

Bit 13 **MDMAT**: Multiple DMA transfers

This bit is set when hashing large files when multiple DMA transfers are needed.

0: DCAL is automatically set at the end of a DMA transfer.

1: DCAL is not automatically set at the end of a DMA transfer.

Bit 12 **DINNE**: DIN not empty

This bit is set when the HASH\_DIN register holds valid data (that is after being written at least once). It is cleared when either the INIT bit (initialization) or the DCAL bit (completion of the previous message processing) is written to 1.

0: No data are present in the data input buffer

1: The input buffer contains at least one word of data

This bit is read-only.

Bits 11:8 **NBW[3:0]**: Number of words already pushed

This bitfield reflects the number of words in the message that have already been pushed into the IN FIFO. NBW is incremented by one when a write access to the HASH\_DIN register is performed (except if DINNE = 0 and the DMA is not used, see below description). NBW goes to zero when the INIT bit is written to 1.

This bitfield is read-only.

**If the DMA is not used**

0000: if DINNE = 0, no word has been pushed into the DIN buffer (both HASH\_DIN register and IN FIFO are empty), otherwise one word has been pushed into the DIN buffer (HASH\_DIN register contains one word and IN FIFO is empty)

0001: two words have been pushed into the DIN buffer (i.e. HASH\_DIN register and the IN FIFO contain one word each)

...

1111: 16 words have been pushed into the DIN buffer.

**If the DMA is used**

NBW contains the exact number of words that have been pushed into the IN FIFO by the DMA.

Bits 18, 7 **ALGO[1:0]**: Algorithm selection

These bits select the hash algorithm.

00: SHA-1

01: MD5

10: SHA-224

11: SHA-256

This selection is only taken into account when the INIT bit is set. Changing this bitfield during a computation has no effect.

Bit 6 **MODE**: Mode selection

This bit selects the HASH or HMAC mode for the selected algorithm:

0: Hash mode selected

1: HMAC mode selected. LKEY must be set if the key being used is longer than 64 bytes.

This selection is only taken into account when the INIT bit is set. Changing this bit during a computation has no effect.

Bits 5:4 **DATATYPE[1:0]**: Data type selection

Defines the format of the data entered into the HASH\_DIN register:

00: 32-bit data. The data written into HASH\_DIN are directly used by the HASH processing, without reordering.

01: 16-bit data, or half-word. The data written into HASH\_DIN are considered as two half-words, and are swapped before being used by the HASH processing.

10: 8-bit data, or bytes. The data written into HASH\_DIN are considered as four bytes, and are swapped before being used by the HASH processing.

11: bit data, or bit-string. The data written into HASH\_DIN are considered as 32 bits (1st bit of the string at position 0), and are swapped before being used by the HASH processing (1st bit of the string at position 31).

Bit 3 **DMAE**: DMA enable

0: DMA transfers disabled

1: DMA transfers enabled. A DMA request is sent as soon as the HASH core is ready to receive data.

After this bit is set it is cleared by hardware while the last data of the message is written into the hash processor.

Setting this bit to 0 while a DMA transfer is on-going is not aborting this current transfer. Instead, the DMA interface of the IP remains internally enabled until the transfer is completed or INIT is written to 1.

Setting INIT bit to 1 does not clear DMAE bit.

Bit 2 **INIT**: Initialize message digest calculation

Writing this bit to 1 resets the hash processor core, so that the HASH is ready to compute the message digest of a new message.

Writing this bit to 0 has no effect. Reading this bit always return 0.

Bits 1:0 Reserved, must be kept at reset value.

### 38.7.2 HASH data input register (HASH\_DIN)

Address offset: 0x04

Reset value: 0x0000 0000

HASH\_DIN is the data input register. It is 32-bit wide. This register is used to enter the message by blocks. When the HASH\_DIN register is programmed, the value presented on the AHB databus is 'pushed' into the hash core and the register takes the new value presented on the AHB databus. To get a correct message format, the DATATYPE bits must have been previously configured in the HASH\_CR register.

When a complete block has been written to the HASH\_DIN register, an intermediate digest calculation is launched:

- by writing new data into the HASH\_DIN register (the first word of the next block) if the DMA is not used (intermediate digest calculation),
- automatically if the DMA is used.

When the last block has been written to the HASH\_DIN register, the final digest calculation (including padding) is launched by writing the DCAL bit to 1 in the HASH\_STR register (final digest calculation). This operation is automatic if the DMA is used and MDMAT bit is set to 0 and DMAA is not set to 1.

Reading the HASH\_DIN register returns the last word written to this location (zero after reset).

**Note:** *When the HASH is busy, a write access to the HASH\_DIN register might stall the AHB bus if the digest calculation (intermediate or final) is not complete.*

|               |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31            | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DATAIN[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw            | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15            | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| DATAIN[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw            | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DATAIN[31:0]**: Data input

Writing this register pushes the current register content into the IN FIFO, and the register takes the new value presented on the AHB databus.

Reading this register returns the current register content.

### 38.7.3 HASH start register (HASH\_STR)

Address offset: 0x08

Reset value: 0x0000 0000

The HASH\_STR register has two functions:

- It is used to define the number of valid bits in the last word of the message entered in the hash processor (that is the number of valid least significant bits in the last data written to the HASH\_DIN register)
- It is used to start the processing of the last block in the message by writing the DCAL bit to 1

|      |      |      |      |      |      |      |      |      |      |      |           |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|-----------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20        | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.      | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |           |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4         | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | DCAL | Res. | Res. | Res. | NBLW[4:0] |      |      |      |      |
|      |      |      |      |      |      |      | rw   |      |      |      | rw        | rw   | rw   | rw   | rw   |

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **DCAL**: Digest calculation

Writing this bit to 1 starts the message padding, using the previously written value of NBLW, and starts the calculation of the final message digest with all data words written to the input FIFO since the INIT bit was last written to 1.  
Reading this bit returns 0.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **NBLW[4:0]**: Number of valid bits in the last word

When the last word of the message bit string is written in HASH\_DIN register, the hash processor takes only the valid bits specified as below, after internal data swapping:

0x00: All 32 bits of the last data written are valid message bits i.e. M[31:0]

0x01: Only one bit of the last data written (after swapping) is valid i.e. M[0]

0x02: Only two bits of the last data written (after swapping) are valid i.e. M[1:0]

0x03: Only three bits of the last data written (after swapping) are valid i.e. M[2:0]

...

0x1F: Only 31 bits of the last data written (after swapping) are valid i.e. M[30:0]

The above mechanism is valid only if DCAL=0. If NBLW bits are written while DCAL is set to 1, the NBLW bitfield remains unchanged. In other words it is not possible to configure NBLW and set DCAL at the same time.

Reading NBLW bits returns the last value written to NBLW.

### 38.7.4 HASH digest registers

These registers contain the message digest result named as follows:

- HASH\_HR0, HASH\_HR1, HASH\_HR2, HASH\_HR3 and HASH\_HR4 registers return the SHA-1 digest result
- HASH\_HR0, HASH\_HR1, HASH\_HR2 and HASH\_HR3 registers return A, B, C and D (respectively), as defined by MD5.
- HASH\_HR0 to HASH\_HR6 registers return the SHA-224 digest result.
- HASH\_HR0 to HASH\_HR7 registers return the SHA-256 digest result.

In all cases, the digest most significant bit is stored in HASH\_H0[31] and unused HASH\_HRx registers are read as zeros.

If a read access to one of these registers is performed while the hash core is calculating an intermediate digest or a final message digest (DCIS bit equals 0), then the read operation is stalled until the hash calculation has completed.

*Note:* When starting a digest computation for a new message (by writing the INIT bit to 1), HASH\_HRx registers are forced to their reset values.  
HASH\_HR0 to HASH\_HR4 registers can be accessed through two different addresses.

#### HASH aliased digest register x (HASH\_HRAx)

Address offset:  $0x0C + 0x04 * x$  ( $x=0$  to 4)

Reset value: 0x0000 0000

The content of the HASH\_HRAx registers is identical to the one of the HASH\_HRx registers located at address offset 0x310.

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **Hx[31:0]**: Hash data x

Refer to [Section 38.7.4: HASH digest registers](#) introduction.

### HASH supplementary digest register x (HASH\_HRx)

Address offset:  $0x310 + 0x04 * x$  ( $x = 5$  to  $7$ )

Reset value: 0x0000 0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Hx[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| Hx[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **Hx[31:0]**: Hash data x

Refer to [Section 38.7.4: HASH digest registers](#) introduction.

### 38.7.5 HASH interrupt enable register (HASH\_IMR)

Address offset: 0x20

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |       |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|-------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.  |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |       |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0     |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DCIE | DINIE |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      | rw   | rw    |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DCIE**: Digest calculation completion interrupt enable

0: Digest calculation completion interrupt disabled

1: Digest calculation completion interrupt enabled.

Bit 0 **DINIE**: Data input interrupt enable

0: Data input interrupt disabled

1: Data input interrupt enabled

### 38.7.6 HASH status register (HASH\_SR)

Address offset: 0x24

Reset value: 0x0000 0001

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |       |       |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|-------|-------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17    | 16    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.  | Res.  |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |       |       |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1     | 0     |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | BUSY | DMAS | DCIS  | DINIS |
|      |      |      |      |      |      |      |      |      |      |      |      | r    | r    | rc_w0 | rc_w0 |

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **BUSY**: Busy bit

- 0: No block is currently being processed
- 1: The hash core is processing a block of data

Bit 2 **DMAS**: DMA Status

This bit provides information on the DMA interface activity. It is set with DMAE and cleared when DMAE=0 and no DMA transfer is ongoing. No interrupt is associated with this bit.

- 0: DMA interface is disabled (DMAE=0) and no transfer is ongoing
- 1: DMA interface is enabled (DMAE=1) or a transfer is ongoing

Bit 1 **DCIS**: Digest calculation completion interrupt status

This bit is set by hardware when a digest becomes ready (the whole message has been processed). It is cleared by writing it to 0 or by writing the INIT bit to 1 in the HASH\_CR register.

- 0: No digest available in the HASH\_HRx registers (zeros are returned)
- 1: Digest calculation complete, a digest is available in the HASH\_HRx registers. An interrupt is generated if the DCIE bit is set in the HASH\_IMR register.

Bit 0 **DINIS**: Data input interrupt status

This bit is set by hardware when the FIFO is ready to get a new block (16 locations are free). It is cleared by writing it to 0 or by writing the HASH\_DIN register.

- 0: Less than 16 locations are free in the input buffer
  - 1: A new block can be entered into the input buffer. An interrupt is generated if the DINIE bit is set in the HASH\_IMR register.
- When DINIS=0, HASH\_CSRx registers reads as zero.

### 38.7.7 HASH context swap registers

These registers contain the complete internal register states of the hash processor. They are useful when a suspend/resume operation has to be performed because a high-priority task needs to use the hash processor while it is already used by another task.

When such an event occurs, the HASH\_CSRx registers have to be read and the read values have to be saved in the system memory space. Then the hash processor can be used by the preemptive task, and when the hash computation is complete, the saved context can be read from memory and written back into the HASH\_CSRx registers.

HASH\_CSRx registers can be read only when DINIS equals to 1, otherwise zeros are returned.

**HASH context swap register 0 (HASH\_CSR0)**

Address offset: 0x0F8

Reset value: 0x0000 0002

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision

These bits return the HASH major revision

Bits 3:0 **MINREV[3:0]**: Minor revision

These bits return the HASH minor revision

### 38.7.10 HASH Identification register (HASH\_IPIDR)

Address offset: 0x3F8

Reset value: 0x0017 0031

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ID[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ID[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r         | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **ID[31:0]**: Identifier

These bits return the unique HASH identifier.

### 38.7.11 HASH size identification register (HASH\_SIDR)

Address offset: 0x3FC

Reset value: 0xA3C5 DD01

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| SID[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| SID[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r          | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **SID[31:0]**: Size identification code

This bitfield returns the size identification code of the RNG peripheral as defined below:

Bits[31:8] = 0xA3C5DD (fixed code)

Bits[7:0] = 0x01 (1 Kbyte address decoding)

## 38.7.12 HASH register map

Table 264 gives the summary HASH register map and reset values.

Table 264. HASH1 register map and reset values

## 39 Cryptographic processor (CRYP)

### 39.1 Introduction

The cryptographic processor (CRYP) can be used both to encrypt and decrypt data using the DES, Triple-DES or AES algorithms. It is a fully compliant implementation of the following standards:

- The data encryption standard (DES) and Triple-DES (TDES) as defined by Federal Information Processing Standards Publication (FIPS PUB 46-3, Oct 1999), and the American National Standards Institute (ANSI X9.52)
- The advanced encryption standard (AES) as defined by Federal Information Processing Standards Publication (FIPS PUB 197, Nov 2001)

Multiple key sizes and chaining modes are supported:

- DES/TDES chaining modes ECB and CBC, supporting standard 56-bit keys with 8-bit parity per key
- AES chaining modes ECB, CBC, CTR, GCM, GMAC, CCM for key sizes of 128, 192 or 256 bits

The CRYP is a 32-bit AHB peripheral. It supports DMA transfers for incoming and outgoing data (two DMA channels are required). The peripheral also includes input and output FIFOs (each 8 words deep) for better performance.

The CRYP peripheral provides hardware acceleration to AES and DES cryptographic algorithms packaged in STM32 cryptographic library.

### 39.2 CRYP main features

- Compliant implementation of the following standards:
  - NIST *FIPS publication 46-3, Data Encryption Standard (DES)*
  - ANSI X9.52, *Triple Data Encryption Algorithm Modes of Operation*
  - NIST *FIPS publication 197, Advanced Encryption Standard (AES)*
- AES symmetric block cipher implementation
  - 128-bit data block processing
  - Support for 128-, 192- and 256-bit cipher key lengths
  - Encryption and decryption with multiple chaining modes: Electronic Code Book (ECB), Cipher Block Chaining (CBC), Counter mode (CTR), Galois Counter Mode (GCM), Galois Message Authentication Code mode (GMAC) and Counter with CBC-MAC (CCM).
  - 14 (respectively 18) clock cycles for processing one 128-bit block of data with a 128-bit (respectively 256-bit) key in AES-ECB mode
  - Integrated key scheduler with its key derivation stage (ECB or CBC decryption only)
- DES/TDES encryption/decryption implementation
  - 64-bit data block processing
  - Support for 64-, 128- and 192-bit cipher key lengths (including parity)
  - Encryption and decryption with support of ECB and CBC chaining modes

- Direct implementation of simple DES algorithms (a single key K1 is used)
- 16 (respectively 48) clock cycles for processing one 64-bit block of data in DES (respectively TDES) ECB mode
- Software implementation of ciphertext stealing
- Features common to DES/TDES and AES
  - AMBA AHB slave peripheral, accessible through 32-bit word single accesses only (otherwise an AHB bus error is generated, and write accesses are ignored)
  - 256-bit register for storing the cryptographic key (8x 32-bit registers)
  - 128-bit registers for storing initialization vectors (4x 32-bit)
  - 1x32-bit INPUT buffer associated with an internal IN FIFO of eight 32-bit words, corresponding to four incoming DES blocks or two AES blocks
  - 1x32-bit OUTPUT buffer associated with an internal OUT FIFO of eight 32-bit words, corresponding to four processed DES blocks or two AES blocks
  - Automatic data flow control supporting direct memory access (DMA) using two channels (one for incoming data, one for processed data). Single and burst transfers are supported.
  - Data swapping logic to support 1-, 8-, 16- or 32-bit data
  - Possibility for software to suspend a message if the cryptographic processor needs to process another message with higher priority (suspend/resume operation)

### 39.3 CRYP functional description

#### 39.3.1 CRYP block diagram

Figure 329 shows the block diagram of the cryptographic processor.

Figure 329. CRYP block diagram

### 39.3.2 CRYP internal signals

[Table 265](#) provides a list of useful-to-know internal signals available at cryptographic processor level and not at STM32 product level (on pads).

**Table 265. CRYP internal input/output signals**

| Signal name  | Signal type          | Description                                      |
|--------------|----------------------|--------------------------------------------------|
| cryp_hclk    | digital input        | AHB bus clock                                    |
| cryp_it      | digital output       | Cryptographic processor global interrupt request |
| cryp_in_dma  | digital input/output | IN FIFO DMA burst request/ acknowledge           |
| cryp_out_dma | digital input/output | OUT FIFO DMA burst request/ acknowledge          |

### 39.3.3 CRYP DES/TDES cryptographic core

#### Overview

The DES/Triple-DES cryptographic core consists of three components:

- The DES Algorithm (DEA core)
- Multiple keys (one for the DES algorithm, one to three for the TDES algorithm)
- The initialization vector, which is used only in CBC mode

The DES/Triple-DES cryptographic core provides two operating modes:

- **ALGODIR=0**: Plaintext encryption using the key stored in the CRYP\_Kx registers.
- **ALGODIR=1**: Ciphertext decryption using the key stored in the CRYP\_Kx registers.

The operating mode is selected by programming the ALGODIR bit in the CRYP\_CR register.

#### Typical data processing

Typical usage of the cryptographic processor in DES modes can be found in [Section 39.3.10: CRYP DES/TDES basic chaining modes \(ECB, CBC\)](#).

*Note: The outputs of the intermediate DEA stages are never revealed outside the cryptographic boundary, with the exclusion of the IV registers in CBC mode.*

#### DES keying and chaining modes

The TDES allows three different keying options:

- *Three independent keys*  
The first option specifies that all the keys are independent, that is, K1, K2 and K3 are independent. FIPS PUB 46-3 – 1999 (and ANSI X9.52 – 1998) refers to this option as the Keying Option 1 and, to the TDES as 3-key TDES.
- *Two independent keys*  
The second option specifies that K1 and K2 are independent and K3 is equal to K1, that is, K1 and K2 are independent, K3 = K1. FIPS PUB 46-3 – 1999 (and ANSI X9.52

– 1998) refers to this second option as the Keying Option 2 and, to the TDES as 2-key TDES.

- *Three equal keys*

The third option specifies that K1, K2 and K3 are equal, that is:

$$K1 = K2 = K3$$

FIPS PUB 46-3 – 1999 (and ANSI X9.52 – 1998) refers to the third option as the Keying Option 3. This “1-key” TDES is equivalent to single DES.

The following chaining algorithms are supported by the DES hardware and can be selected through the ALGOMODE bits in the CRYP\_CR register:

- Electronic Code Book (ECB)
- Cipher Block Chaining (CBC)

These modes are described in details in [Section 39.3.10: CRYP DES/TDES basic chaining modes \(ECB, CBC\)](#).

### 39.3.4 CRYP AES cryptographic core

#### Overview

The AES cryptographic core consists of the following components:

- The AES Algorithm (AEA core)
- The Multiplier over a binary Galois field (GF2mul)
- The key information
- The initialization vector (IV) or Nonce information
- Chaining algorithms logic (XOR, feedback/counter, mask)

The AES core works on 128-bit data blocks of (four words) with 128-, 192- or 256-bit key lengths. Depending on the chaining mode, the peripheral requires zero or one 128-bit initialization vector (IV).

The cryptographic peripheral features two operating modes:

- **ALGODIR=0**: Plaintext encryption using the key stored in the CRYP\_Kx registers.
- **ALGODIR=1**: Ciphertext decryption using the key stored in the CRYP\_Kx registers. When ECB and CBC chaining modes are selected, an initial key derivation process is automatically performed by the cryptographic peripheral.

The operating mode is selected by programming the ALGODIR bit in the CRYP\_CR register.

#### Typical data processing

A description of cryptographic processor typical usage in AES mode can be found in [Section 39.3.11: CRYP AES basic chaining modes \(ECB, CBC\)](#).

*Note:* The outputs of the intermediate AEA stages is never revealed outside the cryptographic boundary, with the exclusion of the IV registers.

## AES chaining modes

The following chaining algorithms are supported by the cryptographic processor and can be selected through the ALGOMODE bits in the CRYP\_CR register:

- Electronic Code Book (ECB)
- Cipher Block Chaining (CBC)
- Counter Mode (CTR)
- Galois/Counter Mode (GCM)
- Galois Message Authentication Code mode (GMAC)
- Counter with CBC-MAC (CCM)

A quick introduction on these chaining modes can be found in the following subsections.

For detailed instructions, refer to [Section 39.3.11: CRYP AES basic chaining modes \(ECB, CBC\)](#) and onward.

## AES Electronic CodeBook (ECB)

Figure 330. AES-ECB mode overview

ECB is the simplest operating mode. There are no chaining operations, and no special initialization stage. The message is divided into blocks and each block is encrypted or decrypted separately.

*Note:* For decryption, a special key scheduling is required before processing the first block.

## AES Cipher block chaining (CBC)

Figure 331. AES-CBC mode overview

CBC operating mode chains the output of each block with the input of the following block. To make each message unique, an initialization vector is used during the first block processing.

*Note:* For decryption, a special key scheduling is required before processing the first block.

## AES Counter mode (CTR)

Figure 332. AES-CTR mode overview

The CTR mode uses the AES core to generate a key stream; these keys are then XORed with the plaintext to obtain the ciphertext as specified in NIST *Special Publication 800-38A, Recommendation for Block Cipher Modes of Operation*.

**Note:** Unlike ECB and CBC modes, no key scheduling is required for the CTR decryption, since in this chaining scheme the AES core is always used in encryption mode for producing the counter blocks.

## AES Galois/Counter mode (GCM)

**Figure 333. AES-GCM mode overview**

In Galois/Counter mode (GCM), the plaintext message is encrypted, while a message authentication code (MAC) is computed in parallel, thus generating the corresponding ciphertext and its MAC (also known as authentication tag). It is defined in NIST *Special Publication 800-38D, Recommendation for Block Cipher Modes of Operation - Galois/Counter Mode (GCM) and GMAC*.

GCM mode is based on AES in counter mode for confidentiality. It uses a multiplier over a fixed finite field for computing the message authentication code. It requires an initial value and a particular 128-bit block at the end of the message.

## AES Galois Message Authentication Code (GMAC)

**Figure 334. AES-GMAC mode overview**

Galois Message Authentication Code (GMAC) allows authenticating a message and generating the corresponding message authentication code (MAC). It is defined in NIST *Special Publication 800-38D, Recommendation for Block Cipher Modes of Operation - Galois/Counter Mode (GCM) and GMAC*.

GMAC is similar to Galois/Counter mode (GCM), except that it is applied on a message composed only by clear-text authenticated data (i.e. only header, no payload).

### AES Counter with CBC-MAC (CCM)

Figure 335. AES-CCM mode overview

In Counter with Cipher Block Chaining-Message Authentication Code (CCM), the plaintext message is encrypted while a message authentication code (MAC) is computed in parallel, thus generating the corresponding ciphertext and the corresponding MAC (also known as tag). It is described by NIST in *Special Publication 800-38C, Recommendation for Block Cipher Modes of Operation - The CCM Mode for Authentication and Confidentiality*.

CCM mode is based on AES in counter mode for confidentiality and it uses CBC for computing the message authentication code. It requires an initial value.

Like GCM CCM chaining mode, AES-CCM mode can be applied on a message composed only by cleartext authenticated data (i.e. only header, no payload). Note that this way of using CCM is not called CMAC (it is not similar to GCM/GMAC), and its usage is not recommended by NIST.

### 39.3.5 CRYP procedure to perform a cipher operation

#### Introduction

To understand how the cryptographic peripheral operates, a typical cipher operation is described below. For the detailed peripheral usage according to the cipher mode, refer to the specific section, e.g. [Section 39.3.11: CRYP AES basic chaining modes \(ECB, CBC\)](#).

#### CRYP initialization

1. Initialize the cryptographic processor. The order of operations is not important except for AES-ECB and AES-CBC decryption, where the key preparation requires a specific sequence.
  - a) Disable the cryptographic processor by setting to 0 the CRYPEN bit in the CRYP\_CR register.
  - b) Configure the key size (128-, 192- or 256-bit, in the AES only) with the KEYSIZE bits in the CRYP\_CR register.
  - c) Write the symmetric key into the CRYP\_KxL/R registers (2 to 8 registers to be written depending on the algorithm).
  - d) Configure the data type (1-, 8-, 16- or 32-bit), with the DATATYPE bits in the CRYP\_CR register.
  - e) In case of decryption in AES-ECB or AES-CBC mode, prepare the key that has been written. First configure the key preparation mode by setting the ALGOMODE bits to 0b111 in the CRYP\_CR register. Then write the CRYPEN bit to 1: the BUSY bit is set automatically. Wait until BUSY returns to 0 (CRYPEN is automatically cleared as well): the key is prepared for decryption.
  - f) Configure the algorithm and chaining with the ALGOMODE bits in the CRYP\_CR register.
  - g) Configure the direction (encryption/decryption) through the ALGODIR bit in the CRYP\_CR register.
  - h) When it is required (e.g. CBC or CTR chaining modes), write the initialization vectors into the CRYP\_IVxL/R register.
2. Flush the IN and OUT FIFOs by writing the FFLUSH bit to 1 in the CRYP\_CR register.

#### Preliminary warning for all cases

If the ECB or CBC mode is selected and data are not a multiple of 64 bits (for DES) or 128 bits (for AES), the second and the last block management is more complex than the sequences below. Refer to [Section 39.3.8: CRYP stealing and data padding](#) for more details.

**Appending data using the CPU in polling mode**

1. Enable the cryptographic processor by setting to 1 the CRYPEN bit in the CRYP\_CR register.
2. Write data in the IN FIFO (one block or until the FIFO is full).
3. Repeat the following sequence until the second last block of data has been processed:
  - a) Wait until the not-empty-flag OFNE is set to 1, then read the OUT FIFO (one block or until the FIFO is empty).
  - b) Wait until the not-full-flag IFNF is set to 1, then write the IN FIFO (one block or until the FIFO is full) except if it is the last block.
4. The BUSY bit is set automatically by the cryptographic processor. At the end of the processing, the BUSY bit returns to 0 and both FIFOs are empty (IN FIFO empty flag IFEM=1 and OUT FIFO not empty flag OFNE=0).
5. If the next processing block is the last block, the CPU must pad (when applicable) the data with zeroes to obtain a complete block and specify the number of non-valid bytes using NPBLB bits in CRYP\_CR register in case of AES GCM payload encryption or AES CCM payload decryption (otherwise the tag computation will be wrong). This operation must be performed after checking that the BUSY bit in the CRYP\_CR register is set to 0.

*Note:* NPBLB bits are not used in the header phase of AES GCM, GMAC and CCM modes.

6. When the operation is complete, the cryptographic processor can be disabled by clearing the CRYPEN bit in CRYP\_CR register.

**Appending data using the CPU in interrupt mode**

1. Enable the interrupts by setting the INIM and OUTIM bits in the CRYP\_IMSCR register.
2. Enable the cryptographic processor by setting to 1 the CRYPEN bit in the CRYP\_CR register.
3. In the interrupt service routine that manages the input data:
  - a) If the last block is being loaded, the CPU must pad (when applicable) the data with zeroes to have a complete block and specify the number of non-valid bytes using NPBLB bits in CRYP\_CR register in case of AES GCM payload encryption or AES CCM payload decryption (otherwise the tag computation will be wrong). This operation must be performed after checking that the BUSY bit in the CRYP\_CR register is set to 0. Then load the block into the IN FIFO.

*Note:* NPBLB bits are not used in the header phase of AES GCM, GMAC and CCM.

- b) If it is not the last block, load the data into the IN FIFO. You can load only one block (2 words for DES, 4 words for AES), or load data until the FIFO is full.
  - c) In all cases, after the last word of data has been written, disable the interrupt by clearing the INIM interrupt mask.
4. In the interrupt service routine that manages the input data:
  - a) Read the output data from the OUT FIFO. You can read only one block (2 words for DES, 4 words for AES), or read data until the FIFO is empty.
  - b) When the last word has been read, INIM and BUSY bits are set to 0 and both FIFOs are empty (IFEM=1 and OFNE=0). You can disable the interrupt by clearing the OUTIM bit, and disable the peripheral by clearing the CRYPEN bit.
  - c) If you read the last block of cleartext data (i.e. decryption), optionally discard the data that is not part of message/payload.

### Appending data using the DMA

1. Prepare the last block of data by optionally padding it with zeroes to have a complete block.
2. Configure the DMA controller to transfer the input data from the memory and transfer the output data from the peripheral to the memory, as described in [Section 39.3.19: CRYP DMA interface](#). The DMA should be configured to set an interrupt on transfer completion to indicate that the processing is complete. In case of AES GCM payload encryption or AES CCM payload decryption, DMA transfers must not include the last block. The sequence using the CPU described above must be used instead for this last block, because NPBLB bits needs to be setup before processing the block (otherwise the tag computation will be wrong).

**Note:** *NPBLB bits are not used in the header phase of AES GCM, GMAC and CCM.*

3. Enable the cryptographic processor by setting to 1 the CRYPEN bit in CRYP\_CR register, then enable the DMA IN and OUT requests by setting to 1 the DIEN and DOEN bits in the CRYP\_DMACR register.
4. All the transfers and processing are managed by the DMA and the cryptographic processor. The DMA interrupt indicates that the processing is complete. Both FIFOs are normally empty and BUSY flag is set 0.

**Note:** *DMA cannot be used when DES/TDES algorithms are selected.*

**Caution:** It is important that DMA controller empties the cryptographic processor output FIFO before filling up the cryptographic processor input FIFO. To achieve this, the DMA controller should be configured so that the transfer from the cryptographic peripheral to the memory has a higher priority than the transfer from the memory to the cryptographic peripheral.

### 39.3.6 CRYP busy state

The cryptographic processor is busy and processing data (BUSY set to 1 in CRYP\_SR register) when all the conditions below are met:

- CRYPEN = 1 in CRYP\_CR register.
- There are enough data in the input FIFO (at least two words for the DES or TDES algorithm mode, four words for the AES algorithm mode).
- There is enough free-space in the output FIFO (at least two word locations for DES, four for AES).

Write operations to the CRYP\_Kx(L/R)R key registers, to the CRYP\_IVx(L/R)R initialization registers, or to bits [9:2] of the CRYP\_CR register, are ignored when cryptographic processor is busy (i.e. the registers are not modified). It is thus not possible to modify the configuration of the cryptographic processor while it is processing a data block.

It is possible to clear the CRYPEN bit while BUSY bit is set to 1. In this case the ongoing DES/TDES or AES processing first completes (i.e. the word results are written to the output FIFO) before the BUSY bit is cleared by hardware.

**Note:** *If the application needs to suspend a message to process another one with a higher priority, refer to [Section 39.3.9: CRYP suspend/resume operations](#)*

When a block is being processed in DES or TDES mode, if the output FIFO becomes full and the input FIFO contains at least one new block, then the new block is popped off the input FIFO and the BUSY bit remains high until there is enough space to store this new block into the output FIFO.

### 39.3.7 Preparing the CRYP AES key for decryption

When performing an AES **ECB** or **CBC** decryption, the AES key has to be prepared, i.e. a complete key schedule of encryption is required before performing the decryption. In other words, the key in the last round of encryption must be used as the first round key for decryption.

This preparation is not required in any other AES modes than AES ECB or CBC decryption.

If the application software stores somehow the initial key prepared for decryption, the key scheduling operation can be performed only once for all the data to be decrypted with a given cipher key.

*Note:* The latency of the key preparation operation is 14, 16 or 18 clock cycles depending on the key size (128-, 192- or 256-bit).

The CRYP key preparation process is performed as follow:

1. Write the encryption key to K0...K3 key registers.
2. Program ALGOMODE bits to 0b111 in CRYP\_CR. Writing this value when CRYPEN is set to 1 immediately starts an AES round for key preparation. The BUSY bit in the CRYP\_SR register is set to 1.
3. When the key processing is complete, the resulting key is copied back into the K0...K3 key registers, and the BUSY bit is cleared.

*Note:* As the CRYPEN bitfield is reset by hardware at the end of the key preparation, the application software must set it again for the next operation.

### 39.3.8 CRYP stealing and data padding

When using DES or AES algorithm in **ECB** or **CBC** modes to manage messages that are not multiple of the block size (64 bits for DES, 128 bits for AES), use ciphertext stealing techniques such as those described in NIST *Special Publication 800-38A, Recommendation for Block Cipher Modes of Operation: Three Variants of Ciphertext Stealing for CBC Mode*. Since the cryptographic processor does not implement such techniques, **the last two blocks** must be handled in a special way by the application.

*Note:* Ciphertext stealing techniques are not documented in this reference manual.

Similarly, when the AES algorithm is used in other modes than ECB or CBC, incomplete input data blocks (i.e. block shorter than 128 bits) have to be padded with zeroes by the application prior to encryption (i.e. extra bits should be appended to the trailing end of the data string). After decryption, the extra bits have to be discarded. The cryptographic processor does not implement automatic data padding operation to **the last block**, so the application should follow the recommendation given in [Section 39.3.5: CRYP procedure to perform a cipher operation](#) to manage messages that are not multiple of 128 bits.

*Note:* Padding data are swapped in a similar way as normal data, according to the DATATYPE field in CRYP\_CR register (see [Section 39.3.16: CRYP data registers and data swapping](#) for details).

### 39.3.9 CRYP suspend/resume operations

A message can be suspended if another message with a higher priority has to be processed. When this highest priority message has been sent, the suspended message can be resumed in both encryption or decryption mode.

Suspend/resume operations do not break the chaining operation and the message processing can be resumed as soon as cryptographic processor is enabled again to receive the next data block.

*Figure 336* gives an example of suspend.resume operation: message 1 is suspended in order to send a higher priority message (message 2), which is shorter than message 1 (AES algorithm).

**Figure 336. Example of suspend mode management**

A detailed description of suspend/resume operations can be found in each AES mode section.

### 39.3.10 CRYP DES/TDES basic chaining modes (ECB, CBC)

#### Overview

FIPS PUB 46-3 – 1999 (and ANSI X9.52-1998) provides a thorough explanation of the processing involved in the four operation modes supplied by the DES computing core: TDES-ECB encryption, TDES-ECB decryption, TDES-CBC encryption and TDES-CBC decryption. This section only gives a brief explanation of each mode.

#### DES/TDES-ECB encryption

[Figure 337](#) illustrates the encryption in DES and TDES Electronic CodeBook (DES/TDES-ECB) mode. This mode is selected by writing in ALGOMODE to 0b000 and ALGODIR to 0 in CRYP\_CR.

**Figure 337. DES/TDES-ECB mode encryption**

1. K: key; C: cipher text; I: input block; O: output block; P: plain text.

A 64-bit plaintext data block (P) is used after bit/byte/half-word as the input block (I). The input block is processed through the DEA in the encrypt state using K1. The output of this process is fed back directly to the input of the DEA where the DES is performed in the decrypt state using K2. The output of this process is fed back directly to the input of the DEA where the DES is performed in the encrypt state using K3. The resultant 64-bit output block (O) is used, after bit/byte/half-word swapping, as ciphertext (C) and it is pushed into the OUT FIFO.

**Note:** For more information on data swapping, refer to [Section 39.3.16: CRYP data registers and data swapping](#).

Detailed DES/TDES encryption sequence can be found in [Section 39.3.5: CRYP procedure to perform a cipher operation](#).

## DES/TDES-ECB mode decryption

[Figure 338](#) illustrates the decryption in DES and TDES Electronic CodeBook (DES/TDES-ECB) mode. This mode is selected by writing ALGOMODE to 0b000 and ALGODIR to 1 in CRYP\_CR.

**Figure 338. DES/TDES-ECB mode decryption**

1. K: key; C: cipher text; I: input block; O: output block; P: plain text.

A 64-bit ciphertext block (C) is used, after bit/byte/half-word swapping, as the input block (I). The keying sequence is reversed compared to that used in the encryption process. The input block is processed through the DEA in the decrypt state using K3. The output of this process is fed back directly to the input of the DEA where the DES is performed in the encrypt state using K2. The new result is directly fed to the input of the DEA where the DES is performed in the decrypt state using K1. The resultant 64-bit output block (O), after bit/byte/half-word swapping, produces the plaintext (P).

**Note:** For more information on data swapping refer to [Section 39.3.16: CRYP data registers and data swapping](#).

Detailed DES/TDES encryption sequence can be found in [Section 39.3.5: CRYP procedure to perform a cipher operation](#).

## DES/TDES-CBC encryption

Figure 339 illustrates the encryption in DES and TDES Cipher Block Chaining (DES/TDES-ECB) mode. This mode is selected by writing in ALGOMODE to 0b001 and ALGODIR to 0 in CRYP\_CR.

Figure 339. DES/TDES-CBC mode encryption

K: key; C: cipher text; I: input block; O: output block; Ps: plain text before swapping (when decoding) or after swapping (when encoding); P: plain text; IV: initialization vectors.

This mode begins by dividing a plaintext message into 64-bit data blocks. In TCBC encryption, the first input block ( $I_1$ ), obtained after bit/byte/half-word swapping, is formed by exclusive-ORing the first plaintext data block ( $P_1$ ) with a 64-bit initialization vector IV ( $I_1 = IV \oplus P_1$ ). The input block is processed through the DEA in the encrypt state using K1. The output of this process is fed back directly to the input of the DEA, which performs the DES in the decrypt state using K2. The output of this process is fed directly to the input of the DEA, which performs the DES in the encrypt state using K3. The resultant 64-bit output block ( $O_1$ ) is used directly as the ciphertext ( $C_1$ ), that is,  $C_1 = O_1$ .

This first ciphertext block is then exclusive-ORed with the second plaintext data block to produce the second input block, ( $I_2 = (C_1 \oplus P_2)$ ). Note that  $I_2$  and  $P_2$  now refer to the second block. The second input block is processed through the TDEA to produce the second ciphertext block.

This encryption process continues to “chain” successive cipher and plaintext blocks together until the last plaintext block in the message is encrypted.

If the message does not consist of an integral number of data blocks, then the final partial data block should be encrypted in a manner specified for the application.

Note: For more information on data swapping refer to [Section 39.3.16: CRYP data registers and data swapping](#).

Detailed DES/TDES encryption sequence can be found in [Section 39.3.5: CRYP procedure to perform a cipher operation](#).

### DES/TDES-CBC decryption

[Figure 339](#) illustrates the decryption in DES and TDES Cipher Block Chaining (DES/TDES-ECB) mode. This mode is selected by writing ALGOMODE to 0b001 and ALGODIR to 1 in CRYP\_CR.

**Figure 340. DES/TDES-CBC mode decryption**

1. K: key; C: cipher text; I: input block; O: output block; Ps: plain text before swapping (when decoding) or after swapping (when encoding); P: plain text; IV: initialization vectors.

In this mode the first ciphertext block ( $C_1$ ) is used directly as the input block ( $I_1$ ). The keying sequence is reversed compared to that used for the encrypt process. The input block is processed through the DEA in the decrypt state using  $K_3$ . The output of this process is fed directly to the input of the DEA where the DES is processed in the encrypt state using  $K_2$ . This resulting value is directly fed to the input of the DEA where the DES is processed in the decrypt state using  $K_1$ . The resulting output block is exclusive-ORed with the IV (which must be the same as that used during encryption) to produce the first plaintext block ( $P_1 = O_1 \oplus IV$ ).

The second ciphertext block is then used as the next input block and is processed through the TDEA. The resulting output block is exclusive-ORed with the first ciphertext block to produce the second plaintext data block ( $P_2 = O_2 \oplus C_1$ ). Note that  $P_2$  and  $O_2$  refer to the second block of data.

The DES/TDES-CBC decryption process continues in this manner until the last complete ciphertext block has been decrypted.

Ciphertext representing a partial data block must be decrypted in a manner specified for the application.

**Note:** For more information on data swapping refer to [Section 39.3.16: CRYP data registers and data swapping](#).

Detailed DES/TDES encryption sequence can be found in [Section 39.3.5: CRYP procedure to perform a cipher operation](#).

### DES/TDES suspend/resume operations in ECB/CBC modes

**Caution:** DMA cannot be used when DES/TDES algorithms are selected.

Before interrupting the current message, the user application must respect the following steps:

1. If DMA is used, stop the DMA transfers to the IN FIFO by clearing to 0 the DIEN bit in the CRYP\_DMACR register.
2. Wait until both the IN and the OUT FIFOs are empty (IFEM=1 and OFNE=0 in the CRYP\_SR) and the BUSY bit is cleared. Alternatively, as the input FIFO can contain up to four unprocessed DES blocks, the application could decide for real-time reason to interrupt the cryptographic processing without waiting for the IN FIFO to be empty. In this case, the alternative is:
  - a) Wait until OUT FIFO is empty (OFNE=0).
  - b) Read back the data loaded in the IN FIFO that have not been processed and save them in the memory until the IN FIFO is empty.
3. If DMA is used stop the DMA transfers from the OUT FIFO by clearing to 0 the DOEN bit in the CRYP\_DMACR register.
4. Disable the cryptographic processor by setting the CRYPEN bit to 0 in CRYP\_CR, then save the current configuration (bits [9:2] in the CRYP\_CR register). If CBC mode is selected, save the initialization vector registers, since CRYP\_IVx registers have changed from initial values during the data processing.

**Note:** Key registers do not need to be saved as the original key value is known by the application.

5. If DMA is used, save the DMA controller status (such as the pointers to IN and OUT data transfers, number of remaining bytes).

To resume message processing, the user application must respect the following sequence:

1. If DMA is used, reconfigure the DMA controller to complete the rest of the FIFO IN and FIFO OUT transfers.
2. Make sure the cryptographic processor is disabled by reading the CRYPEN bit in CRYP\_CR (it must be 0).
3. Configure again the cryptographic processor with the initial setting in CRYP\_CR, as well as the key registers using the saved configuration.
4. If the CBC mode is selected, restore CRYP\_IVx registers using the saved configuration.
5. Optionally, write the data that were saved during context saving into the IN FIFO.
6. Enable the cryptographic processor by setting the CRYPEN bit to 1.
7. If DMA is used, enable again DMA requests for the cryptographic processor, by setting to 1 the DIEN and DOEN bits in the CRYP\_DMACR register.

### 39.3.11 CRYP AES basic chaining modes (ECB, CBC)

#### Overview

FIPS PUB 197 (November 26, 2001) provides a thorough explanation of the processing involved in the four basic operation modes supplied by the AES computing core: AES-ECB encryption, AES-ECB decryption, AES-CBC encryption and AES-CBC decryption. This section only gives a brief explanation of each mode.

#### AES ECB encryption

[Figure 341](#) illustrates the AES Electronic codebook (AES-ECB) mode encryption. This mode is selected by writing ALGOMODE to 0b100 and ALGODIR to 0 in CRYP\_CR.

**Figure 341. AES-ECB mode encryption**

1. K: key; C: cipher text; I: input block; O: output block; P: plain text.
2. If Key size = 128: Key = [K3 K2].  
 If Key size = 192: Key = [K3 K2 K1].  
 If Key size = 256: Key = [K3 K2 K1 K0].

In this mode a 128-bit plaintext data block (P) is used after bit/byte/half-word swapping as the input block (I). The input block is processed through the AEA in the encrypt state using the 128, 192 or 256-bit key. The resultant 128-bit output block (O) is used after bit/byte/half-word swapping as ciphertext (C). It is then pushed into the OUT FIFO.

For more information on data swapping refer to [Section 39.3.16: CRYP data registers and data swapping](#).

## AES ECB decryption

[Figure 342](#) illustrates the AES Electronic codebook (AES-ECB) mode decryption. This mode is selected by writing in ALGOMODE to 0b100 and ALGODIR to 1 in CRYP\_CR.

**Figure 342. AES-ECB mode decryption**

1. K: key; C: cipher text; I: input block; O: output block; P: plain text.
2. If Key size = 128 => Key = [K3 K2]  
 If Key size = 192 => Key = [K3 K2 K1]  
 If Key size = 256 => Key = [K3 K2 K1 K0].

To perform an AES decryption in ECB mode, the secret key has to be prepared (it is necessary to execute the complete key schedule for encryption) by collecting the last round key, and using it as the first round key for the decryption of the ciphertext. This preparation phase is computed by the AES core. Refer to [Section 39.3.7: Preparing the CRYP AES key for decryption](#) for more details on how to prepare the key.

When the key preparation is complete, the decryption proceed as follow: a 128-bit ciphertext block (C) is used after bit/byte/half-word swapping as the input block (I). The keying sequence is reversed compared to that of the encryption process. The resultant 128-bit output block (O), after bit/byte or half-word swapping, produces the plaintext (P). The AES-CBC decryption process continues in this manner until the last complete ciphertext block has been decrypted.

For more information on data swapping refer to [Section 39.3.16: CRYP data registers and data swapping](#).

## AES CBC encryption

Figure 343 illustrates the AES Cipher block chaining (AES-CBC) mode encryption. This mode is selected by writing ALGOMODE to 0b101 and ALGODIR to 0 in CRYP\_CR.

Figure 343. AES-CBC mode encryption

1. K: key; C: cipher text; I: input block; O: output block; Ps: plain text before swapping (when decoding) or after swapping (when encoding); P: plain text; IV: Initialization vectors.
2.  $IV_x = [IV_xR \ IV_xL]$ , R=right, L=left.
3. If Key size = 128 => Key =  $[K_3 \ K_2]$ .  
If Key size = 192 => Key =  $[K_3 \ K_2 \ K_1]$   
If Key size = 256 => Key =  $[K_3 \ K_2 \ K_1 \ K_0]$ .

In this mode the first input block ( $I_1$ ) obtained after bit/byte/half-word swapping is formed by exclusive-ORing the first plaintext data block ( $P_1$ ) with a 128-bit initialization vector IV ( $I_1 = IV \oplus P_1$ ). The input block is processed through the AEA in the encrypt state using the 128-, 192- or 256-bit key ( $K_0 \dots K_3$ ). The resultant 128-bit output block ( $O_1$ ) is used directly as ciphertext ( $C_1$ ), that is,  $C_1 = O_1$ . This first ciphertext block is then exclusive-ORed with the second plaintext data block to produce the second input block, ( $I_2 = C_1 \oplus P_2$ ). Note that  $I_2$  and  $P_2$  now refer to the second block. The second input block is processed through the AEA to produce the second ciphertext block. This encryption process continues to “chain” successive cipher and plaintext blocks together until the last plaintext block in the message is encrypted.

If the message does not consist of an integral number of data blocks, then the final partial data block should be encrypted in a manner specified for the application, as explained in [Section 39.3.8: CRYP stealing and data padding](#).

For more information on data swapping, refer to [Section 39.3.16: CRYP data registers and data swapping](#).

## AES CBC decryption

Figure 344 illustrates the AES Cipher block chaining (AES-CBC) mode decryption. This mode is selected by writing ALGOMODE to 0b101 and ALGODIR to 1 in CRYP\_CR.

Figure 344. AES-CBC mode decryption

1. K: key; C: cipher text; I: input block; O: output block; Ps: plain text before swapping (when decoding) or after swapping (when encoding); P: plain text; IV: Initialization vectors.
2.  $IVx = [IVxR \ IVxL]$ , R=right, L=left.
3. If Key size = 128 => Key = [K3 K2].  
If Key size = 192 => Key = [K3 K2 K1].  
If Key size = 256 => Key = [K3 K2 K1 K0].

In CBC mode, like in ECB mode, the secret key must be prepared to perform an AES decryption. Refer to [Section 39.3.7: Preparing the CRYP AES key for decryption](#) for more details on how to prepare the key.

When the key preparation process is complete, the decryption proceeds as follow: the first 128-bit ciphertext block ( $C_1$ ) is used directly as the input block ( $I_1$ ). The input block is processed through the AEA in the decrypt state using the 128-, 192- or 256-bit key. The resulting output block is exclusive-ORed with the 128-bit initialization vector IV (which must be the same as that used during encryption) to produce the first plaintext block ( $P_1 = O_1 \oplus IV$ ).

The second ciphertext block is then used as the next input block and is processed through the AEA. The resulting output block is exclusive-ORed with the first ciphertext block to produce the second plaintext data block ( $P_2 = O_2 \oplus C_1$ ). Note that  $P_2$  and  $O_2$  refer to the second block of data. The AES-CBC decryption process continues in this manner until the last complete ciphertext block has been decrypted.

Ciphertext representing a partial data block must be decrypted in a manner specified for the application, as explained in [Section 39.3.8: CRYP stealing and data padding](#).

For more information on data swapping, refer to [Section 39.3.16: CRYP data registers and data swapping](#).

### AES suspend/resume operations in ECB/CBC modes

Before interrupting the current message, the user application must respect the following sequence:

1. If DMA is used, stop the DMA transfers to the IN FIFO by clearing to 0 the DIEN bit in the CRYP\_DMACR register.
2. Wait until both the IN and the OUT FIFOs are empty (IFEM=1 and OFNE=0 in the CRYP\_SR) and the BUSY bit is cleared.
3. If DMA is used, stop the DMA transfers from the OUT FIFO by clearing to 0 the DOEN bit in the CRYP\_DMACR register.
4. Disable the CRYP by setting the CRYPEN bit to 0 in CRYP\_CR, then save the current configuration (bits [9:2] in the CRYP\_CR register). If ECB mode is not selected, save the initialization vector registers, because CRYP\_IVx registers have changed from initial values during the data processing.

*Note:* Key registers do not need to be saved as the original key value is known by the application.

5. If DMA is used, save the DMA controller status (such as pointers to IN and OUT data transfers, number of remaining bytes).

To resume message processing, the user application must respect the following sequence:

1. If DMA is used, reconfigure the DMA controller to complete the rest of the FIFO IN and FIFO OUT transfers.
2. Make sure the cryptographic processor is disabled by reading the CRYPEN bit in CRYP\_CR (it must be set to 0).
3. Configure the cryptographic processor again with the initial setting in CRYP\_CR, as well as the key registers using the saved configuration.
4. For AES-ECB or AES-CBC decryption, the key must be prepared again, as described in [Section 39.3.7: Preparing the CRYP AES key for decryption](#).
5. If ECB mode is not selected, restore CRYP\_IVx registers using the saved configuration.
6. Enable the cryptographic processor by setting the CRYPEN bit to 1.
7. If DMA is used, enable again the DMA requests from the cryptographic processor, by setting DIEN and DOEN bits to 1 in the CRYP\_DMACR register.

### 39.3.12 CRYP AES counter mode (AES-CTR)

#### Overview

The AES counter mode (CTR) uses the AES block as a key stream generator. The generated keys are then XORed with the plaintext to obtain the ciphertext.

CTR chaining is defined in NIST *Special Publication 800-38A, Recommendation for Block Cipher Modes of Operation*. A typical message construction in CTR mode is given in [Figure 345](#).

**Figure 345. Message construction for the Counter mode**

The structure of this message is as below:

- A 16-byte Initial Counter Block (ICB), composed of three distinct fields:
  - A *nonce*: a 32-bit, single-use value (i.e. a new nonce should be assigned to each new communication).
  - The *initialization vector* (IV): a 64-bit value that must be unique for each execution of the mode under a given key.
  - The *counter*: a 32-bit big-endian integer that is incremented each time a block has been processed. The initial value of the counter should be set to 1.
- The plaintext (P) is both authenticated and encrypted as ciphertext C, with a known length. This length can be non-multiple of 16 bytes, in which case a plaintext padding is required.

## AES CTR processing

[Figure 346](#) (respectively [Figure 347](#)) describes the AES-CTR encryption (respectively decryption) process implemented within this peripheral. This mode is selected by writing in ALGOMODE bitfield to 0b110 in CRYP\_CR.

**Figure 346. AES-CTR mode encryption**

1. K: key; C: cipher text; I: input Block; o: output block; Ps: plain text before swapping (when decoding) or after swapping (when encoding); Cs: cipher text after swapping (when decoding) or before swapping (when encoding); P: plain text; IV: Initialization vectors.

Figure 347. AES-CTR mode decryption

1. K: key; C: cipher text; I: input Block; o: output block; Ps: plain text before swapping (when decoding) or after swapping (when encoding); Cs: cipher text after swapping (when decoding) or before swapping (when encoding); P: plain text; IV: Initialization vectors.

In CTR mode, the output block is XORed with the subsequent input block before it is input to the algorithm. Initialization vectors in the peripheral must be initialized as shown on [Table 266](#).

Table 266. Counter mode initialization vector

| CRYP_IV1R[31:0] | CRYP_IV1L[31:0] | CRYP_IV0R[31:0] | CRYP_IV0L[31:0]     |
|-----------------|-----------------|-----------------|---------------------|
| nonce           | IV[63:32]       | IV[31:0]        | 32-bit counter= 0x1 |

Unlike in CBC mode, which uses the CRYP\_IVx registers only once when processing the first data block, in CTR mode IV registers are used for processing each data block, and the peripheral increments the least significant 32 bits (leaving the other most significant 96 bits unchanged).

CTR decryption does not differ from CTR encryption, since the core always encrypts the current counter block to produce the key stream that will be XORed with the plaintext or cipher as input. Thus when ALGOMODE is set to 0b110, ALGODIR is don't care.

**Note:** In this mode the key must NOT be prepared for decryption.

The following sequence must be used to perform an encryption or a decryption in CTR chaining mode:

1. Make sure the cryptographic processor is disabled by clearing the CRYPEN bit in the CRYP\_CR register.
2. Configure CRYP\_CR as follows:
  - a) Program ALGOMODE bits to 0b110 to select CTR mode.
  - b) Configure the data type (1, 8, 16 or 32 bits) through the DATATYPE bits.
3. Initialize the key registers (128, 192 and 256 bits) in CRYP\_KEYRx as well as the initialization vector (IV) as described in [Table 266](#).
4. Flush the IN and OUT FIFOs by writing the FFLUSH bit to 1 in the CRYP\_CR register.
5. If it is the last block, optionally pad the data with zeros to have a complete block.
6. Append data in the cryptographic processor and read the result. The three possible scenarios are described in [Section 39.3.5: CRYP procedure to perform a cipher operation](#).
7. Repeat the previous step until the second last block is processed. For the last block, execute the two previous steps. For this last block, the driver must discard the data that is not part of the data when the last block size is less than 16 bytes.

#### Suspend/resume operations in CTR mode

Like for the CBC mode, it is possible to interrupt a message to send a higher priority message, and resume the message which was interrupted. Detailed CBC sequence can be found in [Section 39.3.11: CRYP AES basic chaining modes \(ECB, CBC\)](#).

*Note:* Like for CBC mode, IV registers must be reloaded during the resume operation.

### 39.3.13 CRYP AES Galois/counter mode (GCM)

#### Overview

The AES Galois/counter mode (GCM) allows encrypting and authenticating the plaintext, and generating the correspondent ciphertext and tag (also known as message authentication code). To ensure confidentiality, GCM algorithm is based on AES counter mode. It uses a multiplier over a fixed finite field to generate the tag.

GCM chaining is defined in NIST *Special Publication 800-38D, Recommendation for Block Cipher Modes of Operation - Galois/Counter Mode (GCM) and GMAC*. A typical message construction in GCM mode is given in [Figure 348](#).

**Figure 348. Message construction for the Galois/counter mode**

The structure of this message is defined as below:

- A 16-byte Initial Counter Block (ICB), composed of two distinct fields:
  - The *initialization vector* (IV): a 96-bit value that must be unique for each execution of the mode under a given key. Note that the GCM standard supports IV that are shorter than 96-bit, but in this case strict rules apply.
  - The *counter*: a 32-bit big-endian integer that is incremented each time a block has been processed. According to NIST specification, the counter value is 0x2 when processing the first block of payload.
- The authenticated header A (also known as Additional Authentication Data) has a known length  $Len(A)$  that can be non-multiple of 16 bytes and cannot exceed  $2^{64}-1$  bits. This part of the message is only authenticated, not encrypted.
- The plaintext message (P) is both authenticated and encrypted as ciphertext C, with a known length  $Len(P)$  that can be non-multiple of 16 bytes, and cannot exceed  $2^{32}-2$  blocks of 128-bits.

**Note:** GCM standard specifies that ciphertext C has same bit length as the plaintext P.

- When a part of the message (AAD or P) has a length which is non-multiple of 16 bytes, a special padding scheme is required.
- The last block is composed of the length of A (on 64 bits) and the length of ciphertext C (on 64 bits) as shown in [Table 267](#).

Table 267. GCM last block definition

| Endianness | Bit[0] | Bit[32]             | Bit[64] | Bit[96]              |
|------------|--------|---------------------|---------|----------------------|
| Input data | 0x0    | Header length[31:0] | 0x0     | Payload length[31:0] |

### AES GCM processing

This mode is selected by writing ALGOMODE bitfield to 0b110 in CRYP\_CR.

The mechanism for the confidentiality of the plaintext in GCM mode is a variation of the Counter mode, with a particular 32-bit incrementing function that generates the necessary sequence of counter blocks.

CRYP\_IV registers are used for processing each data block. The cryptographic processor automatically increments the 32 least significant bits of the counter block. The first counter block (CB1) written by the application is equal to the Initial Counter Block incremented by one (see [Table 268](#)).

Table 268. GCM mode IV registers initialization

| Register   | CRYP_IV1R[31:0] | CRYP_IV1L[31:0] | CRYP_IV0R[31:0] | CRYP_IV0L[31:0]                  |
|------------|-----------------|-----------------|-----------------|----------------------------------|
| Input data | ICB[127:96]     | ICB[95:64]      | ICB[63:32]      | ICB[31:0]<br>32-bit counter= 0x2 |

**Note:** *In this mode the key must NOT be prepared for decryption.*

The authentication mechanism in GCM mode is based on a hash function, called *GF2mul*, that performs multiplication by a fixed parameter, called the hash subkey (H), within a binary Galois field.

To process a GCM message, the driver must go through four phases, which are described in the following subsections.

- The Init phase: the peripheral prepares the GCM hash subkey (H) and performs the IV processing
- The Header phase: the peripheral processes the Additional Authenticated Data (AAD), with hash computation only.
- The Payload phase: the peripheral processes the plaintext (P) with hash computation, keystream encryption and data XORing. It operates in a similar way for ciphertext (C).
- The Final phase: the peripheral generates the authenticated tag (T) using the data last block.

### 1. GCM init phase

During this first step, the GCM hash subkey (H) is calculated and saved internally to be used for processing all the blocks. It is recommended to follow the sequence below:

- a) Make sure the cryptographic processor is disabled by clearing the CRYPEN bit in the CRYPT\_CR register.
- b) Select the GCM chaining mode by programming ALGOMODE bits to 0b01000 in CRYPT\_CR.
- c) Configure GCM\_CCMPH bits to 0b00 in CRYPT\_CR to indicate that the init phase is ongoing.
- d) Initialize the key registers (128, 192 and 256 bits) in CRYPT\_KEYRx as well as the initialization vector (IV) as defined in [Table 268](#).
- e) Set CRYPEN bit to 1 to start the calculation of the hash key.
- f) Wait for the CRYPEN bit to be cleared to 0 by the cryptographic processor, before moving on to the next phase.

### 2. GCM header phase

The below sequence shall be performed after the GCM init phase. It must be complete before jumping to the payload phase. The sequence is identical for encryption and decryption.

- g) Set the GCM\_CCMPH bits to 0b01 in CRYPT\_CR to indicate that the header phase is ongoing.
- h) Set the CRYPEN bit to 1 to start accepting data.
- i) If it is the last block of additional authenticated data, optionally pad the data with zeros to have a complete block.
- j) Append additional authenticated data in the cryptographic processor. The three possible scenarios are described in [Section 39.3.5: CRYP procedure to perform a cipher operation](#).
- k) Repeat the previous step until the second last additional authenticated data block is processed. For the last block, execute the two previous steps. Once all the additional authenticated data have been supplied, wait until the BUSY flag is cleared before moving on to the next phase.

*Note:* This phase can be skipped if there is no additional authenticated data, i.e.  $Len(A)=0$ .  
In header and payload phases, CRYPEN bit is not automatically cleared by the cryptographic processor.

### 3. GCM payload phase (encryption or decryption)

When the payload size is not null, this sequence must be executed after the GCM header phase. During this phase, the encrypted/decrypted payload is stored in the CRYP\_DOUT register.

- l) Set the CRYPEN bit to 0.
- m) Configure GCM\_CCMPH to 0b10 in the CRYP\_CR register to indicate that the payload phase is ongoing.
- n) Select the algorithm direction (0 for encryption, 1 for decryption) through the ALGODIR bit in CRYP\_CR.
- o) Set the CRYPEN bit to 1 to start accepting data.
- p) If it is the last block of cleartext or plaintext, optionally pad the data with zeros to have a complete block. For encryption, refer to [Section 39.3.8: CRYP stealing and data padding](#) for more details.
- q) Append payload data in the cryptographic processor, and read the result. The three possible scenarios are described in [Section 39.3.5: CRYP procedure to perform a cipher operation](#).
- r) Repeat the previous step until the second last plaintext block is encrypted or until the last block of ciphertext is decrypted. For the last block of plaintext (encryption only), execute the two previous steps. For the last block, the driver must discard the bits that are not part of the cleartext or the ciphertext when the last block size is less than 16 bytes. Once all payload data have been supplied, wait until the BUSY flag is cleared.

*Note:* This phase can be skipped if there is no payload data, i.e.  $Len(C)=0$  (see GMAC mode).

### 4. GCM final phase

In this last step, the cryptographic processor generates the GCM authentication tag and stores it in CRYP\_DOUT register.

- s) Configure GCM\_CCMPH[1:0] to 0b11 in CRYP\_CR to indicate that the Final phase is ongoing. Set the ALGODIR bit to 0 in the same register.
- t) Write the input to the CRYP\_DIN register four times. The input must be composed of the length in bits of the additional authenticated data (coded on 64 bits) concatenated with the length in bits of the payload (coded of 64 bits), as show in [Table 267](#).

*Note:* In this final phase, data have to be inserted normally (no swapping).

- u) Wait until the OFNE flag (FIFO output not empty) is set to 1 in the CRYP\_SR register.
- v) Read the CRYP\_DOUT register 4four times: the output corresponds to the authentication tag.
- w) Disable the cryptographic processor (CRYPEN bit = 0 in CRYP\_CR)
- x) If an authenticated decryption is being performed, compare the generated tag with the expected tag passed with the message.

### Suspend/resume operations in GCM mode

Before interrupting the current message in header or payload phase, the user application must respect the following sequence:

1. If DMA is used, stop DMA transfers to the IN FIFO by clearing to 0 the DIEN bit in the CRYP\_DMACR register.
2. Wait until both the IN and the OUT FIFOs are empty (IFEM=1 and OFNE=0 in the CRYP\_SR register) and the BUSY bit is cleared.
3. If DMA is used, stop DMA transfers from the OUT FIFO by clearing to 0 the DOEN bit in the CRYP\_DMACR register.
4. Disable the cryptographic processor by setting the CRYPEN bit to 0 in CRYP\_CR, then save the current configuration (bits [9:2], bits [17:16] and bits 19 of the CRYP\_CR register). In addition, save the initialization vector registers, since CRYP\_IVx registers have changed from their initial values during data processing.

*Note:* Key registers do not need to be saved as original their key value is known by the application.

5. Save context swap registers: CRYP\_CSGCMCCM0..7R and CRYP\_CSGCM0..7R
6. If DMA is used, save the DMA controller status (pointers to IN and OUT data transfers, number of remaining bytes, etc.).

To resume message processing, the user must respect the following sequence:

1. If DMA is used, reconfigure the DMA controller to complete the rest of the FIFO IN and FIFO OUT transfers.
2. Make sure the cryptographic processor is disabled by reading the CRYPEN bit in CRYP\_CR (it must be 0).
3. Configure again the cryptographic processor with the initial setting in CRYP\_CR, as well as the key registers using the saved configuration.
4. Restore context swap registers: CRYP\_CSGCMCCM0..7R and CRYP\_CSGCM0..7R
5. Restore CRYP\_IVx registers using the saved configuration.
6. Enable the cryptographic processor by setting the CRYPEN bit to 1.
7. If DMA is used, enable again cryptographic processor DMA requests by setting to 1 the DIEN and DOEN bits in the CRYP\_DMACR register.

*Note:* In Header phase, DMA OUT FIFO transfer is not used.

### 39.3.14 CRYP AES Galois message authentication code (GMAC)

#### Overview

The Galois message authentication code (GMAC) allows authenticating a plaintext and generating the corresponding tag information (also known as message authentication code). It is based on GCM algorithm, as defined in NIST *Special Publication 800-38D, Recommendation for Block Cipher Modes of Operation - Galois/Counter Mode (GCM) and GMAC*.

A typical message construction in GMAC mode is given in [Figure 349](#).

**Figure 349. Message construction for the Galois Message Authentication Code mode**

#### AES GMAC processing

This mode is selected by writing ALGOMODE bitfield to 0b110 in CRYP\_CR.

GMAC algorithm corresponds to the GCM algorithm applied on a message composed only of an header. As a consequence, all steps and settings are the same as in GCM mode, except that the payload phase (3) is not used.

#### Suspend/resume operations in GMAC

GMAC is exactly the same as GCM algorithm except that only header phase (2) can be interrupted.

### 39.3.15 CRYP AES Counter with CBC-MAC (CCM)

#### Overview

The AES Counter with Cipher Block Chaining-Message Authentication Code (CCM) algorithm allows encrypting and authenticating the plaintext, and generating the correspondent ciphertext and tag (also known as message authentication code). To ensure confidentiality, CCM algorithm is based on AES counter mode. It uses Cipher Block Chaining technique to generate the message authentication code. This is commonly called CBC-MAC

**Note:** *NIST does not approve this CBC-MAC as an authentication mode outside of the context of the CCM specification.*

CCM chaining is specified in NIST *Special Publication 800-38C, Recommendation for Block Cipher Modes of Operation - The CCM Mode for Authentication and Confidentiality*. A typical message construction in CCM mode is given in [Figure 350](#)

**Figure 350. Message construction for the Counter with CBC-MAC mode**

The structure of this message is as below:

- One 16-byte first authentication block (called B0 by the standard), composed of three distinct fields:
  - Q:** a bit string representation of the byte length of P (Plen)
  - A nonce (N):** single-use value (i.e. a new nonce should be assigned to each new communication). Size of nonce *Nlen* + size of *Plen* shall be equal to 15 bytes.
  - Flags:** most significant byte containing four flags for control information, as specified by the standard. It contains two 3-bit strings to encode the values *t* (MAC length expressed in bytes) and *q* (plaintext length such as  $Plen < 2^{8q}$  bytes). Note that the counter blocks range associated to *q* is equal to  $2^{8q-4}$ , i.e. if *q* maximum value is 8, the counter blocks used in cipher shall be on 60 bits.

- 16-bytes blocks (B) associated to the Associated Data (A).  
This part of the message is only authenticated, not encrypted. This section has a known length, *ALen*, that can be a non-multiple of 16 bytes (see [Figure 350](#)). The standard also states that, on the MSB bits of the first message block (B1), the associated data length expressed in bytes (*a*) must be encoded as defined below:
  - If  $0 < a < 2^{16}-2^8$ , then it is encoded as  $[a]_{16}$ , i.e. two bytes.
  - If  $2^{16}-2^8 < a < 2^{32}$ , then it is encoded as  $0xff \parallel 0xfe \parallel [a]_{32}$ , i.e. six bytes.
  - If  $2^{32} < a < 2^{64}$ , then it is encoded as  $0xff \parallel 0xff \parallel [a]_{64}$ , i.e. ten bytes.
- 16-byte blocks (B) associated to the plaintext message (P), which is both authenticated and encrypted as ciphertext C, with a known length of *Plen*. This length can be a non-multiple of 16 bytes (see [Figure 350](#)).
- The encrypted MAC (T) of length *Tlen* appended to the ciphertext C of overall length *Clen*.
- When a part of the message (A or P) has a length which is a non-multiple of 16 bytes, a special padding scheme is required.

*Note:* CCM chaining mode can also be used with associated data only (i.e. no payload).

As an example, the C.1 section in *NIST Special Publication 800-38C* gives the following:

```

N: 10111213 141516 (Nlen= 56 bits or 0x7 bytes)
A: 00010203 04050607 (Alen= 64 bits or 0x8 bytes)
P: 20212223 (Plen= 32 bits i.e. Q= 0x4 bytes)
T: 6084341b (Tlen= 32 bits or t= 4)
B0: 4f101112 13141516 00000000 00000004
B1: 00080001 02030405 06070000 00000000
B2: 20212223 00000000 00000000 00000000
CTR0: 0710111213 141516 00000000 00000000
CTR1: 0710111213 141516 00000000 00000001

```

The usage of control blocks CTRx is explained in the following section. The generation of CTR0 from the first block (B0) must be managed by software.

## AES CCM processing

This mode is selected by writing ALGOMODE bitfield to 0b1001 in CRYP\_CR.

The data input to the generation-encryption process are a valid nonce, a valid payload string, and a valid associated data string, all properly formatted. The CBC chaining mechanism is applied to the formatted data to generate a MAC, whose length is known. Counter mode encryption, which requires a sufficiently long sequence of counter blocks as input, is applied to the payload string and separately to the MAC. The resulting data, called the ciphertext C, is the output of the generation-encryption process on plaintext P.

CRYP\_IV registers are used for processing each data block. The cryptographic processor automatically increments the CTR counter with a bit length defined by the first block (B0). The first counter written by application, CTR1, is equal to B0 with the first 5 bits zeroed and the most significant bits containing P byte length also zeroed, then incremented by one (see [Table 269](#)).

**Table 269. CCM mode IV registers initialization**

| Register   | CRYP_IV0L[31:0]                                                      | CRYP_IV0R[31:0] | CRYP_IV1L[31:0] | CRYP_IV1R[31:0]                                                                 |
|------------|----------------------------------------------------------------------|-----------------|-----------------|---------------------------------------------------------------------------------|
| Endianness | IV[0:31]                                                             | IV[32:63]       | IV[64:95]       | IV[96:127]                                                                      |
| Input data | B0[31:0], where the 5 most significant bits are set to 0 (flag bits) | B0[63:32]       | B0[95:64]       | B0[127:96], where Q length bits are set to 0, except for bit 0 that is set to 1 |

**Note:** *In this mode, the key must NOT be prepared for decryption.*

To process a CCM message, the driver must go through four phases, which are described below.

- The Init phase: the peripheral processes the first block and prepares the first counter block.
- The Header phase: the peripheral processes the Associated data (A), with hash computation only.
- The Payload phase: the peripheral processes the plaintext (P), with hash computation, counter block encryption and data XORing. It operates in a similar way for ciphertext (C).
- The Final phase: the peripheral generates the message authentication code (MAC).

### 1. CCM init phase

In this first step, the first block (B0) of the CCM message is programmed into the CRYP\_DIN register. During this phase, the CRYP\_DOUT register does not contain any output data. It is recommended to follow the sequence below:

- a) Make sure that the cryptographic processor is disabled by clearing the CRYPEN bit in the CRYP\_CR register.
- b) Select the CCM chaining mode by programming the ALGOMODE bits to 0b01001 in the CRYP\_CR register.
- c) Configure the GCM\_CCMPH bits to 0b00 in CRYP\_CR to indicate that we are in the init phase.
- d) Initialize the key registers (128, 192 and 256 bits) in CRYP\_KEYRx as well as the initialization vector (IV) with CTR1 information, as defined in [Table 269](#).
- e) Set the CRYPEN bit to 1 in CRYP\_CR to start accepting data.
- f) Write the B0 packet into CRYP\_DIN register, then wait for the CRYPEN bit to be cleared to 0 by the cryptographic processor before moving on to the next phase.

*Note:* In this init phase, data have to be inserted normally (no swapping).

### 2. CCM header phase

The below sequence shall be performed after the CCM Init phase. It must be complete before jumping to the payload phase. The sequence is identical for encryption and decryption. During this phase, the CRYP\_DOUT register does not contain any output data.

- g) Set the GCM\_CCMPH bit to 0b01 in CRYP\_CR to indicate that the header phase is ongoing.
- h) Set the CRYPEN bit to 1 to start accepting data.
- i) If it is the last block of associated data, optionally pad the data with zeros to have a complete block.
- j) Append the associated data in the cryptographic processor. The three possible scenarios are described in [Section 39.3.5: CRYP procedure to perform a cipher operation](#).
- k) Repeat the previous step until the second last associated data block is processed. For the last block, execute the two previous steps. Once all the additional authenticated data have been supplied, wait until the BUSY flag is cleared.

*Note:* This phase can be skipped if there is no associated data (A<sub>len</sub>=0).

*Note:* The first block of the associated data B1 must be formatted with the associated data length. This task must be managed by the driver.

### 3. CCM payload phase (encryption or decryption)

When the payload size is not null, this sequence must be performed after the CCM header phase. During this phase, the encrypted/decrypted payload is stored in the CRYP\_DOUT register.

- l) Set the CRYPEN bit to 0.
- m) Configure GCM\_CCMPH bits to 0b10 in CRYP\_CR to indicate that the payload phase is ongoing.
- n) Select the algorithm direction (0 for encryption, 1 for decryption) through the ALGODIR bit in CRYP\_CR.
- o) Set the CRYPEN bit to 1 to start accepting data.
- p) If it is the last block of cleartext, optionally pad the data with zeros to have a complete block (encryption only). For decryption, refer to [Section 39.3.8: CRYP stealing and data padding](#) for more details.
- q) Append payload data in the cryptographic processor, and read the result. The three possible scenarios are described in [Section 39.3.5: CRYP procedure to perform a cipher operation](#).
- r) Repeat the previous step until the second last plaintext block is encrypted or until the last block of ciphertext is decrypted. For the last block of plaintext (encryption only), execute the two previous steps. For the last block of ciphertext (decryption only), the driver must discard the data that is not part of the cleartext when the last block size is less than 16 bytes. Once all payload data have been supplied, wait until the BUSY flag is cleared

*Note:* This phase can be skipped if there is no payload data, i.e.  $Plen=0$  or  $Clen=Tlen$

*Note:* Do not forget to remove  $LSB_{Tlen}(C)$  encrypted tag information when decrypting ciphertext  $C$ .

### 4. CCM final phase

In this last step, the cryptographic processor generates the CCM authentication tag and stores it in the CRYP\_DOUT register.

- s) Configure GCM\_CCMPH[1:0] bits to 0b11 in CRYP\_CR to indicate that the final phase is ongoing and set the ALGODIR bit to 0 in the same register.
- t) Load in CRYP\_DIN, the CTR0 information which is described in [Table 269](#) with bit[0] set to 0.

*Note:* In this final phase, data have to be inserted normally (no swapping).

- u) Wait until the OFNE flag (FIFO output not empty) is set to 1 in the CRYP\_SR register.
- v) Read the CRYP\_DOUT register four times: the output corresponds to the encrypted CCM tag.
- w) Disable the cryptographic processor (CRYPEN bit set to 0 in CRYP\_CR)
- x) If an authenticated decryption is being performed, compare the generated encrypted tag with the encrypted tag padded in the ciphertext, i.e.  $LSB_{Tlen}(C) = MSB_{Tlen}(CRYP\_DOUT \text{ data})$ .

### Suspend/resume operations in CCM mode

Before interrupting the current message in payload phase, the user application must respect the following sequence:

1. If DMA is used, stop the DMA transfers to the IN FIFO by clearing to 0 the DIEN bit in the CRYP\_DMACR register.
2. Wait until both the IN and the OUT FIFOs are empty (IFEM=1 and OFNE=0 in the CRYP\_SR register) and the BUSY bit is cleared.
3. If DMA is used, stop the DMA transfers from the OUT FIFO by clearing to 0 the DOEN bit in the CRYP\_DMACR register.
4. Disable the cryptographic processor by setting the CRYPEN bit to 0 in CRYP\_CR, then save the current configuration (bits [9:2], bits [17:16] and bits 19 in the CRYP\_CR register). In addition, save the initialization vector registers, since CRYP\_IVx registers have changed from their initial values during the data processing.

*Note:* Key registers do not need to be saved as their original key value is known by the application.

5. Save context swap registers: CRYP\_CSGCMCCM0..7R
6. If DMA is used, save the DMA controller status (pointers for IN and OUT data transfers, number of remaining bytes, etc.).

To resume message processing, the user application must respect the following sequence:

1. If DMA is used, reconfigure the DMA controller to complete the rest of the FIFO IN and FIFO OUT transfers.
2. Make sure the cryptographic processor is disabled by reading the CRYPEN bit in CRYP\_CR (must be 0).
3. Configure the cryptographic processor again with the initial setting in CRYP\_CR and key registers using the saved configuration.
4. Restore context swap registers: CRYP\_CSGCMCCM0..7R
5. Restore CRYP\_IVx registers using the saved configuration.
6. Enable the cryptographic processor by setting the CRYPEN bit to 1.
7. If DMA is used, enable again cryptographic processor DMA requests by setting to 1 the DIEN and DOEN bits in the CRYP\_DMACR register.

*Note:* In Header phase DMA OUT FIFO transfer is not used.

### 39.3.16 CRYP data registers and data swapping

#### Introduction

The CRYP\_DIN register is the 32-bit wide data input register of the peripheral. It is used to enter into the input FIFO up to four 64-bit blocks (TDES) or two 128-bit blocks (AES) of plaintext (when encrypting) or ciphertext (when decrypting), one 32-bit word at a time.

*Note: Data swapping does not apply to GCM and CCM final phases. Data can be inserted normally by the application.*

The first word written into the FIFO is the LSB of the input block. The MSB of the input block is written at the end. CRYP\_DIN data endianness can be described as below when DATATYPE="00" (no data swapping):

- In the DES/TDES modes  
Bit 1 (leftmost bit) of the data block corresponds to the MSB (bit 31) of the first word entered into the FIFO, bit 64 (rightmost bit) corresponds to the LSB (bit 0) of the second word entered into the FIFO.
- In the AES mode  
Bit 0 (leftmost bit) of the data block corresponds to the MSB (bit 31) of the first word written into the FIFO, bit 127 (rightmost bit) corresponds to the LSB (bit 0) of the 4th word written into the FIFO.

Similarly CRYP\_DOUT register is the 32-bit wide data out register of the peripheral. It is a read-only register that is used to retrieve from the output FIFO up to four 64-bit blocks (TDES) or two 128-bit blocks (AES) of plaintext (when encrypting) or ciphertext (when decrypting), one 32-bit word at a time.

Like for the input data, the LSB of the output block is the first word read from the output FIFO. The MSB of the output block is read at the end. CRYP\_DOUT data endianness can be described as below when DATATYPE="00" (no data swapping):

- In the DES/TDES modes  
Bit 1 (leftmost bit) of the data block corresponds to the MSB (bit 31) of the first word read from the FIFO, bit 64 (rightmost bit) corresponds to the LSB (bit 0) of the second word read from the FIFO.
- In the AES mode  
Bit 0 (leftmost bit) of the data block corresponds to the MSB (bit 31) of the first word read from the FIFO, bit 127 (rightmost bit) corresponds to the LSB (bit 0) of the 4th word read from the FIFO.

## DES/TDES data swapping feature

Depending on the type of data to be processed (e.g. byte swapping when data are ASCII text stream), a bit, byte, half-word or no swapping operation must be done on the data read from the input FIFO before entering the little-endian DES processing core. The same swapping must be performed on the data produced by the little-endian DES processing core before they are written to the output FIFO.

Figure 351 shows how the DES processing core 64-bit data block M1...64 is constructed from two consecutive 32-bit words popped into IN FIFO by the driver. This is done according to the DATATYPE bitfield in the CRYP\_CR register.

**Note:** The same swapping is performed between the IN FIFO and the CRYP data block, and between the CRYP data block and the OUT FIFO.

**Figure 351. 64-bit block construction according to the data type (IN FIFO)**

**Note:** The CRYP Key registers (CRYP\_Kx(L/R)) and initialization registers (CRYP\_IVx(L/R)) are not sensitive to the swap mode selected. They have a fixed little-endian configuration (refer to Section 39.3.17 and Section 39.3.18, respectively).

A typical example of data swapping is given in Table 270.

Table 270. DES/TDES data swapping feature

| DATATYPE in CRYPT_CR | Swapping performed          | Data block representation (64-bit)<br>0xABCD7720 6973FE01                                                                                                                                                                                        |

## AES data swapping feature

Depending on the type of data to be processed (e.g. byte swapping when data are ASCII text stream), a bit, byte, half-word or no swapping operation must be done on data read from the input FIFO before entering the little-endian AES processing core. The same swapping must be performed on the data produced by the little-endian AES processing core before they are written to the output FIFO.

Figure 352 shows how the AES processing core 128-bit data block P0..127 is constructed from four consecutive 32-bit words written by the driver to the CRYP\_DIN register. This is done according to the DATATYPE bitfield in the CRYP control register (CRYP\_CR).

**Note:** The same swapping is performed between the CRYP\_DIN and the CRYP data block, and between the CRYP data block and the CRYP\_DOUT.

**Figure 352. 128-bit block construction according to the data type**

**Note:** The swapping operation concerns only the CRYP\_DOUT and CRYP\_DIN registers. The CRYP\_KxL/KxR and CRYP\_IVxL/IVxR registers are not sensitive to the swap mode selected. They have a fixed little-endian configuration (refer to [Section 39.3.17](#) and [Section 39.3.18](#)).

Typical examples of data swapping are given in [Table 271](#).

**Table 271. AES data swapping feature**

| DATATYPE<br>in CRYP_CR | Swapping performed          | Data block representation (64-bit)<br>0x4E6F7720 69732074                                                                                                                                                                            |
|------------------------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                        |                             | System memory data (little-endian)                                                                                                                                                                                                   |
| 0b00                   | No swapping                 | Address @: 0x4E6F7720 (LSB, written first)<br>Address @+4: 0x69732074                                                                                                                                                                |

| 0b10                   | Byte (8-bit) swapping       | Address @: 0x20776F4E (swapped LSB, written first)<br>Address @+4: 0x74207369                                                                                                                                                        |
| 0b11                   | Bit swapping                | LSB data word: 0x4E6F7720<br>0b0100 1110 0110 1111 0111 0111 0010 0000<br>MSB data word: 0x69732074<br>0b0110 1001 0111 0011 0010 0000 0111 0100<br><br>Address @: 0x4EEF672 (swapped LSB, written first)<br>Address @+4: 0x2E04CE96 |

### 39.3.17 CRYP key registers

The CRYP\_Kx registers are used to store the encryption or decryption keys.

They are organized as eight registers in a little-endian configuration, as shown in [Table 272](#).

**Table 272. Key registers CRYP\_KxR/LR endianness (TDES K1/2/3 and AES 128/192/256-bit keys)**

| K0LR[31:0] | K0RR[31:0] | K1LR[31:0] | K1RR[31:0] | K2LR[31:0] | K2RR[31:0] | K3LR[31:0] | K3RR[31:0] |
|------------|------------|------------|------------|------------|------------|------------|------------|
| -          | -          | K1[1:32]   | K1[33:64]  | K2[1:32]   | K2[33:64]  | K3[1:32]   | K3[33:64]  |
| K0LR[31:0] | K0RR[31:0] | K1LR[31:0] | K1RR[31:0] | K2LR[31:0] | K2RR[31:0] | K3LR[31:0] | K3RR[31:0] |
| -          | -          | -          | -          | k[0:31]    | k[32:63]   | k[64:95]   | k[96:127]  |
| K0LR[31:0] | K0RR[31:0] | K1LR[31:0] | K1RR[31:0] | K2LR[31:0] | K2RR[31:0] | K3LR[31:0] | K3RR[31:0] |
| -          | -          | k[0:31]    | k[32:63]   | k[64:95]   | k[96:127]  | k[128:159] | k[160:191] |
| K0LR[31:0] | K0RR[31:0] | K1LR[31:0] | K1RR[31:0] | K2LR[31:0] | K2RR[31:0] | K3LR[31:0] | K3RR[31:0] |
| k[0:31]    | k[32:63]   | k[64:95]   | k[96:127]  | k[128:159] | k[160:191] | k[192:223] | k[224:255] |

**Note:** DES/TDES keys include 8-bit parity information that are not used by the cryptographic processor. In other words, bits 8, 16, 24, 32, 40, 48, 56 and 64 of each 64-bit key value Kx[1:64] are not used.

Keys are considered as four 64-bit data items. They therefore do not have the same data format and representation in system memory as plaintext or ciphertext data.

When TDES is selected (ALGOMODE[2:0] = 000 or 001), three key vectors are used (K1, K2 and K3). When DES is selected (ALGOMODE[2:0] = 010 or 011), a single key vector (K1) is used.

Any write operation to the CRYP\_Kx(L/R) registers when the BUSY bit is set to 1 in the CRYP\_SR register is disregarded (i.e. register content not modified). Thus, the software must check that the BUSY equals 0 before modifying key registers.

Key registers are not affected by the data swapping feature controlled by DATATYPE value in CRYP\_CR register.

Refer to [Section 39.6: CRYP registers](#) for a detailed description of CRYP\_Kx(L/R) registers.

### 39.3.18 CRYP initialization vector registers

The CRYP\_IVxL/IVxR registers are used to store the initialization vector or the nonce, depending on the chaining mode selected. When used, these registers are updated by the core after each computation round of the TDES or AES core.

They are organized as four registers in a little-endian configuration, as shown in [Table 273](#).

**Table 273. Initialization vector registers CRYP\_IVxR endianness**

| CRYP_IV1R[31:0] | CRYP_IV1L[31:0] | CRYP_IV0R[31:0] | CRYP_IV0L[31:0] |
|-----------------|-----------------|-----------------|-----------------|
| IV[96:127]      | IV[64:95]       | IV[32:63]       | IV[0:31]        |

Initialization vector registers are considered as two 64-bit data items. They therefore do not have the same data format and representation in system memory as plaintext or ciphertext data.

Any write operation to the CRYP\_IV0...1(L/R) registers when the BUSY bit is set to 1 in the CRYP\_SR register is disregarded (i.e. register content not modified). Therefore, the software must check that the BUSY equals 0 in the CRYP\_SR register before modifying initialization vectors.

Reading the CRYP\_IV0...1(L/R) register returns the latest counter value (useful for managing suspend mode) except for CCM/GCM.

**Note:** *In DES/TDES mode, only CRYP\_IV0x are used.*

Initialization vector registers are not affected by the data swapping feature controlled by DATATYPE value in CRYP\_CR register.

Refer to [Section 39.6: CRYP registers](#) for a detailed description of CRYP\_IVxL/IVxR registers.

### 39.3.19 CRYP DMA interface

The cryptographic processor provides an interface to connect to the DMA (Direct Memory Access) controller. The DMA operation is controlled through the CRYP DMA control register (CRYP\_DMACR).

*Note:* DMA cannot be used when DES/TDES algorithms are selected.

#### Data input using DMA

DMA can be enabled for writing data into the cryptographic peripheral by setting the DIEN bit in the CRYP\_DMACR register. When this bit is set, the cryptographic processor initiates a DMA request during the INPUT phase each time it requires a word to be written to the CRYP\_DIN register.

[Table 274](#) shows the recommended configuration to transfer data from memory to cryptographic processor through the DMA controller.

**Table 274. Cryptographic processor configuration for memory-to-peripheral DMA transfers**

| DMA channel control register field         | Programming recommendation                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transfer size                              | Message length, multiple of AES cryptographic block size (4 words).<br><i>Note:</i> DES/TDES is not supported with DMA.<br>According to the mode selected, special padding/ ciphertext stealing might be required. As an example, in case of AES GCM encryption or AES CCM decryption, DMA transfers must not include the last block. Please refer to <a href="#">Section 39.3.5: CRYP procedure to perform a cipher operation</a> for details. |
| Source burst size (memory)                 | If high latency memory is used (DDR):<br>CRYP FIFO_size x2 /transfer_width = <b>16</b><br>(FIFO_size= 8x32-bit, transfer_width= 32-bit)<br>If low latency memory is used (SRAM):<br>CRYP FIFO_size /2 /transfer_width = <b>4</b>                                                                                                                                                                                                                |

| Source address increment (memory)          | Yes, after each 32-bit transfer.                                                                                                                                                                                                                                                                                                                                                                                                                |
| Destination address increment (peripheral) | Fixed address of CRYP_DIN shall be used (no increment).                                                                                                                                                                                                                                                                                                                                                                                         |

## Data output using DMA

To enable the DMA for reading data from AES peripheral, set the DOEN bit in the CRYP\_DMACR register. When this bit is set, the cryptographic processor initiates a DMA request during the OUTPUT phase each time it requires a word to be read from the CRYP\_DOUT register.

[Table 275](#) shows the recommended configuration to transfer data from cryptographic processor to memory through the DMA controller.

**Table 275. Cryptographic processor configuration for peripheral-to-memory DMA transfers**

| DMA channel control register field     | Programming recommendation                                                                                                                                                                                                                                                      |

## DMA mode

When AES is used, the cryptographic processor manages two DMA transfer requests through `cryp_in_dma` and `cryp_out_dma` internal input/output signals, which are asserted:

- for IN FIFO: every time a block has been read from FIFO by CRYP,
- for OUT FIFO: every time a block has been written into the FIFO by the cryptographic processor.

*Note: DMA cannot be used when DES/TDES algorithms are selected.*

All request signals are deasserted if the cryptographic peripheral is disabled or the DMA enable bit is cleared (DIEN bit for the IN FIFO and DOEN bit for the OUT FIFO in the CRYP\_DMACR register).

**Caution:** It is important that DMA controller empties the cryptographic peripheral output FIFO before filling up the CRYP input FIFO. To achieve it, the DMA controller should be configured so that the transfer from the peripheral to the memory has a higher priority than the transfer from the memory to the peripheral.

For more detailed information on DMA operations, refer to [Section 39.3.5: CRYP procedure to perform a cipher operation](#).

### 39.3.20 CRYP error management

No error flags are generated by the cryptographic processor.

## 39.4 CRYP interrupts

### Overview

There are two individual maskable interrupt sources generated by the cryptographic processor to signal the following events:

- Input FIFO empty or not full
- Output FIFO full or not empty

These two sources are combined into a single interrupt signal which is the only interrupt signal from the CRYP peripheral that drives the NVIC (nested vectored interrupt controller). You can enable or disable CRYP interrupt sources individually by changing the mask bits in the CRYP\_IMSCR register. Setting the appropriate mask bit to 1 enables the interrupt.

The status of the individual maskable interrupt sources can be read either from the CRYP\_RISR register, for raw interrupt status, or from the CRYP\_MISR register for masked interrupt status. The status of the individual source of event flags can be read from the CRYP\_SR register.

[Table 276](#) gives a summary of the available features.

**Table 276. CRYP interrupt requests**

| Interrupt acronym | Interrupt event       | Event flag                             |            | Enable bit                         | Interrupt clear method                |
|-------------------|-----------------------|----------------------------------------|------------|------------------------------------|---------------------------------------|
|                   |                       | in CRYP_xISR <sup>(1)</sup>            | in CRYP_SR |                                    |                                       |
| CRYP              | Output FIFO full      | OUTRIS (not masked)<br>OUTMIS (masked) | OFFU       | OUTIM <sup>(2)</sup> and<br>CRYPEN | Read one data from output FIFO        |
|                   | Output FIFO not empty |                                        | OFNE       |                                    | Read all data from output FIFO        |
|                   | Input FIFO not full   | INRIS (not masked)<br>INMIS (masked)   | IFNF       | INIM <sup>(2)</sup> and<br>CRYPEN  | Write data until input FIFO is full   |
|                   | Input FIFO empty      |                                        | IFEM       |                                    | Write at least one word in input FIFO |

1. The flags belong to CRYP\_RISR registers (unmasked or raw) or CRYP\_MISR registers (masked).

2. The flags belong to CRYP\_IMSCR register.

**Output FIFO service interrupt - OUTMIS**

The output FIFO service interrupt is asserted when there is one or more (32-bit word) data items in the output FIFO. This interrupt is cleared by reading data from the output FIFO until there is no valid (32-bit) word left (that is when the interrupt follows the state of the output FIFO not empty flag OFNE).

The output FIFO service interrupt OUTMIS is NOT enabled with the CRYP enable bit. Consequently, disabling the CRYP will not force the OUTMIS signal low if the output FIFO is not empty.

**Input FIFO service interrupt - INMIS**

The input FIFO service interrupt is asserted when there are less than four words in the input FIFO. It is cleared by performing write operations to the input FIFO until it holds four or more words.

The input FIFO service interrupt INMIS is enabled with the CRYP enable bit. Consequently, when CRYP is disabled, the INMIS signal is low even if the input FIFO is empty.

## 39.5 CRYP processing time

The time required to process a 128-bit block for each mode of operation is summarized below.

**Table 277. Processing latency for ECB, CBC and CTR**

| Key size  | Operating modes                             | Chaining algorithm | Clock cycles |
|-----------|---------------------------------------------|--------------------|--------------|
| 64 bits   | DES encryption or decryption                | ECD, CBC           | 16           |
| 3x64 bits | TDES encryption or decryption               |                    | 48           |
| 128 bits  | AES encryption or decryption <sup>(1)</sup> | ECD, CBC, CTR      | 14           |
|           | AES key preparation                         | -                  | 12           |
| 192 bits  | AES encryption or decryption <sup>(1)</sup> | ECD, CBC, CTR      | 16           |
|           | AES key preparation                         | -                  | 14           |
| 256 bits  | AES encryption or decryption <sup>(1)</sup> | ECD, CBC, CTR      | 18           |
|           | AES key preparation                         | -                  | 16           |

1. Excluding key preparation time (ECB and CBC only).

**Table 278. Processing time (in clock cycle) for GCM and CCM per 128-bit block**

| Key size | Operating modes              | Chaining algorithm | Init phase | Header phase | Payload phase | Tag phase |
|----------|------------------------------|--------------------|------------|--------------|---------------|-----------|
| 128 bits | AES encryption or decryption | GCM                | 24         | 10           | 14            | 14        |
|          |                              | CCM                | 12         | 14           | 25            | 14        |
| 192 bits |                              | GCM                | 28         | 10           | 16            | 16        |
|          |                              | CCM                | 14         | 16           | 29            | 16        |
| 256 bits |                              | GCM                | 32         | 10           | 18            | 18        |
|          |                              | CCM                | 16         | 18           | 33            | 18        |

## 39.6 CRYP registers

The cryptographic core is associated with several control and status registers, eight key registers and four initialization vectors registers.

### 39.6.1 CRYP control register (CRYP\_CR)

Address offset: 0x00

Reset value: 0x0000 0000

| rw     | w      |      |      |      |      | rw           | rw   | rw            | rw | rw            | rw | rw        | rw      |                |      |

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:20 **NPBLB[3:0]**: Number of Padding Bytes in Last Block of payload.

This padding information must be filled by software before processing the last block of GCM payload encryption or CCM payload decryption, otherwise authentication tag computation is incorrect.

0000: All bytes are valid (no padding)

0001: Padding for the last LSB byte

...

1111: Padding for the 15 LSB bytes of last block.

Writing NPBLB bits while BUSY=1 has no effect. These bits can only be configured when BUSY=0.

Bit 18 Reserved, must be kept at reset value.

Bits 17:16 **GCM\_CCMPH[1:0]**: GCM or CCM Phase selection

This bitfield has no effect if GCM, GMAC or CCM algorithm is not selected in ALGOMODE field.

00: Init phase

01: Header phase

10: Payload phase

11: Final phase

Bit 15 **CRYPEN**: CRYP processor Enable

0: Cryptographic processor peripheral is disabled

1: Cryptographic processor peripheral is enabled

This bit is automatically cleared by hardware when the key preparation process ends (ALGOMODE= 0b111) or after GCM/GMAC or CCM init phase.

Bit 14 **FFLUSH**: CRYP FIFO Flush

0: No FIFO flush

1: FIFO flush enabled

When CRYPEN = 0, writing this bit to 1 flushes the IN and OUT FIFOs (i.e. read and write pointers of the FIFOs are reset). Writing this bit to 0 has no effect.

When CRYPEN = 1, writing this bit to 0 or 1 has no effect.

Reading this bit always returns 0.

FFLUSH bit has to be set only when BUSY=0. If not, the FIFO is flushed, but the block being processed may be pushed into the output FIFO just after the flush operation, resulting in a non-empty FIFO condition.

Bits 13:10 Reserved, must be kept at reset value.

Bits 9:8 **KEYSIZE[1:0]**: Key Size selection (AES mode only)

This bitfield defines the bit-length of the key used for the AES cryptographic core. This bitfield is 'don't care' in the DES or TDES modes.

00: 128-bit key length

01: 192-bit key length

10: 256-bit key length

11: Reserved, do not use this value

Writing KEYSIZE bits while BUSY=1 has no effect. These bits can only be configured when BUSY=0.

Bits 7:6 **DATATYPE[1:0]**: Data Type selection

This bitfield defines the format of data written in CRYP\_DIN or read from CRYP\_DOUT registers. For more details refer to [Section 39.3.16: CRYP data registers and data swapping](#).

00: 32-bit data. No swapping for each word. First word pushed into the IN FIFO (or popped off the OUT FIFO) forms bits 1...32 of the data block, the second word forms bits 33...64 etc.

01: 16-bit data, or half-word. Each word pushed into the IN FIFO (or popped off the OUT FIFO) is considered as 2 half-words, which are swapped with each other.

10: 8-bit data, or bytes. Each word pushed into the IN FIFO (or popped off the OUT FIFO) is considered as 4 bytes, which are swapped with each other.

11: bit data, or bit-string. Each word pushed into the IN FIFO (or popped off the OUT FIFO) is considered as 32 bits (1st bit of the string at position 0), which are swapped with each other.

Writing DATATYPE bits while BUSY=1 has no effect. These bits can only be configured when BUSY=0.

Bits 19, 5:3 **ALGOMODE[3:0]**: Algorithm mode

Below definition includes the bit 19:

0000: TDES-ECB (triple-DES Electronic Codebook).  
 0001: TDES-CBC (triple-DES Cipher Block Chaining).  
 0010: DES-ECB (simple DES Electronic Codebook).  
 0011: DES-CBC (simple DES Cipher Block Chaining).  
 0100: AES-ECB (AES Electronic Codebook).  
 0101: AES-CBC (AES Cipher Block Chaining).  
 0110: AES-CTR (AES Counter Mode).  
 0111: AES key preparation for ECB or CBC decryption.  
 1000: AES-GCM (Galois Counter Mode) and AES-GMAC (Galois Message Authentication Code mode).  
 1001: AES-CCM (Counter with CBC-MAC).

Writing ALGOMODE bits while BUSY=1 has no effect. These bits can only be configured when BUSY=0.

Bit 2 **ALGODIR**: Algorithm Direction

0: Encrypt  
 1: Decrypt

Writing ALGODIR bit while BUSY=1 has no effect. It can only be configured when BUSY=0.

Bits 1:0 Reserved, must be kept at reset value.

### 39.6.2 CRYP status register (CRYP\_SR)

Address offset: 0x04

Reset value: 0x0000 0003

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | BUSY | OFFU | OFNE | IFNF | IFEM |
|      |      |      |      |      |      |      |      |      |      |      | r    | r    | r    | r    | r    |

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **BUSY**: Busy bit

0: The CRYP core is not processing any data. The reason is:

- either that the CRYP core is disabled (CRYPEN=0 in the CRYP\_CR register) and the last processing has completed,
- or the CRYP core is waiting for enough data in the input FIFO or enough free space in the output FIFO (that is in each case at least 2 words in the DES, 4 words in the AES).

1: The CRYP core is currently processing a block of data or a key preparation is ongoing (AES ECB or CBC decryption only).

- Bit 3 **OFFU**: Output FIFO full flag  
 0: Output FIFO is not full  
 1: Output FIFO is full
- Bit 2 **OFNE**: Output FIFO not empty flag  
 0: Output FIFO is empty  
 1: Output FIFO is not empty
- Bit 1 **IFNF**: Input FIFO not full flag  
 0: Input FIFO is full  
 1: Input FIFO is not full
- Bit 0 **IFEM**: Input FIFO empty flag  
 0: Input FIFO is not empty  
 1: Input FIFO is empty

### 39.6.3 CRYP data input register (CRYP\_DIN)

Address offset: 0x08

Reset value: 0x0000 0000

The CRYP\_DIN register is the data input register. It is 32-bit wide. It is used to enter into the input FIFO up to four 64-bit blocks (TDES) or two 128-bit blocks (AES) of plaintext (when encrypting) or ciphertext (when decrypting), one 32-bit word at a time.

To fit different data sizes, the data can be swapped after processing by configuring the DATATYPE bits in the CRYP\_CR register. Refer to [Section 39.3.16: CRYP data registers and data swapping](#) for more details.

When CRYP\_DIN register is written to the data are pushed into the input FIFO.

- If CRYPTEN = 1, when at least two 32-bit words in the DES/TDES mode have been pushed into the input FIFO (four words in the AES mode), and when at least two words are free in the output FIFO (four words in the AES mode), the CRYP engine starts an encrypting or decrypting process.

When CRYP\_DIN register is read:

- If CRYPTEN = 0, the FIFO is popped, and then the data present in the Input FIFO are returned, from the oldest one (first reading) to the newest one (last reading). The IFEM flag must be checked before each read operation to make sure that the FIFO is not empty.
- if CRYPTEN = 1, an undefined value is returned.

**Note:** *After the CRYP\_DIN register has been read once or several times, the FIFO must be flushed by setting the FFLUSH bit prior to processing new data.*

|               |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31            | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DATAIN[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw            | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15            | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| DATAIN[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw            | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DATAIN[31:0]**: Data Input

On read FIFO is popped (last written value is returned), and its value is returned if CRYPEN=0. If CRYPEN=1 DATAIN register returns an undefined value.

On write current register content is pushed inside the FIFO.

### 39.6.4 CRYP data output register (CRYP\_DOUT)

Address offset: 0x0C

Reset value: 0x0000 0000

The CRYP\_DOUT register is the data output register. It is read-only and 32-bit wide. It is used to retrieve from the output FIFO up to four 64-bit blocks (TDES) or two 128-bit blocks (AES) of plaintext (when encrypting) or ciphertext (when decrypting), one 32-bit word at a time.

To fit different data sizes, the data can be swapped after processing by configuring the DATATYPE bits in the CRYP\_CR register. Refer to [Section 39.3.16: CRYP data registers and data swapping](#) for more details.

When CRYP\_DOUT register is read, the last data entered into the output FIFO (pointed to by the read pointer) is returned.

|                |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31             | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DATAOUT[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r              | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |
| 15             | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| DATAOUT[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| r              | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  | r  |

Bits 31:0 **DATAOUT[31:0]**: Data Output

On read returns output FIFO content (pointed to by read pointer), else returns an undefined value.

On write, no effect.

### 39.6.5 CRYP DMA control register (CRYP\_DMACR)

Address offset: 0x10

Reset value: 0x0000 0000

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | DOEN | DIEN |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      | rw   | rw   |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DOEN**: DMA Output Enable

When this bit is set, DMA requests are automatically generated by the peripheral during the output data phase.

0: DMA for outgoing data transfer is disabled

1: DMA for outgoing data transfer is enabled

Bit 0 **DIEN**: DMA Input Enable

When this bit is set, DMA requests are automatically generated by the peripheral during the input data phase.

0: DMA for incoming data transfer is disabled

1: DMA for incoming data transfer is enabled

### 39.6.6 CRYP interrupt mask set/clear register (CRYP\_IMSCR)

Address offset: 0x14

Reset value: 0x0000 0000

The CRYP\_IMSCR register is the interrupt mask set or clear register. It is a read/write register. When a read operation is performed, this register gives the current value of the mask applied to the relevant interrupt. Writing 1 to the particular bit sets the mask, thus enabling the interrupt to be read. Writing 0 to this bit clears the corresponding mask. All the bits are cleared to 0 when the peripheral is reset.

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |       |      |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|-------|------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17    | 16   |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.  | Res. |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |       |      |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1     | 0    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | OUTIM | INIM |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      | rw    | rw   |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **OUTIM**: Output FIFO service interrupt mask

0: Output FIFO service interrupt is masked

1: Output FIFO service interrupt is not masked

Bit 0 **INIM**: Input FIFO service interrupt mask

0: Input FIFO service interrupt is masked

1: Input FIFO service interrupt is not masked

### 39.6.7 CRYP raw interrupt status register (CRYP\_RISR)

Address offset: 0x18

Reset value: 0x0000 0001

The CRYP\_RISR register is the raw interrupt status register. It is a read-only register. When a read operation is performed, this register gives the current raw status of the corresponding

interrupt, i.e. the interrupt information without taking CRYP\_IMSCR mask into account.  
Write operations have no effect.

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |        |       |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|--------|-------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17     | 16    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.   | Res.  |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      |        |       |
| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1      | 0     |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | OUTRIS | INRIS |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      | r      | r     |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **OUTRIS**: Output FIFO service raw interrupt status

This bit gives the output FIFO interrupt information without taking CRYP\_IMSCR corresponding mask into account.

0: Raw interrupt not pending  
1: Raw interrupt pending

Bit 0 **INRIS**: Input FIFO service raw interrupt status

This bit gives the input FIFO interrupt information without taking CRYP\_IMSCR corresponding mask into account.

0: Raw interrupt not pending  
1: Raw interrupt pending

### 39.6.8 CRYP masked interrupt status register (CRYP\_MISR)

Address offset: 0x1C

Reset value: 0x0000 0000

The CRYP\_MISR register is the masked interrupt status register. It is a read-only register. When a read operation is performed, this register gives the current masked status of the corresponding interrupt, i.e. the interrupt information taking CRYP\_IMSCR mask into account. Write operations have no effect.

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |        |       |

| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | OUTMIS | INMIS |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      | r      | r     |

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **OUTMIS**: Output FIFO service masked interrupt status

This bit gives the output FIFO interrupt information without taking into account the corresponding CRYP\_IMSCR mask.

0: Interrupt not pending  
1: Interrupt pending

Bit 0 **INMIS**: Input FIFO service masked interrupt status

This bit gives the input FIFO interrupt information without taking into account the corresponding CRYP\_IMSCR mask.

0: Interrupt not pending

1: Interrupt pending when CRYPEN= 1

### 39.6.9 CRYP key register 0L (CRYP\_K0LR)

Address offset: 0x20

Reset value: 0x0000 0000

CRYP key registers contain the cryptographic keys.

- In DES/TDES mode, the keys are 64-bit binary values (number from left to right, that is the leftmost bit is bit 1) and named K1, K2 and K3 (K0 is not used). Each key consists of 56 information bits and 8 parity bits.
- In AES mode, the key is considered as a single 128, 192 or 256 bits long sequence  $K_0K_1K_2\dots K_{127/191/255}$ . The AES key is entered into the registers as follows:
  - for AES-128:  $K_0..K_{127}$  corresponds to  $b_{127}..b_0$  ( $b_{255}..b_{128}$  are not used),
  - for AES-192:  $K_0..K_{191}$  corresponds to  $b_{191}..b_0$  ( $b_{255}..b_{192}$  are not used),
  - for AES-256:  $K_0..K_{255}$  corresponds to  $b_{255}..b_0$ .

In all cases key bit  $K_0$  is the leftmost bit in CRYP inner memory and register bit  $b_0$  is the rightmost bit in corresponding CRYP\_KxLR key register.

For more information refer to [Section 39.3.17: CRYP key registers](#).

**Note:** Write accesses to these registers are disregarded when the cryptographic processor is busy (bit *BUSY* = 1 in the CRYP\_SR register)

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| K[255:240] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w          | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |

| w          | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |

Bits 31:0 **K[255:224]**: AES key bit x (x= 255 to 224)

**Note:** This register is not used in DES mode

### 39.6.10 CRYP key register 0R (CRYP\_K0RR)

Address offset: 0x24

Reset value: 0x0000 0000

Refer to [Section 39.6.9: CRYP key register 0L \(CRYP\\_K0LR\)](#) for details.

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| K[223:208] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w          | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| K[207:192] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w          | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |

Bits 31:0 **K[223:192]**: AES key bit x (x= 223 to 192)

*Note: This register is not used in DES mode*

### 39.6.11 CRYP key register 1L (CRYP\_K1LR)

Address offset: 0x28

Reset value: 0x0000 0000

Refer to [Section 39.6.9: CRYP key register 0L \(CRYP\\_K0LR\)](#) for details.

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| K[191:176] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w          | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| K[175:160] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w          | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |

Bits 31:0 **K[191:160]**: AES key bit x (x= 191 to 160)

In DES mode, K192 corresponds to key K1 bit 1 and K160 corresponds to key K1 bit 32.

### 39.6.12 CRYP key register 1R (CRYP\_K1RR)

Address offset: 0x2C

Reset value: 0x0000 0000

Refer to [Section 39.6.9: CRYP key register 0L \(CRYP\\_K0LR\)](#) for details.

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| K[159:144] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w          | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| K[143:128] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w          | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |

Bits 31:0 **K[159:128]**: AES key bit x (x= 159 to 128)

In DES mode K159 corresponds to key K1 bit 33 and K128 corresponds to key K1 bit 64.

### 39.6.13 CRYP key register 2L (CRYP\_K2LR)

Address offset: 0x30

Reset value: 0x0000 0000

Refer to [Section 39.6.9: CRYP key register 0L \(CRYP\\_K0LR\)](#) for details.

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| K[127:112] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w          | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| K[111:96]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w          | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |

Bits 31:0 **K[127:96]**: AES key bit x (x= 127 to 96)

In DES mode K127 corresponds to key K2 bit 1 and K96 corresponds to key K2 bit 32.

### 39.6.14 CRYP key register 2R (CRYP\_K2RR)

Address offset: 0x34

Reset value: 0x0000 0000

Refer to [Section 39.6.9: CRYP key register 0L \(CRYP\\_K0LR\)](#) for details.

|          |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| K[95:80] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w        | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |
| 15       | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| K[79:64] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w        | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |

Bits 31:0 **K[95:64]**: AES key bit x (x= 95 to 64)

In DES mode K95 corresponds to key K2 bit 33 and K64 corresponds to key K2 bit 64.

### 39.6.15 CRYP key register 3L (CRYP\_K3LR)

Address offset: 0x38

Reset value: 0x0000 0000

Refer to [Section 39.6.9: CRYP key register 0L \(CRYP\\_K0LR\)](#) for details.

|          |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| K[63:48] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w        | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |
| 15       | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| K[47:32] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w        | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |

Bits 31:0 **K[63:32]**: AES key bit x (x= 63 to 32)

In DES mode K63 corresponds to key K3 bit 1 and K32 corresponds to key K3 bit 32.

### 39.6.16 CRYP key register 3R (CRYP\_K3RR)

Address offset: 0x3C

Reset value: 0x0000 0000

Refer to [Section 39.6.9: CRYP key register 0L \(CRYP\\_K0LR\)](#) for details.

|          |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| K[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w        | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |
| 15       | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| K[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| w        | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  | w  |

Bits 31:0 **K[31:0]**: AES key bit x (x= 31 to 0)

In DES mode K31 corresponds to key K3 bit 33 and K0 corresponds to key K3 bit 64.

### 39.6.17 CRYP initialization vector register 0L (CRYP\_IV0LR)

Address offset: 0x40

Reset value: 0x0000 0000

The CRYP\_IV0...1(L/R)R are the left-word and right-word registers for the initialization vector (64 bits for DES/TDES and 128 bits for AES). For more information refer to [Section 39.3.18: CRYP initialization vector registers](#).

IV0 is the leftmost bit whereas IV63 (DES, TDES) or IV127 (AES) are the rightmost bits of the initialization vector. IV1(L/R)R is used only in the AES. Only CRYP\_IV0(L/R) is used in DES/TDES.

**Note:** Write access to these registers are disregarded when the cryptographic processor is busy (bit *BUSY* = 1 in the *CRYP\_SR* register).

|      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

Bits 31:0 **IV[96:127]**: Initialization vector bit x (x= 96 to 127)

*Note:* This register is not used in DES mode

### 39.6.21 CRYP context swap GCM-CCM registers (CRYP\_CSGCMCCMxR)

Address offset: 0x050 + x\* 0x4 (x=0 to 7)

Reset value: 0x0000 0000

These registers contain the complete internal register states of the CRYP processor when the GCM/GMAC or CCM algorithm is selected. They are useful when a context swap has to be performed because a high-priority task needs the cryptographic processor while it is already in use by another task.

When such an event occurs, the CRYP\_CSGCMCCM0..7R and CRYP\_CSGCM0..7R (in GCM/GMAC mode) or CRYP\_CSGCMCCM0..7R (in CCM mode) registers have to be read and the values retrieved have to be saved in the system memory space. The cryptographic processor can then be used by the preemptive task. Then when the cryptographic computation is complete, the saved context can be read from memory and written back into the corresponding context swap registers.

|                  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31               | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| CSGCMCCMx[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **CFG4[3:0]**: HW Generic 4  
Reserved, must be kept at reset value.

Bits 11:8 **CFG3[3:0]**: HW Generic 3  
This field returns the `use_mdma` generic value (0x11).

Bits 7:4 **CFG2[3:0]**: HW Generic 2  
This field returns the `aes_impl` generic value (0x33).

Bits 3:0 **CFG1[3:0]**: HW Generic 1  
This field returns the `tdes_impl` generic value (0x11).

### 39.6.24 CRYP HW Version Register (CRYP\_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0022

|      |      |      |      |      |      |      |      |          |      |      |      |      |      |      |      |

## 40 Advanced-control timers (TIM1/TIM8)

### 40.1 TIM1/TIM8 introduction

The advanced-control timers (TIM1/TIM8) consist of a 16-bit auto-reload counter driven by a programmable prescaler.

It may be used for a variety of purposes, including measuring the pulse lengths of input signals (input capture) or generating output waveforms (output compare, PWM, complementary PWM with dead-time insertion).

Pulse lengths and waveform periods can be modulated from a few microseconds to several milliseconds using the timer prescaler and the RCC clock controller prescalers.

The advanced-control (TIM1/TIM8) and general-purpose (TIMy) timers are completely independent, and do not share any resources. They can be synchronized together as described in [Section 40.3.26: Timer synchronization](#).

### 40.2 TIM1/TIM8 main features

TIM1/TIM8 timer features include:

- 16-bit up, down, up/down auto-reload counter.
- 16-bit programmable prescaler allowing dividing (also “on the fly”) the counter clock frequency either by any factor between 1 and 65536.
- Up to 6 independent channels for:
  - Input Capture (but channels 5 and 6)
  - Output Compare
  - PWM generation (Edge and Center-aligned Mode)
  - One-pulse mode output
- Complementary outputs with programmable dead-time
- Synchronization circuit to control the timer with external signals and to interconnect several timers together.
- Repetition counter to update the timer registers only after a given number of cycles of the counter.
- 2 break inputs to put the timer’s output signals in a safe user selectable configuration.
- Interrupt/DMA generation on the following events:
  - Update: counter overflow/underflow, counter initialization (by software or internal/external trigger)
  - Trigger event (counter start, stop, initialization or count by internal/external trigger)
  - Input capture
  - Output compare
- Supports incremental (quadrature) encoder and Hall-sensor circuitry for positioning purposes
- Trigger input for external clock or cycle-by-cycle current management

1. See [Figure 396: Break and Break2 circuitry overview](#) for details

## 40.3 TIM1/TIM8 functional description

### 40.3.1 Time-base unit

The main block of the programmable advanced-control timer is a 16-bit counter with its related auto-reload register. The counter can count up, down or both up and down. The counter clock can be divided by a prescaler.

The counter, the auto-reload register and the prescaler register can be written or read by software. This is true even when the counter is running.

The time-base unit includes:

- Counter register (TIMx\_CNT)
- Prescaler register (TIMx\_PSC)
- Auto-reload register (TIMx\_ARR)
- Repetition counter register (TIMx\_RCR)

The auto-reload register is preloaded. Writing to or reading from the auto-reload register accesses the preload register. The content of the preload register are transferred into the shadow register permanently or at each update event (UEV), depending on the auto-reload preload enable bit (ARPE) in TIMx\_CR1 register. The update event is sent when the counter reaches the overflow (or underflow when downcounting) and if the UDIS bit equals 0 in the TIMx\_CR1 register. It can also be generated by software. The generation of the update event is described in detailed for each configuration.

The counter is clocked by the prescaler output CK\_CNT, which is enabled only when the counter enable bit (CEN) in TIMx\_CR1 register is set (refer also to the slave mode controller description to get more details on counter enabling).

Note that the counter starts counting 1 clock cycle after setting the CEN bit in the TIMx\_CR1 register.

#### Prescaler description

The prescaler can divide the counter clock frequency by any factor between 1 and 65536. It is based on a 16-bit counter controlled through a 16-bit register (in the TIMx\_PSC register). It can be changed on the fly as this control register is buffered. The new prescaler ratio is taken into account at the next update event.

*Figure 354* and *Figure 355* give some examples of the counter behavior when the prescaler ratio is changed on the fly:

Figure 354. Counter timing diagram with prescaler division change from 1 to 2

Figure 355. Counter timing diagram with prescaler division change from 1 to 4

### 40.3.2 Counter modes

#### Upcounting mode

In upcounting mode, the counter counts from 0 to the auto-reload value (content of the TIMx\_ARR register), then restarts from 0 and generates a counter overflow event.

If the repetition counter is used, the update event (UEV) is generated after upcounting is repeated for the number of times programmed in the repetition counter register (TIMx\_RCR) + 1. Else the update event is generated at each counter overflow.

Setting the UG bit in the TIMx\_EGR register (by software or by using the slave mode controller) also generates an update event.

The UEV event can be disabled by software by setting the UDIS bit in the TIMx\_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter restarts from 0, as well as the counter of the prescaler (but the prescale rate does not change). In addition, if the URS bit (update request selection) in TIMx\_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx\_SR register) is set (depending on the URS bit):

- The repetition counter is reloaded with the content of TIMx\_RCR register,
- The auto-reload shadow register is updated with the preload value (TIMx\_ARR),
- The buffer of the prescaler is reloaded with the preload value (content of the TIMx\_PSC register).

The following figures show some examples of the counter behavior for different clock frequencies when TIMx\_ARR=0x36.

Figure 360. Counter timing diagram, update event when ARPE=0 (TIMx\_ARR not preloaded)

Figure 361. Counter timing diagram, update event when ARPE=1 (TIMx\_ARR preloaded)

### Downcounting mode

In downcounting mode, the counter counts from the auto-reload value (content of the TIMx\_ARR register) down to 0, then restarts from the auto-reload value and generates a counter underflow event.

If the repetition counter is used, the update event (UEV) is generated after downcounting is repeated for the number of times programmed in the repetition counter register (TIMx\_RCR) + 1. Else the update event is generated at each counter underflow.

Setting the UG bit in the TIMx\_EGR register (by software or by using the slave mode controller) also generates an update event.

The UEV update event can be disabled by software by setting the UDIS bit in TIMx\_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until UDIS bit has been written to 0. However, the counter restarts from the current auto-reload value, whereas the counter of the prescaler restarts from 0 (but the prescale rate doesn't change).

In addition, if the URS bit (update request selection) in TIMx\_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx\_SR register) is set (depending on the URS bit):

- The repetition counter is reloaded with the content of TIMx\_RCR register.
- The buffer of the prescaler is reloaded with the preload value (content of the TIMx\_PSC register).
- The auto-reload active register is updated with the preload value (content of the TIMx\_ARR register). Note that the auto-reload is updated before the counter is reloaded, so that the next period is the expected one.

The following figures show some examples of the counter behavior for different clock frequencies when TIMx\_ARR=0x36.

Figure 364. Counter timing diagram, internal clock divided by 4

Figure 365. Counter timing diagram, internal clock divided by N

**Figure 366. Counter timing diagram, update event when repetition counter is not used**

### Center-aligned mode (up/down counting)

In center-aligned mode, the counter counts from 0 to the auto-reload value (content of the TIMx\_ARR register) – 1, generates a counter overflow event, then counts from the auto-reload value down to 1 and generates a counter underflow event. Then it restarts counting from 0.

Center-aligned mode is active when the CMS bits in TIMx\_CR1 register are not equal to '00'. The Output compare interrupt flag of channels configured in output is set when: the counter counts down (Center aligned mode 1, CMS = "01"), the counter counts up (Center aligned mode 2, CMS = "10") the counter counts up and down (Center aligned mode 3, CMS = "11").

In this mode, the DIR direction bit in the TIMx\_CR1 register cannot be written. It is updated by hardware and gives the current direction of the counter.

The update event can be generated at each counter overflow and at each counter underflow or by setting the UG bit in the TIMx\_EGR register (by software or by using the slave mode controller) also generates an update event. In this case, the counter restarts counting from 0, as well as the counter of the prescaler.

The UEV update event can be disabled by software by setting the UDIS bit in the TIMx\_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until UDIS bit has been written to 0. However, the counter continues counting up and down, based on the current auto-reload value.

In addition, if the URS bit (update request selection) in TIMx\_CR1 register is set, setting the UG bit generates an UEV update event but without setting the UIF flag (thus no interrupt or

DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx\_SR register) is set (depending on the URS bit):

- The repetition counter is reloaded with the content of TIMx\_RCR register
- The buffer of the prescaler is reloaded with the preload value (content of the TIMx\_PSC register)
- The auto-reload active register is updated with the preload value (content of the TIMx\_ARR register). Note that if the update source is a counter overflow, the auto-reload is updated before the counter is reloaded, so that the next period is the expected one (the counter is loaded with the new value).

The following figures show some examples of the counter behavior for different clock frequencies.

**Figure 367. Counter timing diagram, internal clock divided by 1, TIMx\_ARR = 0x6**

1. Here, center-aligned mode 1 is used (for more details refer to [Section 40.4: TIM1/TIM8 registers](#)).

Figure 368. Counter timing diagram, internal clock divided by 2

Figure 370. Counter timing diagram, internal clock divided by N

Figure 371. Counter timing diagram, update event with ARPE=1 (counter underflow)

**Figure 372. Counter timing diagram, Update event with ARPE=1 (counter overflow)**

### 40.3.3 Repetition counter

[Section 40.3.1: Time-base unit](#) describes how the update event (UEV) is generated with respect to the counter overflows/underflows. It is actually generated only when the repetition counter has reached zero. This can be useful when generating PWM signals.

This means that data are transferred from the preload registers to the shadow registers (TIMx\_ARR auto-reload register, TIMx\_PSC prescaler register, but also TIMx\_CCRx capture/compare registers in compare mode) every N+1 counter overflows or underflows, where N is the value in the TIMx\_RCR repetition counter register.

The repetition counter is decremented:

- At each counter overflow in upcounting mode,
  - At each counter underflow in downcounting mode,
  - At each counter overflow and at each counter underflow in center-aligned mode.
- Although this limits the maximum number of repetition to 32768 PWM cycles, it makes it possible to update the duty cycle twice per PWM period. When refreshing compare registers only once per PWM period in center-aligned mode, maximum resolution is  $2 \times T_{ck}$ , due to the symmetry of the pattern.

The repetition counter is an auto-reload type; the repetition rate is maintained as defined by the TIMx\_RCR register value (refer to [Figure 373](#)). When the update event is generated by software (by setting the UG bit in TIMx\_EGR register) or by hardware through the slave mode controller, it occurs immediately whatever the value of the repetition counter is and the repetition counter is reloaded with the content of the TIMx\_RCR register.

In Center aligned mode, for odd values of RCR, the update event occurs either on the overflow or on the underflow depending on when the RCR register was written and when the counter was launched: if the RCR was written before launching the counter, the UEV occurs on the underflow. If the RCR was written after launching the counter, the UEV occurs on the overflow.

For example, for RCR = 3, the UEV is generated each 4th overflow or underflow event depending on when the RCR was written.

**Figure 373. Update rate examples depending on mode and TIMx\_RCR register settings**

### 40.3.4 External trigger input

The timer features an external trigger input ETR. It can be used as:

- external clock (external clock mode 2, see [Section 40.3.5](#))
- trigger for the slave mode (see [Section 40.3.26](#))
- PWM reset input for cycle-by-cycle current regulation (see [Section 40.3.7](#))

[Figure 374](#) below describes the ETR input conditioning. The input polarity is defined with the ETP bit in TIMxSMCR register. The trigger can be prescaled with the divider programmed by the ETPS[1:0] bitfield and digitally filtered with the ETF[3:0] bitfield.

**Figure 374. External trigger input block**

**Figure 375. TIM1/TIM8 ETR input circuitry**

### 40.3.5 Clock selection

The counter clock can be provided by the following clock sources:

- Internal clock (CK\_INT)
- External clock mode1: external input pin
- External clock mode2: external trigger input ETR
- Encoder mode

#### Internal clock source (CK\_INT)

If the slave mode controller is disabled (SMS=000), then the CEN, DIR (in the TIMx\_CR1 register) and UG bits (in the TIMx\_EGR register) are actual control bits and can be changed only by software (except UG which remains cleared automatically). As soon as the CEN bit is written to 1, the prescaler is clocked by the internal clock CK\_INT.

*Figure 376* shows the behavior of the control circuit and the upcounter in normal mode, without prescaler.

**Figure 376. Control circuit in normal mode, internal clock divided by 1**

#### External clock source mode 1

This mode is selected when SMS=111 in the TIMx\_SMCR register. The counter can count at each rising or falling edge on a selected input.

Figure 377. TI2 external clock connection example

1. Codes ranging from 01000 to 11111 are reserved

For example, to configure the upcounter to count in response to a rising edge on the TI2 input, use the following procedure:

1. Select the proper TI2x source (internal or external) with the TI2SEL[3:0] bits in the TIMx\_TISEL register.
2. Configure channel 2 to detect rising edges on the TI2 input by writing CC2S = '01' in the TIMx\_CCMR1 register.
3. Configure the input filter duration by writing the IC2F[3:0] bits in the TIMx\_CCMR1 register (if no filter is needed, keep IC2F=0000).
4. Select rising edge polarity by writing CC2P=0 and CC2NP=0 in the TIMx\_CCER register.
5. Configure the timer in external clock mode 1 by writing SMS=111 in the TIMx\_SMCR register.
6. Select TI2 as the trigger input source by writing TS=00110 in the TIMx\_SMCR register.
7. Enable the counter by writing CEN=1 in the TIMx\_CR1 register.

**Note:** The capture prescaler is not used for triggering, so the user does not need to configure it.

When a rising edge occurs on TI2, the counter counts once and the TIF flag is set.

The delay between the rising edge on TI2 and the actual clock of the counter is due to the resynchronization circuit on TI2 input.

Figure 378. Control circuit in external clock mode 1

### External clock source mode 2

This mode is selected by writing ECE=1 in the TIMx\_SMCR register.

The counter can count at each rising or falling edge on the external trigger input ETR.

The [Figure 379](#) gives an overview of the external trigger input block.

Figure 379. External trigger input block

1. Refer to [Figure 375: TIM1/TIM8 ETR input circuitry](#).

For example, to configure the upcounter to count each 2 rising edges on ETR, use the following procedure:

1. As no filter is needed in this example, write ETRF[3:0]=0000 in the TIMx\_SMCR register.
2. Set the prescaler by writing ETPS[1:0]=01 in the TIMx\_SMCR register
3. Select rising edge detection on the ETR pin by writing ETP=0 in the TIMx\_SMCR register
4. Enable external clock mode 2 by writing ECE=1 in the TIMx\_SMCR register.
5. Enable the counter by writing CEN=1 in the TIMx\_CR1 register.

The counter counts once each 2 ETR rising edges.

The delay between the rising edge on ETR and the actual clock of the counter is due to the resynchronization circuit on the ETRP signal. As a consequence, the maximum frequency which can be correctly captured by the counter is at most  $\frac{1}{4}$  of TIMxCLK frequency. When the ETRP signal is faster, the user should apply a division of the external signal by proper ETPS prescaler setting.

**Figure 380. Control circuit in external clock mode 2**

### 40.3.6 Capture/compare channels

Each Capture/Compare channel is built around a capture/compare register (including a shadow register), an input stage for capture (with digital filter, multiplexing, and prescaler, except for channels 5 and 6) and an output stage (with comparator and output control).

*Figure 381* to *Figure 384* give an overview of one Capture/Compare channel.

The input stage samples the corresponding Tlx input to generate a filtered signal TlxF. Then, an edge detector with polarity selection generates a signal (TlxFPx) which can be used as trigger input by the slave mode controller or as the capture command. It is prescaled before the capture register (ICxPS).

**Figure 381. Capture/compare channel (example: channel 1 input stage)**

The output stage generates an intermediate waveform which is then used for reference: OCxRef (active high). The polarity acts at the end of the chain.

**Figure 382. Capture/compare channel 1 main circuit**

**Figure 383. Output stage of capture/compare channel (channel 1, idem ch. 2 and 3)**

1. OCxREF, where x is the rank of the complementary channel

**Figure 384. Output stage of capture/compare channel (channel 4)**

**Figure 385. Output stage of capture/compare channel (channel 5, idem ch. 6)**

1. Not available externally.

The capture/compare block is made of one preload register and one shadow register. Write and read always access the preload register.

In capture mode, captures are actually done in the shadow register, which is copied into the preload register.

In compare mode, the content of the preload register is copied into the shadow register which is compared to the counter.

### 40.3.7 Input capture mode

In Input capture mode, the Capture/Compare Registers (TIMx\_CCRx) are used to latch the value of the counter after a transition detected by the corresponding ICx signal. When a capture occurs, the corresponding CCxIF flag (TIMx\_SR register) is set and an interrupt or a DMA request can be sent if they are enabled. If a capture occurs while the CCxIF flag was already high, then the over-capture flag CCxOF (TIMx\_SR register) is set. CCxIF can be cleared by software by writing it to '0' or by reading the captured data stored in the TIMx\_CCRx register. CCxOF is cleared when written with '0'.

The following example shows how to capture the counter value in TIMx\_CCR1 when TI1 input rises. To do this, use the following procedure:

1. Select the proper TI1x source (internal or external) with the TI1SEL[3:0] bits in the TIMx\_TISEL register.
2. Select the active input: TIMx\_CCR1 must be linked to the TI1 input, so write the CC1S bits to 01 in the TIMx\_CCMR1 register. As soon as CC1S becomes different from 00, the channel is configured in input and the TIMx\_CCR1 register becomes read-only.
3. Program the appropriate input filter duration in relation with the signal connected to the timer (when the input is one of the TIx (ICxF bits in the TIMx\_CCMRx register). Let's imagine that, when toggling, the input signal is not stable during at most 5 internal clock cycles. We must program a filter duration longer than these 5 clock cycles. We can validate a transition on TI1 when 8 consecutive samples with the new level have been

detected (sampled at  $f_{DTS}$  frequency). Then write IC1F bits to 0011 in the TIMx\_CCMR1 register.

4. Select the edge of the active transition on the TI1 channel by writing CC1P and CC1NP bits to 0 in the TIMx\_CCER register (rising edge in this case).
5. Program the input prescaler. In our example, we wish the capture to be performed at each valid transition, so the prescaler is disabled (write IC1PS bits to '00' in the TIMx\_CCMR1 register).
6. Enable capture from the counter into the capture register by setting the CC1E bit in the TIMx\_CCER register.
7. If needed, enable the related interrupt request by setting the CC1IE bit in the TIMx\_DIER register, and/or the DMA request by setting the CC1DE bit in the TIMx\_DIER register.

When an input capture occurs:

- The TIMx\_CCR1 register gets the value of the counter on the active transition.
- CC1IF flag is set (interrupt flag). CC1OF is also set if at least two consecutive captures occurred whereas the flag was not cleared.
- An interrupt is generated depending on the CC1IE bit.
- A DMA request is generated depending on the CC1DE bit.

In order to handle the overcapture, it is recommended to read the data before the overcapture flag. This is to avoid missing an overcapture which could happen after reading the flag and before reading the data.

*Note:* IC interrupt and/or DMA requests can be generated by software by setting the corresponding CCxG bit in the TIMx\_EGR register.

#### 40.3.8 PWM input mode

This mode is a particular case of input capture mode. The procedure is the same except:

- Two ICx signals are mapped on the same TIx input.
- These 2 ICx signals are active on edges with opposite polarity.
- One of the two TIxFP signals is selected as trigger input and the slave mode controller is configured in reset mode.

For example, the user can measure the period (in TIMx\_CCR1 register) and the duty cycle (in TIMx\_CCR2 register) of the PWM applied on TI1 using the following procedure (depending on CK\_INT frequency and prescaler value):

1. Select the proper TI1x source (internal or external) with the TI1SEL[3:0] bits in the TIMx\_TISEL register.
2. Select the active input for TIMx\_CCR1: write the CC1S bits to 01 in the TIMx\_CCMR1 register (TI1 selected).
3. Select the active polarity for TI1FP1 (used both for capture in TIMx\_CCR1 and counter clear): write the CC1P and CC1NP bits to '0' (active on rising edge).
4. Select the active input for TIMx\_CCR2: write the CC2S bits to 10 in the TIMx\_CCMR1 register (TI1 selected).
5. Select the active polarity for TI1FP2 (used for capture in TIMx\_CCR2): write the CC2P and CC2NP bits to CC2P/CC2NP='10' (active on falling edge).
6. Select the valid trigger input: write the TS bits to 00101 in the TIMx\_SMCR register (TI1FP1 selected).
7. Configure the slave mode controller in reset mode: write the SMS bits to 0100 in the TIMx\_SMCR register.
8. Enable the captures: write the CC1E and CC2E bits to '1' in the TIMx\_CCER register.

Figure 386. PWM input mode timing

### 40.3.9 Forced output mode

In output mode (CCxS bits = 00 in the TIMx\_CCMRx register), each output compare signal (OCxREF and then OCx/OCxN) can be forced to active or inactive level directly by software, independently of any comparison between the output compare register and the counter.

To force an output compare signal (OCxREF/OCx) to its active level, user just needs to write 0101 in the OCxM bits in the corresponding TIMx\_CCMRx register. Thus OCxREF is forced high (OCxREF is always active high) and OCx get opposite value to CCxP polarity bit.

For example: CCxP=0 (OCx active high) => OCx is forced to high level.

The OCxREF signal can be forced low by writing the OCxM bits to 0100 in the TIMx\_CCMRx register.

Anyway, the comparison between the TIMx\_CCRx shadow register and the counter is still performed and allows the flag to be set. Interrupt and DMA requests can be sent accordingly. This is described in the output compare mode section below.

### 40.3.10 Output compare mode

This function is used to control an output waveform or indicate when a period of time has elapsed. Channels 1 to 4 can be output, while Channel 5 and 6 are only available inside the device (for instance, for compound waveform generation or for ADC triggering).

When a match is found between the capture/compare register and the counter, the output compare function:

- Assigns the corresponding output pin to a programmable value defined by the output compare mode (OCxM bits in the TIMx\_CCMRx register) and the output polarity (CCxP bit in the TIMx\_CCER register). The output pin can keep its level (OCxM=0000), be set active (OCxM=0001), be set inactive (OCxM=0010) or can toggle (OCxM=0011) on match.
- Sets a flag in the interrupt status register (CCxIF bit in the TIMx\_SR register).
- Generates an interrupt if the corresponding interrupt mask is set (CCxIE bit in the TIMx\_DIER register).
- Sends a DMA request if the corresponding enable bit is set (CCxDE bit in the TIMx\_DIER register, CCDS bit in the TIMx\_CR2 register for the DMA request selection).

The TIMx\_CCRx registers can be programmed with or without preload registers using the OCxPE bit in the TIMx\_CCMRx register.

In output compare mode, the update event UEV has no effect on OCxREF and OCx output. The timing resolution is one count of the counter. Output compare mode can also be used to output a single pulse (in One Pulse mode).

#### Procedure

1. Select the counter clock (internal, external, prescaler).
2. Write the desired data in the TIMx\_ARR and TIMx\_CCRx registers.
3. Set the CCxIE bit if an interrupt request is to be generated.
4. Select the output mode. For example:
  - Write OCxM = 0011 to toggle OCx output pin when CNT matches CCRx
  - Write OCxPE = 0 to disable preload register
  - Write CCxP = 0 to select active high polarity
  - Write CCxE = 1 to enable the output
5. Enable the counter by setting the CEN bit in the TIMx\_CR1 register.

The TIMx\_CCRx register can be updated at any time by software to control the output waveform, provided that the preload register is not enabled (OCxPE='0', else TIMx\_CCRx shadow register is updated only at the next update event UEV). An example is given in [Figure 387](#).

**Figure 387. Output compare mode, toggle on OC1**

#### 40.3.11 PWM mode

Pulse Width Modulation mode allows a signal to be generated with a frequency determined by the value of the TIMx\_ARR register and a duty cycle determined by the value of the TIMx\_CCRx register.

The PWM mode can be selected independently on each channel (one PWM per OCx output) by writing '0110' (PWM mode 1) or '0111' (PWM mode 2) in the OCxM bits in the TIMx\_CCMRx register. The corresponding preload register must be enabled by setting the OCxPE bit in the TIMx\_CCMRx register, and eventually the auto-reload preload register (in upcounting or center-aligned modes) by setting the ARPE bit in the TIMx\_CR1 register.

As the preload registers are transferred to the shadow registers only when an update event occurs, before starting the counter, all registers must be initialized by setting the UG bit in the TIMx\_EGR register.

OCx polarity is software programmable using the CCxP bit in the TIMx\_CCER register. It can be programmed as active high or active low. OCx output is enabled by a combination of the CCxE, CCxNE, MOE, OSSI and OSSR bits (TIMx\_CCER and TIMx\_BDTR registers). Refer to the TIMx\_CCER register description for more details.

In PWM mode (1 or 2), TIMx\_CNT and TIMx\_CCRx are always compared to determine whether  $TIMx\_CCRx \leq TIMx\_CNT$  or  $TIMx\_CNT \leq TIMx\_CCRx$  (depending on the direction of the counter).

The timer is able to generate PWM in edge-aligned mode or center-aligned mode depending on the CMS bits in the TIMx\_CR1 register.

## PWM edge-aligned mode

- Upcounting configuration

Upcounting is active when the DIR bit in the TIMx\_CR1 register is low. Refer to the [Upcounting mode on page 2047](#).

In the following example, we consider PWM mode 1. The reference PWM signal OCxREF is high as long as TIMx\_CNT < TIMx\_CCRx else it becomes low. If the compare value in TIMx\_CCRx is greater than the auto-reload value (in TIMx\_ARR) then OCxREF is held at '1'. If the compare value is 0 then OCxRef is held at '0'.

[Figure 388](#) shows some edge-aligned PWM waveforms in an example where TIMx\_ARR=8.

**Figure 388. Edge-aligned PWM waveforms (ARR=8)**

- Downcounting configuration

Downcounting is active when DIR bit in TIMx\_CR1 register is high. Refer to the [Downcounting mode on page 2051](#)

In PWM mode 1, the reference signal OCxRef is low as long as TIMx\_CNT > TIMx\_CCRx else it becomes high. If the compare value in TIMx\_CCRx is greater than the auto-reload value in TIMx\_ARR, then OCxREF is held at '1'. 0% PWM is not possible in this mode.

## PWM center-aligned mode

Center-aligned mode is active when the CMS bits in TIMx\_CR1 register are different from '00' (all the remaining configurations having the same effect on the OCxRef/OCx signals). The compare flag is set when the counter counts up, when it counts down or both when it counts up and down depending on the CMS bits configuration. The direction bit (DIR) in the

TIMx\_CR1 register is updated by hardware and must not be changed by software. Refer to the [Center-aligned mode \(up/down counting\) on page 2054](#).

Figure 389 shows some center-aligned PWM waveforms in an example where:

- TIMx\_ARR=8,
- PWM mode is the PWM mode 1,
- The flag is set when the counter counts down corresponding to the center-aligned mode 1 selected for CMS=01 in TIMx\_CR1 register.

**Figure 389. Center-aligned PWM waveforms (ARR=8)**

Hints on using center-aligned mode

- When starting in center-aligned mode, the current up-down configuration is used. It means that the counter counts up or down depending on the value written in the DIR bit

- in the TIMx\_CR1 register. Moreover, the DIR and CMS bits must not be changed at the same time by the software.
- Writing to the counter while running in center-aligned mode is not recommended as it can lead to unexpected results. In particular:
    - The direction is not updated if a value greater than the auto-reload value is written in the counter (TIMx\_CNT > TIMx\_ARR). For example, if the counter was counting up, it continues to count up.
    - The direction is updated if 0 or the TIMx\_ARR value is written in the counter but no Update Event UEV is generated.
  - The safest way to use center-aligned mode is to generate an update by software (setting the UG bit in the TIMx\_EGR register) just before starting the counter and not to write the counter while it is running.

### 40.3.12 Asymmetric PWM mode

Asymmetric mode allows two center-aligned PWM signals to be generated with a programmable phase shift. While the frequency is determined by the value of the TIMx\_ARR register, the duty cycle and the phase-shift are determined by a pair of TIMx\_CCRx register. One register controls the PWM during up-counting, the second during down counting, so that PWM is adjusted every half PWM cycle:

- OC1REFC (or OC2REFC) is controlled by TIMx\_CCR1 and TIMx\_CCR2
- OC3REFC (or OC4REFC) is controlled by TIMx\_CCR3 and TIMx\_CCR4

Asymmetric PWM mode can be selected independently on two channel (one OCx output per pair of CCR registers) by writing '1110' (Asymmetric PWM mode 1) or '1111' (Asymmetric PWM mode 2) in the OCxM bits in the TIMx\_CCMRx register.

*Note: The OCxM[3:0] bit field is split into two parts for compatibility reasons, the most significant bit is not contiguous with the 3 least significant ones.*

When a given channel is used as asymmetric PWM channel, its complementary channel can also be used. For instance, if an OC1REFC signal is generated on channel 1 (Asymmetric PWM mode 1), it is possible to output either the OC2REF signal on channel 2, or an OC2REFC signal resulting from asymmetric PWM mode 1.

[Figure 390](#) represents an example of signals that can be generated using Asymmetric PWM mode (channels 1 to 4 are configured in Asymmetric PWM mode 1). Together with the deadtime generator, this allows a full-bridge phase-shifted DC to DC converter to be controlled.

**Figure 390. Generation of 2 phase-shifted PWM signals with 50% duty cycle**

### 40.3.13 Combined PWM mode

Combined PWM mode allows two edge or center-aligned PWM signals to be generated with programmable delay and phase shift between respective pulses. While the frequency is determined by the value of the TIMx\_ARR register, the duty cycle and delay are determined by the two TIMx\_CCRx registers. The resulting signals, OCxREFC, are made of an OR or AND logical combination of two reference PWMs:

- OC1REFC (or OC2REFC) is controlled by TIMx\_CCR1 and TIMx\_CCR2
- OC3REFC (or OC4REFC) is controlled by TIMx\_CCR3 and TIMx\_CCR4

Combined PWM mode can be selected independently on two channels (one OCx output per pair of CCR registers) by writing '1100' (Combined PWM mode 1) or '1101' (Combined PWM mode 2) in the OCxM bits in the TIMx\_CCMRx register.

When a given channel is used as combined PWM channel, its complementary channel must be configured in the opposite PWM mode (for instance, one in Combined PWM mode 1 and the other in Combined PWM mode 2).

**Note:** The OCxM[3:0] bit field is split into two parts for compatibility reasons, the most significant bit is not contiguous with the 3 least significant ones.

**Figure 391** represents an example of signals that can be generated using Asymmetric PWM mode, obtained with the following configuration:

- Channel 1 is configured in Combined PWM mode 2,
- Channel 2 is configured in PWM mode 1,
- Channel 3 is configured in Combined PWM mode 2,
- Channel 4 is configured in PWM mode 1.

Figure 391. Combined PWM mode on channel 1 and 3

#### 40.3.14 Combined 3-phase PWM mode

Combined 3-phase PWM mode allows one to three center-aligned PWM signals to be generated with a single programmable signal ANDed in the middle of the pulses. The OC5REF signal is used to define the resulting combined signal. The 3-bits GC5C[3:1] in the TIMx\_CCR5 allow selection on which reference signal the OC5REF is combined. The resulting signals, OCxREFC, are made of an AND logical combination of two reference PWMs:

- If GC5C1 is set, OC1REFC is controlled by TIMx\_CCR1 and TIMx\_CCR5
- If GC5C2 is set, OC2REFC is controlled by TIMx\_CCR2 and TIMx\_CCR5
- If GC5C3 is set, OC3REFC is controlled by TIMx\_CCR3 and TIMx\_CCR5

Combined 3-phase PWM mode can be selected independently on channels 1 to 3 by setting at least one of the 3-bits GC5C[3:1].

**Figure 392. 3-phase combined PWM signals with multiple trigger pulses per period**

The TRGO2 waveform shows how the ADC can be synchronized on given 3-phase PWM signals. Refer to [Section 40.3.27: ADC synchronization](#) for more details.

#### 40.3.15 Complementary outputs and dead-time insertion

The advanced-control timers (TIM1/TIM8) can output two complementary signals and manage the switching-off and the switching-on instants of the outputs.

This time is generally known as dead-time and it has to be adjusted depending on the devices that are connected to the outputs and their characteristics (intrinsic delays of level-shifters, delays due to power switches...)

The polarity of the outputs (main output OCx or complementary OCxN) can be selected independently for each output. This is done by writing to the CCxP and CCxNP bits in the TIMx\_CCER register.

The complementary signals OCx and OCxN are activated by a combination of several control bits: the CCxE and CCxNE bits in the TIMx\_CCER register and the MOE, OISx, OISxN, OSSI and OSSR bits in the TIMx\_BDTR and TIMx\_CR2 registers. Refer to [Table 284: Output control bits for complementary OCx and OCxN channels with break feature on page 2123](#) for more details. In particular, the dead-time is activated when switching to the idle state (MOE falling down to 0).

Dead-time insertion is enabled by setting both CCxE and CCxNE bits, and the MOE bit if the break circuit is present. There is one 10-bit dead-time generator for each channel. From a reference waveform OCxREF, it generates 2 outputs OCx and OCxN. If OCx and OCxN are active high:

- The OCx output signal is the same as the reference signal except for the rising edge, which is delayed relative to the reference rising edge.
- The OCxN output signal is the opposite of the reference signal except for the rising edge, which is delayed relative to the reference falling edge.

If the delay is greater than the width of the active output (OCx or OCxN) then the corresponding pulse is not generated.

The following figures show the relationships between the output signals of the dead-time generator and the reference signal OCxREF. (we suppose CCxP=0, CCxNP=0, MOE=1, CCxE=1 and CCxNE=1 in these examples)

**Figure 393. Complementary output with dead-time insertion**

**Figure 394. Dead-time waveforms with delay greater than the negative pulse**

**Figure 395. Dead-time waveforms with delay greater than the positive pulse**

The dead-time delay is the same for each of the channels and is programmable with the DTG bits in the TIMx\_BDTR register. Refer to [Section 40.4.20: TIMx break and dead-time register \(TIMx\\_BDTR\)\(x = 1, 8\)](#) for delay calculation.

### Re-directing OCxREF to OCx or OCxN

In output mode (forced, output compare or PWM), OCxREF can be re-directed to the OCx output or to OCxN output by configuring the CCxE and CCxNE bits in the TIMx\_CCER register.

This allows a specific waveform to be sent (such as PWM or static active level) on one output while the complementary remains at its inactive level. Other alternative possibilities are to have both outputs at inactive level or both outputs active and complementary with dead-time.

**Note:** *When only OCxN is enabled (CCxE=0, CCxNE=1), it is not complemented and becomes active as soon as OCxREF is high. For example, if CCxNP=0 then OCxN=OCxRef. On the other hand, when both OCx and OCxN are enabled (CCxE=CCxNE=1) OCx becomes active when OCxREF is high whereas OCxN is complemented and becomes active when OCxREF is low.*

### 40.3.16 Using the break function

The purpose of the break function is to protect power switches driven by PWM signals generated with the TIM1 and TIM8 timers. The two break inputs are usually connected to fault outputs of power stages and 3-phase inverters. When activated, the break circuitry shuts down the PWM outputs and forces them to a predefined safe state. A number of internal MCU events can also be selected to trigger an output shut-down.

The break features two channels. A break channel which gathers both system-level fault (clock failure, parity error,...) and application fault (from input pins), and can force the outputs to a predefined level (either active or inactive) after a deadtime duration. A break2 channel which only includes application faults and is able to force the outputs to an inactive state.

The output enable signal and output levels during break are depending on several control bits:

- the MOE bit in TIMx\_BDTR register allows the outputs to be enabled/disabled by software and is reset in case of break or break2 event.
- the OSSI bit in the TIMx\_BDTR register defines whether the timer controls the output in inactive state or releases the control to the GPIO controller (typically to have it in Hi-Z mode)
- the OISx and OISxN bits in the TIMx\_CR2 register which are setting the output shut-down level, either active or inactive. The OCx and OCxN outputs cannot be set both to active level at a given time, whatever the OISx and OISxN values. Refer to [Table 284: Output control bits for complementary OCx and OCxN channels with break feature on page 2123](#) for more details.

When exiting from reset, the break circuit is disabled and the MOE bit is low. The break functions can be enabled by setting the BKE and BK2E bits in the TIMx\_BDTR register. The break input polarities can be selected by configuring the BKP and BK2P bits in the same register. BKE/BK2E and BKP/BK2P can be modified at the same time. When the BKE/BK2E and BKP/BK2P bits are written, a delay of 1 APB clock cycle is applied before the writing is effective. Consequently, it is necessary to wait 1 APB clock period to correctly read back the bit after the write operation.

Because MOE falling edge can be asynchronous, a resynchronization circuit has been inserted between the actual signal (acting on the outputs) and the synchronous control bit (accessed in the TIMx\_BDTR register). It results in some delays between the asynchronous and the synchronous signals. In particular, if MOE is set to 1 whereas it was low, a delay must be inserted (dummy instruction) before reading it correctly. This is because the write acts on the asynchronous signal whereas the read reflects the synchronous signal.

The sources for break (BRK) channel are:

- An external source connected to one of the BKIN pin (as per selection done in the AFIO controller), with polarity selection and optional digital filtering
- An internal source:
  - the analog watchdog output of the DFSDM1 peripheral
  - A system break:
    - the Cortex®-M4 LOCKUP output
    - the PVD output

The source for break2 (BRK2) is an external source connected to one of the BKIN pin (as per selection done in the AFIO controller), with polarity selection and optional digital filtering.

Break events can also be generated by software using BG and B2G bits in the TIMx\_EGR register. The software break generation using BG and B2G is active whatever the BKE and BK2E enable bits values.

All sources are ORed before entering the timer BRK or BRK2 inputs, as per [Figure 396](#) below.

Figure 396. Break and Break2 circuitry overview

**Note:** An asynchronous (clockless) operation is only guaranteed when the programmable filter is disabled. If it is enabled, a fail safe clock mode (for example by using the internal PLL and/or the CSS) must be used to guarantee that break events are handled.

When one of the breaks occurs (selected level on one of the break inputs):

- The MOE bit is cleared asynchronously, putting the outputs in inactive state, idle state or even releasing the control to the GPIO controller (selected by the OSS1 bit). This feature is enabled even if the MCU oscillator is off.
- Each output channel is driven with the level programmed in the OISx bit in the TIMx\_CR2 register as soon as MOE=0. If OSS1=0, the timer releases the output control (taken over by the GPIO controller), otherwise the enable output remains high.
- When complementary outputs are used:
  - The outputs are first put in inactive state (depending on the polarity). This is done asynchronously so that it works even if no clock is provided to the timer.
  - If the timer clock is still present, then the dead-time generator is reactivated in order to drive the outputs with the level programmed in the OISx and OISxN bits after a dead-time. Even in this case, OCx and OCxN cannot be driven to their

- active level together. Note that because of the resynchronization on MOE, the dead-time duration is slightly longer than usual (around 2  $ck\_tim$  clock cycles).
- If OSS1=0, the timer releases the output control (taken over by the GPIO controller which forces a Hi-Z state), otherwise the enable outputs remain or become high as soon as one of the CCxE or CCxNE bits is high.
  - The break status flag (SBIF, BIF and B2IF bits in the TIMx\_SR register) is set. An interrupt is generated if the BIE bit in the TIMx\_DIER register is set.
  - If the AOE bit in the TIMx\_BDTR register is set, the MOE bit is automatically set again at the next update event (UEV). As an example, this can be used to perform a regulation. Otherwise, MOE remains low until the application sets it to '1' again. In this case, it can be used for security and the break input can be connected to an alarm from power drivers, thermal sensors or any security components.

**Note:** *The break inputs are active on level. Thus, the MOE cannot be set while the break input is active (neither automatically nor by software). In the meantime, the status flag BIF and B2IF cannot be cleared.*

In addition to the break input and the output management, a write protection has been implemented inside the break circuit to safeguard the application. It allows the configuration of several parameters to be frozen (dead-time duration, OCx/OCxN polarities and state when disabled, OCxM configurations, break enable and polarity). The application can choose from 3 levels of protection selected by the LOCK bits in the TIMx\_BDTR register. Refer to [Section 40.4.20: TIMx break and dead-time register \(TIMx\\_BDTR\)\(x = 1, 8\)](#). The LOCK bits can be written only once after an MCU reset.

[Figure 397](#) shows an example of behavior of the outputs in response to a break.

**Figure 397. Various output behavior in response to a break event on BRK (OSS1 = 1)**

The two break inputs have different behaviors on timer outputs:

- The BRK input can either disable (inactive state) or force the PWM outputs to a predefined safe state.
- BRK2 can only disable (inactive state) the PWM outputs.

The BRK has a higher priority than BRK2 input, as described in [Table 280](#).

**Note:** *BRK2 must only be used with OSSR = OSSl = 1.*

**Table 280. Behavior of timer outputs versus BRK/BRK2 inputs**

| BRK      | BRK2   | Timer outputs state                                                                                                                                                                 | Typical use case                   |                                    |
|----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|------------------------------------|
|          |        |                                                                                                                                                                                     | OCxN output<br>(low side switches) | OCx output<br>(high side switches) |
| Active   | X      | <ul style="list-style-type: none"> <li>– Inactive then forced output state (after a deadtime)</li> <li>– Outputs disabled if OSSl = 0 (control taken over by GPIO logic)</li> </ul> | ON after deadtime insertion        | OFF                                |
| Inactive | Active | Inactive                                                                                                                                                                            | OFF                                | OFF                                |

[Figure 398](#) gives an example of OCx and OCxN output behavior in case of active signals on BRK and BRK2 inputs. In this case, both outputs have active high polarities (CCxP = CCxNP = 0 in TIMx\_CCER register).

**Figure 398. PWM output state following BRK and BRK2 pins assertion (OSSl=1)**

Figure 399. PWM output state following BRK assertion (OSSI=0)

### 40.3.17 Bidirectional break inputs

The TIM1/TIM8 are featuring bidirectional break I/Os, as represented on [Figure 400](#).

They allow the following:

- A board-level global break signal available for signaling faults to external MCUs or gate drivers, with a unique pin being both an input and an output status pin
- Internal break sources and multiple external open drain comparator outputs ORed together to trigger a unique break event, when multiple internal and external break sources must be merged

The break and break2 inputs are configured in bidirectional mode using the BKBID and BK2BID bits in the TIMxBDTR register. The BKBID programming bits can be locked in read-only mode using the LOCK bits in the TIMxBDTR register (in LOCK level 1 or above).

The bidirectional mode is available for both the break and break2 inputs, and require the I/O to be configured in open-drain mode with active low polarity (using BKINP, BKP, BK2INP and BK2P bits). Any break request coming either from system (e.g. CSS), from on-chip peripherals or from break inputs forces a low level on the break input to signal the fault event. The bidirectional mode is inhibited if the polarity bits are not correctly set (active high polarity), for safety purposes.

The break software events (BG and B2G) also cause the break I/O to be forced to '0' to indicate to the external components that the timer has entered in break state. However, this is valid only if the break is enabled (BK(2)E = 1). When a software break event is generated with BK(2)E = 0, the outputs are put in safe state and the break flag is set, but there is no effect on the break(2) I/O.

A safe disarming mechanism prevents the system to be definitively locked-up (a low level on the break input triggers a break which enforces a low level on the same input).

When the BKDSRM (BK2DSRM) bit is set to 1, this releases the break output to clear a fault signal and to give the possibility to re-arm the system.

At no point the break protection circuitry can be disabled:

- The break input path is always active: a break event is active even if the BKDSRM (BK2DSRM) bit is set and the open drain control is released. This prevents the PWM output to be re-started as long as the break condition is present.
- The BK(2)DSRM bit cannot disarm the break protection as long as the outputs are enabled (MOE bit is set) (see [Table 281](#))

Table 281. Break protection disarming conditions

| MOE | BKDIR<br>(BK2DIR) | BKDSRM<br>(BK2DSRM) | Break protection state |
|-----|-------------------|---------------------|------------------------|
| 0   | 0                 | X                   | Armed                  |
| 0   | 1                 | 0                   | Armed                  |
| 0   | 1                 | 1                   | Disarmed               |
| 1   | X                 | X                   | Armed                  |

### Arming and re-arming break circuitry

The break circuitry (in input or bidirectional mode) is armed by default (peripheral reset configuration).

The following procedure must be followed to re-arm the protection after a break (break2) event:

- The BKDSRM (BK2DSRM) bit must be set to release the output control
- The software must wait until the system break condition disappears (if any) and clear the SBIF status flag (or clear it systematically before re-arming)
- The software must poll the BKDSRM (BK2DSRM) bit until it is cleared by hardware (when the application break condition disappears)

From this point, the break circuitry is armed and active, and the MOE bit can be set to re-enable the PWM outputs.

Figure 400. Output redirection (BRK2 request not represented)

### 40.3.18 Clearing the OCxREF signal on an external event

The OCxREF signal of a given channel can be cleared when a high level is applied on the ocref\_clr\_int input (OCxCE enable bit in the corresponding TIMx\_CCMRx register set to 1). OCxREF remains low until the next update event (UEV) occurs. This function can only be

used in Output compare and PWM modes. It does not work in Forced mode. The `ocref_clr_int` is connected to the ETRF signal (ETRF after filtering).

When ETRF is chosen, ETR must be configured as follows:

1. The External Trigger Prescaler should be kept off: bits ETPS[1:0] of the TIMx\_SMCR register set to '00'.
2. The external clock mode 2 must be disabled: bit ECE of the TIMx\_SMCR register set to '0'.
3. The External Trigger Polarity (ETP) and the External Trigger Filter (ETF) can be configured according to the user needs.

**Figure 401** shows the behavior of the OCxREF signal when the ETRF Input becomes High, for both values of the enable bit OCxCE. In this example, the timer TIMx is programmed in PWM mode.

**Figure 401. Clearing TIMx OCxREF**

**Note:** In case of a PWM with a 100% duty cycle (if  $CCR_x > ARR$ ), then OCxREF is enabled again at the next counter overflow.

### 40.3.19 6-step PWM generation

When complementary outputs are used on a channel, preload bits are available on the OCxM, CCxE and CCxNE bits. The preload bits are transferred to the shadow bits at the COM commutation event. Thus one can program in advance the configuration for the next step and change the configuration of all the channels at the same time. COM can be generated by software by setting the COM bit in the TIMx\_EGR register or by hardware (on TRGI rising edge).

A flag is set when the COM event occurs (COMIF bit in the TIMx\_SR register), which can generate an interrupt (if the COMIE bit is set in the TIMx\_DIER register) or a DMA request (if the COMDE bit is set in the TIMx\_DIER register).

The [Figure 402](#) describes the behavior of the OCx and OCxN outputs when a COM event occurs, in 3 different examples of programmed configurations.

**Figure 402. 6-step generation, COM example (OSSR=1)**

### 40.3.20 One-pulse mode

One-pulse mode (OPM) is a particular case of the previous modes. It allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length after a programmable delay.

Starting the counter can be controlled through the slave mode controller. Generating the waveform can be done in output compare mode or PWM mode. One-pulse mode is selected by setting the OPM bit in the TIMx\_CR1 register. This makes the counter stop automatically at the next update event UEV.

A pulse can be correctly generated only if the compare value is different from the counter initial value. Before starting (when the timer is waiting for the trigger), the configuration must be:

- In upcounting:  $CNT < CCRx \leq ARR$  (in particular,  $0 < CCRx$ )
- In downcounting:  $CNT > CCRx$

**Figure 403. Example of one pulse mode.**

MS31099V1

For example one may want to generate a positive pulse on OC1 with a length of  $t_{PULSE}$  and after a delay of  $t_{DELAY}$  as soon as a positive edge is detected on the TI2 input pin.

Let's use TI2FP2 as trigger 1:

1. Select the proper TI2x source (internal or external) with the TI2SEL[3:0] bits in the TIMx\_TISEL register.
2. Map TI2FP2 to TI2 by writing CC2S='01' in the TIMx\_CCMR1 register.
3. TI2FP2 must detect a rising edge, write CC2P='0' and CC2NP='0' in the TIMx\_CCER register.
4. Configure TI2FP2 as trigger for the slave mode controller (TRGI) by writing TS=00110 in the TIMx\_SMCR register.
5. TI2FP2 is used to start the counter by writing SMS to '110' in the TIMx\_SMCR register (trigger mode).

The OPM waveform is defined by writing the compare registers (taking into account the clock frequency and the counter prescaler).

- The  $t_{\text{DELAY}}$  is defined by the value written in the TIMx\_CCR1 register.
- The  $t_{\text{PULSE}}$  is defined by the difference between the auto-reload value and the compare value (TIMx\_ARR - TIMx\_CCR1).
- Let's say one want to build a waveform with a transition from '0' to '1' when a compare match occurs and a transition from '1' to '0' when the counter reaches the auto-reload value. To do this PWM mode 2 must be enabled by writing OC1M=111 in the TIMx\_CCMR1 register. Optionally the preload registers can be enabled by writing OC1PE='1' in the TIMx\_CCMR1 register and ARPE in the TIMx\_CR1 register. In this case one has to write the compare value in the TIMx\_CCR1 register, the auto-reload value in the TIMx\_ARR register, generate an update by setting the UG bit and wait for external trigger event on TI2. CC1P is written to '0' in this example.

In our example, the DIR and CMS bits in the TIMx\_CR1 register should be low.

Since only 1 pulse (Single mode) is needed, a 1 must be written in the OPM bit in the TIMx\_CR1 register to stop the counter at the next update event (when the counter rolls over from the auto-reload value back to 0). When OPM bit in the TIMx\_CR1 register is set to '0', so the Repetitive Mode is selected.

Particular case: OCx fast enable:

In One-pulse mode, the edge detection on TIx input set the CEN bit which enables the counter. Then the comparison between the counter and the compare value makes the output toggle. But several clock cycles are needed for these operations and it limits the minimum delay  $t_{\text{DELAY min}}$  we can get.

If one wants to output a waveform with the minimum delay, the OCxFE bit can be set in the TIMx\_CCMRx register. Then OCxRef (and OCx) are forced in response to the stimulus, without taking in account the comparison. Its new level is the same as if a compare match had occurred. OCxFE acts only if the channel is configured in PWM1 or PWM2 mode.

### 40.3.21 Retriggerable one pulse mode (OPM)

This mode allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length, but with the following differences with Non-retriggerable one pulse mode described in [Section 40.3.20](#):

- The pulse starts as soon as the trigger occurs (no programmable delay)
- The pulse is extended if a new trigger occurs before the previous one is completed

The timer must be in Slave mode, with the bits SMS[3:0] = '1000' (Combined Reset + trigger mode) in the TIMx\_SMCR register, and the OCxM[3:0] bits set to '1000' or '1001' for Retriggerable OPM mode 1 or 2.

If the timer is configured in Up-counting mode, the corresponding CCRx must be set to 0 (the ARR register sets the pulse length). If the timer is configured in Down-counting mode, CCRx must be above or equal to ARR.

*Note: The OCxM[3:0] and SMS[3:0] bit fields are split into two parts for compatibility reasons, the most significant bit are not contiguous with the 3 least significant ones.*

*This mode must not be used with center-aligned PWM modes. It is mandatory to have CMS[1:0] = 00 in TIMx\_CR1.*

Figure 404. Retriggerable one pulse mode

### 40.3.22 Encoder interface mode

To select Encoder Interface mode write SMS='001' in the TIMx\_SMCR register if the counter is counting on TI2 edges only, SMS='010' if it is counting on TI1 edges only and SMS='011' if it is counting on both TI1 and TI2 edges.

Select the TI1 and TI2 polarity by programming the CC1P and CC2P bits in the TIMx\_CCER register. When needed, the input filter can be programmed as well. CC1NP and CC2NP must be kept low.

The two inputs TI1 and TI2 are used to interface to a quadrature encoder. Refer to [Table 282](#). The counter is clocked by each valid transition on TI1FP1 or TI2FP2 (TI1 and TI2 after input filter and polarity selection, TI1FP1=TI1 if not filtered and not inverted, TI2FP2=TI2 if not filtered and not inverted) assuming that it is enabled (CEN bit in TIMx\_CR1 register written to '1'). The sequence of transitions of the two inputs is evaluated and generates count pulses as well as the direction signal. Depending on the sequence the counter counts up or down, the DIR bit in the TIMx\_CR1 register is modified by hardware accordingly. The DIR bit is calculated at each transition on any input (TI1 or TI2), whatever the counter is counting on TI1 only, TI2 only or both TI1 and TI2.

Encoder interface mode acts simply as an external clock with direction selection. This means that the counter just counts continuously between 0 and the auto-reload value in the TIMx\_ARR register (0 to ARR or ARR down to 0 depending on the direction). So the TIMx\_ARR must be configured before starting. In the same way, the capture, compare, repetition counter, trigger output features continue to work as normal. Encoder mode and External clock mode 2 are not compatible and must not be selected together.

**Note:** *The prescaler must be set to zero when encoder mode is enabled*

In this mode, the counter is modified automatically following the speed and the direction of the quadrature encoder and its content, therefore, always represents the encoder's position. The count direction correspond to the rotation direction of the connected sensor. The table summarizes the possible combinations, assuming TI1 and TI2 do not switch at the same time.

Table 282. Counting direction versus encoder signals

| Active edge             | Level on opposite signal (TI1FP1 for TI2, TI2FP2 for TI1) | TI1FP1 signal |          | TI2FP2 signal |          |
|-------------------------|-----------------------------------------------------------|---------------|----------|---------------|----------|
|                         |                                                           | Rising        | Falling  | Rising        | Falling  |
| Counting on TI1 only    | High                                                      | Down          | Up       | No Count      | No Count |
|                         | Low                                                       | Up            | Down     | No Count      | No Count |
| Counting on TI2 only    | High                                                      | No Count      | No Count | Up            | Down     |
|                         | Low                                                       | No Count      | No Count | Down          | Up       |
| Counting on TI1 and TI2 | High                                                      | Down          | Up       | Up            | Down     |
|                         | Low                                                       | Up            | Down     | Down          | Up       |

A quadrature encoder can be connected directly to the MCU without external interface logic. However, comparators are normally be used to convert the encoder's differential outputs to digital signals. This greatly increases noise immunity. The third encoder output which indicate the mechanical zero position, may be connected to an external interrupt input and trigger a counter reset.

The [Figure 405](#) gives an example of counter operation, showing count signal generation and direction control. It also shows how input jitter is compensated where both edges are selected. This might occur if the sensor is positioned near to one of the switching points. For this example we assume that the configuration is the following:

- CC1S='01' (TIMx\_CCMR1 register, TI1FP1 mapped on TI1).
- CC2S='01' (TIMx\_CCMR2 register, TI1FP2 mapped on TI2).
- CC1P='0' and CC1NP='0' (TIMx\_CCER register, TI1FP1 non-inverted, TI1FP1=TI1).
- CC2P='0' and CC2NP='0' (TIMx\_CCER register, TI1FP2 non-inverted, TI1FP2= TI2).
- SMS='011' (TIMx\_SMCR register, both inputs are active on both rising and falling edges).
- CEN='1' (TIMx\_CR1 register, Counter enabled).

Figure 405. Example of counter operation in encoder interface mode.

MS33107V1

Figure 406 gives an example of counter behavior when TI1FP1 polarity is inverted (same configuration as above except CC1P='1').

**Figure 406. Example of encoder interface mode with TI1FP1 polarity inverted.**

The timer, when configured in Encoder Interface mode provides information on the sensor's current position. Dynamic information can be obtained (speed, acceleration, deceleration) by measuring the period between two encoder events using a second timer configured in capture mode. The output of the encoder which indicates the mechanical zero can be used for this purpose. Depending on the time between two events, the counter can also be read at regular times. This can be done by latching the counter value into a third input capture register if available (then the capture signal must be periodic and can be generated by another timer). when available, it is also possible to read its value through a DMA request.

The IUFREMAP bit in the TIMx\_CR1 register forces a continuous copy of the update interrupt flag (UIF) into the timer counter register's bit 31 (TIMxCNT[31]). This allows both the counter value and a potential roll-over condition signaled by the UIFCPY flag to be read in an atomic way. It eases the calculation of angular speed by avoiding race conditions caused, for instance, by a processing shared between a background task (counter reading) and an interrupt (update interrupt).

There is no latency between the UIF and UIFCPY flag assertions.

In 32-bit timer implementations, when the IUFREMAP bit is set, bit 31 of the counter is overwritten by the UIFCPY flag upon read access (the counter's most significant bit is only accessible in write mode).

### 40.3.23 UIF bit remapping

The IUFREMAP bit in the TIMx\_CR1 register forces a continuous copy of the Update Interrupt Flag UIF into the timer counter register's bit 31 (TIMxCNT[31]). This allows both the counter value and a potential roll-over condition signaled by the UIFCPY flag to be read in an atomic way. In particular cases, it can ease the calculations by avoiding race conditions, caused for instance by a processing shared between a background task (counter reading) and an interrupt (Update Interrupt).

There is no latency between the UIF and UIFCPY flags assertion.

### 40.3.24 Timer input XOR function

The TI1S bit in the TIMx\_CR2 register, allows the input filter of channel 1 to be connected to the output of an XOR gate, combining the three input pins TIMx\_CH1, TIMx\_CH2 and TIMx\_CH3.

The XOR output can be used with all the timer input functions such as trigger or input capture. It is convenient to measure the interval between edges on two input signals, as per [Figure 407](#) below.

**Figure 407. Measuring time interval between edges on 3 signals**

### 40.3.25 Interfacing with Hall sensors

This is done using the advanced-control timers (TIM1 or TIM8) to generate PWM signals to drive the motor and another timer TIMx (TIM2, TIM3, TIM4) referred to as “interfacing timer” in [Figure 408](#). The “interfacing timer” captures the 3 timer input pins (CC1, CC2, CC3) connected through a XOR to the TI1 input channel (selected by setting the TI1S bit in the TIMx\_CR2 register).

The slave mode controller is configured in reset mode; the slave input is TI1F\_ED. Thus, each time one of the 3 inputs toggles, the counter restarts counting from 0. This creates a time base triggered by any change on the Hall inputs.

On the “interfacing timer”, capture/compare channel 1 is configured in capture mode, capture signal is TRC (See [Figure 381: Capture/compare channel \(example: channel 1 input stage\) on page 2065](#)). The captured value, which corresponds to the time elapsed between 2 changes on the inputs, gives information about motor speed.

The “interfacing timer” can be used in output mode to generate a pulse which changes the configuration of the channels of the advanced-control timer (TIM1 or TIM8) (by triggering a COM event). The TIM1 timer is used to generate PWM signals to drive the motor. To do this, the interfacing timer channel must be programmed so that a positive pulse is generated after a programmed delay (in output compare or PWM mode). This pulse is sent to the advanced-control timer (TIM1 or TIM8) through the TRGO output.

Example: one wants to change the PWM configuration of the advanced-control timer TIM1 after a programmed delay each time a change occurs on the Hall inputs connected to one of the TIMx timers.

- Configure 3 timer inputs ORed to the TI1 input channel by writing the TI1S bit in the TIMx\_CR2 register to '1',
- Program the time base: write the TIMx\_ARR to the max value (the counter must be cleared by the TI1 change. Set the prescaler to get a maximum counter period longer than the time between 2 changes on the sensors,
- Program the channel 1 in capture mode (TRC selected): write the CC1S bits in the TIMx\_CCMR1 register to '01'. The digital filter can also be programmed if needed,
- Program the channel 2 in PWM 2 mode with the desired delay: write the OC2M bits to '111' and the CC2S bits to '00' in the TIMx\_CCMR1 register,
- Select OC2REF as trigger output on TRGO: write the MMS bits in the TIMx\_CR2 register to '101',

In the advanced-control timer TIM1, the right ITR input must be selected as trigger input, the timer is programmed to generate PWM signals, the capture/compare control signals are preloaded (CCPC=1 in the TIMx\_CR2 register) and the COM event is controlled by the trigger input (CCUS=1 in the TIMx\_CR2 register). The PWM control bits (CCxE, OCxM) are written after a COM event for the next step (this can be done in an interrupt subroutine generated by the rising edge of OC2REF).

The [Figure 408](#) describes this example.

Figure 408. Example of Hall sensor interface

### 40.3.26 Timer synchronization

The TIMx timers are linked together internally for timer synchronization or chaining. They can be synchronized in several modes: Reset mode, Gated mode, and Trigger mode.

#### Slave mode: Reset mode

The counter and its prescaler can be reinitialized in response to an event on a trigger input. Moreover, if the URS bit from the TIMx\_CR1 register is low, an update event UEV is generated. Then all the preloaded registers (TIMx\_ARR, TIMx\_CCRx) are updated.

In the following example, the upcounter is cleared in response to a rising edge on TI1 input:

- Configure the channel 1 to detect rising edges on TI1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F=0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in the TIMx\_CCMR1 register. Write CC1P=0 and CC1NP='0' in TIMx\_CCER register to validate the polarity (and detect rising edges only).
- Configure the timer in reset mode by writing SMS=100 in TIMx\_SMCR register. Select TI1 as the input source by writing TS=00101 in TIMx\_SMCR register.
- Start the counter by writing CEN=1 in the TIMx\_CR1 register.

The counter starts counting on the internal clock, then behaves normally until TI1 rising edge. When TI1 rises, the counter is cleared and restarts from 0. In the meantime, the trigger flag is set (TIF bit in the TIMx\_SR register) and an interrupt request, or a DMA request can be sent if enabled (depending on the TIE and TDE bits in TIMx\_DIER register).

The following figure shows this behavior when the auto-reload register TIMx\_ARR=0x36. The delay between the rising edge on TI1 and the actual reset of the counter is due to the resynchronization circuit on TI1 input.

**Figure 409. Control circuit in reset mode**

### Slave mode: Gated mode

The counter can be enabled depending on the level of a selected input.

In the following example, the upcounter counts only when TI1 input is low:

- Configure the channel 1 to detect low levels on TI1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F=0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S=01 in TIMx\_CCMR1 register. Write CC1P=1 and CC1NP='0' in TIMx\_CCER register to validate the polarity (and detect low level only).
- Configure the timer in gated mode by writing SMS=101 in TIMx\_SMCR register. Select TI1 as the input source by writing TS=00101 in TIMx\_SMCR register.
- Enable the counter by writing CEN=1 in the TIMx\_CR1 register (in gated mode, the counter doesn't start if CEN=0, whatever is the trigger input level).

The counter starts counting on the internal clock as long as TI1 is low and stops as soon as TI1 becomes high. The TIF flag in the TIMx\_SR register is set both when the counter starts or stops.

The delay between the rising edge on TI1 and the actual stop of the counter is due to the resynchronization circuit on TI1 input.

**Figure 410. Control circuit in Gated mode**

### Slave mode: Trigger mode

The counter can start in response to an event on a selected input.

In the following example, the upcounter starts in response to a rising edge on TI2 input:

- Configure the channel 2 to detect rising edges on TI2. Configure the input filter duration (in this example, we do not need any filter, so we keep IC2F=0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC2S bits are configured to select the input capture source only, CC2S=01 in TIMx\_CCMR1

register. Write CC2P=1 and CC2NP=0 in TIMx\_CCER register to validate the polarity (and detect low level only).

- Configure the timer in trigger mode by writing SMS=110 in TIMx\_SMCR register. Select TI2 as the input source by writing TS=00110 in TIMx\_SMCR register.

When a rising edge occurs on TI2, the counter starts counting on the internal clock and the TIF flag is set.

The delay between the rising edge on TI2 and the actual start of the counter is due to the resynchronization circuit on TI2 input.

**Figure 411. Control circuit in trigger mode**

### Slave mode: Combined reset + trigger mode

In this case, a rising edge of the selected trigger input (TRGI) reinitializes the counter, generates an update of the registers, and starts the counter.

This mode is used for one-pulse mode.

### Slave mode: external clock mode 2 + trigger mode

The external clock mode 2 can be used in addition to another slave mode (except external clock mode 1 and encoder mode). In this case, the ETR signal is used as external clock input, and another input can be selected as trigger input (in reset mode, gated mode or trigger mode). It is recommended not to select ETR as TRGI through the TS bits of TIMx\_SMCR register.

In the following example, the upcounter is incremented at each rising edge of the ETR signal as soon as a rising edge of TI1 occurs:

- Configure the external trigger input circuit by programming the TIMx\_SMCR register as follows:
  - ETF = 0000: no filter
  - ETPS=00: prescaler disabled
  - ETP=0: detection of rising edges on ETR and ECE=1 to enable the external clock mode 2.
- Configure the channel 1 as follows, to detect rising edges on TI:
  - IC1F=0000: no filter.
  - The capture prescaler is not used for triggering and does not need to be configured.
  - CC1S=01 in TIMx\_CCMR1 register to select only the input capture source
  - CC1P=0 and CC1NP='0' in TIMx\_CCER register to validate the polarity (and detect rising edge only).
- Configure the timer in trigger mode by writing SMS=110 in TIMx\_SMCR register. Select TI1 as the input source by writing TS=00101 in TIMx\_SMCR register.

A rising edge on TI1 enables the counter and sets the TIF flag. The counter then counts on ETR rising edges.

The delay between the rising edge of the ETR signal and the actual reset of the counter is due to the resynchronization circuit on ETRP input.

**Figure 412. Control circuit in external clock mode 2 + trigger mode**

**Note:** The clock of the slave peripherals (timer, ADC, ...) receiving the TRGO or the TRGO2 signals must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

### 40.3.27 ADC synchronization

The timer can generate an ADC triggering event with various internal signals, such as reset, enable or compare events. It is also possible to generate a pulse issued by internal edge detectors, such as:

- Rising and falling edges of OC4ref
- Rising edge on OC5ref or falling edge on OC6ref

The triggers are issued on the TRGO2 internal line which is redirected to the ADC. There is a total of 16 possible events, which can be selected using the MMS2[3:0] bits in the TIMx\_CR2 register.

An example of an application for 3-phase motor drives is given in [Figure 392 on page 2077](#).

*Note: The clock of the slave peripherals (timer, ADC, ...) receiving the TRGO or the TRGO2 signals must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.*

*Note: The clock of the ADC must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the timer.*

### 40.3.28 DMA burst mode

The TIMx timers have the capability to generate multiple DMA requests upon a single event. The main purpose is to be able to re-program part of the timer multiple times without software overhead, but it can also be used to read several registers in a row, at regular intervals.

The DMA controller destination is unique and must point to the virtual register TIMx\_DMAR. On a given timer event, the timer launches a sequence of DMA requests (burst). Each write into the TIMx\_DMAR register is actually redirected to one of the timer registers.

The DBL[4:0] bits in the TIMx\_DCR register set the DMA burst length. The timer recognizes a burst transfer when a read or a write access is done to the TIMx\_DMAR address, i.e. the number of transfers (either in half-words or in bytes).

The DBA[4:0] bits in the TIMx\_DCR registers define the DMA base address for DMA transfers (when read/write access are done through the TIMx\_DMAR address). DBA is defined as an offset starting from the address of the TIMx\_CR1 register:

Example:

00000: TIMx\_CR1

00001: TIMx\_CR2

00010: TIMx\_SMCR

As an example, the timer DMA burst feature is used to update the contents of the CCRx registers (x = 2, 3, 4) upon an update event, with the DMA transferring half words into the CCRx registers.

This is done in the following steps:

1. Configure the corresponding DMA channel as follows:
  - DMA channel peripheral address is the DMAR register address
  - DMA channel memory address is the address of the buffer in the RAM containing the data to be transferred by DMA into CCRx registers.
  - Number of data to transfer = 3 (See note below).
  - Circular mode disabled.
2. Configure the DCR register by configuring the DBA and DBL bit fields as follows:  
DBL = 3 transfers, DBA = 0xE.
3. Enable the TIMx update DMA request (set the UDE bit in the DIER register).
4. Enable TIMx
5. Enable the DMA channel

This example is for the case where every CCRx register to be updated once. If every CCRx register is to be updated twice for example, the number of data to transfer should be 6. Let's take the example of a buffer in the RAM containing data1, data2, data3, data4, data5 and data6. The data is transferred to the CCRx registers as follows: on the first update DMA request, data1 is transferred to CCR2, data2 is transferred to CCR3, data3 is transferred to CCR4 and on the second update DMA request, data4 is transferred to CCR2, data5 is transferred to CCR3 and data6 is transferred to CCR4.

*Note:* A null value can be written to the reserved registers.

### 40.3.29 Debug mode

When the system enters debug mode (processor core halted), the TIMx counter either continues to work normally or stops, depending on DBG\_TIMx\_STOP configuration bit in DBG module.

For safety purposes, when the counter is stopped, the outputs are disabled (as if the MOE bit was reset). The outputs can either be forced to an inactive state (OSSI bit = 1), or have their control taken over by the GPIO controller (OSSI bit = 0), typically to force a Hi-Z.

For more details, refer to section Debug support (DBG).

## 40.4 TIM1/TIM8 registers

Refer to for a list of abbreviations used in register descriptions.

The peripheral registers can be accessed by half-words (16-bit) or words (32-bit).

### 40.4.1 TIMx control register 1 (TIMx\_CR1)(x = 1, 8)

Address offset: 0x00

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11           | 10   | 9        | 8  | 7    | 6        | 5  | 4   | 3   | 2   | 1    | 0   |
|------|------|------|------|--------------|------|----------|----|------|----------|----|-----|-----|-----|------|-----|
| Res. | Res. | Res. | Res. | UIFRE<br>MAP | Res. | CKD[1:0] |    | ARPE | CMS[1:0] |    | DIR | OPM | URS | UDIS | CEN |
|      |      |      |      | rW           |      | rW       | rW | rW   | rW       | rW | rW  | rW  | rW  | rW   | rW  |

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **UIFREMAP**: UIF status bit remapping

0: No remapping. UIF status bit is not copied to TIMx\_CNT register bit 31.

1: Remapping enabled. UIF status bit is copied to TIMx\_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division

This bit-field indicates the division ratio between the timer clock (CK\_INT) frequency and the dead-time and sampling clock ( $t_{DTS}$ ) used by the dead-time generators and the digital filters (ETR, TIx),

00:  $t_{DTS}=t_{CK\_INT}$

01:  $t_{DTS}=2*t_{CK\_INT}$

10:  $t_{DTS}=4*t_{CK\_INT}$

11: Reserved, do not program this value

Bit 7 **ARPE**: Auto-reload preload enable

0: TIMx\_ARR register is not buffered

1: TIMx\_ARR register is buffered

Bits 6:5 **CMS[1:0]**: Center-aligned mode selection

00: Edge-aligned mode. The counter counts up or down depending on the direction bit (DIR).

01: Center-aligned mode 1. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS=00 in TIMx\_CCMRx register) are set only when the counter is counting down.

10: Center-aligned mode 2. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS=00 in TIMx\_CCMRx register) are set only when the counter is counting up.

11: Center-aligned mode 3. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS=00 in TIMx\_CCMRx register) are set both when the counter is counting up or down.

*Note: Switch from edge-aligned mode to center-aligned mode as long as the counter is enabled (CEN=1) is not allowed*

Bit 4 **DIR**: Direction

- 0: Counter used as upcounter
- 1: Counter used as downcounter

*Note: This bit is read only when the timer is configured in Center-aligned mode or Encoder mode.*

Bit 3 **OPM**: One pulse mode

- 0: Counter is not stopped at update event
- 1: Counter stops counting at the next update event (clearing the bit CEN)

Bit 2 **URS**: Update request source

This bit is set and cleared by software to select the UEV event sources.

0: Any of the following events generate an update interrupt or DMA request if enabled. These events can be:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

1: Only counter overflow/underflow generates an update interrupt or DMA request if enabled.

Bit 1 **UDIS**: Update disable

This bit is set and cleared by software to enable/disable UEV event generation.

0: UEV enabled. The Update (UEV) event is generated by one of the following events:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

Buffered registers are then loaded with their preload values.

1: UEV disabled. The Update event is not generated, shadow registers keep their value (ARR, PSC, CCRx). However the counter and the prescaler are reinitialized if the UG bit is set or if a hardware reset is received from the slave mode controller.

Bit 0 **CEN**: Counter enable

- 0: Counter disabled
- 1: Counter enabled

*Note: External clock, gated mode and encoder mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.*

#### 40.4.2 TIMx control register 2 (TIMx\_CR2)(x = 1, 8)

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:20 **MMS2[3:0]**: Master mode selection 2

These bits allow the information to be sent to ADC for synchronization (TRGO2) to be selected. The combination is as follows:

0000: **Reset** - the UG bit from the TIMx\_EGR register is used as trigger output (TRGO2). If the reset is generated by the trigger input (slave mode controller configured in reset mode), the signal on TRGO2 is delayed compared to the actual reset.

0001: **Enable** - the Counter Enable signal CNT\_EN is used as trigger output (TRGO2). It is useful to start several timers at the same time or to control a window in which a slave timer is enabled. The Counter Enable signal is generated by a logic AND between the CEN control bit and the trigger input when configured in Gated mode. When the Counter Enable signal is controlled by the trigger input, there is a delay on TRGO2, except if the Master/Slave mode is selected (see the MSM bit description in TIMx\_SMCR register).

0010: **Update** - the update event is selected as trigger output (TRGO2). For instance, a master timer can then be used as a prescaler for a slave timer.

0011: **Compare pulse** - the trigger output sends a positive pulse when the CC1IF flag is to be set (even if it was already high), as soon as a capture or compare match occurs (TRGO2).

0100: **Compare** - OC1REF signal is used as trigger output (TRGO2)

0101: **Compare** - OC2REF signal is used as trigger output (TRGO2)

0110: **Compare** - OC3REF signal is used as trigger output (TRGO2)

0111: **Compare** - OC4REF signal is used as trigger output (TRGO2)

1000: **Compare** - OC5REF signal is used as trigger output (TRGO2)

1001: **Compare** - OC6REF signal is used as trigger output (TRGO2)

1010: **Compare Pulse** - OC4REF rising or falling edges generate pulses on TRGO2

1011: **Compare Pulse** - OC6REF rising or falling edges generate pulses on TRGO2

1100: **Compare Pulse** - OC4REF or OC6REF rising edges generate pulses on TRGO2

1101: **Compare Pulse** - OC4REF rising or OC6REF falling edges generate pulses on TRGO2

1110: **Compare Pulse** - OC5REF or OC6REF rising edges generate pulses on TRGO2

1111: **Compare Pulse** - OC5REF rising or OC6REF falling edges generate pulses on TRGO2

*Note: The clock of the slave timer or ADC must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.*

Bit 19 Reserved, must be kept at reset value.

Bit 18 **OIS6**: Output Idle state 6 (OC6 output)

Refer to OIS1 bit

Bit 17 Reserved, must be kept at reset value.

Bit 16 **OIS5**: Output Idle state 5 (OC5 output)

Refer to OIS1 bit

Bit 15 Reserved, must be kept at reset value.

Bit 14 **OIS4**: Output Idle state 4 (OC4 output)

Refer to OIS1 bit

Bit 13 **OIS3N**: Output Idle state 3 (OC3N output)

Refer to OIS1N bit

Bit 12 **OIS3**: Output Idle state 3 (OC3 output)

Refer to OIS1 bit

- Bit 11 **OIS2N**: Output Idle state 2 (OC2N output)  
Refer to OIS1N bit
- Bit 10 **OIS2**: Output Idle state 2 (OC2 output)  
Refer to OIS1 bit
- Bit 9 **OIS1N**: Output Idle state 1 (OC1N output)  
0: OC1N=0 after a dead-time when MOE=0  
1: OC1N=1 after a dead-time when MOE=0  
*Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx\_BDTR register).*
- Bit 8 **OIS1**: Output Idle state 1 (OC1 output)  
0: OC1=0 (after a dead-time if OC1N is implemented) when MOE=0  
1: OC1=1 (after a dead-time if OC1N is implemented) when MOE=0  
*Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx\_BDTR register).*
- Bit 7 **TI1S**: TI1 selection  
0: The TIMx\_CH1 pin is connected to TI1 input  
1: The TIMx\_CH1, CH2 and CH3 pins are connected to the TI1 input (XOR combination)
- Bits 6:4 **MMS[2:0]**: Master mode selection  
These bits allow selected information to be sent in master mode to slave timers for synchronization (TRGO). The combination is as follows:  
000: **Reset** - the UG bit from the TIMx\_EGR register is used as trigger output (TRGO). If the reset is generated by the trigger input (slave mode controller configured in reset mode) then the signal on TRGO is delayed compared to the actual reset.  
001: **Enable** - the Counter Enable signal CNT\_EN is used as trigger output (TRGO). It is useful to start several timers at the same time or to control a window in which a slave timer is enable. The Counter Enable signal is generated by a logic AND between CEN control bit and the trigger input when configured in gated mode. When the Counter Enable signal is controlled by the trigger input, there is a delay on TRGO, except if the master/slave mode is selected (see the MSM bit description in TIMx\_SMCR register).  
010: **Update** - The update event is selected as trigger output (TRGO). For instance a master timer can then be used as a prescaler for a slave timer.  
011: **Compare Pulse** - The trigger output send a positive pulse when the CC1IF flag is to be set (even if it was already high), as soon as a capture or a compare match occurred. (TRGO).  
100: **Compare** - OC1REF signal is used as trigger output (TRGO)  
101: **Compare** - OC2REF signal is used as trigger output (TRGO)  
110: **Compare** - OC3REF signal is used as trigger output (TRGO)  
111: **Compare** - OC4REF signal is used as trigger output (TRGO)  
*Note: The clock of the slave timer or ADC must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.*
- Bit 3 **CCDS**: Capture/compare DMA selection  
0: CCx DMA request sent when CCx event occurs  
1: CCx DMA requests sent when update event occurs

Bit 2 **CCUS**: Capture/compare control update selection

0: When capture/compare control bits are preloaded (CCPC=1), they are updated by setting the COMG bit only

1: When capture/compare control bits are preloaded (CCPC=1), they are updated by setting the COMG bit or when an rising edge occurs on TRGI

*Note: This bit acts only on channels that have a complementary output.*

Bit 1 Reserved, must be kept at reset value.

Bit 0 **CCPC**: Capture/compare preloaded control

0: CCxE, CCxNE and OCxM bits are not preloaded

1: CCxE, CCxNE and OCxM bits are preloaded, after having been written, they are updated only when a commutation event (COM) occurs (COMG bit set or rising edge detected on TRGI, depending on the CCUS bit).

*Note: This bit acts only on channels that have a complementary output.*

Bits 31:22 Reserved, must be kept at reset value.

Bits 19:17 Reserved, must be kept at reset value.

Bit 15 **ETP**: External trigger polarity

This bit selects whether ETR or  $\overline{\text{ETR}}$  is used for trigger operations

0: ETR is non-inverted, active at high level or rising edge.

1: ETR is inverted, active at low level or falling edge.

Bit 14 **ECE**: External clock enable

This bit enables External clock mode 2.

0: External clock mode 2 disabled

1: External clock mode 2 enabled. The counter is clocked by any active edge on the ETRF signal.

*Note: Setting the ECE bit has the same effect as selecting external clock mode 1 with TRGI connected to ETRF (SMS=111 and TS=00111).*

*It is possible to simultaneously use external clock mode 2 with the following slave modes: reset mode, gated mode and trigger mode. Nevertheless, TRGI must not be connected to ETRF in this case (TS bits must not be 00111).*

*If external clock mode 1 and external clock mode 2 are enabled at the same time, the external clock input is ETRF.*

Bits 13:12 **ETPS[1:0]**: External trigger prescaler

External trigger signal ETRP frequency must be at most 1/4 of TIMxCLK frequency. A prescaler can be enabled to reduce ETRP frequency. It is useful when inputting fast external clocks.

- 00: Prescaler OFF
- 01: ETRP frequency divided by 2
- 10: ETRP frequency divided by 4
- 11: ETRP frequency divided by 8

Bits 11:8 **ETF[3:0]**: External trigger filter

This bit-field then defines the frequency used to sample ETRP signal and the length of the digital filter applied to ETRP. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

- 0000: No filter, sampling is done at  $f_{DTS}$
- 0001:  $f_{SAMPLING}=f_{CK\_INT}$ , N=2
- 0010:  $f_{SAMPLING}=f_{CK\_INT}$ , N=4
- 0011:  $f_{SAMPLING}=f_{CK\_INT}$ , N=8
- 0100:  $f_{SAMPLING}=f_{DTS}/2$ , N=6
- 0101:  $f_{SAMPLING}=f_{DTS}/2$ , N=8
- 0110:  $f_{SAMPLING}=f_{DTS}/4$ , N=6
- 0111:  $f_{SAMPLING}=f_{DTS}/4$ , N=8
- 1000:  $f_{SAMPLING}=f_{DTS}/8$ , N=6
- 1001:  $f_{SAMPLING}=f_{DTS}/8$ , N=8
- 1010:  $f_{SAMPLING}=f_{DTS}/16$ , N=5
- 1011:  $f_{SAMPLING}=f_{DTS}/16$ , N=6
- 1100:  $f_{SAMPLING}=f_{DTS}/16$ , N=8
- 1101:  $f_{SAMPLING}=f_{DTS}/32$ , N=5
- 1110:  $f_{SAMPLING}=f_{DTS}/32$ , N=6
- 1111:  $f_{SAMPLING}=f_{DTS}/32$ , N=8

Bit 7 **MSM**: Master/slave mode

- 0: No action
- 1: The effect of an event on the trigger input (TRGI) is delayed to allow a perfect synchronization between the current timer and its slaves (through TRGO). It is useful if we want to synchronize several timers on a single external event.

Bits 21, 20, 6, 5, 4 **TS[4:0]**: Trigger selection

This bit-field selects the trigger input to be used to synchronize the counter.

- 00000: Internal Trigger 0 (ITR0)
- 00001: Internal Trigger 1 (ITR1)
- 00010: Internal Trigger 2 (ITR2)
- 00011: Internal Trigger 3 (ITR3)
- 00100: TI1 Edge Detector (TI1F\_ED)
- 00101: Filtered Timer Input 1 (TI1FP1)
- 00110: Filtered Timer Input 2 (TI2FP2)
- 00111: External Trigger input (ETRF)
- Others: Reserved

See [Table 283: TIMx internal trigger connection on page 2109](#) for more details on ITRx meaning for each Timer.

*Note: These bits must be changed only when they are not used (e.g. when SMS=000) to avoid wrong edge detections at the transition.*

Bit 3 Reserved, must be kept at reset value.

Bits 16, 2, 1, 0 **SMS[3:0]**: Slave mode selection

When external signals are selected the active edge of the trigger signal (TRGI) is linked to the polarity selected on the external input (see Input Control register and Control Register description).

0000: Slave mode disabled - if CEN = '1' then the prescaler is clocked directly by the internal clock.

0001: Encoder mode 1 - Counter counts up/down on TI1FP1 edge depending on TI2FP2 level.

0010: Encoder mode 2 - Counter counts up/down on TI2FP2 edge depending on TI1FP1 level.

0011: Encoder mode 3 - Counter counts up/down on both TI1FP1 and TI2FP2 edges depending on the level of the other input.

0100: Reset Mode - Rising edge of the selected trigger input (TRGI) reinitializes the counter and generates an update of the registers.

0101: Gated Mode - The counter clock is enabled when the trigger input (TRGI) is high. The counter stops (but is not reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

0110: Trigger Mode - The counter starts at a rising edge of the trigger TRGI (but it is not reset). Only the start of the counter is controlled.

0111: External Clock Mode 1 - Rising edges of the selected trigger (TRGI) clock the counter.

1000: Combined reset + trigger mode - Rising edge of the selected trigger input (TRGI) reinitializes the counter, generates an update of the registers and starts the counter.

Codes above 1000: Reserved.

*Note: The gated mode must not be used if TI1F\_ED is selected as the trigger input (TS=00100). Indeed, TI1F\_ED outputs 1 pulse for each transition on TI1F, whereas the gated mode checks the level of the trigger signal.*

*Note: The clock of the slave peripherals (timer, ADC, ...) receiving the TRGO or the TRGO2 signals must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.*

**Table 283. TIMx internal trigger connection**

| Slave TIM | ITR0 (TS = 00000) | ITR1 (TS = 00001) | ITR2 (TS = 00010) | ITR3 (TS = 00011) |
|-----------|-------------------|-------------------|-------------------|-------------------|

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **CC6IF**: Compare 6 interrupt flag

Refer to CC1IF description (Note: Channel 6 can only be configured as output)

Bit 16 **CC5IF**: Compare 5 interrupt flag

Refer to CC1IF description (Note: Channel 5 can only be configured as output)

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **SBIF**: System Break interrupt flag

This flag is set by hardware as soon as the system break input goes active. It can be cleared by software if the system break input is not active.

This flag must be reset to re-start PWM operation.

0: No break event occurred.

1: An active level has been detected on the system break input. An interrupt is generated if BIE=1 in the TIMx\_DIER register.

Bit 12 **CC4OF**: Capture/Compare 4 overcapture flag

Refer to CC1OF description

Bit 11 **CC3OF**: Capture/Compare 3 overcapture flag

Refer to CC1OF description

Bit 10 **CC2OF**: Capture/Compare 2 overcapture flag

Refer to CC1OF description

Bit 9 **CC1OF**: Capture/Compare 1 overcapture flag

This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to '0'.

0: No overcapture has been detected.

1: The counter value has been captured in TIMx\_CCR1 register while CC1IF flag was already set

Bit 8 **B2IF**: Break 2 interrupt flag

This flag is set by hardware as soon as the break 2 input goes active. It can be cleared by software if the break 2 input is not active.

0: No break event occurred.

1: An active level has been detected on the break 2 input. An interrupt is generated if BIE=1 in the TIMx\_DIER register.

Bit 7 **BIF**: Break interrupt flag

This flag is set by hardware as soon as the break input goes active. It can be cleared by software if the break input is not active.

0: No break event occurred.

1: An active level has been detected on the break input. An interrupt is generated if BIE=1 in the TIMx\_DIER register.

Bit 6 **TIF**: Trigger interrupt flag

This flag is set by hardware on the TRG trigger event (active edge detected on TRGI input when the slave mode controller is enabled in all modes but gated mode. It is set when the counter starts or stops when gated mode is selected. It is cleared by software.

0: No trigger event occurred.

1: Trigger interrupt pending.

Bit 5 **COMIF**: COM interrupt flag

This flag is set by hardware on COM event (when Capture/compare Control bits - CCxE, CCxNE, OCxM - have been updated). It is cleared by software.

0: No COM event occurred.

1: COM interrupt pending.

Bit 4 **CC4IF**: Capture/Compare 4 interrupt flag

Refer to CC1IF description

Bit 3 **CC3IF**: Capture/Compare 3 interrupt flag

Refer to CC1IF description

Bit 2 **CC2IF**: Capture/Compare 2 interrupt flag

Refer to CC1IF description

Bit 1 **CC1IF**: Capture/Compare 1 interrupt flag

This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIMx\_CCR1 register (input capture mode only).

0: No compare match / No input capture occurred

1: A compare match or an input capture occurred.

**If channel CC1 is configured as output:** this flag is set when the content of the counter TIMx\_CNT matches the content of the TIMx\_CCR1 register. When the content of TIMx\_CCR1 is greater than the content of TIMx\_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in down-counting mode). There are 3 possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIMx\_CR1 register for the full description.

**If channel CC1 is configured as input:** this bit is set when counter value has been captured in TIMx\_CCR1 register (an edge has been detected on IC1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIMx\_CCER).

Bit 0 **UIF**: Update interrupt flag

This bit is set by hardware on an update event. It is cleared by software.

0: No update occurred.

1: Update interrupt pending. This bit is set by hardware when the registers are updated:

- At overflow or underflow regarding the repetition counter value (update if repetition counter = 0) and if the UDIS=0 in the TIMx\_CR1 register.
- When CNT is reinitialized by software using the UG bit in TIMx\_EGR register, if URS=0 and UDIS=0 in the TIMx\_CR1 register.
- When CNT is reinitialized by a trigger event (refer to [Section 40.4.3: TIMx slave mode control register \(TIMx\\_SMCR\)\(x = 1, 8\)](#)), if URS=0 and UDIS=0 in the TIMx\_CR1 register.

**40.4.6 TIMx event generation register (TIMx\_EGR)(x = 1, 8)**

Address offset: 0x14

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8   | 7  | 6  | 5    | 4    | 3    | 2    | 1    | 0  |

|      |      |      |      |      |      |      | w   | w  | w  | w    | w    | w    | w    | w    | w  |

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **B2G**: Break 2 generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action

1: A break 2 event is generated. MOE bit is cleared and B2IF flag is set. Related interrupt can occur if enabled.

Bit 7 **BG**: Break generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action

1: A break event is generated. MOE bit is cleared and BIF flag is set. Related interrupt or DMA transfer can occur if enabled.

Bit 6 **TG**: Trigger generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action

1: The TIF flag is set in TIMx\_SR register. Related interrupt or DMA transfer can occur if enabled.

Bit 5 **COMG**: Capture/Compare control update generation

This bit can be set by software, it is automatically cleared by hardware

0: No action

1: When CCPC bit is set, it allows CCxE, CCxNE and OCxM bits to be updated.

*Note: This bit acts only on channels having a complementary output.*

Bit 4 **CC4G**: Capture/Compare 4 generation

Refer to CC1G description

Bit 3 **CC3G**: Capture/Compare 3 generation

Refer to CC1G description

Bit 2 **CC2G**: Capture/Compare 2 generation

Refer to CC1G description

Bit 1 **CC1G**: Capture/Compare 1 generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action

1: A capture/compare event is generated on channel 1:

**If channel CC1 is configured as output:**

CC1IF flag is set, Corresponding interrupt or DMA request is sent if enabled.

**If channel CC1 is configured as input:**

The current value of the counter is captured in TIMx\_CCR1 register. The CC1IF flag is set, the corresponding interrupt or DMA request is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation

This bit can be set by software, it is automatically cleared by hardware.

0: No action

1: Reinitialize the counter and generates an update of the registers. The prescaler internal counter is also cleared (the prescaler ratio is not affected). The counter is cleared if the center-aligned mode is selected or if DIR=0 (upcounting), else it takes the auto-reload value (TIMx\_ARR) if DIR=1 (downcounting).

#### 40.4.7 TIMx capture/compare mode register 1 [alternate] (TIMx\_CCMR1)(x = 1, 8)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (e.g. channel 1 in input capture mode and channel 2 in output compare mode).

**Input capture mode:**

|           |      |      |      |             |      |           |      |           |      |      |      |             |      |           |      |

| 15        | 14   | 13   | 12   | 11          | 10   | 9         | 8    | 7         | 6    | 5    | 4    | 3           | 2    | 1         | 0    |
| IC2F[3:0] |      |      |      | IC2PSC[1:0] |      | CC2S[1:0] |      | IC1F[3:0] |      |      |      | IC1PSC[1:0] |      | CC1S[1:0] |      |
| rw        | rw   | rw   | rw   | rw          | rw   | rw        | rw   | rw        | rw   | rw   | rw   | rw          | rw   | rw        | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC2F[3:0]**: Input capture 2 filter

Refer to IC1F[3:0] description.

Bits 11:10 **IC2PSC[1:0]**: Input capture 2 prescaler

Refer to OC1PSC[1:0] description.

Bits 9:8 **CC2S[1:0]**: Capture/Compare 2 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output

01: CC2 channel is configured as input, IC2 is mapped on TI2

10: CC2 channel is configured as input, IC2 is mapped on TI1

11: CC2 channel is configured as input, IC2 is mapped on TRC. This mode is working only if an internal trigger input is selected through TS bit (TIMx\_SMCR register)

*Note:* CC2S bits are writable only when the channel is OFF (CC2E = '0' in TIMx\_CCER).

Bits 7:4 **IC1F[3:0]**: Input capture 1 filter

This bit-field defines the frequency used to sample TI1 input and the length of the digital filter applied to TI1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at  $f_{DTS}$

0001:  $f_{SAMPLING}=f_{CK\_INT}$ , N=2

0010:  $f_{SAMPLING}=f_{CK\_INT}$ , N=4

0011:  $f_{SAMPLING}=f_{CK\_INT}$ , N=8

0100:  $f_{SAMPLING}=f_{DTS}/2$ , N=6

0101:  $f_{SAMPLING}=f_{DTS}/2$ , N=8

0110:  $f_{SAMPLING}=f_{DTS}/4$ , N=6

0111:  $f_{SAMPLING}=f_{DTS}/4$ , N=8

1000:  $f_{SAMPLING}=f_{DTS}/8$ , N=6

1001:  $f_{SAMPLING}=f_{DTS}/8$ , N=8

1010:  $f_{SAMPLING}=f_{DTS}/16$ , N=5

1011:  $f_{SAMPLING}=f_{DTS}/16$ , N=6

1100:  $f_{SAMPLING}=f_{DTS}/16$ , N=8

1101:  $f_{SAMPLING}=f_{DTS}/32$ , N=5

1110:  $f_{SAMPLING}=f_{DTS}/32$ , N=6

1111:  $f_{SAMPLING}=f_{DTS}/32$ , N=8

Bits 3:2 **IC1PSC[1:0]**: Input capture 1 prescaler

This bit-field defines the ratio of the prescaler acting on CC1 input (IC1). The prescaler is reset as soon as CC1E='0' (TIMx\_CCER register).

00: no prescaler, capture is done each time an edge is detected on the capture input

01: capture is done once every 2 events

10: capture is done once every 4 events

11: capture is done once every 8 events

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 Selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, IC1 is mapped on TI1

10: CC1 channel is configured as input, IC1 is mapped on TI2

11: CC1 channel is configured as input, IC1 is mapped on TRC. This mode is working only if an internal trigger input is selected through TS bit (TIMx\_SMCR register)

*Note:* CC1S bits are writable only when the channel is OFF (CC1E = '0' in TIMx\_CCER).

#### 40.4.8 TIMx capture/compare mode register 1 [alternate] (TIMx\_CCMR1)(x = 1, 8)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the

corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (e.g. channel 1 in input capture mode and channel 2 in output compare mode).

#### Output compare mode:

|           |           |      |      |           |           |           |         |           |           |      |      |           |           |           |         |

Bits 31:25 Reserved, must be kept at reset value.

Bits 23:17 Reserved, must be kept at reset value.

Bit 15 **OC2CE**: Output Compare 2 clear enable  
Refer to OC1CE description.

Bits 24, 14:12 **OC2M[3:0]**: Output Compare 2 mode  
Refer to OC1M[3:0] description.

Bit 11 **OC2PE**: Output Compare 2 preload enable  
Refer to OC1PE description.

Bit 10 **OC2FE**: Output Compare 2 fast enable  
Refer to OC1FE description.

Bits 9:8 **CC2S[1:0]**: Capture/Compare 2 selection  
This bit-field defines the direction of the channel (input/output) as well as the used input.  
00: CC2 channel is configured as output  
01: CC2 channel is configured as input, IC2 is mapped on TI2  
10: CC2 channel is configured as input, IC2 is mapped on TI1  
11: CC2 channel is configured as input, IC2 is mapped on TRC. This mode is working only if an internal trigger input is selected through the TS bit (TIMx\_SMCR register)  
*Note: CC2S bits are writable only when the channel is OFF (CC2E = '0' in TIMx\_CCER).*

Bit 7 **OC1CE**: Output Compare 1 clear enable  
0: OC1Ref is not affected by the ETRF input  
1: OC1Ref is cleared as soon as a High level is detected on ETRF input

Bits 16, 6:4 **OC1M[3:0]**: Output Compare 1 mode

These bits define the behavior of the output reference signal OC1REF from which OC1 and OC1N are derived. OC1REF is active high whereas OC1 and OC1N active level depends on CC1P and CC1NP bits.

0000: Frozen - The comparison between the output compare register TIMx\_CCR1 and the counter TIMx\_CNT has no effect on the outputs.(this mode is used to generate a timing base).

0001: Set channel 1 to active level on match. OC1REF signal is forced high when the counter TIMx\_CNT matches the capture/compare register 1 (TIMx\_CCR1).

0010: Set channel 1 to inactive level on match. OC1REF signal is forced low when the counter TIMx\_CNT matches the capture/compare register 1 (TIMx\_CCR1).

0011: Toggle - OC1REF toggles when TIMx\_CNT=TIMx\_CCR1.

0100: Force inactive level - OC1REF is forced low.

0101: Force active level - OC1REF is forced high.

0110: PWM mode 1 - In upcounting, channel 1 is active as long as TIMx\_CNT<TIMx\_CCR1 else inactive. In downcounting, channel 1 is inactive (OC1REF='0') as long as TIMx\_CNT>TIMx\_CCR1 else active (OC1REF='1').

0111: PWM mode 2 - In upcounting, channel 1 is inactive as long as TIMx\_CNT<TIMx\_CCR1 else active. In downcounting, channel 1 is active as long as TIMx\_CNT>TIMx\_CCR1 else inactive.

1000: Retriggerable OPM mode 1 - In up-counting mode, the channel is active until a trigger event is detected (on TRGI signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update. In down-counting mode, the channel is inactive until a trigger event is detected (on TRGI signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update.

1001: Retriggerable OPM mode 2 - In up-counting mode, the channel is inactive until a trigger event is detected (on TRGI signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update. In down-counting mode, the channel is active until a trigger event is detected (on TRGI signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

1010: Reserved,

1011: Reserved,

1100: Combined PWM mode 1 - OC1REF has the same behavior as in PWM mode 1. OC1REFC is the logical OR between OC1REF and OC2REF.

1101: Combined PWM mode 2 - OC1REF has the same behavior as in PWM mode 2. OC1REFC is the logical AND between OC1REF and OC2REF.

1110: Asymmetric PWM mode 1 - OC1REF has the same behavior as in PWM mode 1. OC1REFC outputs OC1REF when the counter is counting up, OC2REF when it is counting down.

1111: Asymmetric PWM mode 2 - OC1REF has the same behavior as in PWM mode 2. OC1REFC outputs OC1REF when the counter is counting up, OC2REF when it is counting down.

*Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIMx\_BDTR register) and CC1S='00' (the channel is configured in output).*

*Note: In PWM mode, the OCREF level changes only when the result of the comparison changes or when the output compare mode switches from "frozen" mode to "PWM" mode.*

*Note: On channels having a complementary output, this bit field is preloaded. If the CCPC bit is set in the TIMx\_CR2 register then the OC1M active bits take the new value from the preloaded bits only when a COM event is generated.*

Bit 3 **OC1PE**: Output Compare 1 preload enable

0: Preload register on TIMx\_CCR1 disabled. TIMx\_CCR1 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIMx\_CCR1 enabled. Read/Write operations access the preload register. TIMx\_CCR1 preload value is loaded in the active register at each update event.

*Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIMx\_BDTR register) and CC1S='00' (the channel is configured in output).*

*The PWM mode can be used without validating the preload register only in one pulse mode (OPM bit set in TIMx\_CR1 register). Else the behavior is not guaranteed.*

Bit 2 **OC1FE**: Output Compare 1 fast enable

This bit is used to accelerate the effect of an event on the trigger in input on the CC output.

0: CC1 behaves normally depending on counter and CCR1 values even when the trigger is ON. The minimum delay to activate CC1 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC1 output. Then, OC is set to the compare level independently from the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to 3 clock cycles. OCFE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, IC1 is mapped on TI1

10: CC1 channel is configured as input, IC1 is mapped on TI2

11: CC1 channel is configured as input, IC1 is mapped on TRC. This mode is working only if an internal trigger input is selected through TS bit (TIMx\_SMCR register)

*Note: CC1S bits are writable only when the channel is OFF (CC1E = '0' in TIMx\_CCER).*

#### 40.4.9 TIMx capture/compare mode register 2 [alternate] (TIMx\_CCMR2)(x = 1, 8)

Address offset: 0x1C

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (e.g. channel 1 in input capture mode and channel 2 in output compare mode).

**Input capture mode:**

|           |      |      |      |             |      |           |      |           |      |      |      |             |      |           |      |

Refer to CC1E description

Bit 3 **CC1NP**: Capture/Compare 1 complementary output polarity

**CC1 channel configured as output:**

0: OC1N active high.

1: OC1N active low.

**CC1 channel configured as input:**

This bit is used in conjunction with CC1P to define the polarity of TI1FP1 and TI2FP1. Refer to CC1P description.

*Note: This bit is not writable as soon as LOCK level 2 or 3 has been programmed (LOCK bits in TIMx\_BDTR register) and CC1S="00" (channel configured as output).*

*On channels having a complementary output, this bit is preloaded. If the CCPC bit is set in the TIMx\_CR2 register then the CC1NP active bit takes the new value from the preloaded bit only when a Commutation event is generated.*

Bit 2 **CC1NE**: Capture/Compare 1 complementary output enable

0: Off - OC1N is not active. OC1N level is then function of MOE, OSS1, OSSR, OIS1, OIS1N and CC1E bits.

1: On - OC1N signal is output on the corresponding output pin depending on MOE, OSS1, OSSR, OIS1, OIS1N and CC1E bits.

*On channels having a complementary output, this bit is preloaded. If the CCPC bit is set in the TIMx\_CR2 register then the CC1NE active bit takes the new value from the preloaded bit only when a Commutation event is generated.*

Bit 1 **CC1P**: Capture/Compare 1 output polarity

0: OC1 active high (output mode) / Edge sensitivity selection (input mode, see below)

1: OC1 active low (output mode) / Edge sensitivity selection (input mode, see below)

When CC1 channel is configured as input, both CC1NP/CC1P bits select the active polarity of TI1FP1 and TI2FP1 for trigger or capture operations.

CC1NP=0, CC1P=0: non-inverted/rising edge. The circuit is sensitive to TIxFP1 rising edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode or encoder mode).

CC1NP=0, CC1P=1: inverted/falling edge. The circuit is sensitive to TIxFP1 falling edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is inverted (trigger operation in gated mode or encoder mode).

CC1NP=1, CC1P=1: non-inverted/both edges/ The circuit is sensitive to both TIxFP1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode). This configuration must not be used in encoder mode.

CC1NP=1, CC1P=0: The configuration is reserved, it must not be used.

*Note: This bit is not writable as soon as LOCK level 2 or 3 has been programmed (LOCK bits in TIMx\_BDTR register).*

*On channels having a complementary output, this bit is preloaded. If the CCPC bit is set in the TIMx\_CR2 register then the CC1P active bit takes the new value from the preloaded bit only when a Commutation event is generated.*

Bit 0 **CC1E**: Capture/Compare 1 output enable

0: Capture mode disabled / OC1 is not active (see below)

1: Capture mode enabled / OC1 signal is output on the corresponding output pin

**When CC1 channel is configured as output**, the OC1 level depends on MOE, OSSI, OSSR, OIS1, OIS1N and CC1NE bits, regardless of the CC1E bits state. Refer to [Table 284](#) for details.

*Note: On channels having a complementary output, this bit is preloaded. If the CCPC bit is set in the TIMx\_CR2 register then the CC1E active bit takes the new value from the preloaded bit only when a Commutation event is generated.*

**Table 284. Output control bits for complementary OCx and OCxN channels with break feature**

| Control bits |          |          |          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Output states <sup>(1)</sup>                                                                                                        |                                                              |

|              | 1        |          | 1        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                     |                                                              |

1. When both outputs of a channel are not used (control taken over by GPIO), the OISx, OISxN, CCxP and CCxNP bits must be kept cleared.

**Note:** *The state of the external I/O pins connected to the complementary OCx and OCxN channels depends on the OCx and OCxN channel state and the GPIO registers.*

**40.4.12 TIMx counter (TIMx\_CNT)(x = 1, 8)**

Address offset: 0x24

Reset value: 0x0000 0000

Bit 31 **UIFCPY**: UIF copy

This bit is a read-only copy of the UIF bit of the TIMx\_ISR register. If the UIFREMAP bit in the TIMxCR1 is reset, bit 31 is reserved and read at 0.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]**: Counter value**40.4.13 TIMx prescaler (TIMx\_PSC)(x = 1, 8)**

Address offset: 0x28

Reset value: 0x0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| PSC[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **PSC[15:0]**: Prescaler value

The counter clock frequency (CK\_CNT) is equal to  $f_{CK\_PSC} / (PSC[15:0] + 1)$ .

PSC contains the value to be loaded in the active prescaler register at each update event (including when the counter is cleared through UG bit of TIMx\_EGR register or through trigger controller when configured in “reset mode”).

**40.4.14 TIMx auto-reload register (TIMx\_ARR)(x = 1, 8)**

Address offset: 0x2C

Reset value: 0xFFFF

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ARR[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **ARR[15:0]**: Auto-reload value

ARR is the value to be loaded in the actual auto-reload register.

Refer to the [Section 40.3.1: Time-base unit on page 2045](#) for more details about ARR update and behavior.

The counter is blocked while the auto-reload value is null.

#### 40.4.15 TIMx repetition counter register (TIMx\_RCR)(x = 1, 8)

Address offset: 0x30

Reset value: 0x0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| REP[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW        | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 15:0 **REP[15:0]**: Repetition counter value

These bits allow the user to set-up the update rate of the compare registers (i.e. periodic transfers from preload to active registers) when preload registers are enable, as well as the update interrupt generation rate, if this interrupt is enable.

Each time the REP\_CNT related downcounter reaches zero, an update event is generated and it restarts counting from REP value. As REP\_CNT is reloaded with REP value only at the repetition update event U\_RC, any write to the TIMx\_RCR register is not taken in account until the next repetition update event.

It means in PWM mode (REP+1) corresponds to:  
the number of PWM periods in edge-aligned mode  
the number of half PWM period in center-aligned mode.

#### 40.4.16 TIMx capture/compare register 1 (TIMx\_CCR1)(x = 1, 8)

Address offset: 0x34

Reset value: 0x0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CCR1[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW         | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 15:0 **CCR1[15:0]**: Capture/Compare 1 value

**If channel CC1 is configured as output:** CCR1 is the value to be loaded in the actual capture/compare 1 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIMx\_CCMR1 register (bit OC1PE). Else the preload value is copied in the active capture/compare 1 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx\_CNT and signaled on OC1 output.

**If channel CC1 is configured as input:** CR1 is the counter value transferred by the last input capture 1 event (IC1). The TIMx\_CCR1 register is read-only and cannot be programmed.

**40.4.17 TIMx capture/compare register 2 (TIMx\_CCR2)(x = 1, 8)**

Address offset: 0x38

Reset value: 0x0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CCR2[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **CCR2[15:0]**: Capture/Compare 2 value

**If channel CC2 is configured as output:** CCR2 is the value to be loaded in the actual capture/compare 2 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIMx\_CCMR1 register (bit OC2PE). Else the preload value is copied in the active capture/compare 2 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx\_CNT and signaled on OC2 output.

**If channel CC2 is configured as input:** CCR2 is the counter value transferred by the last input capture 2 event (IC2). The TIMx\_CCR2 register is read-only and cannot be programmed.

**40.4.18 TIMx capture/compare register 3 (TIMx\_CCR3)(x = 1, 8)**

Address offset: 0x3C

Reset value: 0x0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CCR3[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **CCR3[15:0]**: Capture/Compare value

**If channel CC3 is configured as output:** CCR3 is the value to be loaded in the actual capture/compare 3 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIMx\_CCMR2 register (bit OC3PE). Else the preload value is copied in the active capture/compare 3 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx\_CNT and signalled on OC3 output.

**If channel CC3 is configured as input:** CCR3 is the counter value transferred by the last input capture 3 event (IC3). The TIMx\_CCR3 register is read-only and cannot be programmed.

#### 40.4.19 TIMx capture/compare register 4 (TIMx\_CCR4)(x = 1, 8)

Address offset: 0x40

Reset value: 0x0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CCR4[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **CCR4[15:0]**: Capture/Compare value

**If channel CC4 is configured as output:** CCR4 is the value to be loaded in the actual capture/compare 4 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIMx\_CCMR2 register (bit OC4PE). Else the preload value is copied in the active capture/compare 4 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx\_CNT and signalled on OC4 output.

**If channel CC4 is configured as input:** CCR4 is the counter value transferred by the last input capture 4 event (IC4). The TIMx\_CCR4 register is read-only and cannot be programmed.

#### 40.4.20 TIMx break and dead-time register (TIMx\_BDTR)(x = 1, 8)

Address offset: 0x44

**Note:** As the bits BK2BID, BKBID, BK2DSRM, BKDSRM, BK2P, BK2E, BK2F[3:0], BKF[3:0], AOE, BKP, BKE, OSSI, OSSR and DTG[7:0] can be write-locked depending on the LOCK configuration, it can be necessary to configure all of them during the first write access to the TIMx\_BDTR register.

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **BK2BID**: Break2 bidirectional

Refer to BKBID description

Bit 28 **BKBID**: Break Bidirectional

- 0: Break input BRK in input mode
- 1: Break input BRK in bidirectional mode

In the bidirectional mode (BKBID bit set to 1), the break input is configured both in input mode and in open drain output mode. Any active break event asserts a low logic level on the Break input to indicate an internal break event to external devices.

*Note: This bit cannot be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

*Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.*

Bit 27 **BK2DSRM**: Break2 Disarm

Refer to BKDSRM description

Bit 26 **BKDSRM**: Break Disarm

- 0: Break input BRK is armed
- 1: Break input BRK is disarmed

This bit is cleared by hardware when no break source is active.

The BKDSRM bit must be set by software to release the bidirectional output control (open-drain output in Hi-Z state) and then be polled it until it is reset by hardware, indicating that the fault condition has disappeared.

*Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.*

Bit 25 **BK2P**: Break 2 polarity

- 0: Break input BRK2 is active low
- 1: Break input BRK2 is active high

*Note: This bit cannot be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

*Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.*

Bit 24 **BK2E**: Break 2 enable

This bit enables the complete break 2 protection (including all sources connected to bk\_acth and BKIN sources, as per [Figure 396: Break and Break2 circuitry overview](#)).

- 0: Break2 function disabled
- 1: Break2 function enabled

*Note: The BKIN2 must only be used with OSSR = OSSR = 1.*

*Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

*Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.*

Bits 23:20 **BK2F[3:0]**: Break 2 filter

This bit-field defines the frequency used to sample BRK2 input and the length of the digital filter applied to BRK2. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, BRK2 acts asynchronously

0001:  $f_{\text{SAMPLING}} = f_{\text{CK\_INT}}$ , N=2

0010:  $f_{\text{SAMPLING}} = f_{\text{CK\_INT}}$ , N=4

0011:  $f_{\text{SAMPLING}} = f_{\text{CK\_INT}}$ , N=8

0100:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/2$ , N=6

0101:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/2$ , N=8

0110:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/4$ , N=6

0111:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/4$ , N=8

1000:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/8$ , N=6

1001:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/8$ , N=8

1010:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/16$ , N=5

1011:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/16$ , N=6

1100:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/16$ , N=8

1101:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/32$ , N=5

1110:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/32$ , N=6

1111:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/32$ , N=8

*Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bits 19:16 **BKF[3:0]**: Break filter

This bit-field defines the frequency used to sample BRK input and the length of the digital filter applied to BRK. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, BRK acts asynchronously

0001:  $f_{\text{SAMPLING}} = f_{\text{CK\_INT}}$ , N=2

0010:  $f_{\text{SAMPLING}} = f_{\text{CK\_INT}}$ , N=4

0011:  $f_{\text{SAMPLING}} = f_{\text{CK\_INT}}$ , N=8

0100:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/2$ , N=6

0101:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/2$ , N=8

0110:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/4$ , N=6

0111:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/4$ , N=8

1000:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/8$ , N=6

1001:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/8$ , N=8

1010:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/16$ , N=5

1011:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/16$ , N=6

1100:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/16$ , N=8

1101:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/32$ , N=5

1110:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/32$ , N=6

1111:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/32$ , N=8

*Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bit 15 **MOE**: Main output enable

This bit is cleared asynchronously by hardware as soon as one of the break inputs is active (BRK or BRK2). It is set by software or automatically depending on the AOE bit. It is acting only on the channels which are configured in output.

0: In response to a break 2 event. OC and OCN outputs are disabled

In response to a break event or if MOE is written to 0: OC and OCN outputs are disabled or forced to idle state depending on the OSSR bit.

1: OC and OCN outputs are enabled if their respective enable bits are set (CCxE, CCxNE in TIMx\_CCER register).

See OC/OCN enable description for more details ([Section 40.4.11: TIMx capture/compare enable register \(TIMx\\_CCER\)\(x = 1, 8\)](#)).

Bit 14 **AOE**: Automatic output enable

0: MOE can be set only by software

1: MOE can be set by software or automatically at the next update event (if none of the break inputs BRK and BRK2 is active)

*Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bit 13 **BKP**: Break polarity

0: Break input BRK is active low

1: Break input BRK is active high

*Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

*Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.*

Bit 12 **BKE**: Break enable

This bit enables the complete break protection (including all sources connected to bk\_acth and BKIN sources, as per [Figure 396: Break and Break2 circuitry overview](#)).

0: Break function disabled

1: Break function enabled

*Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

*Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.*

Bit 11 **OSSR**: Off-state selection for Run mode

This bit is used when MOE=1 on channels having a complementary output which are configured as outputs. OSSR is not implemented if no complementary output is implemented in the timer.

See OC/OCN enable description for more details ([Section 40.4.11: TIMx capture/compare enable register \(TIMx\\_CCER\)\(x = 1, 8\)](#)).

0: When inactive, OC/OCN outputs are disabled (the timer releases the output control which is taken over by the GPIO logic, which forces a Hi-Z state).

1: When inactive, OC/OCN outputs are enabled with their inactive level as soon as CCxE=1 or CCxNE=1 (the output is still controlled by the timer).

*Note: This bit can not be modified as soon as the LOCK level 2 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bit 10 **OSSI**: Off-state selection for Idle mode

This bit is used when MOE=0 due to a break event or by a software write, on channels configured as outputs.

See OC/OCN enable description for more details ([Section 40.4.11: TIMx capture/compare enable register \(TIMx\\_CCER\)\(x = 1, 8\)](#)).

0: When inactive, OC/OCN outputs are disabled (the timer releases the output control which is taken over by the GPIO logic and which imposes a Hi-Z state).

1: When inactive, OC/OCN outputs are first forced with their inactive level then forced to their idle level after the deadtime. The timer maintains its control over the output.

*Note: This bit can not be modified as soon as the LOCK level 2 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bits 9:8 **LOCK[1:0]**: Lock configuration

These bits offer a write protection against software errors.

00: LOCK OFF - No bit is write protected.

01: LOCK Level 1 = DTG bits in TIMx\_BDTR register, OISx and OISxN bits in TIMx\_CR2 register and BK2BD, BKBID, BK2DSRM, BKDSRM, BK2P, BK2E, BK2F[3:0], BKF[3:0], AOE, BKP, BKE, OSSI, OSSR and DTG[7:0] bits in TIMx\_BDTR register can no longer be written.

10: LOCK Level 2 = LOCK Level 1 + CC Polarity bits (CCxP/CCxNP bits in TIMx\_CCER register, as long as the related channel is configured in output through the CCxS bits) as well as OSSR and OSSI bits can no longer be written.

11: LOCK Level 3 = LOCK Level 2 + CC Control bits (OCxM and OCxPE bits in TIMx\_CCMRx registers, as long as the related channel is configured in output through the CCxS bits) can no longer be written.

*Note: The LOCK bits can be written only once after the reset. Once the TIMx\_BDTR register has been written, their content is frozen until the next reset.*

Bits 7:0 **DTG[7:0]**: Dead-time generator setup

This bit-field defines the duration of the dead-time inserted between the complementary outputs. DT correspond to this duration.

DTG[7:5]=0xx => DT=DTG[7:0]x  $t_{dtg}$  with  $t_{dtg}=t_{DTS}$ .

DTG[7:5]=10x => DT=(64+DTG[5:0])x  $t_{dtg}$  with  $t_{dtg}=2x t_{DTS}$ .

DTG[7:5]=110 => DT=(32+DTG[4:0])x  $t_{dtg}$  with  $t_{dtg}=8x t_{DTS}$ .

DTG[7:5]=111 => DT=(32+DTG[4:0])x  $t_{dtg}$  with  $t_{dtg}=16x t_{DTS}$ .

Example if  $T_{DTS}=125\text{ns}$  (8MHz), dead-time possible values are:

0 to 15875 ns by 125 ns steps,

16 us to 31750 ns by 250 ns steps,

32 us to 63us by 1 us steps,

64 us to 126 us by 2 us steps

*Note: This bit-field can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx\_BDTR register).*

#### 40.4.21 TIMx DMA control register (TIMx\_DCR)(x = 1, 8)

Address offset: 0x48

Reset value: 0x0000

| 15   | 14   | 13   | 12       | 11 | 10 | 9  | 8  | 7    | 6    | 5    | 4        | 3  | 2  | 1  | 0  |
|------|------|------|----------|----|----|----|----|------|------|------|----------|----|----|----|----|
| Res. | Res. | Res. | DBL[4:0] |    |    |    |    | Res. | Res. | Res. | DBA[4:0] |    |    |    |    |
|      |      |      | rw       | rw | rw | rw | rw |      |      |      | rw       | rw | rw | rw | rw |

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **DBL[4:0]**: DMA burst length

This 5-bit vector defines the length of DMA transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIMx\_DMAR address), i.e. the number of transfers. Transfers can be in half-words or in bytes (see example below).

00000: 1 transfer

00001: 2 transfers

00010: 3 transfers

...

10001: 18 transfers

**Example:** Let us consider the following transfer: DBL = 7 bytes & DBA = TIMx\_CR1.

– If DBL = 7 bytes and DBA = TIMx\_CR1 represents the address of the byte to be transferred, the address of the transfer should be given by the following equation:

(TIMx\_CR1 address) + DBA + (DMA index), where DMA index = DBL

In this example, 7 bytes are added to (TIMx\_CR1 address) + DBA, which gives us the address from/to which the data is copied. In this case, the transfer is done to 7 registers starting from the following address: (TIMx\_CR1 address) + DBA

According to the configuration of the DMA Data Size, several cases may occur:

– If the DMA Data Size is configured in half-words, 16-bit data is transferred to each of the 7 registers.

– If the DMA Data Size is configured in bytes, the data is also transferred to 7 registers: the first register contains the first MSB byte, the second register, the first LSB byte and so on. So with the transfer Timer, one also has to specify the size of data transferred by DMA.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **DBA[4:0]**: DMA base address

This 5-bits vector defines the base-address for DMA transfers (when read/write access are done through the TIMx\_DMAR address). DBA is defined as an offset starting from the address of the TIMx\_CR1 register.

Example:

00000: TIMx\_CR1,

00001: TIMx\_CR2,

00010: TIMx\_SMCR,

...

#### 40.4.22 TIMx DMA address for full transfer (TIMx\_DMAR)(x = 1, 8)

Address offset: 0x4C

Reset value: 0x0000 0000

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| DMAB[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| DMAB[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:0 **DMAB[31:0]**: DMA register for burst accesses

A read or write operation to the DMAR register accesses the register located at the address (TIMx\_CR1 address) + (DBA + DMA index) x 4

where TIMx\_CR1 address is the address of the control register 1, DBA is the DMA base address configured in TIMx\_DCR register, DMA index is automatically controlled by the DMA transfer, and ranges from 0 to DBL (DBL configured in TIMx\_DCR).

#### 40.4.23 TIMx capture/compare mode register 3 (TIMx\_CCMR3)(x = 1, 8)

Address offset: 0x54

Reset value: 0x0000 0000

The channels 5 and 6 can only be configured in output.

**Output compare mode:**

**Bit 31 GC5C3:** Group Channel 5 and Channel 3

Distortion on Channel 3 output:

0: No effect of OC5REF on OC3REFC

1: OC3REFC is the logical AND of OC3REFC and OC5REF

This bit can either have immediate effect or be preloaded and taken into account after an update event (if preload feature is selected in TIMx\_CCMR2).

*Note: it is also possible to apply this distortion on combined PWM signals.***Bit 30 GC5C2:** Group Channel 5 and Channel 2

Distortion on Channel 2 output:

0: No effect of OC5REF on OC2REFC

1: OC2REFC is the logical AND of OC2REFC and OC5REF

This bit can either have immediate effect or be preloaded and taken into account after an update event (if preload feature is selected in TIMx\_CCMR1).

*Note: it is also possible to apply this distortion on combined PWM signals.***Bit 29 GC5C1:** Group Channel 5 and Channel 1

Distortion on Channel 1 output:

0: No effect of OC5REF on OC1REFC5

1: OC1REFC is the logical AND of OC1REFC and OC5REF

This bit can either have immediate effect or be preloaded and taken into account after an update event (if preload feature is selected in TIMx\_CCMR1).

*Note: it is also possible to apply this distortion on combined PWM signals.***Bits 28:16** Reserved, must be kept at reset value.**Bits 15:0 CCR5[15:0]:** Capture/Compare 5 value

CCR5 is the value to be loaded in the actual capture/compare 5 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIMx\_CCMR3 register (bit OC5PE). Else the preload value is copied in the active capture/compare 5 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx\_CNT and signaled on OC5 output.

**40.4.25 TIMx capture/compare register 6 (TIMx\_CCR6)(x = 1, 8)**

Address offset: 0x5C

Reset value: 0x0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |

| rw          | rw   |      |      |      |      | rw    | rw            |      |      |      |      |      |      |             | rw    |

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:14 **ETRSEL[3:0]**: ETR source selection

These bits select the ETR input source.

0000: ETR input is connected to I/O

0001: Reserved

0010: Reserved

0011: ADC1 AWD1

0100: ADC1 AWD2

0101: ADC1 AWD3

0110: ADC2 AWD1

0111: ADC2 AWD2

1000: ADC2 AWD3

Others: Reserved

Note: These bits can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).

Bits 13:10 Reserved, must be kept at reset value.

Bit 9 **BKINP**: BRK BKIN input polarity

This bit selects the BKIN alternate function input sensitivity. It must be programmed together with the BKP polarity bit.

0: BKIN input is active high

1: BKIN input is active low

*Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bit 8 **BKDF1BK0E**: BRK dfsdm1\_break[0] enable

This bit enables the dfsdm1\_break[0] for the timer's BRK input. dfsdm1\_break[0] output is 'ORed' with the other BRK sources.

0: dfsdm1\_break[0] input disabled

1: dfsdm1\_break[0] input enabled

*Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **BKINE**: BRK BKIN input enable

This bit enables the BKIN alternate function input for the timer's BRK input. BKIN input is 'ORed' with the other BRK sources.

0: BKIN input disabled

1: BKIN input enabled

*Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

*Note: Refer to [Figure 375: TIM1/TIM8 ETR input circuitry](#) and to [Figure 396: Break and Break2 circuitry overview](#).*

#### 40.4.27 TIM1 Alternate function register 2 (TIM1\_AF2)

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **BK2INP**: BRK2 BKIN2 input polarity

This bit selects the BKIN2 alternate function input sensitivity. It must be programmed together with the BK2P polarity bit.

0: BKIN2 input is active low

1: BKIN2 input is active high

*Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bit 8 **BK2DF1BK1E**: BRK2 dfsdm1\_break[1] enable

This bit enables the dfsdm1\_break[1] for the timer's BRK2 input. dfsdm1\_break[1] output is 'ORed' with the other BRK2 sources.

0: dfsdm1\_break[1] input disabled

1: dfsdm1\_break[1] input enabled

*Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **BK2INE**: BRK2 BKIN input enable

This bit enables the BKIN2 alternate function input for the timer's BRK2 input. BKIN2 input is 'ORed' with the other BRK2 sources.

0: BKIN2 input disabled

1: BKIN2 input enabled

*Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

*Note: Refer to [Figure 396: Break and Break2 circuitry overview](#).*

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

#### 40.4.33 TIM8 register map

TIM8 registers are mapped as 16-bit addressable registers as described in the table below:

Table 286. TIM8 register map and reset values

| Offset | Register name | 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23        | 22   | 21       | 20   | 19   | 18   | 17    | 16     | 15   | 14   | 13          | 12    | 11       | 10    | 9         | 8    | 7       | 6         | 5         | 4        | 3     | 2     | 1     | 0   |
|--------|---------------|------|------|------|------|------|------|------|------|-----------|------|----------|------|------|------|-------|--------|------|------|-------------|-------|----------|-------|-----------|------|---------|-----------|-----------|----------|-------|-------|-------|-----|

## 41 General-purpose timers (TIM2/TIM3/TIM4/TIM5)

### 41.1 TIM2/TIM3/TIM4/TIM5 introduction

The general-purpose timers consist of a 16-bit/32-bit auto-reload counter driven by a programmable prescaler.

They may be used for a variety of purposes, including measuring the pulse lengths of input signals (*input capture*) or generating output waveforms (*output compare and PWM*).

Pulse lengths and waveform periods can be modulated from a few microseconds to several milliseconds using the timer prescaler and the RCC clock controller prescalers.

The timers are completely independent, and do not share any resources. They can be synchronized together as described in [Section 41.3.19: Timer synchronization](#).

### 41.2 TIM2/TIM3/TIM4/TIM5 main features

General-purpose TIMx timer features include:

- 16-bit (TIM3, TIM4) or 32-bit (TIM2 and TIM5) up, down, up/down auto-reload counter.
- 16-bit programmable prescaler used to divide (also “on the fly”) the counter clock frequency by any factor between 1 and 65535.
- Up to 4 independent channels for:
  - Input capture
  - Output compare
  - PWM generation (Edge- and Center-aligned modes)
  - One-pulse mode output
- Synchronization circuit to control the timer with external signals and to interconnect several timers.
- Interrupt/DMA generation on the following events:
  - Update: counter overflow/underflow, counter initialization (by software or internal/external trigger)
  - Trigger event (counter start, stop, initialization or count by internal/external trigger)
  - Input capture
  - Output compare
- Supports incremental (quadrature) encoder and hall-sensor circuitry for positioning purposes
- Trigger input for external clock or cycle-by-cycle current management

## 41.3 TIM2/TIM3/TIM4/TIM5 functional description

### 41.3.1 Time-base unit

The main block of the programmable timer is a 16-bit/32-bit counter with its related auto-reload register. The counter can count up, down or both up and down but also down or both up and down. The counter clock can be divided by a prescaler.

The counter, the auto-reload register and the prescaler register can be written or read by software. This is true even when the counter is running.

The time-base unit includes:

- Counter Register (TIMx\_CNT)
- Prescaler Register (TIMx\_PSC)
- Auto-Reload Register (TIMx\_ARR)

The auto-reload register is preloaded. Writing to or reading from the auto-reload register accesses the preload register. The content of the preload register are transferred into the shadow register permanently or at each update event (UEV), depending on the auto-reload preload enable bit (ARPE) in TIMx\_CR1 register. The update event is sent when the counter reaches the overflow (or underflow when downcounting) and if the UDIS bit equals 0 in the TIMx\_CR1 register. It can also be generated by software. The generation of the update event is described in detail for each configuration.

The counter is clocked by the prescaler output CK\_CNT, which is enabled only when the counter enable bit (CEN) in TIMx\_CR1 register is set (refer also to the slave mode controller description to get more details on counter enabling).

Note that the actual counter enable signal CNT\_EN is set 1 clock cycle after CEN.

#### Prescaler description

The prescaler can divide the counter clock frequency by any factor between 1 and 65536. It is based on a 16-bit counter controlled through a 16-bit/32-bit register (in the TIMx\_PSC register). It can be changed on the fly as this control register is buffered. The new prescaler ratio is taken into account at the next update event.

[Figure 414](#) and [Figure 415](#) give some examples of the counter behavior when the prescaler ratio is changed on the fly:

Figure 414. Counter timing diagram with prescaler division change from 1 to 2

Figure 415. Counter timing diagram with prescaler division change from 1 to 4

### 41.3.2 Counter modes

#### Upcounting mode

In upcounting mode, the counter counts from 0 to the auto-reload value (content of the TIMx\_ARR register), then restarts from 0 and generates a counter overflow event.

An Update event can be generated at each counter overflow or by setting the UG bit in the TIMx\_EGR register (by software or by using the slave mode controller).

The UEV event can be disabled by software by setting the UDIS bit in TIMx\_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter restarts from 0, as well as the counter of the prescaler (but the prescale rate does not change). In addition, if the URS bit (update request selection) in TIMx\_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx\_SR register) is set (depending on the URS bit):

- The buffer of the prescaler is reloaded with the preload value (content of the TIMx\_PSC register)
- The auto-reload shadow register is updated with the preload value (TIMx\_ARR)

The following figures show some examples of the counter behavior for different clock frequencies when TIMx\_ARR=0x36.

**Figure 416. Counter timing diagram, internal clock divided by 1**

Figure 417. Counter timing diagram, internal clock divided by 2

Figure 418. Counter timing diagram, internal clock divided by 4

Figure 419. Counter timing diagram, internal clock divided by N

Figure 420. Counter timing diagram, Update event when ARPE=0 (TIMx\_ARR not preloaded)

**Figure 421. Counter timing diagram, Update event when ARPE=1 (TIMx\_ARR preloaded)**

### Downcounting mode

In downcounting mode, the counter counts from the auto-reload value (content of the TIMx\_ARR register) down to 0, then restarts from the auto-reload value and generates a counter underflow event.

An Update event can be generated at each counter underflow or by setting the UG bit in the TIMx\_EGR register (by software or by using the slave mode controller)

The UEV update event can be disabled by software by setting the UDIS bit in TIMx\_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until UDIS bit has been written to 0. However, the counter restarts from the current auto-reload value, whereas the counter of the prescaler restarts from 0 (but the prescale rate doesn't change).

In addition, if the URS bit (update request selection) in TIMx\_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx\_SR register) is set (depending on the URS bit):

- The buffer of the prescaler is reloaded with the preload value (content of the TIMx\_PSC register).
- The auto-reload active register is updated with the preload value (content of the TIMx\_ARR register). Note that the auto-reload is updated before the counter is reloaded, so that the next period is the expected one.

The following figures show some examples of the counter behavior for different clock frequencies when TIMx\_ARR=0x36.

Figure 422. Counter timing diagram, internal clock divided by 1

Figure 423. Counter timing diagram, internal clock divided by 2

Figure 424. Counter timing diagram, internal clock divided by 4

Figure 425. Counter timing diagram, internal clock divided by N

**Figure 426. Counter timing diagram, Update event when repetition counter is not used****Center-aligned mode (up/down counting)**

In center-aligned mode, the counter counts from 0 to the auto-reload value (content of the TIMx\_ARR register) – 1, generates a counter overflow event, then counts from the auto-reload value down to 1 and generates a counter underflow event. Then it restarts counting from 0.

Center-aligned mode is active when the CMS bits in TIMx\_CR1 register are not equal to '00'. The Output compare interrupt flag of channels configured in output is set when: the counter counts down (Center aligned mode 1, CMS = "01"), the counter counts up (Center aligned mode 2, CMS = "10") the counter counts up and down (Center aligned mode 3, CMS = "11").

In this mode, the direction bit (DIR from TIMx\_CR1 register) cannot be written. It is updated by hardware and gives the current direction of the counter.

The update event can be generated at each counter overflow and at each counter underflow or by setting the UG bit in the TIMx\_EGR register (by software or by using the slave mode controller) also generates an update event. In this case, the counter restarts counting from 0, as well as the counter of the prescaler.

The UEV update event can be disabled by software by setting the UDIS bit in TIMx\_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter continues counting up and down, based on the current auto-reload value.

In addition, if the URS bit (update request selection) in TIMx\_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or

DMA request is sent). This is to avoid generating both update and capture interrupt when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx\_SR register) is set (depending on the URS bit):

- The buffer of the prescaler is reloaded with the preload value (content of the TIMx\_PSC register).
- The auto-reload active register is updated with the preload value (content of the TIMx\_ARR register). Note that if the update source is a counter overflow, the auto-reload is updated before the counter is reloaded, so that the next period is the expected one (the counter is loaded with the new value).

The following figures show some examples of the counter behavior for different clock frequencies.

**Figure 427. Counter timing diagram, internal clock divided by 1, TIMx\_ARR=0x6**

1. Here, center-aligned mode 1 is used (for more details refer to [Section 41.4.1: TIMx control register 1 \(TIMx\\_CR1\)\(x = 2 to 5\) on page 2190](#)).

**Figure 432. Counter timing diagram, Update event with ARPE=1 (counter overflow)**

### 41.3.3 Clock selection

The counter clock can be provided by the following clock sources:

- Internal clock (CK\_INT)
- External clock mode1: external input pin (TIx)
- External clock mode2: external trigger input (ETR)
- Internal trigger inputs (ITRx): using one timer as prescaler for another timer, for example, Timer X can be configured to act as a prescaler for Timer Y. Refer to : [Using one timer as prescaler for another timer on page 2185](#) for more details.

#### Internal clock source (CK\_INT)

If the slave mode controller is disabled (SMS=000 in the TIMx\_SMCR register), then the CEN, DIR (in the TIMx\_CR1 register) and UG bits (in the TIMx\_EGR register) are actual control bits and can be changed only by software (except UG which remains cleared automatically). As soon as the CEN bit is written to 1, the prescaler is clocked by the internal clock CK\_INT.

[Figure 433](#) shows the behavior of the control circuit and the upcounter in normal mode, without prescaler.

**Figure 433. Control circuit in normal mode, internal clock divided by 1****External clock source mode 1**

This mode is selected when SMS=111 in the TIMx\_SMCR register. The counter can count at each rising or falling edge on a selected input.

**Figure 434. TI2 external clock connection example**

1. Codes ranging from 01000 to 11111: ITRy.

For example, to configure the upcounter to count in response to a rising edge on the TI2 input, use the following procedure:

1. Select the proper TI2x source (internal or external) with the TI2SEL[3:0] bits in the TIMx\_TISEL register.
2. Configure channel 2 to detect rising edges on the TI2 input by writing CC2S= '01 in the TIMx\_CCMR1 register.
3. Configure the input filter duration by writing the IC2F[3:0] bits in the TIMx\_CCMR1 register (if no filter is needed, keep IC2F=0000).

**Note:** The capture prescaler is not used for triggering, so it does not need to be configured.

4. Select rising edge polarity by writing CC2P=0 and CC2NP=0 and CC2NP=0 in the TIMx\_CCER register.
5. Configure the timer in external clock mode 1 by writing SMS=111 in the TIMx\_SMCR register.
6. Select TI2 as the input source by writing TS=00110 in the TIMx\_SMCR register.
7. Enable the counter by writing CEN=1 in the TIMx\_CR1 register.

When a rising edge occurs on TI2, the counter counts once and the TIF flag is set.

The delay between the rising edge on TI2 and the actual clock of the counter is due to the resynchronization circuit on TI2 input.

**Figure 435. Control circuit in external clock mode 1**

### External clock source mode 2

This mode is selected by writing ECE=1 in the TIMx\_SMCR register.

The counter can count at each rising or falling edge on the external trigger input ETR.

[Figure 436](#) gives an overview of the external trigger input block.

Figure 436. External trigger input block

For example, to configure the upcounter to count each 2 rising edges on ETR, use the following procedure:

1. Select the proper ETR source (internal or external) with the ETRSEL[3:0] bits in the TIMx\_AF1 register.
2. As no filter is needed in this example, write ETF[3:0]=0000 in the TIMx\_SMCR register.
3. Set the prescaler by writing ETPS[1:0]=01 in the TIMx\_SMCR register
4. Select rising edge detection on the ETR pin by writing ETP=0 in the TIMx\_SMCR register
5. Enable external clock mode 2 by writing ECE=1 in the TIMx\_SMCR register.
6. Enable the counter by writing CEN=1 in the TIMx\_CR1 register.

The counter counts once each 2 ETR rising edges.

The delay between the rising edge on ETR and the actual clock of the counter is due to the resynchronization circuit on the ETRP signal. As a consequence, the maximum frequency which can be correctly captured by the counter is at most  $\frac{1}{4}$  of TIMxCLK frequency. When the ETRP signal is faster, the user should apply a division of the external signal by a proper ETPS prescaler setting.

Figure 437. Control circuit in external clock mode 2

#### 41.3.4 Capture/Compare channels

Each Capture/Compare channel is built around a capture/compare register (including a shadow register), a input stage for capture (with digital filter, multiplexing and prescaler) and an output stage (with comparator and output control).

The following figure gives an overview of one Capture/Compare channel.

The input stage samples the corresponding TIMx input to generate a filtered signal TIxF. Then, an edge detector with polarity selection generates a signal (TIxFPx) which can be used as trigger input by the slave mode controller or as the capture command. It is prescaled before the capture register (ICxPS).

Figure 438. Capture/Compare channel (example: channel 1 input stage)

The output stage generates an intermediate waveform which is then used for reference: OCxRef (active high). The polarity acts at the end of the chain.

**Figure 439. Capture/Compare channel 1 main circuit**

**Figure 440. Output stage of Capture/Compare channel (channel 1)**

The capture/compare block is made of one preload register and one shadow register. Write and read always access the preload register.

In capture mode, captures are actually done in the shadow register, which is copied into the preload register.

In compare mode, the content of the preload register is copied into the shadow register which is compared to the counter.

### 41.3.5 Input capture mode

In Input capture mode, the Capture/Compare Registers (TIMx\_CCRx) are used to latch the value of the counter after a transition detected by the corresponding ICx signal. When a capture occurs, the corresponding CCxIF flag (TIMx\_SR register) is set and an interrupt or a DMA request can be sent if they are enabled. If a capture occurs while the CCxIF flag was already high, then the over-capture flag CCxOF (TIMx\_SR register) is set. CCxIF can be cleared by software by writing it to 0 or by reading the captured data stored in the TIMx\_CCRx register. CCxOF is cleared when it is written with 0.

The following example shows how to capture the counter value in TIMx\_CCR1 when TI1 input rises. To do this, use the following procedure:

1. Select the proper TI1x source (internal or external) with the TI1SEL[3:0] bits in the TIMx\_TISEL register.
2. Select the active input: TIMx\_CCR1 must be linked to the TI1 input, so write the CC1S bits to 01 in the TIMx\_CCMR1 register. As soon as CC1S becomes different from 00, the channel is configured in input and the TIMx\_CCR1 register becomes read-only.
3. Program the appropriate input filter duration in relation with the signal connected to the timer (when the input is one of the TIx (ICxF bits in the TIMx\_CCMRx register). Let's imagine that, when toggling, the input signal is not stable during at most 5 internal clock cycles. We must program a filter duration longer than these 5 clock cycles. We can validate a transition on TI1 when 8 consecutive samples with the new level have been detected (sampled at  $f_{DTS}$  frequency). Then write IC1F bits to 0011 in the TIMx\_CCMR1 register.
4. Select the edge of the active transition on the TI1 channel by writing the CC1P and CC1NP and CC1NP bits to 000 in the TIMx\_CCER register (rising edge in this case).
5. Program the input prescaler. In our example, we wish the capture to be performed at each valid transition, so the prescaler is disabled (write IC1PS bits to 00 in the TIMx\_CCMR1 register).
6. Enable capture from the counter into the capture register by setting the CC1E bit in the TIMx\_CCER register.
7. If needed, enable the related interrupt request by setting the CC1IE bit in the TIMx\_DIER register, and/or the DMA request by setting the CC1DE bit in the TIMx\_DIER register.

When an input capture occurs:

- The TIMx\_CCR1 register gets the value of the counter on the active transition.
- CC1IF flag is set (interrupt flag). CC1OF is also set if at least two consecutive captures occurred whereas the flag was not cleared.
- An interrupt is generated depending on the CC1IE bit.
- A DMA request is generated depending on the CC1DE bit.

In order to handle the overcapture, it is recommended to read the data before the overcapture flag. This is to avoid missing an overcapture which could happen after reading the flag and before reading the data.

**Note:** *IC interrupt and/or DMA requests can be generated by software by setting the corresponding CCxG bit in the TIMx\_EGR register.*

### 41.3.6 PWM input mode

This mode is a particular case of input capture mode. The procedure is the same except:

- Two ICx signals are mapped on the same TIx input.
- These 2 ICx signals are active on edges with opposite polarity.
- One of the two TIxFP signals is selected as trigger input and the slave mode controller is configured in reset mode.

For example, one can measure the period (in TIMx\_CCR1 register) and the duty cycle (in TIMx\_CCR2 register) of the PWM applied on TI1 using the following procedure (depending on CK\_INT frequency and prescaler value):

1. Select the proper TI1x source (internal or external) with the TI1SEL[3:0] bits in the TIMx\_TISEL register.
2. Select the active input for TIMx\_CCR1: write the CC1S bits to 01 in the TIMx\_CCMR1 register (TI1 selected).
3. Select the active polarity for TI1FP1 (used both for capture in TIMx\_CCR1 and counter clear): write the CC1P to '0' and the CC1NP bit to '0' (active on rising edge).
4. Select the active input for TIMx\_CCR2: write the CC2S bits to 10 in the TIMx\_CCMR1 register (TI1 selected).
5. Select the active polarity for TI1FP2 (used for capture in TIMx\_CCR2): write the CC2P bit to '1' and the CC2NP bit to '0' (active on falling edge).
6. Select the valid trigger input: write the TS bits to 00101 in the TIMx\_SMCR register (TI1FP1 selected).
7. Configure the slave mode controller in reset mode: write the SMS bits to 100 in the TIMx\_SMCR register.
8. Enable the captures: write the CC1E and CC2E bits to '1' in the TIMx\_CCER register.

**Figure 441. PWM input mode timing**

1. The PWM input mode can be used only with the TIMx\_CH1/TIMx\_CH2 signals due to the fact that only TI1FP1 and TI2FP2 are connected to the slave mode controller.

### 41.3.7 Forced output mode

In output mode (CCxS bits = 00 in the TIMx\_CCMRx register), each output compare signal (OCxREF and then OCx) can be forced to active or inactive level directly by software, independently of any comparison between the output compare register and the counter.

To force an output compare signal (ocxref/OCx) to its active level, one just needs to write 101 in the OCxM bits in the corresponding TIMx\_CCMRx register. Thus ocxref is forced high (OCxREF is always active high) and OCx get opposite value to CCxP polarity bit.

e.g.: CCxP=0 (OCx active high) => OCx is forced to high level.

ocxref signal can be forced low by writing the OCxM bits to 100 in the TIMx\_CCMRx register.

Anyway, the comparison between the TIMx\_CCRx shadow register and the counter is still performed and allows the flag to be set. Interrupt and DMA requests can be sent accordingly. This is described in the Output Compare Mode section.

### 41.3.8 Output compare mode

This function is used to control an output waveform or indicating when a period of time has elapsed.

When a match is found between the capture/compare register and the counter, the output compare function:

- Assigns the corresponding output pin to a programmable value defined by the output compare mode (OCxM bits in the TIMx\_CCMRx register) and the output polarity (CCxP bit in the TIMx\_CCER register). The output pin can keep its level (OCxM=000), be set active (OCxM=001), be set inactive (OCxM=010) or can toggle (OCxM=011) on match.
- Sets a flag in the interrupt status register (CCxIF bit in the TIMx\_SR register).
- Generates an interrupt if the corresponding interrupt mask is set (CCxIE bit in the TIMx\_DIER register).
- Sends a DMA request if the corresponding enable bit is set (CCxDE bit in the TIMx\_DIER register, CCDS bit in the TIMx\_CR2 register for the DMA request selection).

The TIMx\_CCRx registers can be programmed with or without preload registers using the OCxPE bit in the TIMx\_CCMRx register.

In output compare mode, the update event UEV has no effect on ocxref and OCx output. The timing resolution is one count of the counter. Output compare mode can also be used to output a single pulse (in One-pulse mode).

#### Procedure

1. Select the counter clock (internal, external, prescaler).
2. Write the desired data in the TIMx\_ARR and TIMx\_CCRx registers.
3. Set the CCxIE and/or CCxDE bits if an interrupt and/or a DMA request is to be generated.
4. Select the output mode. For example, one must write OCxM=011, OCxPE=0, CCxP=0 and CCxE=1 to toggle OCx output pin when CNT matches CCRx, CCRx preload is not used, OCx is enabled and active high.
5. Enable the counter by setting the CEN bit in the TIMx\_CR1 register.

The TIMx\_CCRx register can be updated at any time by software to control the output waveform, provided that the preload register is not enabled (OCxPE=0, else TIMx\_CCRx shadow register is updated only at the next update event UEV). An example is given in [Figure 442](#).

**Figure 442. Output compare mode, toggle on OC1**

### 41.3.9 PWM mode

Pulse width modulation mode allows to generate a signal with a frequency determined by the value of the TIMx\_ARR register and a duty cycle determined by the value of the TIMx\_CCRx register.

The PWM mode can be selected independently on each channel (one PWM per OCx output) by writing 110 (PWM mode 1) or '111 (PWM mode 2) in the OCxM bits in the TIMx\_CCMRx register. The corresponding preload register must be enabled by setting the OCxPE bit in the TIMx\_CCMRx register, and eventually the auto-reload preload register (in upcounting or center-aligned modes) by setting the ARPE bit in the TIMx\_CR1 register.

As the preload registers are transferred to the shadow registers only when an update event occurs, before starting the counter, all registers must be initialized by setting the UG bit in the TIMx\_EGR register.

OCx polarity is software programmable using the CCxP bit in the TIMx\_CCER register. It can be programmed as active high or active low. OCx output is enabled by the CCxE bit in the TIMx\_CCER register. Refer to the TIMx\_CCERx register description for more details.

In PWM mode (1 or 2), TIMx\_CNT and TIMx\_CCRx are always compared to determine whether  $TIMx\_CCRx \leq TIMx\_CNT$  or  $TIMx\_CNT \leq TIMx\_CCRx$  (depending on the direction of the counter). However, to comply with the OCREF\_CLR functionality (OCREF can be

cleared by an external event through the ETR signal until the next PWM period), the OCREF signal is asserted only:

- When the result of the comparison or
- When the output compare mode (OCxM bits in TIMx\_CCMRx register) switches from the “frozen” configuration (no comparison, OCxM=‘000) to one of the PWM modes (OCxM=‘110 or ‘111).

This forces the PWM by software while the timer is running.

The timer is able to generate PWM in edge-aligned mode or center-aligned mode depending on the CMS bits in the TIMx\_CR1 register.

### PWM edge-aligned mode

Upcounting configuration

Upcounting is active when the DIR bit in the TIMx\_CR1 register is low. Refer to [Upcounting mode on page 2150](#).

In the following example, we consider PWM mode 1. The reference PWM signal OCxREF is high as long as  $TIMx\_CNT < TIMx\_CCRx$  else it becomes low. If the compare value in TIMx\_CCRx is greater than the auto-reload value (in TIMx\_ARR) then OCxREF is held at ‘1’. If the compare value is 0 then OCxREF is held at ‘0’. [Figure 443](#) shows some edge-aligned PWM waveforms in an example where  $TIMx\_ARR=8$ .

**Figure 443. Edge-aligned PWM waveforms (ARR=8)**

### Downcounting configuration

Downcounting is active when DIR bit in TIMx\_CR1 register is high. Refer to [Downcounting mode on page 2153](#).

In PWM mode 1, the reference signal ocxref is low as long as TIMx\_CNT > TIMx\_CCRx else it becomes high. If the compare value in TIMx\_CCRx is greater than the auto-reload value in TIMx\_ARR, then ocxref is held at 100%. PWM is not possible in this mode.

### PWM center-aligned mode

Center-aligned mode is active when the CMS bits in TIMx\_CR1 register are different from '00 (all the remaining configurations having the same effect on the ocxref/OCx signals). The compare flag is set when the counter counts up, when it counts down or both when it counts up and down depending on the CMS bits configuration. The direction bit (DIR) in the TIMx\_CR1 register is updated by hardware and must not be changed by software. Refer to [Center-aligned mode \(up/down counting\) on page 2156](#).

[Figure 444](#) shows some center-aligned PWM waveforms in an example where:

- TIMx\_ARR=8,
- PWM mode is the PWM mode 1,
- The flag is set when the counter counts down corresponding to the center-aligned mode 1 selected for CMS=01 in TIMx\_CR1 register.

Figure 444. Center-aligned PWM waveforms (ARR=8)

Hints on using center-aligned mode:

- When starting in center-aligned mode, the current up-down configuration is used. It means that the counter counts up or down depending on the value written in the DIR bit in the TIMx\_CR1 register. Moreover, the DIR and CMS bits must not be changed at the same time by the software.
- Writing to the counter while running in center-aligned mode is not recommended as it can lead to unexpected results. In particular:
  - The direction is not updated if a value greater than the auto-reload value is written in the counter (TIMx\_CNT > TIMx\_ARR). For example, if the counter was counting up, it continues to count up.
  - The direction is updated if 0 or the TIMx\_ARR value is written in the counter but no Update Event UEV is generated.
- The safest way to use center-aligned mode is to generate an update by software (setting the UG bit in the TIMx\_EGR register) just before starting the counter and not to write the counter while it is running.

### 41.3.10 Asymmetric PWM mode

Asymmetric mode allows two center-aligned PWM signals to be generated with a programmable phase shift. While the frequency is determined by the value of the TIMx\_ARR register, the duty cycle and the phase-shift are determined by a pair of TIMx\_CCRx registers. One register controls the PWM during up-counting, the second during down counting, so that PWM is adjusted every half PWM cycle:

- OC1REFC (or OC2REFC) is controlled by TIMx\_CCR1 and TIMx\_CCR2
- OC3REFC (or OC4REFC) is controlled by TIMx\_CCR3 and TIMx\_CCR4

Asymmetric PWM mode can be selected independently on two channels (one OCx output per pair of CCR registers) by writing '1110' (Asymmetric PWM mode 1) or '1111' (Asymmetric PWM mode 2) in the OCxM bits in the TIMx\_CCMRx register.

**Note:** The OCxM[3:0] bit field is split into two parts for compatibility reasons, the most significant bit is not contiguous with the 3 least significant ones.

When a given channel is used as asymmetric PWM channel, its secondary channel can also be used. For instance, if an OC1REFC signal is generated on channel 1 (Asymmetric PWM mode 1), it is possible to output either the OC2REF signal on channel 2, or an OC2REFC signal resulting from asymmetric PWM mode 2.

Figure 445 shows an example of signals that can be generated using Asymmetric PWM mode (channels 1 to 4 are configured in Asymmetric PWM mode 1).

**Figure 445. Generation of 2 phase-shifted PWM signals with 50% duty cycle**

### 41.3.11 Combined PWM mode

Combined PWM mode allows two edge or center-aligned PWM signals to be generated with programmable delay and phase shift between respective pulses. While the frequency is determined by the value of the TIMx\_ARR register, the duty cycle and delay are determined by the two TIMx\_CCRx registers. The resulting signals, OCxREFC, are made of an OR or AND logical combination of two reference PWMs:

- OC1REFC (or OC2REFC) is controlled by TIMx\_CCR1 and TIMx\_CCR2
- OC3REFC (or OC4REFC) is controlled by TIMx\_CCR3 and TIMx\_CCR4

Combined PWM mode can be selected independently on two channels (one OCx output per pair of CCR registers) by writing '1100' (Combined PWM mode 1) or '1101' (Combined PWM mode 2) in the OCxM bits in the TIMx\_CCMRx register.

When a given channel is used as combined PWM channel, its secondary channel must be configured in the opposite PWM mode (for instance, one in Combined PWM mode 1 and the other in Combined PWM mode 2).

**Note:** The OCxM[3:0] bit field is split into two parts for compatibility reasons, the most significant bit is not contiguous with the 3 least significant ones.

Figure 446 shows an example of signals that can be generated using Asymmetric PWM mode, obtained with the following configuration:

- Channel 1 is configured in Combined PWM mode 2,
- Channel 2 is configured in PWM mode 1,
- Channel 3 is configured in Combined PWM mode 2,
- Channel 4 is configured in PWM mode 1

**Figure 446. Combined PWM mode on channels 1 and 3**

#### 41.3.12 Clearing the OCxREF signal on an external event

The OCxREF signal of a given channel can be cleared when a high level is applied on the ocref\_clr\_int input (OCxCE enable bit in the corresponding TIMx\_CCMRx register set to 1). OCxREF remains low until the next update event (UEV) occurs. This function can only be used in Output compare and PWM modes. It does not work in Forced mode.

The ocref\_clr\_int is connected to the ETRF signal (ETR after filtering).

The OCxREF signal for a given channel can be reset by applying a high level on the ETRF input (OCxCE enable bit set to 1 in the corresponding TIMx\_CCMRx register). OCxREF remains low until the next update event (UEV) occurs.

This function can be used only in the output compare and PWM modes. It does not work in forced mode.

For example, the OCxREF signal can be connected to the output of a comparator to be used for current handling. In this case, ETR must be configured as follows:

1. The external trigger prescaler should be kept off: bits ETPS[1:0] in the TIMx\_SMCR register are cleared to 00.
2. The external clock mode 2 must be disabled: bit ECE in the TIM1\_SMCR register is cleared to 0.
3. The external trigger polarity (ETP) and the external trigger filter (ETF) can be configured according to the application's needs.

Figure 447 shows the behavior of the OCxREF signal when the ETRF input becomes high, for both values of the OCxCE enable bit. In this example, the timer TIMx is programmed in PWM mode.

**Figure 447. Clearing TIMx OCxREF**

**Note:** In case of a PWM with a 100% duty cycle (if  $CCR_x > ARR$ ), OCxREF is enabled again at the next counter overflow.

### 41.3.13 One-pulse mode

One-pulse mode (OPM) is a particular case of the previous modes. It allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length after a programmable delay.

Starting the counter can be controlled through the slave mode controller. Generating the waveform can be done in output compare mode or PWM mode. One-pulse mode is selected by setting the OPM bit in the TIMx\_CR1 register. This makes the counter stop automatically at the next update event UEV.

A pulse can be correctly generated only if the compare value is different from the counter initial value. Before starting (when the timer is waiting for the trigger), the configuration must be:

- $CNT < CCRx \leq ARR$  (in particular,  $0 < CCRx$ ),

**Figure 448. Example of one-pulse mode.**

For example one may want to generate a positive pulse on OC1 with a length of  $t_{PULSE}$  and after a delay of  $t_{DELAY}$  as soon as a positive edge is detected on the TI2 input pin.

Let's use TI2FP2 as trigger 1:

1. Select the proper TI2x source (internal or external) with the TI2SEL[3:0] bits in the TIMx\_TISEL register.
2. Map TI2FP2 on TI2 by writing CC2S=01 in the TIMx\_CCMR1 register.
3. TI2FP2 must detect a rising edge, write CC2P=0 and CC2NP='0' in the TIMx\_CCER register.
4. Configure TI2FP2 as trigger for the slave mode controller (TRGI) by writing TS=00110 in the TIMx\_SMCR register.
5. TI2FP2 is used to start the counter by writing SMS to '110 in the TIMx\_SMCR register (trigger mode).

The OPM waveform is defined by writing the compare registers (taking into account the clock frequency and the counter prescaler).

- The  $t_{\text{DELAY}}$  is defined by the value written in the TIMx\_CCR1 register.
- The  $t_{\text{PULSE}}$  is defined by the difference between the auto-reload value and the compare value (TIMx\_ARR - TIMx\_CCR1).
- Let's say one want to build a waveform with a transition from '0' to '1' when a compare match occurs and a transition from '1' to '0' when the counter reaches the auto-reload value. To do this PWM mode 2 must be enabled by writing OC1M=111 in the TIMx\_CCMR1 register. Optionally the preload registers can be enabled by writing OC1PE=1 in the TIMx\_CCMR1 register and ARPE in the TIMx\_CR1 register. In this case one has to write the compare value in the TIMx\_CCR1 register, the auto-reload value in the TIMx\_ARR register, generate an update by setting the UG bit and wait for external trigger event on TI2. CC1P is written to '0' in this example.

In our example, the DIR and CMS bits in the TIMx\_CR1 register should be low.

Since only 1 pulse (Single mode) is needed, a 1 must be written in the OPM bit in the TIMx\_CR1 register to stop the counter at the next update event (when the counter rolls over from the auto-reload value back to 0). When OPM bit in the TIMx\_CR1 register is set to '0', so the Repetitive Mode is selected.

#### Particular case: OCx fast enable:

In One-pulse mode, the edge detection on TIx input set the CEN bit which enables the counter. Then the comparison between the counter and the compare value makes the output toggle. But several clock cycles are needed for these operations and it limits the minimum delay  $t_{\text{DELAY}}$  min we can get.

If one wants to output a waveform with the minimum delay, the OCxFE bit can be set in the TIMx\_CCMRx register. Then OCxRef (and OCx) is forced in response to the stimulus, without taking in account the comparison. Its new level is the same as if a compare match had occurred. OCxFE acts only if the channel is configured in PWM1 or PWM2 mode.

### 41.3.14 Retriggerable one pulse mode (OPM)

This mode allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length, but with the following differences with Non-retriggerable one pulse mode described in [Section 41.3.13](#):

- The pulse starts as soon as the trigger occurs (no programmable delay)
- The pulse is extended if a new trigger occurs before the previous one is completed

The timer must be in Slave mode, with the bits SMS[3:0] = '1000' (Combined Reset + trigger mode) in the TIMx\_SMCR register, and the OCxM[3:0] bits set to '1000' or '1001' for Retriggerable OPM mode 1 or 2.

If the timer is configured in Up-counting mode, the corresponding CCRx must be set to 0 (the ARR register sets the pulse length). If the timer is configured in Down-counting mode CCRx must be above or equal to ARR.

*Note:* In retriggerable one pulse mode, the CCxIF flag is not significant.

*The OCxM[3:0] and SMS[3:0] bit fields are split into two parts for compatibility reasons, the most significant bit is not contiguous with the 3 least significant ones.*

*This mode must not be used with center-aligned PWM modes. It is mandatory to have CMS[1:0] = 00 in TIMx\_CR1.*

Figure 449. Retriggerable one-pulse mode.

MS33106V1

### 41.3.15 Encoder interface mode

To select Encoder Interface mode write SMS='001 in the TIMx\_SMCR register if the counter is counting on TI2 edges only, SMS=010 if it is counting on TI1 edges only and SMS=011 if it is counting on both TI1 and TI2 edges.

Select the TI1 and TI2 polarity by programming the CC1P and CC2P bits in the TIMx\_CCER register. CC1NP and CC2NP must be kept cleared. When needed, the input filter can be programmed as well. CC1NP and CC2NP must be kept low.

The two inputs TI1 and TI2 are used to interface to an incremental encoder. Refer to [Table 287](#). The counter is clocked by each valid transition on TI1FP1 or TI2FP2 (TI1 and TI2 after input filter and polarity selection, TI1FP1=TI1 if not filtered and not inverted, TI2FP2=TI2 if not filtered and not inverted) assuming that it is enabled (CEN bit in TIMx\_CR1 register written to '1'). The sequence of transitions of the two inputs is evaluated and generates count pulses as well as the direction signal. Depending on the sequence the counter counts up or down, the DIR bit in the TIMx\_CR1 register is modified by hardware accordingly. The DIR bit is calculated at each transition on any input (TI1 or TI2), whatever the counter is counting on TI1 only, TI2 only or both TI1 and TI2.

Encoder interface mode acts simply as an external clock with direction selection. This means that the counter just counts continuously between 0 and the auto-reload value in the TIMx\_ARR register (0 to ARR or ARR down to 0 depending on the direction). So the TIMx\_ARR must be configured before starting. In the same way, the capture, compare, prescaler, trigger output features continue to work as normal.

In this mode, the counter is modified automatically following the speed and the direction of the-quadrature encoder and its content, therefore, always represents the encoder's position. The count direction correspond to the rotation direction of the connected sensor. The table summarizes the possible combinations, assuming TI1 and TI2 do not switch at the same time.

Table 287. Counting direction versus encoder signals

| Active edge             | Level on opposite signal (TI1FP1 for TI2, TI2FP2 for TI1) | TI1FP1 signal |          | TI2FP2 signal |          |
|-------------------------|-----------------------------------------------------------|---------------|----------|---------------|----------|
|                         |                                                           | Rising        | Falling  | Rising        | Falling  |
| Counting on TI1 only    | High                                                      | Down          | Up       | No Count      | No Count |
|                         | Low                                                       | Up            | Down     | No Count      | No Count |
| Counting on TI2 only    | High                                                      | No Count      | No Count | Up            | Down     |
|                         | Low                                                       | No Count      | No Count | Down          | Up       |
| Counting on TI1 and TI2 | High                                                      | Down          | Up       | Up            | Down     |
|                         | Low                                                       | Up            | Down     | Down          | Up       |

An external incremental encoder can be connected directly to the MCU without external interface logic. However, comparators are normally be used to convert the encoder's differential outputs to digital signals. This greatly increases noise immunity. The third encoder output which indicate the mechanical zero position, may be connected to an external interrupt input and trigger a counter reset.

*Figure 450* gives an example of counter operation, showing count signal generation and direction control. It also shows how input jitter is compensated where both edges are selected. This might occur if the sensor is positioned near to one of the switching points. For this example we assume that the configuration is the following:

- CC1S= 01 (TIMx\_CCMR1 register, TI1FP1 mapped on TI1)
- CC2S= 01 (TIMx\_CCMR2 register, TI2FP2 mapped on TI2)
- CC1P and CC1NP = '0' (TIMx\_CCER register, TI1FP1 noninverted, TI1FP1=TI1)
- CC2P and CC2NP = '0' (TIMx\_CCER register, TI2FP2 noninverted, TI2FP2=TI2)
- SMS= 011 (TIMx\_SMCR register, both inputs are active on both rising and falling edges)
- CEN= 1 (TIMx\_CR1 register, Counter is enabled)

Figure 450. Example of counter operation in encoder interface mode

*Figure 451* gives an example of counter behavior when TI1FP1 polarity is inverted (same configuration as above except CC1P=1).

**Figure 451. Example of encoder interface mode with TI1FP1 polarity inverted**

The timer, when configured in Encoder Interface mode provides information on the sensor's current position. Dynamic information can be obtained (speed, acceleration, deceleration) by measuring the period between two encoder events using a second timer configured in capture mode. The output of the encoder which indicates the mechanical zero can be used for this purpose. Depending on the time between two events, the counter can also be read at regular times. This can be done by latching the counter value into a third input capture register if available (then the capture signal must be periodic and can be generated by another timer). when available, it is also possible to read its value through a DMA request generated by a Real-Time clock.

#### 41.3.16 UIF bit remapping

The IUFREMAP bit in the TIMx\_CR1 register forces a continuous copy of the update interrupt flag (UIF) into bit 31 of the timer counter register's bit 31 (TIMxCNT[31]). This allows to atomically read both the counter value and a potential roll-over condition signaled by the UIFCPY flag. It eases the calculation of angular speed by avoiding race conditions caused, for instance, by a processing shared between a background task (counter reading) and an interrupt (update interrupt).

There is no latency between the UIF and UIFCPY flag assertions.

In 32-bit timer implementations, when the IUFREMAP bit is set, bit 31 of the counter is overwritten by the UIFCPY flag upon read access (the counter's most significant bit is only accessible in write mode).

#### 41.3.17 Timer input XOR function

The TI1S bit in the TIM1xx\_CR2 register, allows the input filter of channel 1 to be connected to the output of a XOR gate, combining the three input pins TIMx\_CH1 to TIMx\_CH3.

The XOR output can be used with all the timer input functions such as trigger or input capture.

An example of this feature used to interface Hall sensors is given in [Section 40.3.25: Interfacing with Hall sensors on page 2094](#).

### 41.3.18 Timers and external trigger synchronization

The TIMx Timers can be synchronized with an external trigger in several modes: Reset mode, Gated mode and Trigger mode.

#### Slave mode: Reset mode

The counter and its prescaler can be reinitialized in response to an event on a trigger input. Moreover, if the URS bit from the TIMx\_CR1 register is low, an update event UEV is generated. Then all the preloaded registers (TIMx\_ARR, TIMx\_CCRx) are updated.

In the following example, the upcounter is cleared in response to a rising edge on TI1 input:

1. Configure the channel 1 to detect rising edges on TI1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F=0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in the TIMx\_CCMR1 register. Write CC1P=0 and CC1NP=0 in TIMx\_CCER register to validate the polarity (and detect rising edges only).
2. Configure the timer in reset mode by writing SMS=100 in TIMx\_SMCR register. Select TI1 as the input source by writing TS=00101 in TIMx\_SMCR register.
3. Start the counter by writing CEN=1 in the TIMx\_CR1 register.

The counter starts counting on the internal clock, then behaves normally until TI1 rising edge. When TI1 rises, the counter is cleared and restarts from 0. In the meantime, the trigger flag is set (TIF bit in the TIMx\_SR register) and an interrupt request, or a DMA request can be sent if enabled (depending on the TIE and TDE bits in TIMx\_DIER register).

The following figure shows this behavior when the auto-reload register TIMx\_ARR=0x36. The delay between the rising edge on TI1 and the actual reset of the counter is due to the resynchronization circuit on TI1 input.

**Figure 452. Control circuit in reset mode**

#### Slave mode: Gated mode

The counter can be enabled depending on the level of a selected input.

In the following example, the upcounter counts only when TI1 input is low:

1. Configure the channel 1 to detect low levels on TI1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F=0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S=01 in TIMx\_CCMR1 register. Write CC1P=1 and CC1NP=0 in TIMx\_CCER register to validate the polarity (and detect low level only).
2. Configure the timer in gated mode by writing SMS=101 in TIMx\_SMCR register. Select TI1 as the input source by writing TS=00101 in TIMx\_SMCR register.
3. Enable the counter by writing CEN=1 in the TIMx\_CR1 register (in gated mode, the counter doesn't start if CEN=0, whatever is the trigger input level).

The counter starts counting on the internal clock as long as TI1 is low and stops as soon as TI1 becomes high. The TIF flag in the TIMx\_SR register is set both when the counter starts or stops.

The delay between the rising edge on TI1 and the actual stop of the counter is due to the resynchronization circuit on TI1 input.

**Figure 453. Control circuit in gated mode**

1. The configuration "CCxP=CCxNP=1" (detection of both rising and falling edges) does not have any effect in gated mode because gated mode acts on a level and not on an edge.

**Note:** *The configuration "CCxP=CCxNP=1" (detection of both rising and falling edges) does not have any effect in gated mode because gated mode acts on a level and not on an edge.*

### Slave mode: Trigger mode

The counter can start in response to an event on a selected input.

In the following example, the upcounter starts in response to a rising edge on TI2 input:

1. Configure the channel 2 to detect rising edges on TI2. Configure the input filter duration (in this example, we do not need any filter, so we keep IC2F=0000). The capture prescaler is not used for triggering, so it does not need to be configured. CC2S bits are selecting the input capture source only, CC2S=01 in TIMx\_CCMR1 register. Write

CC2P=1 and CC2NP=0 in TIMx\_CCER register to validate the polarity (and detect low level only).

2. Configure the timer in trigger mode by writing SMS=110 in TIMx\_SMCR register. Select TI2 as the input source by writing TS=00110 in TIMx\_SMCR register.

When a rising edge occurs on TI2, the counter starts counting on the internal clock and the TIF flag is set.

The delay between the rising edge on TI2 and the actual start of the counter is due to the resynchronization circuit on TI2 input.

**Figure 454. Control circuit in trigger mode**

### Slave mode: External Clock mode 2 + trigger mode

The external clock mode 2 can be used in addition to another slave mode (except external clock mode 1 and encoder mode). In this case, the ETR signal is used as external clock input, and another input can be selected as trigger input when operating in reset mode, gated mode or trigger mode. It is recommended not to select ETR as TRGI through the TS bits of TIMx\_SMCR register.

In the following example, the upcounter is incremented at each rising edge of the ETR signal as soon as a rising edge of TI1 occurs:

1. Configure the external trigger input circuit by programming the TIMx\_SMCR register as follows:
  - ETF = 0000: no filter
  - ETPS=00: prescaler disabled
  - ETP=0: detection of rising edges on ETR and ECE=1 to enable the external clock mode 2.
2. Configure the channel 1 as follows, to detect rising edges on TI1:
  - IC1F=0000: no filter.
  - The capture prescaler is not used for triggering and does not need to be configured.
  - CC1S=01 in TIMx\_CCMR1 register to select only the input capture source
  - CC1P=0 and CC1NP=0 in TIMx\_CCER register to validate the polarity (and detect rising edge only).
3. Configure the timer in trigger mode by writing SMS=110 in TIMx\_SMCR register. Select TI1 as the input source by writing TS=00101 in TIMx\_SMCR register.

A rising edge on TI1 enables the counter and sets the TIF flag. The counter then counts on ETR rising edges.

The delay between the rising edge of the ETR signal and the actual reset of the counter is due to the resynchronization circuit on ETRP input.

**Figure 455. Control circuit in external clock mode 2 + trigger mode**

### 41.3.19 Timer synchronization

The TIMx timers are linked together internally for timer synchronization or chaining. When one Timer is configured in Master Mode, it can reset, start, stop or clock the counter of another Timer configured in Slave Mode.

*Figure 456: Master/Slave timer example* presents an overview of the trigger selection and the master mode selection blocks.

**Figure 456. Master/Slave timer example**

### Using one timer as prescaler for another timer

For example, TIM3 can be configured to act as a prescaler for TIM2. Refer to [Figure 456](#). To do this:

1. Configure TIM3 in master mode so that it outputs a periodic trigger signal on each update event UEV. If MMS=010 is written in the TIM3\_CR2 register, a rising edge is output on TRGO each time an update event is generated.
2. To connect the TRGO output of TIM3 to TIM2, TIM2 must be configured in slave mode using ITR2 as internal trigger. This is selected through the TS bits in the TIM2\_SMCR register (writing TS=00010).
3. Then the slave mode controller must be put in external clock mode 1 (write SMS=111 in the TIM2\_SMCR register). This causes TIM2 to be clocked by the rising edge of the periodic TIM3 trigger signal (which correspond to the TIM3 counter overflow).
4. Finally both timers must be enabled by setting their respective CEN bits (TIMx\_CR1 register).

**Note:** If OCx is selected on TIM3 as the trigger output (MMS=1xx), its rising edge is used to clock the counter of TIM2.

### Using one timer to enable another timer

In this example, we control the enable of TIM2 with the output compare 1 of Timer 3. Refer to [Figure 456](#) for connections. TIM2 counts on the divided internal clock only when OC1REF of TIM3 is high. Both counter clock frequencies are divided by 3 by the prescaler compared to CK\_INT ( $f_{CK\_CNT} = f_{CK\_INT}/3$ ).

1. Configure TIM3 master mode to send its Output Compare 1 Reference (OC1REF) signal as trigger output (MMS=100 in the TIM3\_CR2 register).
2. Configure the TIM3 OC1REF waveform (TIM3\_CCMR1 register).
3. Configure TIM2 to get the input trigger from TIM3 (TS=00010 in the TIM2\_SMCR register).
4. Configure TIM2 in gated mode (SMS=101 in TIM2\_SMCR register).
5. Enable TIM2 by writing '1' in the CEN bit (TIM2\_CR1 register).
6. Start TIM3 by writing '1' in the CEN bit (TIM3\_CR1 register).

**Note:** The counter 2 clock is not synchronized with counter 1, this mode only affects the TIM2 counter enable signal.

**Figure 457. Gating TIM2 with OC1REF of TIM3**

MS33119V1

In the example in [Figure 457](#), the TIM2 counter and prescaler are not initialized before being started. So they start counting from their current value. It is possible to start from a given value by resetting both timers before starting TIM3. Then any value can be written in the timer counters. The timers can easily be reset by software using the UG bit in the TIMx\_EGR registers.

In the next example (refer to [Figure 458](#)), we synchronize TIM3 and TIM2. TIM3 is the master and starts from 0. TIM2 is the slave and starts from 0xE7. The prescaler ratio is the same for both timers. TIM2 stops when TIM3 is disabled by writing '0 to the CEN bit in the TIM3\_CR1 register:

1. Configure TIM3 master mode to send its Output Compare 1 Reference (OC1REF) signal as trigger output (MMS=100 in the TIM3\_CR2 register).
2. Configure the TIM3 OC1REF waveform (TIM3\_CCMR1 register).
3. Configure TIM2 to get the input trigger from TIM3 (TS=00010 in the TIM2\_SMCR register).
4. Configure TIM2 in gated mode (SMS=101 in TIM2\_SMCR register).
5. Reset TIM3 by writing '1 in UG bit (TIM3\_EGR register).
6. Reset TIM2 by writing '1 in UG bit (TIM2\_EGR register).
7. Initialize TIM2 to 0xE7 by writing '0xE7' in the TIM2 counter (TIM2\_CNT).
8. Enable TIM2 by writing '1 in the CEN bit (TIM2\_CR1 register).
9. Start TIM3 by writing '1 in the CEN bit (TIM3\_CR1 register).
10. Stop TIM3 by writing '0 in the CEN bit (TIM3\_CR1 register).

**Figure 458. Gating TIM2 with Enable of TIM3**

### Using one timer to start another timer

In this example, we set the enable of Timer 2 with the update event of Timer 3. Refer to [Figure 456](#) for connections. Timer 2 starts counting from its current value (which can be non-zero) on the divided internal clock as soon as the update event is generated by Timer 1. When Timer 2 receives the trigger signal its CEN bit is automatically set and the counter counts until we write '0 to the CEN bit in the TIM2\_CR1 register. Both counter clock frequencies are divided by 3 by the prescaler compared to CK\_INT ( $f_{CK\_CNT} = f_{CK\_INT}/3$ ).

1. Configure TIM3 master mode to send its Update Event (UEV) as trigger output (MMS=010 in the TIM3\_CR2 register).
2. Configure the TIM3 period (TIM3\_ARR registers).
3. Configure TIM2 to get the input trigger from TIM3 (TS=00010 in the TIM2\_SMCR register).
4. Configure TIM2 in trigger mode (SMS=110 in TIM2\_SMCR register).
5. Start TIM3 by writing '1' in the CEN bit (TIM3\_CR1 register).

**Figure 459. Triggering TIM2 with update of TIM3**

As in the previous example, both counters can be initialized before starting counting. [Figure 460](#) shows the behavior with the same configuration as in [Figure 459](#) but in trigger mode instead of gated mode (SMS=110 in the TIM2\_SMCR register).

**Figure 460. Triggering TIM2 with Enable of TIM3**

### Starting 2 timers synchronously in response to an external trigger

In this example, we set the enable of TIM3 when its TI1 input rises, and the enable of TIM2 with the enable of TIM3. Refer to [Figure 456](#) for connections. To ensure the counters are

aligned, TIM3 must be configured in Master/Slave mode (slave with respect to TI1, master with respect to TIM2):

1. Configure TIM3 master mode to send its Enable as trigger output (MMS=001 in the TIM3\_CR2 register).
2. Configure TIM3 slave mode to get the input trigger from TI1 (TS=00100 in the TIM3\_SMCR register).
3. Configure TIM3 in trigger mode (SMS=110 in the TIM3\_SMCR register).
4. Configure the TIM3 in Master/Slave mode by writing MSM=1 (TIM3\_SMCR register).
5. Configure TIM2 to get the input trigger from TIM3 (TS=00000 in the TIM2\_SMCR register).
6. Configure TIM2 in trigger mode (SMS=110 in the TIM2\_SMCR register).

When a rising edge occurs on TI1 (TIM3), both counters starts counting synchronously on the internal clock and both TIF flags are set.

**Note:** *In this example both timers are initialized before starting (by setting their respective UG bits). Both counters starts from 0, but an offset can easily be inserted between them by writing any of the counter registers (TIMx\_CNT). One can see that the master/slave mode insert a delay between CNT\_EN and CK\_PSC on TIM3.*

**Figure 461. Triggering TIM3 and TIM2 with TIM3 TI1 input**

**Note:** *The clock of the slave peripherals (timer, ADC, ...) receiving the TRGO or the TRGO2 signals must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.*

### 41.3.20 DMA burst mode

The TIMx timers have the capability to generate multiple DMA requests upon a single event. The main purpose is to be able to re-program part of the timer multiple times without software overhead, but it can also be used to read several registers in a row, at regular intervals.

The DMA controller destination is unique and must point to the virtual register TIMx\_DMAR. On a given timer event, the timer launches a sequence of DMA requests (burst). Each write into the TIMx\_DMAR register is actually redirected to one of the timer registers.

The DBL[4:0] bits in the TIMx\_DCR register set the DMA burst length. The timer recognizes a burst transfer when a read or a write access is done to the TIMx\_DMAR address, i.e. the number of transfers (either in half-words or in bytes).

The DBA[4:0] bits in the TIMx\_DCR registers define the DMA base address for DMA transfers (when read/write access are done through the TIMx\_DMAR address). DBA is defined as an offset starting from the address of the TIMx\_CR1 register:

Example:

00000: TIMx\_CR1

00001: TIMx\_CR2

00010: TIMx\_SMCR

As an example, the timer DMA burst feature is used to update the contents of the CCRx registers (x = 2, 3, 4) upon an update event, with the DMA transferring half words into the CCRx registers.

This is done in the following steps:

1. Configure the corresponding DMA channel as follows:
  - DMA channel peripheral address is the DMAR register address
  - DMA channel memory address is the address of the buffer in the RAM containing the data to be transferred by DMA into CCRx registers.
  - Number of data to transfer = 3 (See note below).
  - Circular mode disabled.
2. Configure the DCR register by configuring the DBA and DBL bit fields as follows:  
DBL = 3 transfers, DBA = 0xE.
3. Enable the TIMx update DMA request (set the UDE bit in the DIER register).
4. Enable TIMx
5. Enable the DMA channel

This example is for the case where every CCRx register has to be updated once. If every CCRx register is to be updated twice for example, the number of data to transfer should be 6. Let's take the example of a buffer in the RAM containing data1, data2, data3, data4, data5 and data6. The data is transferred to the CCRx registers as follows: on the first update DMA request, data1 is transferred to CCR2, data2 is transferred to CCR3, data3 is transferred to CCR4 and on the second update DMA request, data4 is transferred to CCR2, data5 is transferred to CCR3 and data6 is transferred to CCR4.

*Note:* A null value can be written to the reserved registers.

### 41.3.21 Debug mode

When the system enters debug mode (processor core halted), the TIMx counter either continues to work normally or stops, depending on TIMx configuration bit in DBGMCU module. For more details, refer to [Section 66.10.9: Microprocessor debug unit \(DBGMCU\)](#).

For safety purposes, when the counter is stopped (TIMx = 1 in DBGMCU\_APB1FZ2), the outputs are disabled.

## 41.4 TIM2/TIM3/TIM4/TIM5 registers

Refer to [Section 1.2](#) for a list of abbreviations used in register descriptions.

The peripheral registers can be accessed by half-words (16-bit) or words (32-bit).

### 41.4.1 TIMx control register 1 (TIMx\_CR1)(x = 2 to 5)

Address offset: 0x00

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11           | 10   | 9        | 8   | 7    | 6        | 5   | 4   | 3   | 2   | 1    | 0   |
|------|------|------|------|--------------|------|----------|-----|------|----------|-----|-----|-----|-----|------|-----|
| Res. | Res. | Res. | Res. | UIFRE<br>MAP | Res. | CKD[1:0] |     | ARPE | CMS[1:0] |     | DIR | OPM | URS | UDIS | CEN |
|      |      |      |      | r/w          |      | r/w      | r/w | r/w  | r/w      | r/w | r/w | r/w | r/w | r/w  | r/w |

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **UIFREMAP**: UIF status bit remapping

0: No remapping. UIF status bit is not copied to TIMx\_CNT register bit 31.

1: Remapping enabled. UIF status bit is copied to TIMx\_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division

This bit-field indicates the division ratio between the timer clock (CK\_INT) frequency and sampling clock used by the digital filters (ETR, Tlx),

00:  $t_{DTS} = t_{CK\_INT}$

01:  $t_{DTS} = 2 \times t_{CK\_INT}$

10:  $t_{DTS} = 4 \times t_{CK\_INT}$

11: Reserved

Bit 7 **ARPE**: Auto-reload preload enable

0: TIMx\_ARR register is not buffered

1: TIMx\_ARR register is buffered

Bits 6:5 **CMS[1:0]**: Center-aligned mode selection

00: Edge-aligned mode. The counter counts up or down depending on the direction bit (DIR).

01: Center-aligned mode 1. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS=00 in TIMx\_CCMRx register) are set only when the counter is counting down.

10: Center-aligned mode 2. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS=00 in TIMx\_CCMRx register) are set only when the counter is counting up.

11: Center-aligned mode 3. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS=00 in TIMx\_CCMRx register) are set both when the counter is counting up or down.

*Note: It is not allowed to switch from edge-aligned mode to center-aligned mode as long as the counter is enabled (CEN=1)*

Bit 4 **DIR**: Direction

0: Counter used as upcounter

1: Counter used as downcounter

*Note: This bit is read only when the timer is configured in Center-aligned mode or Encoder mode.*

Bit 3 **OPM**: One-pulse mode

0: Counter is not stopped at update event

1: Counter stops counting at the next update event (clearing the bit CEN)

Bit 2 **URS**: Update request source

This bit is set and cleared by software to select the UEV event sources.

0: Any of the following events generate an update interrupt or DMA request if enabled.

These events can be:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

1: Only counter overflow/underflow generates an update interrupt or DMA request if enabled.

Bit 1 **UDIS**: Update disable

This bit is set and cleared by software to enable/disable UEV event generation.

0: UEV enabled. The Update (UEV) event is generated by one of the following events:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

Buffered registers are then loaded with their preload values.

1: UEV disabled. The Update event is not generated, shadow registers keep their value (ARR, PSC, CCRx). However the counter and the prescaler are reinitialized if the UG bit is set or if a hardware reset is received from the slave mode controller.

Bit 0 **CEN**: Counter enable

0: Counter disabled

1: Counter enabled

*Note: External clock, gated mode and encoder mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.*

CEN is cleared automatically in one-pulse mode, when an update event occurs.

#### 41.4.2 TIMx control register 2 (TIMx\_CR2)(x = 2 to 5)

Address offset: 0x04

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6        | 5  | 4  | 3    | 2    | 1    | 0    |
|------|------|------|------|------|------|------|------|------|----------|----|----|------|------|------|------|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TI1S | MMS[2:0] |    |    | CCDS | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      | rw   | rw       | rw | rw | rw   |      |      |      |

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **TI1S**: TI1 selection

0: The TIMx\_CH1 pin is connected to TI1 input

1: The TIMx\_CH1, CH2 and CH3 pins are connected to the TI1 input (XOR combination)

See also [Section 40.3.25: Interfacing with Hall sensors on page 2094](#)

Bits 6:4 **MMS[2:0]**: Master mode selection

These bits allow to select the information to be sent in master mode to slave timers for synchronization (TRGO). The combination is as follows:

000: **Reset** - the UG bit from the TIMx\_EGR register is used as trigger output (TRGO). If the reset is generated by the trigger input (slave mode controller configured in reset mode) then the signal on TRGO is delayed compared to the actual reset.

001: **Enable** - the Counter enable signal, CNT\_EN, is used as trigger output (TRGO). It is useful to start several timers at the same time or to control a window in which a slave timer is enabled. The Counter Enable signal is generated by a logic AND between CEN control bit and the trigger input when configured in gated mode.

When the Counter Enable signal is controlled by the trigger input, there is a delay on TRGO, except if the master/slave mode is selected (see the MSM bit description in TIMx\_SMCR register).

010: **Update** - The update event is selected as trigger output (TRGO). For instance a master timer can then be used as a prescaler for a slave timer.

011: **Compare Pulse** - The trigger output send a positive pulse when the CC1IF flag is to be set (even if it was already high), as soon as a capture or a compare match occurred. (TRGO)

100: **Compare** - OC1REF signal is used as trigger output (TRGO)

101: **Compare** - OC2REF signal is used as trigger output (TRGO)

110: **Compare** - OC3REF signal is used as trigger output (TRGO)

111: **Compare** - OC4REF signal is used as trigger output (TRGO)

*Note: The clock of the slave timer or ADC must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.*

Bit 3 **CCDS**: Capture/compare DMA selection

0: CCx DMA request sent when CCx event occurs

1: CCx DMA requests sent when update event occurs

Bits 2:0 Reserved, must be kept at reset value.

### 41.4.3 TIMx slave mode control register (TIMx\_SMCR)(x = 2 to 5)

Address offset: 0x08

Reset value: 0x0000 0000

|      |      |           |      |          |      |      |      |      |         |         |    |      |          |      |        |
|------|------|-----------|------|----------|------|------|------|------|---------|---------|----|------|----------|------|--------|
| 31   | 30   | 29        | 28   | 27       | 26   | 25   | 24   | 23   | 22      | 21      | 20 | 19   | 18       | 17   | 16     |
| Res. | Res. | Res.      | Res. | Res.     | Res. | Res. | Res. | Res. | Res.    | TS[4:3] |    | Res. | Res.     | Res. | SMS[3] |
|      |      |           |      |          |      |      |      |      |         | rw      | rw |      |          |      | rw     |
| 15   | 14   | 13        | 12   | 11       | 10   | 9    | 8    | 7    | 6       | 5       | 4  | 3    | 2        | 1    | 0      |
| ETP  | ECE  | ETPS[1:0] |      | ETF[3:0] |      |      |      | MSM  | TS[2:0] |         |    | Res. | SMS[2:0] |      |        |
| rw   | rw   | rw        | rw   | rw       | rw   | rw   | rw   | rw   | rw      | rw      | rw |      | rw       | rw   | rw     |

Bits 31:22 Reserved, must be kept at reset value.

Bits 19:17 Reserved, must be kept at reset value.

Bit 15 **ETP**: External trigger polarity

This bit selects whether ETR or  $\overline{\text{ETR}}$  is used for trigger operations

0: ETR is non-inverted, active at high level or rising edge

1: ETR is inverted, active at low level or falling edge

Bit 14 **ECE**: External clock enable

This bit enables External clock mode 2.

0: External clock mode 2 disabled

1: External clock mode 2 enabled. The counter is clocked by any active edge on the ETRF signal.

*Note: Setting the ECE bit has the same effect as selecting external clock mode 1 with TRGI connected to ETRF (SMS=111 and TS=00111).*

*It is possible to simultaneously use external clock mode 2 with the following slave modes: reset mode, gated mode and trigger mode. Nevertheless, TRGI must not be connected to ETRF in this case (TS bits must not be 00111).*

*If external clock mode 1 and external clock mode 2 are enabled at the same time, the external clock input is ETRF.*

Bits 13:12 **ETPS[1:0]**: External trigger prescaler

External trigger signal ETRP frequency must be at most 1/4 of CK\_INT frequency. A prescaler can be enabled to reduce ETRP frequency. It is useful when inputting fast external clocks.

00: Prescaler OFF

01: ETRP frequency divided by 2

10: ETRP frequency divided by 4

11: ETRP frequency divided by 8

Bits 11:8 **ETF[3:0]**: External trigger filter

This bit-field then defines the frequency used to sample ETRP signal and the length of the digital filter applied to ETRP. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at  $f_{DTS}$

0001:  $f_{SAMPLING}=f_{CK\_INT}$ ,  $N=2$

0010:  $f_{SAMPLING}=f_{CK\_INT}$ ,  $N=4$

0011:  $f_{SAMPLING}=f_{CK\_INT}$ ,  $N=8$

0100:  $f_{SAMPLING}=f_{DTS}/2$ ,  $N=6$

0101:  $f_{SAMPLING}=f_{DTS}/2$ ,  $N=8$

0110:  $f_{SAMPLING}=f_{DTS}/4$ ,  $N=6$

0111:  $f_{SAMPLING}=f_{DTS}/4$ ,  $N=8$

1000:  $f_{SAMPLING}=f_{DTS}/8$ ,  $N=6$

1001:  $f_{SAMPLING}=f_{DTS}/8$ ,  $N=8$

1010:  $f_{SAMPLING}=f_{DTS}/16$ ,  $N=5$

1011:  $f_{SAMPLING}=f_{DTS}/16$ ,  $N=6$

1100:  $f_{SAMPLING}=f_{DTS}/16$ ,  $N=8$

1101:  $f_{SAMPLING}=f_{DTS}/32$ ,  $N=5$

1110:  $f_{SAMPLING}=f_{DTS}/32$ ,  $N=6$

1111:  $f_{SAMPLING}=f_{DTS}/32$ ,  $N=8$

Bit 7 **MSM**: Master/Slave mode

0: No action

1: The effect of an event on the trigger input (TRGI) is delayed to allow a perfect synchronization between the current timer and its slaves (through TRGO). It is useful if we want to synchronize several timers on a single external event.

Bits 21, 20, 6, 5, 4 **TS[4:0]**: Trigger selection

This bit-field selects the trigger input to be used to synchronize the counter.

00000: Internal Trigger 0 (ITR0)  
 00001: Internal Trigger 1 (ITR1)  
 00010: Internal Trigger 2 (ITR2)  
 00011: Internal Trigger 3 (ITR3)  
 00100: TI1 Edge Detector (TI1F\_ED)  
 00101: Filtered Timer Input 1 (TI1FP1)  
 00110: Filtered Timer Input 2 (TI2FP2)  
 00111: External Trigger input (ETRF)  
 01000: Internal Trigger 4 (ITR4)  
 01001: Internal Trigger 5 (ITR5)  
 01010: Internal Trigger 6 (ITR6)  
 01011: Internal Trigger 7 (ITR7)  
 01100: Internal Trigger 8 (ITR8)  
 Others: Reserved

See [Table 288: TIMx internal trigger connection on page 2196](#) for more details on ITRx meaning for each Timer.

*Note: These bits must be changed only when they are not used (e.g. when SMS=000) to avoid wrong edge detections at the transition.*

Bit 3 Reserved, must be kept at reset value.

Bits 16, 2, 1, 0 **SMS[3:0]**: Slave mode selection

When external signals are selected the active edge of the trigger signal (TRGI) is linked to the polarity selected on the external input (see Input Control register and Control Register description).

0000: Slave mode disabled - if CEN = '1 then the prescaler is clocked directly by the internal clock.  
 0001: Encoder mode 1 - Counter counts up/down on TI1FP1 edge depending on TI2FP2 level.  
 0010: Encoder mode 2 - Counter counts up/down on TI2FP2 edge depending on TI1FP1 level.  
 0011: Encoder mode 3 - Counter counts up/down on both TI1FP1 and TI2FP2 edges depending on the level of the other input.  
 0100: Reset Mode - Rising edge of the selected trigger input (TRGI) reinitializes the counter and generates an update of the registers.  
 0101: Gated Mode - The counter clock is enabled when the trigger input (TRGI) is high. The counter stops (but is not reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.  
 0110: Trigger Mode - The counter starts at a rising edge of the trigger TRGI (but it is not reset). Only the start of the counter is controlled.  
 0111: External Clock Mode 1 - Rising edges of the selected trigger (TRGI) clock the counter.  
 1000: Combined reset + trigger mode - Rising edge of the selected trigger input (TRGI) reinitializes the counter, generates an update of the registers and starts the counter.

*Note: The gated mode must not be used if TI1F\_ED is selected as the trigger input (TS=00100). Indeed, TI1F\_ED outputs 1 pulse for each transition on TI1F, whereas the gated mode checks the level of the trigger signal.*

*Note: The clock of the slave peripherals (timer, ADC, ...) receiving the TRGO or the TRGO2 signals must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.*

Table 288. TIMx internal trigger connection

| Slave TIM | ITR0 | ITR1 | ITR2  | ITR3 | ITR4 | ITR5 | ITR6       | ITR7 | ITR8    |
|-----------|------|------|-------|------|------|------|------------|------|---------|
| TIM2      | TIM1 | TIM8 | TIM3  | TIM4 | -    | -    | -          | -    | -       |
| TIM3      | TIM1 | TIM2 | TIM15 | TIM4 | -    | -    | -          | -    | -       |
| TIM4      | TIM1 | TIM2 | TIM3  | TIM8 | -    | -    | -          | -    | -       |
| TIM5      | TIM1 | TIM8 | TIM3  | TIM4 | -    | -    | fdcan1_soc | -    | OTG_SOF |

#### 41.4.4 TIMx DMA/Interrupt enable register (TIMx\_DIER)(x = 2 to 5)

Address offset: 0x0C

Reset value: 0x0000

| 15   | 14  | 13   | 12    | 11    | 10    | 9     | 8   | 7    | 6   | 5    | 4     | 3     | 2     | 1     | 0   |

Bit 15 Reserved, must be kept at reset value.

Bit 14 **TDE**: Trigger DMA request enable

0: Trigger DMA request disabled.

1: Trigger DMA request enabled.

Bit 13 Reserved, must be kept at reset value.

Bit 12 **CC4DE**: Capture/Compare 4 DMA request enable

0: CC4 DMA request disabled.

1: CC4 DMA request enabled.

Bit 11 **CC3DE**: Capture/Compare 3 DMA request enable

0: CC3 DMA request disabled.

1: CC3 DMA request enabled.

Bit 10 **CC2DE**: Capture/Compare 2 DMA request enable

0: CC2 DMA request disabled.

1: CC2 DMA request enabled.

Bit 9 **CC1DE**: Capture/Compare 1 DMA request enable

0: CC1 DMA request disabled.

1: CC1 DMA request enabled.

Bit 8 **UDE**: Update DMA request enable

0: Update DMA request disabled.

1: Update DMA request enabled.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **TIE**: Trigger interrupt enable

0: Trigger interrupt disabled.

1: Trigger interrupt enabled.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **CC4IE**: Capture/Compare 4 interrupt enable

0: CC4 interrupt disabled.

1: CC4 interrupt enabled.

Bit 3 **CC3IE**: Capture/Compare 3 interrupt enable

0: CC3 interrupt disabled.

1: CC3 interrupt enabled.

Bit 2 **CC2IE**: Capture/Compare 2 interrupt enable

0: CC2 interrupt disabled.

1: CC2 interrupt enabled.

Bit 1 **CC1IE**: Capture/Compare 1 interrupt enable

0: CC1 interrupt disabled.

1: CC1 interrupt enabled.

Bit 0 **UIE**: Update interrupt enable

0: Update interrupt disabled.

1: Update interrupt enabled.

#### 41.4.5 TIMx status register (TIMx\_SR)(x = 2 to 5)

Address offset: 0x10

Reset value: 0x0000

| 15   | 14   | 13   | 12    | 11    | 10    | 9     | 8    | 7    | 6     | 5    | 4     | 3     | 2     | 1     | 0     |
|------|------|------|-------|-------|-------|-------|------|------|-------|------|-------|-------|-------|-------|-------|
| Res. | Res. | Res. | CC4OF | CC3OF | CC2OF | CC1OF | Res. | Res. | TIF   | Res. | CC4IF | CC3IF | CC2IF | CC1IF | UIF   |
|      |      |      | rc_w0 | rc_w0 | rc_w0 | rc_w0 |      |      | rc_w0 |      | rc_w0 | rc_w0 | rc_w0 | rc_w0 | rc_w0 |

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **CC4OF**: Capture/Compare 4 overcapture flag

refer to CC1OF description

Bit 11 **CC3OF**: Capture/Compare 3 overcapture flag

refer to CC1OF description

Bit 10 **CC2OF**: Capture/compare 2 overcapture flag

refer to CC1OF description

Bit 9 **CC1OF**: Capture/Compare 1 overcapture flag

This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to '0'.

0: No overcapture has been detected.

1: The counter value has been captured in TIMx\_CCR1 register while CC1IF flag was already set

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 **TIF**: Trigger interrupt flag

This flag is set by hardware on the TRG trigger event (active edge detected on TRGI input when the slave mode controller is enabled in all modes but gated mode. It is set when the counter starts or stops when gated mode is selected. It is cleared by software.

0: No trigger event occurred.

1: Trigger interrupt pending.

Bit 5 Reserved, must be kept at reset value.

- Bit 4 **CC4IF**: Capture/Compare 4 interrupt flag  
Refer to CC1IF description
- Bit 3 **CC3IF**: Capture/Compare 3 interrupt flag  
Refer to CC1IF description
- Bit 2 **CC2IF**: Capture/Compare 2 interrupt flag  
Refer to CC1IF description
- Bit 1 **CC1IF**: Capture/compare 1 interrupt flag  
This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIMx\_CCR1 register (input capture mode only).  
0: No compare match / No input capture occurred  
1: A compare match or an input capture occurred  
**If channel CC1 is configured as output**: this flag is set when the content of the counter TIMx\_CNT matches the content of the TIMx\_CCR1 register. When the content of TIMx\_CCR1 is greater than the content of TIMx\_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in down-counting mode). There are 3 possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIMx\_CR1 register for the full description.  
**If channel CC1 is configured as input**: this bit is set when counter value has been captured in TIMx\_CCR1 register (an edge has been detected on IC1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIMx\_CCER).
- Bit 0 **UIF**: Update interrupt flag  
This bit is set by hardware on an update event. It is cleared by software.  
0: No update occurred  
1: Update interrupt pending. This bit is set by hardware when the registers are updated: At overflow or underflow (for TIM2 to TIM4) and if UDIS=0 in the TIMx\_CR1 register. When CNT is reinitialized by software using the UG bit in TIMx\_EGR register, if URS=0 and UDIS=0 in the TIMx\_CR1 register. When CNT is reinitialized by a trigger event (refer to the synchro control register description), if URS=0 and UDIS=0 in the TIMx\_CR1 register.

#### 41.4.6 TIMx event generation register (TIMx\_EGR)(x = 2 to 5)

Address offset: 0x14

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6  | 5    | 4    | 3    | 2    | 1    | 0  |
|------|------|------|------|------|------|------|------|------|----|------|------|------|------|------|----|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TG | Res. | CC4G | CC3G | CC2G | CC1G | UG |
|      |      |      |      |      |      |      |      |      | w  |      | w    | w    | w    | w    | w  |

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **TG**: Trigger generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action

1: The TIF flag is set in TIMx\_SR register. Related interrupt or DMA transfer can occur if enabled.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **CC4G**: Capture/compare 4 generation

Refer to CC1G description

Bit 3 **CC3G**: Capture/compare 3 generation

Refer to CC1G description

Bit 2 **CC2G**: Capture/compare 2 generation

Refer to CC1G description

Bit 1 **CC1G**: Capture/compare 1 generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action

1: A capture/compare event is generated on channel 1:

**If channel CC1 is configured as output:**

CC1IF flag is set, Corresponding interrupt or DMA request is sent if enabled.

**If channel CC1 is configured as input:**

The current value of the counter is captured in TIMx\_CCR1 register. The CC1IF flag is set, the corresponding interrupt or DMA request is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation

This bit can be set by software, it is automatically cleared by hardware.

0: No action

1: Re-initialize the counter and generates an update of the registers. Note that the prescaler counter is cleared too (anyway the prescaler ratio is not affected). The counter is cleared if the center-aligned mode is selected or if DIR=0 (upcounting), else it takes the auto-reload value (TIMx\_ARR) if DIR=1 (downcounting).

#### 41.4.7 TIMx capture/compare mode register 1 [alternate] (TIMx\_CCMR1) (x = 2 to 5)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function in input and in output mode.

**Input capture mode:**

|           |      |      |      |             |      |           |      |           |      |      |      |             |      |           |      |
|-----------|------|------|------|-------------|------|-----------|------|-----------|------|------|------|-------------|------|-----------|------|
| 31        | 30   | 29   | 28   | 27          | 26   | 25        | 24   | 23        | 22   | 21   | 20   | 19          | 18   | 17        | 16   |
| Res.      | Res. | Res. | Res. | Res.        | Res. | Res.      | Res. | Res.      | Res. | Res. | Res. | Res.        | Res. | Res.      | Res. |
|           |      |      |      |             |      |           |      |           |      |      |      |             |      |           |      |
| 15        | 14   | 13   | 12   | 11          | 10   | 9         | 8    | 7         | 6    | 5    | 4    | 3           | 2    | 1         | 0    |
| IC2F[3:0] |      |      |      | IC2PSC[1:0] |      | CC2S[1:0] |      | IC1F[3:0] |      |      |      | IC1PSC[1:0] |      | CC1S[1:0] |      |
| rw        | rw   | rw   | rw   | rw          | rw   | rw        | rw   | rw        | rw   | rw   | rw   | rw          | rw   | rw        | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC2F[3:0]**: Input capture 2 filter

Bits 11:10 **IC2PSC[1:0]**: Input capture 2 prescaler

Bits 9:8 **CC2S[1:0]**: Capture/compare 2 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output.

01: CC2 channel is configured as input, IC2 is mapped on TI2.

10: CC2 channel is configured as input, IC2 is mapped on TI1.

11: CC2 channel is configured as input, IC2 is mapped on TRC. This mode is working only if an internal trigger input is selected through TS bit (TIMx\_SMCR register)

*Note: CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIMx\_CCER).*

Bits 7:4 **IC1F[3:0]**: Input capture 1 filter

This bit-field defines the frequency used to sample TI1 input and the length of the digital filter applied to TI1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at  $f_{DTS}$

0001:  $f_{SAMPLING}=f_{CK\_INT}$ , N=2

0010:  $f_{SAMPLING}=f_{CK\_INT}$ , N=4

0011:  $f_{SAMPLING}=f_{CK\_INT}$ , N=8

0100:  $f_{SAMPLING}=f_{DTS}/2$ , N=6

0101:  $f_{SAMPLING}=f_{DTS}/2$ , N=8

0110:  $f_{SAMPLING}=f_{DTS}/4$ , N=6

0111:  $f_{SAMPLING}=f_{DTS}/4$ , N=8

1000:  $f_{SAMPLING}=f_{DTS}/8$ , N=6

1001:  $f_{SAMPLING}=f_{DTS}/8$ , N=8

1010:  $f_{SAMPLING}=f_{DTS}/16$ , N=5

1011:  $f_{SAMPLING}=f_{DTS}/16$ , N=6

1100:  $f_{SAMPLING}=f_{DTS}/16$ , N=8

1101:  $f_{SAMPLING}=f_{DTS}/32$ , N=5

1110:  $f_{SAMPLING}=f_{DTS}/32$ , N=6

1111:  $f_{SAMPLING}=f_{DTS}/32$ , N=8

Bits 3:2 **IC1PSC[1:0]**: Input capture 1 prescaler

This bit-field defines the ratio of the prescaler acting on CC1 input (IC1). The prescaler is reset as soon as CC1E=0 (TIMx\_CCER register).

00: no prescaler, capture is done each time an edge is detected on the capture input

01: capture is done once every 2 events

10: capture is done once every 4 events

11: capture is done once every 8 events

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, IC1 is mapped on TI1

10: CC1 channel is configured as input, IC1 is mapped on TI2

11: CC1 channel is configured as input, IC1 is mapped on TRC. This mode is working only if an internal trigger input is selected through TS bit (TIMx\_SMCR register)

*Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx\_CCER).*

#### 41.4.8 TIMx capture/compare mode register 1 [alternate] (TIMx\_CCMR1) (x = 2 to 5)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function in input and in output mode.

##### Output compare mode:

|       |           |      |      |       |       |           |             |       |           |      |      |       |       |           |             |
|-------|-----------|------|------|-------|-------|-----------|-------------|-------|-----------|------|------|-------|-------|-----------|-------------|
| 31    | 30        | 29   | 28   | 27    | 26    | 25        | 24          | 23    | 22        | 21   | 20   | 19    | 18    | 17        | 16          |
| Res.  | Res.      | Res. | Res. | Res.  | Res.  | Res.      | OC2M<br>[3] | Res.  | Res.      | Res. | Res. | Res.  | Res.  | Res.      | OC1M<br>[3] |
|       |           |      |      |       |       |           | rw          |       |           |      |      |       |       |           | rw          |
| 15    | 14        | 13   | 12   | 11    | 10    | 9         | 8           | 7     | 6         | 5    | 4    | 3     | 2     | 1         | 0           |
| OC2CE | OC2M[2:0] |      |      | OC2PE | OC2FE | CC2S[1:0] |             | OC1CE | OC1M[2:0] |      |      | OC1PE | OC1FE | CC1S[1:0] |             |
| rw    | rw        | rw   | rw   | rw    | rw    | rw        | rw          | rw    | rw        | rw   | rw   | rw    | rw    | rw        | rw          |

Bits 31:25 Reserved, must be kept at reset value.

Bits 23:17 Reserved, must be kept at reset value.

Bit 15 **OC2CE**: Output compare 2 clear enable

Bits 24, 14:12 **OC2M[3:0]**: Output compare 2 mode  
refer to OC1M description on bits 6:4

Bit 11 **OC2PE**: Output compare 2 preload enable

Bit 10 **OC2FE**: Output compare 2 fast enable

Bits 9:8 **CC2S[1:0]**: Capture/Compare 2 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output

01: CC2 channel is configured as input, IC2 is mapped on TI2

10: CC2 channel is configured as input, IC2 is mapped on TI1

11: CC2 channel is configured as input, IC2 is mapped on TRC. This mode is working only if an internal trigger input is selected through the TS bit (TIMx\_SMCR register)

*Note:* CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIMx\_CCER).

Bit 7 **OC1CE**: Output compare 1 clear enable

0: OC1Ref is not affected by the ETRF input

1: OC1Ref is cleared as soon as a High level is detected on ETRF input

Bits 16, 6:4 **OC1M[3:0]**: Output compare 1 mode

These bits define the behavior of the output reference signal OC1REF from which OC1 and OC1N are derived. OC1REF is active high whereas OC1 and OC1N active level depends on CC1P and CC1NP bits.

0000: Frozen - The comparison between the output compare register TIMx\_CCR1 and the counter TIMx\_CNT has no effect on the outputs.(this mode is used to generate a timing base).

0001: Set channel 1 to active level on match. OC1REF signal is forced high when the counter TIMx\_CNT matches the capture/compare register 1 (TIMx\_CCR1).

0010: Set channel 1 to inactive level on match. OC1REF signal is forced low when the counter TIMx\_CNT matches the capture/compare register 1 (TIMx\_CCR1).

0011: Toggle - OC1REF toggles when TIMx\_CNT=TIMx\_CCR1.

0100: Force inactive level - OC1REF is forced low.

0101: Force active level - OC1REF is forced high.

0110: PWM mode 1 - In upcounting, channel 1 is active as long as TIMx\_CNT<TIMx\_CCR1 else inactive. In downcounting, channel 1 is inactive (OC1REF=0) as long as TIMx\_CNT>TIMx\_CCR1 else active (OC1REF=1).

0111: PWM mode 2 - In upcounting, channel 1 is inactive as long as TIMx\_CNT<TIMx\_CCR1 else active. In downcounting, channel 1 is active as long as TIMx\_CNT>TIMx\_CCR1 else inactive.

1000: Retriggerable OPM mode 1 - In up-counting mode, the channel is active until a trigger event is detected (on TRGI signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update. In down-counting mode, the channel is inactive until a trigger event is detected (on TRGI signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update.

1001: Retriggerable OPM mode 2 - In up-counting mode, the channel is inactive until a trigger event is detected (on TRGI signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update. In down-counting mode, the channel is active until a trigger event is detected (on TRGI signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

1010: Reserved,

1011: Reserved,

1100: Combined PWM mode 1 - OC1REF has the same behavior as in PWM mode 1. OC1REFC is the logical OR between OC1REF and OC2REF.

1101: Combined PWM mode 2 - OC1REF has the same behavior as in PWM mode 2. OC1REFC is the logical AND between OC1REF and OC2REF.

1110: Asymmetric PWM mode 1 - OC1REF has the same behavior as in PWM mode 1. OC1REFC outputs OC1REF when the counter is counting up, OC2REF when it is counting down.

1111: Asymmetric PWM mode 2 - OC1REF has the same behavior as in PWM mode 2. OC1REFC outputs OC1REF when the counter is counting up, OC2REF when it is counting down.

*Note: In PWM mode, the OCREF level changes only when the result of the comparison changes or when the output compare mode switches from "frozen" mode to "PWM" mode.*

Bit 3 **OC1PE**: Output compare 1 preload enable

0: Preload register on TIMx\_CCR1 disabled. TIMx\_CCR1 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIMx\_CCR1 enabled. Read/Write operations access the preload register. TIMx\_CCR1 preload value is loaded in the active register at each update event.

*Note: The PWM mode can be used without validating the preload register only in one-pulse mode (OPM bit set in TIMx\_CR1 register). Else the behavior is not guaranteed.*

Bit 2 **OC1FE**: Output compare 1 fast enable

This bit is used to accelerate the effect of an event on the trigger in input on the CC output.  
0: CC1 behaves normally depending on counter and CCR1 values even when the trigger is ON. The minimum delay to activate CC1 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC1 output. Then, OC is set to the compare level independently from the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to 3 clock cycles. OCFE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output.

01: CC1 channel is configured as input, IC1 is mapped on TI1.

10: CC1 channel is configured as input, IC1 is mapped on TI2.

11: CC1 channel is configured as input, IC1 is mapped on TRC. This mode is working only if an internal trigger input is selected through TS bit (TIMx\_SMCR register)

*Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx\_CCER).*

#### 41.4.9 TIMx capture/compare mode register 2 [alternate] (TIMx\_CCMR2) (x = 2 to 5)

Address offset: 0x1C

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function in input and in output mode.

**Input capture mode:**

|           |      |      |      |             |      |           |      |           |      |      |      |             |      |           |      |
|-----------|------|------|------|-------------|------|-----------|------|-----------|------|------|------|-------------|------|-----------|------|
| 31        | 30   | 29   | 28   | 27          | 26   | 25        | 24   | 23        | 22   | 21   | 20   | 19          | 18   | 17        | 16   |
| Res.      | Res. | Res. | Res. | Res.        | Res. | Res.      | Res. | Res.      | Res. | Res. | Res. | Res.        | Res. | Res.      | Res. |
|           |      |      |      |             |      |           |      |           |      |      |      |             |      |           |      |
| 15        | 14   | 13   | 12   | 11          | 10   | 9         | 8    | 7         | 6    | 5    | 4    | 3           | 2    | 1         | 0    |
| IC4F[3:0] |      |      |      | IC4PSC[1:0] |      | CC4S[1:0] |      | IC3F[3:0] |      |      |      | IC3PSC[1:0] |      | CC3S[1:0] |      |
| rw        | rw   | rw   | rw   | rw          | rw   | rw        | rw   | rw        | rw   | rw   | rw   | rw          | rw   | rw        | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC4F[3:0]**: Input capture 4 filter

Bits 11:10 **IC4PSC[1:0]**: Input capture 4 prescaler

Bits 9:8 **CC4S[1:0]**: Capture/Compare 4 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC4 channel is configured as output

01: CC4 channel is configured as input, IC4 is mapped on TI4

10: CC4 channel is configured as input, IC4 is mapped on TI3

11: CC4 channel is configured as input, IC4 is mapped on TRC. This mode is working only if an internal trigger input is selected through TS bit (TIMx\_SMCR register)

*Note: CC4S bits are writable only when the channel is OFF (CC4E = 0 in TIMx\_CCER).*

Bits 7:4 **IC3F[3:0]**: Input capture 3 filter

Bits 3:2 **IC3PSC[1:0]**: Input capture 3 prescaler

Bits 1:0 **CC3S[1:0]**: Capture/Compare 3 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC3 channel is configured as output

01: CC3 channel is configured as input, IC3 is mapped on TI3

10: CC3 channel is configured as input, IC3 is mapped on TI4

11: CC3 channel is configured as input, IC3 is mapped on TRC. This mode is working only if an internal trigger input is selected through TS bit (TIMx\_SMCR register)

*Note: CC3S bits are writable only when the channel is OFF (CC3E = 0 in TIMx\_CCER).*

#### 41.4.10 TIMx capture/compare mode register 2 [alternate] (TIMx\_CCMR2) (x = 2 to 5)

Address offset: 0x1C

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function in input and in output mode.

##### Output compare mode:

|       |           |      |      |       |       |           |         |       |           |      |      |       |       |           |         |
|-------|-----------|------|------|-------|-------|-----------|---------|-------|-----------|------|------|-------|-------|-----------|---------|
| 31    | 30        | 29   | 28   | 27    | 26    | 25        | 24      | 23    | 22        | 21   | 20   | 19    | 18    | 17        | 16      |
| Res.  | Res.      | Res. | Res. | Res.  | Res.  | Res.      | OC4M[3] | Res.  | Res.      | Res. | Res. | Res.  | Res.  | Res.      | OC3M[3] |
|       |           |      |      |       |       |           | rw      |       |           |      |      |       |       |           | rw      |
| 15    | 14        | 13   | 12   | 11    | 10    | 9         | 8       | 7     | 6         | 5    | 4    | 3     | 2     | 1         | 0       |
| OC4CE | OC4M[2:0] |      |      | OC4PE | OC4FE | CC4S[1:0] |         | OC3CE | OC3M[2:0] |      |      | OC3PE | OC3FE | CC3S[1:0] |         |
| rw    | rw        | rw   | rw   | rw    | rw    | rw        | rw      | rw    | rw        | rw   | rw   | rw    | rw    | rw        | rw      |

Bits 31:25 Reserved, must be kept at reset value.

Bits 23:17 Reserved, must be kept at reset value.

Bit 15 **OC4CE**: Output compare 4 clear enable

Bits 24, 14:12 **OC4M[3:0]**: Output compare 4 mode

Refer to OC1M description (bits 6:4 in TIMx\_CCMR1 register)

Bit 11 **OC4PE**: Output compare 4 preload enable

Bit 10 **OC4FE**: Output compare 4 fast enable

Bits 9:8 **CC4S[1:0]**: Capture/Compare 4 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC4 channel is configured as output

01: CC4 channel is configured as input, IC4 is mapped on TI4

10: CC4 channel is configured as input, IC4 is mapped on TI3

11: CC4 channel is configured as input, IC4 is mapped on TRC. This mode is working only if an internal trigger input is selected through TS bit (TIMx\_SMCR register)

*Note: CC4S bits are writable only when the channel is OFF (CC4E = 0 in TIMx\_CCER).*

Bit 7 **OC3CE**: Output compare 3 clear enable

Bits 16, 6:4 **OC3M[3:0]**: Output compare 3 mode

Refer to OC1M description (bits 6:4 in TIMx\_CCMR1 register)

Bit 3 **OC3PE**: Output compare 3 preload enable

Bit 2 **OC3FE**: Output compare 3 fast enable

Bits 1:0 **CC3S[1:0]**: Capture/Compare 3 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC3 channel is configured as output

01: CC3 channel is configured as input, IC3 is mapped on TI3

10: CC3 channel is configured as input, IC3 is mapped on TI4

11: CC3 channel is configured as input, IC3 is mapped on TRC. This mode is working only if an internal trigger input is selected through TS bit (TIMx\_SMCR register)

*Note: CC3S bits are writable only when the channel is OFF (CC3E = 0 in TIMx\_CCER).*

#### 41.4.11 TIMx capture/compare enable register (TIMx\_CCER)(x = 2 to 5)

Address offset: 0x20

Reset value: 0x0000

| 15    | 14   | 13   | 12   | 11    | 10   | 9    | 8    | 7     | 6    | 5    | 4    | 3     | 2    | 1    | 0    |
|-------|------|------|------|-------|------|------|------|-------|------|------|------|-------|------|------|------|
| CC4NP | Res. | CC4P | CC4E | CC3NP | Res. | CC3P | CC3E | CC2NP | Res. | CC2P | CC2E | CC1NP | Res. | CC1P | CC1E |
| rw    |      | rw   | rw   | rw    |      | rw   | rw   | rw    |      | rw   | rw   | rw    |      | rw   | rw   |

Bit 15 **CC4NP**: Capture/Compare 4 output Polarity.

Refer to CC1NP description

Bit 14 Reserved, must be kept at reset value.

Bit 13 **CC4P**: Capture/Compare 4 output Polarity.

Refer to CC1P description

Bit 12 **CC4E**: Capture/Compare 4 output enable.

refer to CC1E description

Bit 11 **CC3NP**: Capture/Compare 3 output Polarity.

Refer to CC1NP description

Bit 10 Reserved, must be kept at reset value.

Bit 9 **CC3P**: Capture/Compare 3 output Polarity.

Refer to CC1P description

Bit 8 **CC3E**: Capture/Compare 3 output enable.

Refer to CC1E description

Bit 7 **CC2NP**: *Capture/Compare 2 output Polarity.*

Refer to CC1NP description

Bit 6 Reserved, must be kept at reset value.

Bit 5 **CC2P**: *Capture/Compare 2 output Polarity.*

refer to CC1P description

Bit 4 **CC2E**: *Capture/Compare 2 output enable.*

Refer to CC1E description

Bit 3 **CC1NP**: *Capture/Compare 1 output Polarity.*

**CC1 channel configured as output**: CC1NP must be kept cleared in this case.

**CC1 channel configured as input**: This bit is used in conjunction with CC1P to define TI1FP1/TI2FP1 polarity. refer to CC1P description.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CC1P**: *Capture/Compare 1 output Polarity.*

0: OC1 active high (output mode) / Edge sensitivity selection (input mode, see below)

1: OC1 active low (output mode) / Edge sensitivity selection (input mode, see below)

**When CC1 channel is configured as input**, both CC1NP/CC1P bits select the active polarity of TI1FP1 and TI2FP1 for trigger or capture operations.

CC1NP=0, CC1P=0: non-inverted/rising edge. The circuit is sensitive to TIxFP1 rising edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode or encoder mode).

CC1NP=0, CC1P=1: inverted/falling edge. The circuit is sensitive to TIxFP1 falling edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is inverted (trigger operation in gated mode or encoder mode).

CC1NP=1, CC1P=1: non-inverted/both edges. The circuit is sensitive to both TIxFP1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode). This configuration must not be used in encoder mode.

CC1NP=1, CC1P=0: This configuration is reserved, it must not be used.

Bit 0 **CC1E**: *Capture/Compare 1 output enable.*

0: Capture mode disabled / OC1 is not active

1: Capture mode enabled / OC1 signal is output on the corresponding output pin

**Table 289. Output control bit for standard OCx channels**

| CCxE bit | OCx output state                  |
|----------|-----------------------------------|
| 0        | Output Disabled (OCx=0, OCx_EN=0) |
| 1        | OCx=OCxREF + Polarity, OCx_EN=1   |

*Note:* The state of the external IO pins connected to the standard OCx channels depends on the OCx channel state and the GPIO and AFIO registers.

#### 41.4.12 TIMx counter [alternate] (TIMx\_CNT)(x = 2 to 5)

Bit 31 of this register has two possible definitions depending on the value of UIFREMAP in TIMx\_CR1 register:

- This section is for UIFREMAP = 0
- Next section is for UIFREMAP = 1

Address offset: 0x24

Reset value: 0x0000 0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| CNT[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CNT[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **CNT[31:16]**: Most significant part counter value (TIM2 and TIM5)

Bits 15:0 **CNT[15:0]**: Least significant part of counter value

#### 41.4.13 TIMx counter [alternate] (TIMx\_CNT)(x = 2 to 5)

Bit 31 of this register has two possible definitions depending on the value of UIFREMAP in TIMx\_CR1 register:

- Previous section is for UIFREMAP = 0
- This section is for UIFREMAP = 1

Address offset: 0x24

Reset value: 0x0000 0000

|           |            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31        | 30         | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| UIFCPY    | CNT[30:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15        | 14         | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CNT[15:0] |            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bit 31 **UIFCPY**: UIF Copy

This bit is a read-only copy of the UIF bit of the TIMx\_ISR register

Bits 30:16 **CNT[30:16]**: Most significant part counter value (TIM2 and TIM5)

Bits 15:0 **CNT[15:0]**: Least significant part of counter value

#### 41.4.14 TIMx prescaler (TIMx\_PSC)(x = 2 to 5)

Address offset: 0x28

Reset value: 0x0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| PSC[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **PSC[15:0]**: Prescaler value

The counter clock frequency  $CK\_CNT$  is equal to  $f_{CK\_PSC} / (PSC[15:0] + 1)$ .

PSC contains the value to be loaded in the active prescaler register at each update event (including when the counter is cleared through UG bit of TIMx\_EGR register or through trigger controller when configured in “reset mode”).

#### 41.4.15 TIMx auto-reload register (TIMx\_ARR)(x = 2 to 5)

Address offset: 0x2C

Reset value: 0xFFFF FFFF

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31         | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| ARR[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ARR[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **ARR[31:16]**: High auto-reload value (TIM2 and TIM5)

Bits 15:0 **ARR[15:0]**: Low Auto-reload value

ARR is the value to be loaded in the actual auto-reload register.

Refer to the [Section 41.3.1: Time-base unit on page 2148](#) for more details about ARR update and behavior.

The counter is blocked while the auto-reload value is null.

#### 41.4.16 TIMx capture/compare register 1 (TIMx\_CCR1)(x = 2 to 5)

Address offset: 0x34

Reset value: 0x0000 0000

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 31          | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| CCR1[31:16] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |
| 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CCR1[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw          | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 31:16 **CCR1[31:16]**: High Capture/Compare 1 value (TIM2 and TIM5)

Bits 15:0 **CCR1[15:0]**: Low Capture/Compare 1 value

**If channel CC1 is configured as output:**

CCR1 is the value to be loaded in the actual capture/compare 1 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIMx\_CCMR1 register (bit OC1PE). Else the preload value is copied in the active capture/compare 1 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx\_CNT and signaled on OC1 output.

**If channel CC1 is configured as input:**

CCR1 is the counter value transferred by the last input capture 1 event (IC1). The TIMx\_CCR1 register is read-only and cannot be programmed.

#### 41.4.17 TIMx capture/compare register 2 (TIMx\_CCR2)(x = 2 to 5)

Address offset: 0x38

Reset value: 0x0000 0000

|             |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

| 15          | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CCR4[15:0]  |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW          | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 31:16 **CCR4[31:16]**: High Capture/Compare 4 value (TIM2 and TIM5)

Bits 15:0 **CCR4[15:0]**: Low Capture/Compare value

- if CC4 channel is configured as output (CC4S bits):  
CCR4 is the value to be loaded in the actual capture/compare 4 register (preload value). It is loaded permanently if the preload feature is not selected in the TIMx\_CCMR2 register (bit OC4PE). Else the preload value is copied in the active capture/compare 4 register when an update event occurs.  
The active capture/compare register contains the value to be compared to the counter TIMx\_CNT and signalled on OC4 output.
- if CC4 channel is configured as input (CC4S bits in TIMx\_CCMR4 register):  
CCR4 is the counter value transferred by the last input capture 4 event (IC4). The TIMx\_CCR4 register is read-only and cannot be programmed.

#### 41.4.20 TIMx DMA control register (TIMx\_DCR)(x = 2 to 5)

Address offset: 0x48

Reset value: 0x0000

| 15   | 14   | 13   | 12       | 11 | 10 | 9  | 8  | 7    | 6    | 5    | 4        | 3  | 2  | 1  | 0  |
|------|------|------|----------|----|----|----|----|------|------|------|----------|----|----|----|----|
| Res. | Res. | Res. | DBL[4:0] |    |    |    |    | Res. | Res. | Res. | DBA[4:0] |    |    |    |    |
|      |      |      | rw       | rw | rw | rw | rw |      |      |      | rw       | rw | rw | rw | rw |

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **DBL[4:0]**: DMA burst length

This 5-bit vector defines the number of DMA transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIMx\_DMAR address).

00000: 1 transfer,

00001: 2 transfers,

00010: 3 transfers,

...

10001: 18 transfers.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **DBA[4:0]**: DMA base address

This 5-bit vector defines the base-address for DMA transfers (when read/write access are done through the TIMx\_DMAR address). DBA is defined as an offset starting from the address of the TIMx\_CR1 register.

Example:

00000: TIMx\_CR1

00001: TIMx\_CR2

00010: TIMx\_SMCR

...

**Example:** Let us consider the following transfer: DBL = 7 transfers & DBA = TIMx\_CR1. In this case the transfer is done to/from 7 registers starting from the TIMx\_CR1 address.

#### 41.4.21 TIMx DMA address for full transfer (TIMx\_DMAR)(x = 2 to 5)

Address offset: 0x4C

Reset value: 0x0000

| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| DMAB[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **DMAB[15:0]**: DMA register for burst accesses

A read or write operation to the DMAR register accesses the register located at the address  
 $(\text{TIMx\_CR1 address}) + (\text{DBA} + \text{DMA index}) \times 4$

where TIMx\_CR1 address is the address of the control register 1, DBA is the DMA base address configured in TIMx\_DCR register, DMA index is automatically controlled by the DMA transfer, and ranges from 0 to DBL (DBL configured in TIMx\_DCR).

**41.4.22 TIM2 alternate function option register 1 (TIM2\_AF1)**

Address offset: 0x60

Reset value: 0x0000 0000

## 42 General-purpose timers (TIM12/TIM13/TIM14)

### 42.1 TIM12/TIM13/TIM14 introduction

The TIM12/TIM13/TIM14 general-purpose timers consist in a 16-bit auto-reload counter driven by a programmable prescaler.

They may be used for a variety of purposes, including measuring the pulse lengths of input signals (input capture) or generating output waveforms (output compare, PWM).

Pulse lengths and waveform periods can be modulated from a few microseconds to several milliseconds using the timer prescaler and the RCC clock controller prescalers.

The TIM12/TIM13/TIM14 timers are completely independent, and do not share any resources. They can be synchronized together as described in [Section 42.3.17: Timer synchronization \(TIM12\)](#).

### 42.2 TIM12/TIM13/TIM14 main features

#### 42.2.1 TIM12 main features

The features of the TIM12 general-purpose timer include:

- 16-bit auto-reload upcounter
- 16-bit programmable prescaler used to divide the counter clock frequency by any factor between 1 and 65536 (can be changed “on the fly”)
- Up to 2 independent channels for:
  - Input capture
  - Output compare
  - PWM generation (edge-aligned mode)
  - One-pulse mode output
- Synchronization circuit to control the timer with external signals and to interconnect several timers together
- Interrupt generation on the following events:
  - Update: counter overflow, counter initialization (by software or internal trigger)
  - Trigger event (counter start, stop, initialization or count by internal trigger)
  - Input capture
  - Output compare

Figure 462. General-purpose timer block diagram (TIM12)

### 42.2.2 TIM13/TIM14 main features

The features of general-purpose timers TIM13/TIM14 include:

- 16-bit auto-reload upcounter
- 16-bit programmable prescaler used to divide the counter clock frequency by any factor between 1 and 65536 (can be changed “on the fly”)
- independent channel for:
  - Input capture
  - Output compare
  - PWM generation (edge-aligned mode)
  - One-pulse mode output
- Interrupt generation on the following events:
  - Update: counter overflow, counter initialization (by software)
  - Input capture
  - Output compare

Figure 463. General-purpose timer block diagram (TIM13/TIM14)

## 42.3 TIM12/TIM13/TIM14 functional description

### 42.3.1 Time-base unit

The main block of the timer is a 16-bit up-counter with its related auto-reload register. The counter clock can be divided by a prescaler.

The counter, the auto-reload register and the prescaler register can be written or read by software. This is true even when the counter is running.

The time-base unit includes:

- Counter register (TIMx\_CNT)
- Prescaler register (TIMx\_PSC)
- Auto-reload register (TIMx\_ARR)

The auto-reload register is preloaded. Writing to or reading from the auto-reload register accesses the preload register. The content of the preload register are transferred into the shadow register permanently or at each update event (UEV), depending on the auto-reload preload enable bit (ARPE) in TIMx\_CR1 register. The update event is sent when the counter reaches the overflow and if the UDIS bit equals 0 in the TIMx\_CR1 register. It can also be generated by software. The generation of the update event is described in details for each configuration.

The counter is clocked by the prescaler output CK\_CNT, which is enabled only when the counter enable bit (CEN) in TIMx\_CR1 register is set (refer also to the slave mode controller description to get more details on counter enabling).

Note that the counter starts counting 1 clock cycle after setting the CEN bit in the TIMx\_CR1 register.

#### Prescaler description

The prescaler can divide the counter clock frequency by any factor between 1 and 65536. It is based on a 16-bit counter controlled through a 16-bit register (in the TIMx\_PSC register). It can be changed on the fly as this control register is buffered. The new prescaler ratio is taken into account at the next update event.

[Figure 464](#) and [Figure 465](#) give some examples of the counter behavior when the prescaler ratio is changed on the fly.

Figure 464. Counter timing diagram with prescaler division change from 1 to 2

Figure 465. Counter timing diagram with prescaler division change from 1 to 4

## 42.3.2 Counter modes

### Upcounting mode

In upcounting mode, the counter counts from 0 to the auto-reload value (content of the TIMx\_ARR register), then restarts from 0 and generates a counter overflow event.

Setting the UG bit in the TIMx\_EGR register (by software or by using the slave mode controller on TIM12) also generates an update event.

The UEV event can be disabled by software by setting the UDIS bit in the TIMx\_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter restarts from 0, as well as the counter of the prescaler (but the prescale rate does not change). In addition, if the URS bit (update request selection) in TIMx\_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx\_SR register) is set (depending on the URS bit):

- The auto-reload shadow register is updated with the preload value (TIMx\_ARR),
- The buffer of the prescaler is reloaded with the preload value (content of the TIMx\_PSC register).

The following figures show some examples of the counter behavior for different clock frequencies when TIMx\_ARR=0x36.

**Figure 466. Counter timing diagram, internal clock divided by 1**

Figure 469. Counter timing diagram, internal clock divided by N

Figure 470. Counter timing diagram, update event when ARPE=0 (TIMx\_ARR not preloaded)

**Figure 471. Counter timing diagram, update event when ARPE=1 (TIMx\_ARR preloaded)**

### 42.3.3 Clock selection

The counter clock can be provided by the following clock sources:

- Internal clock (CK\_INT)
- External clock mode1 (for TIM12): external input pin (TIx)
- Internal trigger inputs (ITRx) (for TIM12): connecting the trigger output from another timer. For instance, another timer can be configured as a prescaler for TIM12. Refer to [Section : Using one timer as prescaler for another timer](#) for more details.

#### Internal clock source (CK\_INT)

The internal clock source is the default clock source for TIM13/TIM14.

For TIM12, the internal clock source is selected when the slave mode controller is disabled (SMS='000'). The CEN bit in the TIMx\_CR1 register and the UG bit in the TIMx\_EGR register are then used as control bits and can be changed only by software (except for UG which remains cleared). As soon as the CEN bit is programmed to 1, the prescaler is clocked by the internal clock CK\_INT.

[Figure 472](#) shows the behavior of the control circuit and the upcounter in normal mode, without prescaler.

**Figure 472. Control circuit in normal mode, internal clock divided by 1**

### External clock source mode 1 (TIM12)

This mode is selected when SMS='111' in the TIMx\_SMCR register. The counter can count at each rising or falling edge on a selected input.

**Figure 473. TI2 external clock connection example**

For example, to configure the upcounter to count in response to a rising edge on the TI2 input, use the following procedure:

1. Select the proper TI2[x] source (internal or external) with the TI2SEL[3:0] bits in the TIMx\_TISEL register.
2. Configure channel 2 to detect rising edges on the TI2 input by writing CC2S = '01' in the TIMx\_CCMR1 register.
3. Configure the input filter duration by writing the IC2F[3:0] bits in the TIMx\_CCMR1 register (if no filter is needed, keep IC2F='0000').
4. Select the rising edge polarity by writing CC2P='0' and CC2NP='0' in the TIMx\_CCER register.
5. Configure the timer in external clock mode 1 by writing SMS='111' in the TIMx\_SMCR register.
6. Select TI2 as the trigger input source by writing TS='110' in the TIMx\_SMCR register.
7. Enable the counter by writing CEN='1' in the TIMx\_CR1 register.

**Note:** *The capture prescaler is not used for triggering, so it does not need to be configured.*

When a rising edge occurs on TI2, the counter counts once and the TIF flag is set.

The delay between the rising edge on TI2 and the actual clock of the counter is due to the resynchronization circuit on TI2 input.

**Figure 474. Control circuit in external clock mode 1**

#### 42.3.4 Capture/compare channels

Each Capture/Compare channel is built around a capture/compare register (including a shadow register), a input stage for capture (with digital filter, multiplexing and prescaler) and an output stage (with comparator and output control).

[Figure 475](#) to [Figure 477](#) give an overview of one capture/compare channel.

The input stage samples the corresponding TIx input to generate a filtered signal TIxF. Then, an edge detector with polarity selection generates a signal (TIxFPx) which can be used as trigger input by the slave mode controller or as the capture command. It is prescaled before the capture register (ICxPS).

**Figure 475. Capture/compare channel (example: channel 1 input stage)**

The output stage generates an intermediate waveform which is then used for reference: OCxRef (active high). The polarity acts at the end of the chain.

**Figure 476. Capture/compare channel 1 main circuit**

**Figure 477. Output stage of capture/compare channel (channel 1)**

1. Available on TIM12 only.

The capture/compare block is made of one preload register and one shadow register. Write and read always access the preload register.

In capture mode, captures are actually done in the shadow register, which is copied into the preload register.

In compare mode, the content of the preload register is copied into the shadow register which is compared to the counter.

### 42.3.5 Input capture mode

In Input capture mode, the Capture/Compare Registers (TIMx\_CCRx) are used to latch the value of the counter after a transition detected by the corresponding ICx signal. When a capture occurs, the corresponding CCxIF flag (TIMx\_SR register) is set and an interrupt or a DMA request can be sent if they are enabled. If a capture occurs while the CCxIF flag was already high, then the over-capture flag CCxOF (TIMx\_SR register) is set. CCxIF can be cleared by software by writing it to '0' or by reading the captured data stored in the TIMx\_CCRx register. CCxOF is cleared when it is written with 0.

The following example shows how to capture the counter value in TIMx\_CCR1 when TI1 input rises. To do this, use the following procedure:

1. Select the proper TI1[x] source (internal or external) with the TI1SEL[3:0] bits in the TIMx\_TISEL register.
2. Select the active input: TIMx\_CCR1 must be linked to the TI1 input, so write the CC1S bits to '01' in the TIMx\_CCMR1 register. As soon as CC1S becomes different from '00', the channel is configured in input mode and the TIMx\_CCR1 register becomes read-only.
3. Program the appropriate input filter duration in relation with the signal connected to the timer (by programming the ICxF bits in the TIMx\_CCMRx register if the input is one of the TIx inputs). Let's imagine that, when toggling, the input signal is not stable during at must 5 internal clock cycles. We must program a filter duration longer than these 5 clock cycles. We can validate a transition on TI1 when 8 consecutive samples with the

new level have been detected (sampled at  $f_{DTS}$  frequency). Then write IC1F bits to '0011' in the TIMx\_CCMR1 register.

4. Select the edge of the active transition on the TI1 channel by programming CC1P and CC1NP bits to '00' in the TIMx\_CCER register (rising edge in this case).
5. Program the input prescaler. In our example, we wish the capture to be performed at each valid transition, so the prescaler is disabled (write IC1PS bits to '00' in the TIMx\_CCMR1 register).
6. Enable capture from the counter into the capture register by setting the CC1E bit in the TIMx\_CCER register.
7. If needed, enable the related interrupt request by setting the CC1IE bit in the TIMx\_DIER register.

When an input capture occurs:

- The TIMx\_CCR1 register gets the value of the counter on the active transition.
- CC1IF flag is set (interrupt flag). CC1OF is also set if at least two consecutive captures occurred whereas the flag was not cleared.
- An interrupt is generated depending on the CC1IE bit.

In order to handle the overcapture, it is recommended to read the data before the overcapture flag. This is to avoid missing an overcapture which could happen after reading the flag and before reading the data.

*Note:* IC interrupt requests can be generated by software by setting the corresponding CCxG bit in the TIMx\_EGR register.

#### 42.3.6 PWM input mode (only for TIM12)

This mode is a particular case of input capture mode. The procedure is the same except:

- Two ICx signals are mapped on the same TIx input.
- These 2 ICx signals are active on edges with opposite polarity.
- One of the two TIxFP signals is selected as trigger input and the slave mode controller is configured in reset mode.

For example, one can measure the period (in TIMx\_CCR1 register) and the duty cycle (in TIMx\_CCR2 register) of the PWM applied on TI1 using the following procedure (depending on CK\_INT frequency and prescaler value):

1. Select the proper TI1[x] source (internal or external) with the TI1SEL[3:0] bits in the TIMx\_TISEL register.
2. Select the active input for TIMx\_CCR1: write the CC1S bits to '01' in the TIMx\_CCMR1 register (TI1 selected).
3. Select the active polarity for TI1FP1 (used both for capture in TIMx\_CCR1 and counter clear): program the CC1P and CC1NP bits to '00' (active on rising edge).
4. Select the active input for TIMx\_CCR2: write the CC2S bits to '10' in the TIMx\_CCMR1 register (TI1 selected).
5. Select the active polarity for TI1FP2 (used for capture in TIMx\_CCR2): program the CC2P and CC2NP bits to '11' (active on falling edge).
6. Select the valid trigger input: write the TS bits to '00101' in the TIMx\_SMCR register (TI1FP1 selected).
7. Configure the slave mode controller in reset mode: write the SMS bits to '100' in the TIMx\_SMCR register.
8. Enable the captures: write the CC1E and CC2E bits to '1' in the TIMx\_CCER register.

Figure 478. PWM input mode timing

1. The PWM input mode can be used only with the TIMx\_CH1/TIMx\_CH2 signals due to the fact that only TI1FP1 and TI2FP2 are connected to the slave mode controller.

### 42.3.7 Forced output mode

In output mode (CCxS bits = '00' in the TIMx\_CCMRx register), each output compare signal (OCxREF and then OCx) can be forced to active or inactive level directly by software, independently of any comparison between the output compare register and the counter.

To force an output compare signal (OCXREF/OCx) to its active level, one just needs to write '0101' in the OCxM bits in the corresponding TIMx\_CCMRx register. Thus OCXREF is forced high (OCxREF is always active high) and OCx get opposite value to CCxP polarity bit.

For example: CCxP='0' (OCx active high) => OCx is forced to high level.

The OCxREF signal can be forced low by writing the OCxM bits to '0100' in the TIMx\_CCMRx register.

Anyway, the comparison between the TIMx\_CCRx shadow register and the counter is still performed and allows the flag to be set. Interrupt requests can be sent accordingly. This is described in the output compare mode section below.

### 42.3.8 Output compare mode

This function is used to control an output waveform or indicating when a period of time has elapsed.

When a match is found between the capture/compare register and the counter, the output compare function:

1. Assigns the corresponding output pin to a programmable value defined by the output compare mode (OCxM bits in the TIMx\_CCMRx register) and the output polarity (CCxP bit in the TIMx\_CCER register). The output pin can keep its level (OCxM='0000'), be set active (OCxM='0001'), be set inactive (OCxM='0010') or can toggle (OCxM='0011') on match.
2. Sets a flag in the interrupt status register (CCxIF bit in the TIMx\_SR register).
3. Generates an interrupt if the corresponding interrupt mask is set (CCXIE bit in the TIMx\_DIER register).

The TIMx\_CCRx registers can be programmed with or without preload registers using the OCxPE bit in the TIMx\_CCMRx register.

In output compare mode, the update event UEV has no effect on OCxREF and OCx output. The timing resolution is one count of the counter. Output compare mode can also be used to output a single pulse (in One-pulse mode).

Procedure:

1. Select the counter clock (internal, external, prescaler).
2. Write the desired data in the TIMx\_ARR and TIMx\_CCRx registers.
3. Set the CCXIE bit if an interrupt request is to be generated.
4. Select the output mode. For example:
  - Write OCxM = '0011' to toggle OCx output pin when CNT matches CCRx
  - Write OCxPE = '0' to disable preload register
  - Write CCxP = '0' to select active high polarity
  - Write CCxE = '1' to enable the output
5. Enable the counter by setting the CEN bit in the TIMx\_CR1 register.

The TIMx\_CCRx register can be updated at any time by software to control the output waveform, provided that the preload register is not enabled (OCxPE='0', else TIMx\_CCRx shadow register is updated only at the next update event UEV). An example is given in [Figure 479](#).

**Figure 479. Output compare mode, toggle on OC1.**

### 42.3.9 PWM mode

Pulse Width Modulation mode allows to generate a signal with a frequency determined by the value of the TIMx\_ARR register and a duty cycle determined by the value of the TIMx\_CCRx register.

The PWM mode can be selected independently on each channel (one PWM per OCx output) by writing '0110' (PWM mode 1) or '0111' (PWM mode 2) in the OCxM bits in the TIMx\_CCMRx register. The corresponding preload register must be enabled by setting the OCxPE bit in the TIMx\_CCMRx register, and eventually the auto-reload preload register (in upcounting or center-aligned modes) by setting the ARPE bit in the TIMx\_CR1 register.

As the preload registers are transferred to the shadow registers only when an update event occurs, before starting the counter, all registers must be initialized by setting the UG bit in the TIMx\_EGR register.

The OCx polarity is software programmable using the CCxP bit in the TIMx\_CCER register. It can be programmed as active high or active low. The OCx output is enabled by the CCxE bit in the TIMx\_CCER register. Refer to the TIMx\_CCERx register description for more details.

In PWM mode (1 or 2), TIMx\_CNT and TIMx\_CCRx are always compared to determine whether  $TIMx\_CNT \leq TIMx\_CCRx$ .

The timer is able to generate PWM in edge-aligned mode only since the counter is upcounting.

In the following example, we consider PWM mode 1. The reference PWM signal OCxREF is high as long as  $TIMx\_CNT < TIMx\_CCRx$  else it becomes low. If the compare value in TIMx\_CCRx is greater than the auto-reload value (in TIMx\_ARR) then OCxREF is held at '1'. If the compare value is 0 then OCxRef is held at '0'. [Figure 480](#) shows some edge-aligned PWM waveforms in an example where TIMx\_ARR=8.

Figure 480. Edge-aligned PWM waveforms (ARR=8)

MS31093V1

#### 42.3.10 Combined PWM mode (TIM12 only)

Combined PWM mode allows two edge or center-aligned PWM signals to be generated with programmable delay and phase shift between respective pulses. While the frequency is determined by the value of the TIMx\_ARR register, the duty cycle and delay are determined by the two TIMx\_CCRx registers. The resulting signals, OCxREFC, are made of an OR or AND logical combination of two reference PWMs:

- OC1REFC (or OC2REFC) is controlled by the TIMx\_CCR1 and TIMx\_CCR2 registers

Combined PWM mode can be selected independently on two channels (one OCx output per pair of CCR registers) by writing '1100' (Combined PWM mode 1) or '1101' (Combined PWM mode 2) in the OCxM bits in the TIMx\_CCMRx register.

When a given channel is used as a combined PWM channel, its complementary channel must be configured in the opposite PWM mode (for instance, one in Combined PWM mode 1 and the other in Combined PWM mode 2).

**Note:** The OCxM[3:0] bit field is split into two parts for compatibility reasons, the most significant bit is not contiguous with the 3 least significant ones.

Figure 481 represents an example of signals that can be generated using combined PWM mode, obtained with the following configuration:

- Channel 1 is configured in Combined PWM mode 2,
- Channel 2 is configured in PWM mode 1,

Figure 481. Combined PWM mode on channel 1 and 2

#### 42.3.11 One-pulse mode

One-pulse mode (OPM) is a particular case of the previous modes. It allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length after a programmable delay.

Starting the counter can be controlled through the slave mode controller. Generating the waveform can be done in output compare mode or PWM mode. One-pulse mode is selected by setting the OPM bit in the TIMx\_CR1 register. This makes the counter stop automatically at the next update event UEV.

A pulse can be correctly generated only if the compare value is different from the counter initial value. Before starting (when the timer is waiting for the trigger), the configuration must be as follows:

$$CNT < CCRx \leq ARR \text{ (in particular, } 0 < CCRx)$$

Figure 482. Example of one pulse mode.

For example one may want to generate a positive pulse on OC1 with a length of  $t_{PULSE}$  and after a delay of  $t_{DELAY}$  as soon as a positive edge is detected on the TI2 input pin.

Use TI2FP2 as trigger 1:

1. Select the proper TI2[x] source (internal or external) with the TI2SEL[3:0] bits in the TIMx\_TISEL register.
2. Map TI2FP2 to TI2 by writing CC2S='01' in the TIMx\_CCMR1 register.
3. TI2FP2 must detect a rising edge, write CC2P='0' and CC2NP='0' in the TIMx\_CCER register.
4. Configure TI2FP2 as trigger for the slave mode controller (TRGI) by writing TS='00110' in the TIMx\_SMCR register.
5. TI2FP2 is used to start the counter by writing SMS to '110' in the TIMx\_SMCR register (trigger mode).

The OPM waveform is defined by writing the compare registers (taking into account the clock frequency and the counter prescaler).

- The  $t_{DELAY}$  is defined by the value written in the TIMx\_CCR1 register.
- The  $t_{PULSE}$  is defined by the difference between the auto-reload value and the compare value (TIMx\_ARR - TIMx\_CCR1).
- Let's say one want to build a waveform with a transition from '0' to '1' when a compare match occurs and a transition from '1' to '0' when the counter reaches the auto-reload value. To do this PWM mode 2 must be enabled by writing OC1M='0111' in the TIMx\_CCMR1 register. Optionally the preload registers can be enabled by writing OC1PE='1' in the TIMx\_CCMR1 register and ARPE in the TIMx\_CR1 register. In this case one has to write the compare value in the TIMx\_CCR1 register, the auto-reload value in the TIMx\_ARR register, generate an update by setting the UG bit and wait for external trigger event on TI2. CC1P is written to '0' in this example.

Since only 1 pulse (Single mode) is needed, a 1 must be written in the OPM bit in the TIMx\_CR1 register to stop the counter at the next update event (when the counter rolls over from the auto-reload value back to 0). When OPM bit in the TIMx\_CR1 register is set to '0', so the Repetitive Mode is selected.

**Particular case: OCx fast enable**

In One-pulse mode, the edge detection on TIx input set the CEN bit which enables the counter. Then the comparison between the counter and the compare value makes the output toggle. But several clock cycles are needed for these operations and it limits the minimum delay  $t_{\text{DELAY min}}$  we can get.

If one wants to output a waveform with the minimum delay, the OCxFE bit can be set in the TIMx\_CCMRx register. Then OCxRef (and OCx) are forced in response to the stimulus, without taking in account the comparison. Its new level is the same as if a compare match had occurred. OCxFE acts only if the channel is configured in PWM1 or PWM2 mode.

**42.3.12 Retriggerable one pulse mode (OPM) (TIM12 only)**

This mode allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length, but with the following differences with non-retriggerable one pulse mode described in [Section 42.3.11: One-pulse mode](#):

- The pulse starts as soon as the trigger occurs (no programmable delay)
- The pulse is extended if a new trigger occurs before the previous one is completed

The timer must be in Slave mode, with the bits SMS[3:0] = '1000' (Combined Reset + trigger mode) in the TIMx\_SMCR register, and the OCxM[3:0] bits set to '1000' or '1001' for retriggerable OPM mode 1 or 2.

If the timer is configured in up-counting mode, the corresponding CCRx must be set to 0 (the ARR register sets the pulse length). If the timer is configured in down-counting mode, CCRx must be above or equal to ARR.

*Note: The OCxM[3:0] and SMS[3:0] bit fields are split into two parts for compatibility reasons, the most significant bit are not contiguous with the 3 least significant ones.*

*This mode must not be used with center-aligned PWM modes. It is mandatory to have CMS[1:0] = 00 in TIMx\_CR1.*

**Figure 483. Retriggerable one pulse mode**

### 42.3.13 UIF bit remapping

The IUFREMAP bit in the TIMx\_CR1 register forces a continuous copy of the Update Interrupt Flag UIF into bit 31 of the timer counter register (TIMxCNT[31]). This allows to atomically read both the counter value and a potential roll-over condition signaled by the UIFCPY flag. In particular cases, it can ease the calculations by avoiding race conditions caused for instance by a processing shared between a background task (counter reading) and an interrupt (Update Interrupt).

There is no latency between the assertions of the UIF and UIFCPY flags.

### 42.3.14 Timer input XOR function

The TI1S bit in the TIMx\_CR2 register, allows the input filter of channel 1 to be connected to the output of a XOR gate, combining the two input pins TIMx\_CH1 and TIMx\_CH2.

The XOR output can be used with all the timer input functions such as trigger or input capture. It is useful for measuring the interval between the edges on two input signals, as shown in [Figure 484](#).

**Figure 484. Measuring time interval between edges on 2 signals**

### 42.3.15 TIM12 external trigger synchronization

The TIM12 timer can be synchronized with an external trigger in several modes: Reset mode, Gated mode and Trigger mode.

#### Slave mode: Reset mode

The counter and its prescaler can be reinitialized in response to an event on a trigger input. Moreover, if the URS bit from the TIMx\_CR1 register is low, an update event UEV is generated. Then all the preloaded registers (TIMx\_ARR, TIMx\_CCRx) are updated.

In the following example, the upcounter is cleared in response to a rising edge on TI1 input:

1. Configure the channel 1 to detect rising edges on TI1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F='0000'). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = '01' in the TIMx\_CCMR1 register.

Program CC1P and CC1NP to '00' in TIMx\_CCER register to validate the polarity (and detect rising edges only).

2. Configure the timer in reset mode by writing SMS='100' in TIMx\_SMCR register. Select TI1 as the input source by writing TS='00101' in TIMx\_SMCR register.
3. Start the counter by writing CEN='1' in the TIMx\_CR1 register.

The counter starts counting on the internal clock, then behaves normally until TI1 rising edge. When TI1 rises, the counter is cleared and restarts from 0. In the meantime, the trigger flag is set (TIF bit in the TIMx\_SR register) and an interrupt request can be sent if enabled (depending on the TIE bit in TIMx\_DIER register).

The following figure shows this behavior when the auto-reload register TIMx\_ARR=0x36. The delay between the rising edge on TI1 and the actual reset of the counter is due to the resynchronization circuit on TI1 input.

**Figure 485. Control circuit in reset mode**

MS31401V2

### Slave mode: Gated mode

The counter can be enabled depending on the level of a selected input.

In the following example, the upcounter counts only when TI1 input is low:

1. Configure the channel 1 to detect low levels on TI1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F='0000'). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S='01' in TIMx\_CCMR1 register. Program CC1P='1' and CC1NP='0' in TIMx\_CCER register to validate the polarity (and detect low level only).
2. Configure the timer in gated mode by writing SMS='101' in TIMx\_SMCR register. Select TI1 as the input source by writing TS='00101' in TIMx\_SMCR register.
3. Enable the counter by writing CEN='1' in the TIMx\_CR1 register (in gated mode, the counter doesn't start if CEN='0', whatever is the trigger input level).

The counter starts counting on the internal clock as long as TI1 is low and stops as soon as TI1 becomes high. The TIF flag in the TIMx\_SR register is set both when the counter starts or stops.

The delay between the rising edge on TI1 and the actual stop of the counter is due to the resynchronization circuit on TI1 input.

**Figure 486. Control circuit in gated mode**

### Slave mode: Trigger mode

The counter can start in response to an event on a selected input.

In the following example, the upcounter starts in response to a rising edge on TI2 input:

1. Configure the channel 2 to detect rising edges on TI2. Configure the input filter duration (in this example, we do not need any filter, so we keep IC2F='0000'). The capture prescaler is not used for triggering, so it does not need to be configured. The CC2S bits are configured to select the input capture source only, CC2S='01' in TIMx\_CCMR1 register. Program CC2P='1' and CC2NP='0' in TIMx\_CCER register to validate the polarity (and detect low level only).
2. Configure the timer in trigger mode by writing SMS='110' in TIMx\_SMCR register. Select TI2 as the input source by writing TS='00110' in TIMx\_SMCR register.

When a rising edge occurs on TI2, the counter starts counting on the internal clock and the TIF flag is set.

The delay between the rising edge on TI2 and the actual start of the counter is due to the resynchronization circuit on TI2 input.

**Figure 487. Control circuit in trigger mode**

#### 42.3.16 Slave mode – combined reset + trigger mode

In this case, a rising edge of the selected trigger input (TRGI) reinitializes the counter, generates an update of the registers, and starts the counter.

This mode is used for one-pulse mode.

### 42.3.17 Timer synchronization (TIM12)

The TIM timers are linked together internally for timer synchronization or chaining. Refer to [Section 41.3.19: Timer synchronization](#) for details.

**Note:** *The clock of the slave timer must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.*

### 42.3.18 Debug mode

When the system enters debug mode (processor core halted), the TIMx counter either continues to work normally or stops, depending on DBG\_TIMx\_STOP configuration bit in DBGMCU module. For more details, refer to [Section 66.10.9: Microprocessor debug unit \(DBGMCU\)](#)

## 42.4 TIM12 registers

Refer to [Section 1.2](#) for a list of abbreviations used in register descriptions.

The peripheral registers have to be written by half-words (16 bits) or words (32 bits). Read accesses can be done by bytes (8 bits), half-words (16 bits) or words (32 bits).

### 42.4.1 TIM12 control register 1 (TIM12\_CR1)

Address offset: 0x00

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11           | 10   | 9        | 8  | 7    | 6    | 5    | 4    | 3   | 2   | 1    | 0   |

|      |      |      |      | rw           |      | rw       | rw | rw   |      |      |      | rw  | rw  | rw   | rw  |

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **UIFREMAP**: UIF status bit remapping

0: No remapping. UIF status bit is not copied to TIMx\_CNT register bit 31.

1: Remapping enabled. UIF status bit is copied to TIMx\_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division

This bit-field indicates the division ratio between the timer clock (CK\_INT) frequency and sampling clock used by the digital filters (Tlx),

00:  $t_{DTS} = t_{CK\_INT}$

01:  $t_{DTS} = 2 \times t_{CK\_INT}$

10:  $t_{DTS} = 4 \times t_{CK\_INT}$

11: Reserved

Bit 7 **ARPE**: Auto-reload preload enable

0: TIMx\_ARR register is not buffered.

1: TIMx\_ARR register is buffered.

Bits 6:4 Reserved, must be kept at reset value.

Bit 3 **OPM**: One-pulse mode

- 0: Counter is not stopped on the update event
- 1: Counter stops counting on the next update event (clearing the CEN bit).

Bit 2 **URS**: Update request source

This bit is set and cleared by software to select the UEV event sources.

0: Any of the following events generates an update interrupt if enabled. These events can be:

- Counter overflow
- Setting the UG bit
- Update generation through the slave mode controller

1: Only counter overflow generates an update interrupt if enabled.

Bit 1 **UDIS**: Update disable

This bit is set and cleared by software to enable/disable update event (UEV) generation.

0: UEV enabled. An UEV is generated by one of the following events:

- Counter overflow
- Setting the UG bit

Buffered registers are then loaded with their preload values.

1: UEV disabled. No UEV is generated, shadow registers keep their value (ARR, PSC, CCRx). The counter and the prescaler are reinitialized if the UG bit is set.

Bit 0 **CEN**: Counter enable

- 0: Counter disabled
- 1: Counter enabled

CEN is cleared automatically in one-pulse mode, when an update event occurs.

*Note:* External clock and gated mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.

#### 42.4.2 TIM12 control register 2 (TIM12\_CR2)

Address offset: 0x04

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6        | 5  | 4  | 3    | 2    | 1    | 0    |
|------|------|------|------|------|------|------|------|------|----------|----|----|------|------|------|------|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TI1S | MMS[2:0] |    |    | Res. | Res. | Res. | Res. |
|      |      |      |      |      |      |      |      | rw   | rw       | rw | rw |      |      |      |      |

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **TI1S**: TI1 selection

- 0: The TIM12\_CH1 pin is connected to TI1 input
- 1: The TIM12\_CH1, CH2 pins are connected to the TI1 input (XOR combination)

Bits 6:4 **MMS[2:0]**: Master mode selection

These bits allow to select the information to be sent in master mode to slave timers for synchronization (TRGO). The combination is as follows:

- 000: Reset - the UG bit from the TIMx\_EGR register is used as trigger output (TRGO). If the reset is generated by the trigger input (slave mode controller configured in reset mode) then the signal on TRGO is delayed compared to the actual reset.
- 001: Enable - the Counter Enable signal CNT\_EN is used as trigger output (TRGO). It is useful to start several timers at the same time or to control a window in which a slave timer is enable. The Counter Enable signal is generated by a logic AND between CEN control bit and the trigger input when configured in gated mode. When the Counter Enable signal is controlled by the trigger input, there is a delay on TRGO, except if the master/slave mode is selected (see the MSM bit description in TIMx\_SMCR register).
- 010: Update - The update event is selected as trigger output (TRGO). For instance a master timer can then be used as a prescaler for a slave timer.
- 011: Compare Pulse - The trigger output send a positive pulse when the CC1IF flag is to be set (even if it was already high), as soon as a capture or a compare match occurred. (TRGO).
- 100: Compare - OC1REF signal is used as trigger output (TRGO).
- 101: Compare - OC2REF signal is used as trigger output (TRGO).

Bits 3:0 Reserved, must be kept at reset value.

#### 42.4.3 TIM12 slave mode control register (TIM12\_SMCR)

Address offset: 0x08

Bits 31:22 Reserved, must be kept at reset value.

Bits 19:17 Reserved, must be kept at reset value.

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **MSM**: Master/Slave mode

- 0: No action
- 1: The effect of an event on the trigger input (TRGI) is delayed to allow a perfect synchronization between the current timer and its slaves (through TRGO). It is useful in order to synchronize several timers on a single external event.

Bits 21, 20, 6, 5, 4 **TS[4:0]**: Trigger selection

This TS[4:0] bitfield selects the trigger input to be used to synchronize the counter.

00000: Internal Trigger 0 (ITR0)

00001: Internal Trigger 1 (ITR1)

00010: Internal Trigger 2 (ITR2)

00011: Internal Trigger 3 (ITR3)

00100: TI1 Edge Detector (TI1F\_ED)

00101: Filtered Timer Input 1 (TI1FP1)

00110: Filtered Timer Input 2 (TI2FP2)

Others: Reserved

See [Table 291: TIMx internal trigger connection on page 2249](#) for more details on the meaning of ITRx for each timer.

*Note: These bits must be changed only when they are not used (e.g. when SMS='000') to avoid wrong edge detections at the transition.*

Bit 3 Reserved, must be kept at reset value.

Bits 16, 2, 1, 0 **SMS[3:0]**: Slave mode selection

When external signals are selected the active edge of the trigger signal (TRGI) is linked to the polarity selected on the external input (see Input Control register and Control Register description).

0000: Slave mode disabled - if CEN = '1' then the prescaler is clocked directly by the internal clock.

0001: Reserved

0010: Reserved

0011: Reserved

0100: Reset Mode - Rising edge of the selected trigger input (TRGI) reinitializes the counter and generates an update of the registers.

0101: Gated Mode - The counter clock is enabled when the trigger input (TRGI) is high. The counter stops (but is not reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

0110: Trigger Mode - The counter starts at a rising edge of the trigger TRGI (but it is not reset). Only the start of the counter is controlled.

0111: External Clock Mode 1 - Rising edges of the selected trigger (TRGI) clock the counter.

1000: Combined reset + trigger mode - Rising edge of the selected trigger input (TRGI) reinitializes the counter, generates an update of the registers and starts the counter.

Other codes: reserved.

*Note: The gated mode must not be used if TI1F\_ED is selected as the trigger input (TS='00100'). Indeed, TI1F\_ED outputs 1 pulse for each transition on TI1F, whereas the gated mode checks the level of the trigger signal.*

*Note: The clock of the slave timer must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.*

**Table 291. TIMx internal trigger connection**

| Slave TIM | ITR0 (TS = '00000') | ITR1 (TS = '00001') | ITR2 (TS = '00010') | ITR3 (TS = '00011') |
|-----------|---------------------|---------------------|---------------------|---------------------|
| TIM12     | TIM4                | TIM5                | TIM13 OC1           | TIM14 OC1           |

#### 42.4.4 TIM12 Interrupt enable register (TIM12\_DIER)

Address offset: 0x0C

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6   | 5    | 4    | 3    | 2     | 1     | 0   |

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **TIE**: Trigger interrupt enable  
 0: Trigger interrupt disabled.  
 1: Trigger interrupt enabled.

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **CC2IE**: Capture/Compare 2 interrupt enable  
 0: CC2 interrupt disabled.  
 1: CC2 interrupt enabled.

Bit 1 **CC1IE**: Capture/Compare 1 interrupt enable  
 0: CC1 interrupt disabled.  
 1: CC1 interrupt enabled.

Bit 0 **UIE**: Update interrupt enable  
 0: Update interrupt disabled.  
 1: Update interrupt enabled.

#### 42.4.5 TIM12 status register (TIM12\_SR)

Address offset: 0x10

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10    | 9     | 8    | 7    | 6     | 5    | 4    | 3    | 2     | 1     | 0     |
|------|------|------|------|------|-------|-------|------|------|-------|------|------|------|-------|-------|-------|
| Res. | Res. | Res. | Res. | Res. | CC2OF | CC1OF | Res. | Res. | TIF   | Res. | Res. | Res. | CC2IF | CC1IF | UIF   |
|      |      |      |      |      | rc_w0 | rc_w0 |      |      | rc_w0 |      |      |      | rc_w0 | rc_w0 | rc_w0 |

Bits 15:11 Reserved, must be kept at reset value.

Bit 10 **CC2OF**: Capture/compare 2 overcapture flag  
 refer to CC1OF description

Bit 9 **CC1OF**: Capture/Compare 1 overcapture flag  
 This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to '0'.  
 0: No overcapture has been detected.  
 1: The counter value has been captured in TIMx\_CCR1 register while CC1IF flag was already set

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 **TIF**: Trigger interrupt flag

This flag is set by hardware on the TRG trigger event (active edge detected on TRGI input when the slave mode controller is enabled in all modes but gated mode. It is set when the counter starts or stops when gated mode is selected. It is cleared by software.

0: No trigger event occurred.

1: Trigger interrupt pending.

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **CC2IF**: Capture/Compare 2 interrupt flag

refer to CC1IF description

Bit 1 **CC1IF**: Capture/compare 1 interrupt flag

This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIMx\_CCR1 register (input capture mode only).

0: No compare match / No input capture occurred

1: A compare match or an input capture occurred.

**If channel CC1 is configured as output:** this flag is set when the content of the counter TIMx\_CNT matches the content of the TIMx\_CCR1 register. When the content of TIMx\_CCR1 is greater than the content of TIMx\_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in down-counting mode). There are 3 possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIMx\_CR1 register for the full description.

**If channel CC1 is configured as input:** this bit is set when counter value has been captured in TIMx\_CCR1 register (an edge has been detected on IC1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIMx\_CCER).

Bit 0 **UIF**: Update interrupt flag

This bit is set by hardware on an update event. It is cleared by software.

0: No update occurred.

1: Update interrupt pending. This bit is set by hardware when the registers are updated:

- At overflow and if UDIS='0' in the TIMx\_CR1 register.
- When CNT is reinitialized by software using the UG bit in TIMx\_EGR register, if URS='0' and UDIS='0' in the TIMx\_CR1 register.
- When CNT is reinitialized by a trigger event (refer to the synchro control register description), if URS='0' and UDIS='0' in the TIMx\_CR1 register.

#### 42.4.6 TIM12 event generation register (TIM12\_EGR)

Address offset: 0x14

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6  | 5    | 4    | 3    | 2    | 1    | 0  |
|------|------|------|------|------|------|------|------|------|----|------|------|------|------|------|----|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | TG | Res. | Res. | Res. | CC2G | CC1G | UG |
|      |      |      |      |      |      |      |      |      | w  |      |      |      | w    | w    | w  |

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **TG**: Trigger generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action

1: The TIF flag is set in the TIMx\_SR register. Related interrupt can occur if enabled

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **CC2G**: Capture/compare 2 generation  
refer to CC1G description

Bit 1 **CC1G**: Capture/compare 1 generation

This bit is set by software to generate an event, it is automatically cleared by hardware.

0: No action

1: A capture/compare event is generated on channel 1:

**If channel CC1 is configured as output:**

the CC1IF flag is set, the corresponding interrupt is sent if enabled.

**If channel CC1 is configured as input:**

The current counter value is captured in the TIMx\_CCR1 register. The CC1IF flag is set, the corresponding interrupt is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation

This bit can be set by software, it is automatically cleared by hardware.

0: No action

1: Re-initializes the counter and generates an update of the registers. The prescaler counter is also cleared and the prescaler ratio is not affected. The counter is cleared.

#### 42.4.7 TIM12 capture/compare mode register 1 [alternate] (TIM12\_CCMR1)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits in this register have different functions in input and output modes.

**Input capture mode:**

|           |      |      |      |             |      |           |      |           |      |      |      |             |      |           |      |
|-----------|------|------|------|-------------|------|-----------|------|-----------|------|------|------|-------------|------|-----------|------|
| 31        | 30   | 29   | 28   | 27          | 26   | 25        | 24   | 23        | 22   | 21   | 20   | 19          | 18   | 17        | 16   |

|           |      |      |      |             |      |           |      |           |      |      |      |             |      |           |      |
| 15        | 14   | 13   | 12   | 11          | 10   | 9         | 8    | 7         | 6    | 5    | 4    | 3           | 2    | 1         | 0    |
| IC2F[3:0] |      |      |      | IC2PSC[1:0] |      | CC2S[1:0] |      | IC1F[3:0] |      |      |      | IC1PSC[1:0] |      | CC1S[1:0] |      |
| r/w       | r/w  | r/w  | r/w  | r/w         | r/w  | r/w       | r/w  | r/w       | r/w  | r/w  | r/w  | r/w         | r/w  | r/w       | r/w  |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC2F[3:0]**: Input capture 2 filter

Bits 11:10 **IC2PSC[1:0]**: Input capture 2 prescaler

Bits 9:8 **CC2S[1:0]**: Capture/compare 2 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output

01: CC2 channel is configured as input, IC2 is mapped on TI2

10: CC2 channel is configured as input, IC2 is mapped on TI1

11: CC2 channel is configured as input, IC2 is mapped on TRC. This mode works only if an internal trigger input is selected through the TS bit (TIMx\_SMCR register)

*Note: The CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIMx\_CCER).*

**Bits 7:4 IC1F[3:0]: Input capture 1 filter**

This bitfield defines the frequency used to sample the TI1 input and the length of the digital filter applied to TI1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at  $f_{DTS}$

0001:  $f_{SAMPLING}=f_{CK\_INT}$ , N=2

0010:  $f_{SAMPLING}=f_{CK\_INT}$ , N=4

0011:  $f_{SAMPLING}=f_{CK\_INT}$ , N=8

0100:  $f_{SAMPLING}=f_{DTS}/2$ , N=6

0101:  $f_{SAMPLING}=f_{DTS}/2$ , N=8

0110:  $f_{SAMPLING}=f_{DTS}/4$ , N=6

0111:  $f_{SAMPLING}=f_{DTS}/4$ , N=8

1000:  $f_{SAMPLING}=f_{DTS}/8$ , N=6

1001:  $f_{SAMPLING}=f_{DTS}/8$ , N=8

1010:  $f_{SAMPLING}=f_{DTS}/16$ , N=5

1011:  $f_{SAMPLING}=f_{DTS}/16$ , N=6

1100:  $f_{SAMPLING}=f_{DTS}/16$ , N=8

1101:  $f_{SAMPLING}=f_{DTS}/32$ , N=5

1110:  $f_{SAMPLING}=f_{DTS}/32$ , N=6

1111:  $f_{SAMPLING}=f_{DTS}/32$ , N=8

**Bits 3:2 IC1PSC[1:0]: Input capture 1 prescaler**

This bitfield defines the ratio of the prescaler acting on the CC1 input (IC1).

The prescaler is reset as soon as CC1E='0' (TIMx\_CCER register).

00: no prescaler, capture is done each time an edge is detected on the capture input

01: capture is done once every 2 events

10: capture is done once every 4 events

11: capture is done once every 8 events

**Bits 1:0 CC1S[1:0]: Capture/Compare 1 selection**

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, IC1 is mapped on TI1

10: CC1 channel is configured as input, IC1 is mapped on TI2

11: CC1 channel is configured as input, IC1 is mapped on TRC. This mode is working only if an internal trigger input is selected through TS bit (TIMx\_SMCR register)

*Note: The CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx\_CCER).*

#### 42.4.8 TIM12 capture/compare mode register 1 [alternate] (TIM12\_CCMR1)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the

corresponding CCxS bits. All the other bits in this register have different functions in input and output modes.

#### Output compare mode:

|      |           |      |      |       |       |           |             |      |           |      |      |       |       |           |             |
|------|-----------|------|------|-------|-------|-----------|-------------|------|-----------|------|------|-------|-------|-----------|-------------|
| 31   | 30        | 29   | 28   | 27    | 26    | 25        | 24          | 23   | 22        | 21   | 20   | 19    | 18    | 17        | 16          |
| Res. | Res.      | Res. | Res. | Res.  | Res.  | Res.      | OC2M<br>[3] | Res. | Res.      | Res. | Res. | Res.  | Res.  | Res.      | OC1M<br>[3] |
|      |           |      |      |       |       |           | rw          |      |           |      |      |       |       |           | rw          |
| 15   | 14        | 13   | 12   | 11    | 10    | 9         | 8           | 7    | 6         | 5    | 4    | 3     | 2     | 1         | 0           |
| Res. | OC2M[2:0] |      |      | OC2PE | OC2FE | CC2S[1:0] |             | Res. | OC1M[2:0] |      |      | OC1PE | OC1FE | CC1S[1:0] |             |
|      | rw        | rw   | rw   | rw    | rw    | rw        | rw          |      | rw        | rw   | rw   | rw    | rw    | rw        | rw          |

Bits 31:25 Reserved, must be kept at reset value.

Bits 23:17 Reserved, must be kept at reset value.

Bit 15 Reserved, must be kept at reset value.

Bits 24, 14:12 **OC2M[3:0]**: Output compare 2 mode

Refer to OC1M[3:0] for bit description.

Bit 11 **OC2PE**: Output compare 2 preload enable

Bit 10 **OC2FE**: Output compare 2 fast enable

Bits 9:8 **CC2S[1:0]**: Capture/Compare 2 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output

01: CC2 channel is configured as input, IC2 is mapped on TI2

10: CC2 channel is configured as input, IC2 is mapped on TI1

11: CC2 channel is configured as input, IC2 is mapped on TRC. This mode works only if an internal trigger input is selected through the TS bit (TIMx\_SMCR register)

*Note: The CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIMx\_CCER).*

Bit 7 Reserved, must be kept at reset value.

Bits 16, 6:4 **OC1M[3:0]**: Output compare 1 mode (refer to bit 16 for OC1M[3])

These bits define the behavior of the output reference signal OC1REF from which OC1 is derived. OC1REF is active high whereas the active level of OC1 depends on the CC1P.

0000: Frozen - The comparison between the output compare register TIMx\_CCR1 and the counter TIMx\_CNT has no effect on the outputs.(this mode is used to generate a timing base).

0001: Set channel 1 to active level on match. The OC1REF signal is forced high when the TIMx\_CNT counter matches the capture/compare register 1 (TIMx\_CCR1).

0010: Set channel 1 to inactive level on match. The OC1REF signal is forced low when the TIMx\_CNT counter matches the capture/compare register 1 (TIMx\_CCR1).

0011: Toggle - OC1REF toggles when TIMx\_CNT=TIMx\_CCR1

0100: Force inactive level - OC1REF is forced low

0101: Force active level - OC1REF is forced high

0110: PWM mode 1 - channel 1 is active as long as TIMx\_CNT<TIMx\_CCR1 else it is inactive

0111: PWM mode 2 - channel 1 is inactive as long as TIMx\_CNT<TIMx\_CCR1 else it is active

1000: Retriggerable OPM mode 1 - The channel is active until a trigger event is detected (on TRGI signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

1001: Retriggerable OPM mode 2 - The channel is inactive until a trigger event is detected (on TRGI signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update.

1010: Reserved,

1011: Reserved,

1100: Combined PWM mode 1 - OC1REF has the same behavior as in PWM mode 1. OC1REFC is the logical OR between OC1REF and OC2REF.

1101: Combined PWM mode 2 - OC1REF has the same behavior as in PWM mode 2. OC1REFC is the logical AND between OC1REF and OC2REF.

1110: Reserved,

1111: Reserved

*Note: In PWM mode 1 or 2, the OCREF level changes only when the result of the comparison changes or when the output compare mode switches from "frozen" mode to "PWM" mode.*

Bit 3 **OC1PE**: Output compare 1 preload enable

0: Preload register on TIMx\_CCR1 disabled. TIMx\_CCR1 can be written at anytime, the new value is taken into account immediately

1: Preload register on TIMx\_CCR1 enabled. Read/Write operations access the preload register. TIMx\_CCR1 preload value is loaded into the active register at each update event

*Note: The PWM mode can be used without validating the preload register only in one-pulse mode (OPM bit set in the TIMx\_CR1 register). Else the behavior is not guaranteed.*

Bit 2 **OC1FE**: Output compare 1 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIMx\_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

0: CC1 behaves normally depending on the counter and CCR1 values even when the trigger is ON. The minimum delay to activate the CC1 output when an edge occurs on the trigger input is 5 clock cycles

1: An active edge on the trigger input acts like a compare match on the CC1 output. Then, OC is set to the compare level independently of the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to 3 clock cycles. OC1FE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, IC1 is mapped on TI1

10: CC1 channel is configured as input, IC1 is mapped on TI2

11: CC1 channel is configured as input, IC1 is mapped on TRC. This mode works only if an internal trigger input is selected through the TS bit (TIMx\_SMCR register)

*Note: The CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx\_CCER).*

#### 42.4.9 TIM12 capture/compare enable register (TIM12\_CCER)

Address offset: 0x20

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7     | 6    | 5    | 4    | 3     | 2    | 1    | 0    |
|------|------|------|------|------|------|------|------|-------|------|------|------|-------|------|------|------|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CC2NP | Res. | CC2P | CC2E | CC1NP | Res. | CC1P | CC1E |
|      |      |      |      |      |      |      |      | rw    |      | rw   | rw   | rw    |      | rw   | rw   |

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **CC2NP**: Capture/Compare 2 output Polarity

Refer to CC1NP description

Bit 6 Reserved, must be kept at reset value.

Bit 5 **CC2P**: Capture/Compare 2 output Polarity

Refer to CC1P description

Bit 4 **CC2E**: Capture/Compare 2 output enable

Refer to CC1E description

Bit 3 **CC1NP**: Capture/Compare 1 complementary output Polarity

CC1 channel configured as output: CC1NP must be kept cleared

CC1 channel configured as input: CC1NP is used in conjunction with CC1P to define TI1FP1/TI2FP1 polarity (refer to CC1P description).

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CC1P**: Capture/Compare 1 output Polarity.

0: OC1 active high (output mode) / Edge sensitivity selection (input mode, see below)

1: OC1 active low (output mode) / Edge sensitivity selection (input mode, see below)

**When CC1 channel is configured as input**, both CC1NP/CC1P bits select the active polarity of TI1FP1 and TI2FP1 for trigger or capture operations.

CC1NP=0, CC1P=0: non-inverted/rising edge. The circuit is sensitive to TIxFP1 rising edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode or encoder mode).

CC1NP=0, CC1P=1: inverted/falling edge. The circuit is sensitive to TIxFP1 falling edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is inverted (trigger operation in gated mode or encoder mode).

CC1NP=1, CC1P=1: non-inverted/both edges/ The circuit is sensitive to both TIxFP1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode). This configuration must not be used in encoder mode.

CC1NP=1, CC1P=0: This configuration is reserved, it must not be used.

Bit 0 **CC1E**: Capture/Compare 1 output enable.

0: Capture mode disabled / OC1 is not active

1: Capture mode enabled / OC1 signal is output on the corresponding output pin

**Table 292. Output control bit for standard OCx channels**

| CCxE bit | OCx output state                      |
|----------|---------------------------------------|
| 0        | Output disabled (OCx='0', OCx_EN='0') |
| 1        | OCx=OCxREF + Polarity, OCx_EN='1'     |

*Note:* The states of the external I/O pins connected to the standard OCx channels depend on the state of the OCx channel and on the GPIO registers.

#### 42.4.10 TIM12 counter (TIM12\_CNT)

Address offset: 0x24

Reset value: 0x0000 0000

|            |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31         | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   |
| UIF<br>CPY | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. |
| rw         |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |

| rw         | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bit 31 **UIFCPY**: UIF Copy

This bit is a read-only copy of the UIF bit in the TIMx\_ISR register.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]**: Counter value

**42.4.11 TIM12 prescaler (TIM12\_PSC)**

Address offset: 0x28

Reset value: 0x0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| PSC[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW        | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 15:0 **PSC[15:0]**: Prescaler valueThe counter clock frequency CK\_CNT is equal to  $f_{CK\_PSC} / (PSC[15:0] + 1)$ .

PSC contains the value to be loaded into the active prescaler register at each update event. (including when the counter is cleared through UG bit of TIMx\_EGR register or through trigger controller when configured in "reset mode").

**42.4.12 TIM12 auto-reload register (TIM12\_ARR)**

Address offset: 0x2C

Reset value: 0xFFFF

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ARR[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW        | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 15:0 **ARR[15:0]**: Auto-reload value

ARR is the value to be loaded into the actual auto-reload register.

Refer to the [Section 42.3.1: Time-base unit on page 2224](#) for more details about ARR update and behavior.

The counter is blocked while the auto-reload value is null.

**42.4.13 TIM12 capture/compare register 1 (TIM12\_CCR1)**

Address offset: 0x34

Reset value: 0x0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CCR1[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rW         | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW | rW |

Bits 15:0 **CCR1[15:0]**: Capture/Compare 1 value**If channel CC1 is configured as output:**

CCR1 is the value to be loaded into the actual capture/compare 1 register (preload value). It is loaded permanently if the preload feature is not selected in the TIMx\_CCMR1 register (OC1PE bit). Else the preload value is copied into the active capture/compare 1 register when an update event occurs.

The active capture/compare register contains the value to be compared to the TIMx\_CNT counter and signaled on the OC1 output.

**If channel CC1 is configured as input:**

CCR1 is the counter value transferred by the last input capture 1 event (IC1).

#### 42.4.14 TIM12 capture/compare register 2 (TIM12\_CCR2)

Address offset: 0x38

Reset value: 0x0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CCR2[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **CCR2[15:0]**: Capture/Compare 2 value

**If channel CC2 is configured as output:**

CCR2 is the value to be loaded into the actual capture/compare 2 register (preload value). It is loaded permanently if the preload feature is not selected in the TIMx\_CCMR2 register (OC2PE bit). Else the preload value is copied into the active capture/compare 2 register when an update event occurs.

The active capture/compare register contains the value to be compared to the TIMx\_CNT counter and signalled on the OC2 output.

**If channel CC2 is configured as input:**

CCR2 is the counter value transferred by the last input capture 2 event (IC2).

#### 42.4.15 TIM12 timer input selection register (TIM12\_TISEL)

Address offset: 0x68

Reset value: 0x0000

|      |      |      |      |             |    |    |    |      |      |      |      |             |    |    |    |
|------|------|------|------|-------------|----|----|----|------|------|------|------|-------------|----|----|----|
| 15   | 14   | 13   | 12   | 11          | 10 | 9  | 8  | 7    | 6    | 5    | 4    | 3           | 2  | 1  | 0  |
| Res. | Res. | Res. | Res. | TI2SEL[3:0] |    |    |    | Res. | Res. | Res. | Res. | TI1SEL[3:0] |    |    |    |
|      |      |      |      | rw          | rw | rw | rw |      |      |      |      | rw          | rw | rw | rw |

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **TI2SEL[3:0]**: selects TI2[0] to TI2[15] input

0000: TIM12\_CH2 input

Other: Reserved

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **TI1SEL[3:0]**: selects TI1[0] to TI1[15] input

0000: TIM12\_CH1 input

0001: hsi\_cal\_ck

0010: csi\_cal\_ck

Other: Reserved

## 42.4.16 TIM12 register map

TIM12 registers are mapped as 16-bit addressable registers as described below:

Table 293. TIM12 register map and reset values

| Offset | Register name                     | 31     | 30   | 29   | 28   | 27   | 26   | 25   | 24      | 23   | 22   | 21       | 20   | 19   | 18   | 17   | 16      | 15        | 14         | 13   | 12            | 11         | 10         | 9         | 8         | 7          | 6             | 5          | 4     | 3          | 2     | 1     | 0     |      |

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 42.5 TIM13/TIM14 registers

The peripheral registers have to be written by half-words (16 bits) or words (32 bits). Read accesses can be done by bytes (8 bits), half-words (16 bits) or words (32 bits).

### 42.5.1 TIMx control register 1 (TIMx\_CR1)(x = 13 to 14)

Address offset: 0x00

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11           | 10   | 9        | 8  | 7    | 6    | 5    | 4    | 3   | 2   | 1    | 0   |
|------|------|------|------|--------------|------|----------|----|------|------|------|------|-----|-----|------|-----|
| Res. | Res. | Res. | Res. | UIFRE<br>MAP | Res. | CKD[1:0] |    | ARPE | Res. | Res. | Res. | OPM | URS | UDIS | CEN |
|      |      |      |      | rw           |      | rw       | rw | rw   |      |      |      | rw  | rw  | rw   | rw  |

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **UIFREMAP**: UIF status bit remapping

0: No remapping. UIF status bit is not copied to TIMx\_CNT register bit 31.

1: Remapping enabled. UIF status bit is copied to TIMx\_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division

This bit-field indicates the division ratio between the timer clock (CK\_INT) frequency and sampling clock used by the digital filters (Tlx),

00:  $t_{DTS} = t_{CK\_INT}$

01:  $t_{DTS} = 2 \times t_{CK\_INT}$

10:  $t_{DTS} = 4 \times t_{CK\_INT}$

11: Reserved

Bit 7 **ARPE**: Auto-reload preload enable

0: TIMx\_ARR register is not buffered

1: TIMx\_ARR register is buffered

Bits 6:4 Reserved, must be kept at reset value.

Bit 3 **OPM**: One-pulse mode

0: Counter is not stopped on the update event

1: Counter stops counting on the next update event (clearing the CEN bit).

Bit 2 **URS**: Update request source

This bit is set and cleared by software to select the update interrupt (UEV) sources.

0: Any of the following events generate an UEV if enabled:

- Counter overflow
- Setting the UG bit

1: Only counter overflow generates an UEV if enabled.

Bit 1 **UDIS**: Update disable

This bit is set and cleared by software to enable/disable update interrupt (UEV) event generation.

0: UEV enabled. An UEV is generated by one of the following events:

- Counter overflow
- Setting the UG bit.

Buffered registers are then loaded with their preload values.

1: UEV disabled. No UEV is generated, shadow registers keep their value (ARR, PSC, CCRx). The counter and the prescaler are reinitialized if the UG bit is set.

Bit 0 **CEN**: Counter enable

0: Counter disabled

1: Counter enabled

*Note: External clock and gated mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.*

## 42.5.2 TIMx Interrupt enable register (TIMx\_DIER)(x = 13 to 14)

Address offset: 0x0C

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1     | 0   |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|-------|-----|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CC1IE | UIE |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      | rw    | rw  |

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **CC1IE**: Capture/Compare 1 interrupt enable

0: CC1 interrupt disabled

1: CC1 interrupt enabled

Bit 0 **UIE**: Update interrupt enable

0: Update interrupt disabled

1: Update interrupt enabled

## 42.5.3 TIMx status register (TIMx\_SR)(x = 13 to 14)

Address offset: 0x10

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9     | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1     | 0     |
|------|------|------|------|------|------|-------|------|------|------|------|------|------|------|-------|-------|
| Res. | Res. | Res. | Res. | Res. | Res. | CC1OF | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CC1IF | UIF   |
|      |      |      |      |      |      | rc_w0 |      |      |      |      |      |      |      | rc_w0 | rc_w0 |

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **CC1OF**: Capture/Compare 1 overcapture flag

This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to '0'.

0: No overcapture has been detected.

1: The counter value has been captured in TIMx\_CCR1 register while CC1IF flag was already set

Bits 8:2 Reserved, must be kept at reset value.

Bit 1 **CC1IF**: Capture/compare 1 interrupt flag

This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIMx\_CCR1 register (input capture mode only).

0: No compare match / No input capture occurred

1: A compare match or an input capture occurred.

**If channel CC1 is configured as output:** this flag is set when the content of the counter TIMx\_CNT matches the content of the TIMx\_CCR1 register. When the content of TIMx\_CCR1 is greater than the content of TIMx\_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in down-counting mode). There are 3 possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIMx\_CR1 register for the full description.

**If channel CC1 is configured as input:** this bit is set when counter value has been captured in TIMx\_CCR1 register (an edge has been detected on IC1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIMx\_CCER).

Bit 0 **UIF**: Update interrupt flag

This bit is set by hardware on an update event. It is cleared by software.

0: No update occurred.

1: Update interrupt pending. This bit is set by hardware when the registers are updated:

- At overflow and if UDIS='0' in the TIMx\_CR1 register.
- When CNT is reinitialized by software using the UG bit in TIMx\_EGR register, if URS='0' and UDIS='0' in the TIMx\_CR1 register.

#### 42.5.4 TIMx event generation register (TIMx\_EGR)(x = 13 to 14)

Address offset: 0x14

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0  |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|----|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CC1G | UG |
|      |      |      |      |      |      |      |      |      |      |      |      |      |      | w    | w  |

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **CC1G**: Capture/compare 1 generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action

1: A capture/compare event is generated on channel 1:

**If channel CC1 is configured as output:**

CC1IF flag is set, Corresponding interrupt or is sent if enabled.

**If channel CC1 is configured as input:**

The current value of the counter is captured in TIMx\_CCR1 register. The CC1IF flag is set, the corresponding interrupt is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation

This bit can be set by software, it is automatically cleared by hardware.

0: No action

1: Re-initialize the counter and generates an update of the registers. Note that the prescaler counter is cleared too (anyway the prescaler ratio is not affected). The counter is cleared.

### 42.5.5 TIMx capture/compare mode register 1 [alternate] (TIMx\_CCMR1)(x = 13 to 14)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function in input and in output mode.

**Input capture mode:**

|      |      |      |      |      |      |      |      |           |      |      |      |             |      |           |      |

Bits 31:8 Reserved, must be kept at reset value.

**Bits 7:4 IC1F[3:0]: Input capture 1 filter**

This bit-field defines the frequency used to sample TI1 input and the length of the digital filter applied to TI1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at  $f_{DTS}$

0001:  $f_{SAMPLING}=f_{CK\_INT}$ , N=2

0010:  $f_{SAMPLING}=f_{CK\_INT}$ , N=4

0011:  $f_{SAMPLING}=f_{CK\_INT}$ , N=8

0100:  $f_{SAMPLING}=f_{DTS}/2$ , N=6

0101:  $f_{SAMPLING}=f_{DTS}/2$ , N=8

0110:  $f_{SAMPLING}=f_{DTS}/4$ , N=6

0111:  $f_{SAMPLING}=f_{DTS}/4$ , N=8

1000:  $f_{SAMPLING}=f_{DTS}/8$ , N=6

1001:  $f_{SAMPLING}=f_{DTS}/8$ , N=8

1010:  $f_{SAMPLING}=f_{DTS}/16$ , N=5

1011:  $f_{SAMPLING}=f_{DTS}/16$ , N=6

1100:  $f_{SAMPLING}=f_{DTS}/16$ , N=8

1101:  $f_{SAMPLING}=f_{DTS}/32$ , N=5

1110:  $f_{SAMPLING}=f_{DTS}/32$ , N=6

1111:  $f_{SAMPLING}=f_{DTS}/32$ , N=8

**Bits 3:2 IC1PSC[1:0]: Input capture 1 prescaler**

This bit-field defines the ratio of the prescaler acting on CC1 input (IC1).

The prescaler is reset as soon as CC1E='0' (TIMx\_CCER register).

00: no prescaler, capture is done each time an edge is detected on the capture input

01: capture is done once every 2 events

10: capture is done once every 4 events

11: capture is done once every 8 events

**Bits 1:0 CC1S[1:0]: Capture/Compare 1 selection**

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, IC1 is mapped on TI1

10: Reserved

11: Reserved

*Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx\_CCER).*

## 42.5.6 TIMx capture/compare mode register 1 [alternate] (TIMx\_CCMR1)(x = 13 to 14)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the

corresponding CCxS bits. All the other bits of this register have a different function in input and in output mode.

#### Output compare mode:

|      |      |      |      |      |      |      |      |      |           |      |      |       |       |           |         |
|------|------|------|------|------|------|------|------|------|-----------|------|------|-------|-------|-----------|---------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22        | 21   | 20   | 19    | 18    | 17        | 16      |

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6         | 5    | 4    | 3     | 2     | 1         | 0       |
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | OC1M[2:0] |      |      | OC1PE | OC1FE | CC1S[1:0] |         |
|      |      |      |      |      |      |      |      |      | rw        | rw   | rw   | rw    | rw    | rw        | rw      |

Bits 31:17 Reserved, must be kept at reset value.

Bits 15:7 Reserved, must be kept at reset value.

Bits 16, 6:4 **OC1M[3:0]**: Output compare 1 mode (refer to bit 16 for OC1M[3])

These bits define the behavior of the output reference signal OC1REF from which OC1 is derived. OC1REF is active high whereas OC1 active level depends on CC1P bit.

0000: Frozen. The comparison between the output compare register TIMx\_CCR1 and the counter TIMx\_CNT has no effect on the outputs.

0001: Set channel 1 to active level on match. OC1REF signal is forced high when the counter TIMx\_CNT matches the capture/compare register 1 (TIMx\_CCR1).

0010: Set channel 1 to inactive level on match. OC1REF signal is forced low when the counter TIMx\_CNT matches the capture/compare register 1 (TIMx\_CCR1).

0011: Toggle - OC1REF toggles when TIMx\_CNT = TIMx\_CCR1.

0100: Force inactive level - OC1REF is forced low.

0101: Force active level - OC1REF is forced high.

0110: PWM mode 1 - Channel 1 is active as long as TIMx\_CNT < TIMx\_CCR1 else inactive.

0111: PWM mode 2 - Channel 1 is inactive as long as TIMx\_CNT < TIMx\_CCR1 else active

Others: Reserved

*Note: In PWM mode 1 or 2, the OCREF level changes when the result of the comparison changes or when the output compare mode switches from frozen to PWM mode.*

Bit 3 **OC1PE**: Output compare 1 preload enable

- 0: Preload register on TIMx\_CCR1 disabled. TIMx\_CCR1 can be written at anytime, the new value is taken in account immediately.
- 1: Preload register on TIMx\_CCR1 enabled. Read/Write operations access the preload register. TIMx\_CCR1 preload value is loaded in the active register at each update event.

*Note: The PWM mode can be used without validating the preload register only in one pulse mode (OPM bit set in TIMx\_CR1 register). Else the behavior is not guaranteed.*

Bit 2 **OC1FE**: Output compare 1 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIMx\_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

- 0: CC1 behaves normally depending on counter and CCR1 values even when the trigger is ON. The minimum delay to activate CC1 output when an edge occurs on the trigger input is 5 clock cycles.
- 1: An active edge on the trigger input acts like a compare match on CC1 output. OC is then set to the compare level independently of the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to 3 clock cycles. OC1FE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

- 00: CC1 channel is configured as output.
- 01: CC1 channel is configured as input, IC1 is mapped on TI1.
- 10: Reserved.
- 11: Reserved.

*Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx\_CCER).*

#### 42.5.7 TIMx capture/compare enable register (TIMx\_CCER)(x = 13 to 14)

Address offset: 0x20

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3     | 2    | 1    | 0    |
|------|------|------|------|------|------|------|------|------|------|------|------|-------|------|------|------|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CC1NP | Res. | CC1P | CC1E |
|      |      |      |      |      |      |      |      |      |      |      |      | rw    |      | rw   | rw   |

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **CC1NP**: Capture/Compare 1 complementary output Polarity.

CC1 channel configured as output: CC1NP must be kept cleared.

CC1 channel configured as input: CC1NP bit is used in conjunction with CC1P to define TI1FP1 polarity (refer to CC1P description).

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CC1P**: Capture/Compare 1 output Polarity.

0: OC1 active high (output mode) / Edge sensitivity selection (input mode, see below)

1: OC1 active low (output mode) / Edge sensitivity selection (input mode, see below)

**When CC1 channel is configured as input**, both CC1NP/CC1P bits select the active polarity of TI1FP1 and TI2FP1 for trigger or capture operations.

CC1NP=0, CC1P=0: non-inverted/rising edge. The circuit is sensitive to TIxFP1 rising edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode or encoder mode).

CC1NP=0, CC1P=1: inverted/falling edge. The circuit is sensitive to TIxFP1 falling edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is inverted (trigger operation in gated mode or encoder mode).

CC1NP=1, CC1P=1: non-inverted/both edges/ The circuit is sensitive to both TIxFP1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode). This configuration must not be used in encoder mode.

CC1NP=1, CC1P=0: This configuration is reserved, it must not be used.

Bit 0 **CC1E**: Capture/Compare 1 output enable.

0: Capture mode disabled / OC1 is not active

1: Capture mode enabled / OC1 signal is output on the corresponding output pin

**Table 294. Output control bit for standard OCx channels**

| CCxE bit | OCx output state                      |
|----------|---------------------------------------|
| 0        | Output Disabled (OCx='0', OCx_EN='0') |
| 1        | OCx=OCxREF + Polarity, OCx_EN='1'     |

*Note:* The state of the external I/O pins connected to the standard OCx channels depends on the OCx channel state and the GPIO registers.

#### 42.5.8 TIMx counter (TIMx\_CNT)(x = 13 to 14)

Address offset: 0x24

Reset value: 0x0000 0000

Bit 31 **UIFCPY**: UIF Copy

This bit is a read-only copy of the UIF bit in the TIMx\_ISR register.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]**: Counter value

**42.5.9 TIMx prescaler (TIMx\_PSC)(x = 13 to 14)**

Address offset: 0x28

Reset value: 0x0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| PSC[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **PSC[15:0]**: Prescaler valueThe counter clock frequency CK\_CNT is equal to  $f_{CK\_PSC} / (PSC[15:0] + 1)$ .

PSC contains the value to be loaded in the active prescaler register at each update event.

(including when the counter is cleared through UG bit of TIMx\_EGR register or through trigger controller when configured in “reset mode”).

**42.5.10 TIMx auto-reload register (TIMx\_ARR)(x = 13 to 14)**

Address offset: 0x2C

Reset value: 0xFFFF

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ARR[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **ARR[15:0]**: Auto-reload value

ARR is the value to be loaded in the actual auto-reload register.

Refer to [Section 42.3.1: Time-base unit on page 2224](#) for more details about ARR update and behavior.

The counter is blocked while the auto-reload value is null.

**42.5.11 TIMx capture/compare register 1 (TIMx\_CCR1)(x = 13 to 14)**

Address offset: 0x34

Reset value: 0x0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CCR1[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **CCR1[15:0]**: Capture/Compare 1 value

**If channel CC1 is configured as output:**

CCR1 is the value to be loaded in the actual capture/compare 1 register (preload value). It is loaded permanently if the preload feature is not selected in the TIMx\_CCMR1 register (bit OC1PE). Else the preload value is copied in the active capture/compare 1 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx\_CNT and signaled on OC1 output.

**If channel CC1 is configured as input:**

CCR1 is the counter value transferred by the last input capture 1 event (IC1).

#### 42.5.12 TIM13 timer input selection register (TIM13\_TISEL)

Address offset: 0x68

Reset value: 0x0000

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 43 General-purpose timers (TIM15/TIM16/TIM17)

### 43.1 TIM15/TIM16/TIM17 introduction

The TIM15/TIM16/TIM17 timers consist of a 16-bit auto-reload counter driven by a programmable prescaler.

They may be used for a variety of purposes, including measuring the pulse lengths of input signals (input capture) or generating output waveforms (output compare, PWM, complementary PWM with dead-time insertion).

Pulse lengths and waveform periods can be modulated from a few microseconds to several milliseconds using the timer prescaler and the RCC clock controller prescalers.

The TIM15/TIM16/TIM17 timers are completely independent, and do not share any resources. TIM15 can be synchronized as described in [Section 43.4.22: Timer synchronization \(TIM15\)](#).

### 43.2 TIM15 main features

TIM15 includes the following features:

- 16-bit auto-reload upcounter
- 16-bit programmable prescaler used to divide (also “on the fly”) the counter clock frequency by any factor between 1 and 65535
- Up to 2 independent channels for:
  - Input capture
  - Output compare
  - PWM generation (edge mode)
  - One-pulse mode output
- Complementary outputs with programmable dead-time (for channel 1 only)
- Synchronization circuit to control the timer with external signals and to interconnect several timers together
- Repetition counter to update the timer registers only after a given number of cycles of the counter
- Break input to put the timer’s output signals in the reset state or a known state
- Interrupt/DMA generation on the following events:
  - Update: counter overflow, counter initialization (by software or internal/external trigger)
  - Trigger event (counter start, stop, initialization or count by internal/external trigger)
  - Input capture
  - Output compare
  - Break input (interrupt request)

### 43.3 TIM16/TIM17 main features

The TIM16/TIM17 timers include the following features:

- 16-bit auto-reload upcounter
- 16-bit programmable prescaler used to divide (also “on the fly”) the counter clock frequency by any factor between 1 and 65535
- One channel for:
  - Input capture
  - Output compare
  - PWM generation (edge-aligned mode)
  - One-pulse mode output
- Complementary outputs with programmable dead-time
- Repetition counter to update the timer registers only after a given number of cycles of the counter
- Break input to put the timer’s output signals in the reset state or a known state
- Interrupt/DMA generation on the following events:
  - Update: counter overflow
  - Input capture
  - Output compare
  - Break input

## 43.4 TIM15/TIM16/TIM17 functional description

### 43.4.1 Time-base unit

The main block of the programmable advanced-control timer is a 16-bit upcounter with its related auto-reload register. The counter clock can be divided by a prescaler.

The counter, the auto-reload register and the prescaler register can be written or read by software. This is true even when the counter is running.

The time-base unit includes:

- Counter register (TIMx\_CNT)
- Prescaler register (TIMx\_PSC)
- Auto-reload register (TIMx\_ARR)
- Repetition counter register (TIMx\_RCR)

The auto-reload register is preloaded. Writing to or reading from the auto-reload register accesses the preload register. The content of the preload register are transferred into the shadow register permanently or at each update event (UEV), depending on the auto-reload preload enable bit (ARPE) in TIMx\_CR1 register. The update event is sent when the counter reaches the overflow and if the UDIS bit equals 0 in the TIMx\_CR1 register. It can also be generated by software. The generation of the update event is described in detailed for each configuration.

The counter is clocked by the prescaler output CK\_CNT, which is enabled only when the counter enable bit (CEN) in TIMx\_CR1 register is set (refer also to the slave mode controller description to get more details on counter enabling).

Note that the counter starts counting 1 clock cycle after setting the CEN bit in the TIMx\_CR1 register.

#### Prescaler description

The prescaler can divide the counter clock frequency by any factor between 1 and 65536. It is based on a 16-bit counter controlled through a 16-bit register (in the TIMx\_PSC register). It can be changed on the fly as this control register is buffered. The new prescaler ratio is taken into account at the next update event.

*Figure 490* and *Figure 491* give some examples of the counter behavior when the prescaler ratio is changed on the fly:

Figure 490. Counter timing diagram with prescaler division change from 1 to 2

Figure 491. Counter timing diagram with prescaler division change from 1 to 4

## 43.4.2 Counter modes

### Upcounting mode

In upcounting mode, the counter counts from 0 to the auto-reload value (content of the TIMx\_ARR register), then restarts from 0 and generates a counter overflow event.

If the repetition counter is used, the update event (UEV) is generated after upcounting is repeated for the number of times programmed in the repetition counter register (TIMx\_RCR). Else the update event is generated at each counter overflow.

Setting the UG bit in the TIMx\_EGR register (by software or by using the slave mode controller) also generates an update event.

The UEV event can be disabled by software by setting the UDIS bit in the TIMx\_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter restarts from 0, as well as the counter of the prescaler (but the prescale rate does not change). In addition, if the URS bit (update request selection) in TIMx\_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx\_SR register) is set (depending on the URS bit):

- The repetition counter is reloaded with the content of TIMx\_RCR register,
- The auto-reload shadow register is updated with the preload value (TIMx\_ARR),
- The buffer of the prescaler is reloaded with the preload value (content of the TIMx\_PSC register).

The following figures show some examples of the counter behavior for different clock frequencies when TIMx\_ARR=0x36.

Figure 492. Counter timing diagram, internal clock divided by 1

Figure 493. Counter timing diagram, internal clock divided by 2

Figure 494. Counter timing diagram, internal clock divided by 4

Figure 495. Counter timing diagram, internal clock divided by N

**Figure 496. Counter timing diagram, update event when ARPE=0 (TIMx\_ARR not preloaded)**

**Figure 497. Counter timing diagram, update event when ARPE=1 (TIMx\_ARR preloaded)**

### 43.4.3 Repetition counter

[Section 43.4.1: Time-base unit](#) describes how the update event (UEV) is generated with respect to the counter overflows. It is actually generated only when the repetition counter has reached zero. This can be useful when generating PWM signals.

This means that data are transferred from the preload registers to the shadow registers (TIMx\_ARR auto-reload register, TIMx\_PSC prescaler register, but also TIMx\_CCRx capture/compare registers in compare mode) every N counter overflows, where N is the value in the TIMx\_RCR repetition counter register.

The repetition counter is decremented at each counter overflow.

The repetition counter is an auto-reload type; the repetition rate is maintained as defined by the TIMx\_RCR register value (refer to [Figure 498](#)). When the update event is generated by software (by setting the UG bit in TIMx\_EGR register) or by hardware through the slave mode controller, it occurs immediately whatever the value of the repetition counter is and the repetition counter is reloaded with the content of the TIMx\_RCR register.

**Figure 498. Update rate examples depending on mode and TIMx\_RCR register settings**

#### 43.4.4 Clock selection

The counter clock can be provided by the following clock sources:

- Internal clock (CK\_INT)
- External clock mode1: external input pin
- Internal trigger inputs (ITRx) (only for TIM15): using one timer as the prescaler for another timer, for example, TIM1 can be configured to act as a prescaler for TIM15. Refer to [Using one timer as prescaler for another timer on page 2185](#) for more details.

##### Internal clock source (CK\_INT)

If the slave mode controller is disabled (SMS=000), then the CEN (in the TIMx\_CR1 register) and UG bits (in the TIMx\_EGR register) are actual control bits and can be changed

only by software (except UG which remains cleared automatically). As soon as the CEN bit is written to 1, the prescaler is clocked by the internal clock CK\_INT.

Figure 499 shows the behavior of the control circuit and the upcounter in normal mode, without prescaler.

**Figure 499. Control circuit in normal mode, internal clock divided by 1**

### External clock source mode 1

This mode is selected when SMS=111 in the TIMx\_SMCR register. The counter can count at each rising or falling edge on a selected input.

**Figure 500. TI2 external clock connection example**

For example, to configure the upcounter to count in response to a rising edge on the TI2 input, use the following procedure:

1. Select the proper TI2[x] source (internal or external) with the TI2SEL[3:0] bits in the TIMx\_TISEL register.
2. Configure channel 2 to detect rising edges on the TI2 input by writing CC2S = '01' in the TIMx\_CCMR1 register.
3. Configure the input filter duration by writing the IC2F[3:0] bits in the TIMx\_CCMR1 register (if no filter is needed, keep IC2F=0000).
4. Select rising edge polarity by writing CC2P=0 in the TIMx\_CCER register.
5. Configure the timer in external clock mode 1 by writing SMS=111 in the TIMx\_SMCR register.
6. Select TI2 as the trigger input source by writing TS=00110 in the TIMx\_SMCR register.
7. Enable the counter by writing CEN=1 in the TIMx\_CR1 register.

**Note:** *The capture prescaler is not used for triggering, so it does not need to be configured.*

When a rising edge occurs on TI2, the counter counts once and the TIF flag is set.

The delay between the rising edge on TI2 and the actual clock of the counter is due to the resynchronization circuit on TI2 input.

**Figure 501. Control circuit in external clock mode 1**

### 43.4.5 Capture/compare channels

Each Capture/Compare channel is built around a capture/compare register (including a shadow register), a input stage for capture (with digital filter, multiplexing and prescaler) and an output stage (with comparator and output control).

[Figure 502](#) to [Figure 505](#) give an overview of one Capture/Compare channel.

The input stage samples the corresponding TIx input to generate a filtered signal TIxF. Then, an edge detector with polarity selection generates a signal (TIxFPx) which can be used as trigger input by the slave mode controller or as the capture command. It is prescaled before the capture register (ICxPS).

**Figure 502. Capture/compare channel (example: channel 1 input stage)**

The output stage generates an intermediate waveform which is then used for reference: OCxRef (active high). The polarity acts at the end of the chain.

**Figure 503. Capture/compare channel 1 main circuit**

Figure 504. Output stage of capture/compare channel (channel 1)

Figure 505. Output stage of capture/compare channel (channel 2 for TIM15)

The capture/compare block is made of one preload register and one shadow register. Write and read always access the preload register.

In capture mode, captures are actually done in the shadow register, which is copied into the preload register.

In compare mode, the content of the preload register is copied into the shadow register which is compared to the counter.

#### 43.4.6 Input capture mode

In Input capture mode, the Capture/Compare Registers (TIMx\_CCRx) are used to latch the value of the counter after a transition detected by the corresponding ICx signal. When a capture occurs, the corresponding CCXIF flag (TIMx\_SR register) is set and an interrupt or a DMA request can be sent if they are enabled. If a capture occurs while the CCXIF flag was

already high, then the over-capture flag CCxOF (TIMx\_SR register) is set. CCxIF can be cleared by software by writing it to '0' or by reading the captured data stored in the TIMx\_CCRx register. CCxOF is cleared when it is written with 0.

The following example shows how to capture the counter value in TIMx\_CCR1 when TI1 input rises. To do this, use the following procedure:

1. Select the proper TI1x source (internal or external) with the TI1SEL[3:0] bits in the TIMx\_TISEL register.
2. Select the active input: TIMx\_CCR1 must be linked to the TI1 input, so write the CC1S bits to 01 in the TIMx\_CCMR1 register. As soon as CC1S becomes different from 00, the channel is configured in input and the TIMx\_CCR1 register becomes read-only.
3. Program the appropriate input filter duration in relation with the signal connected to the timer (when the input is one of the TIx (ICxF bits in the TIMx\_CCMRx register). Let's imagine that, when toggling, the input signal is not stable during at least 5 internal clock cycles. We must program a filter duration longer than these 5 clock cycles. We can validate a transition on TI1 when 8 consecutive samples with the new level have been detected (sampled at  $f_{DTS}$  frequency). Then write IC1F bits to 0011 in the TIMx\_CCMR1 register.
4. Select the edge of the active transition on the TI1 channel by writing CC1P bit to 0 in the TIMx\_CCER register (rising edge in this case).
5. Program the input prescaler. In our example, we wish the capture to be performed at each valid transition, so the prescaler is disabled (write IC1PS bits to '00' in the TIMx\_CCMR1 register).
6. Enable capture from the counter into the capture register by setting the CC1E bit in the TIMx\_CCER register.
7. If needed, enable the related interrupt request by setting the CC1IE bit in the TIMx\_DIER register, and/or the DMA request by setting the CC1DE bit in the TIMx\_DIER register.

When an input capture occurs:

- The TIMx\_CCR1 register gets the value of the counter on the active transition.
- CC1IF flag is set (interrupt flag). CC1OF is also set if at least two consecutive captures occurred whereas the flag was not cleared.
- An interrupt is generated depending on the CC1IE bit.
- A DMA request is generated depending on the CC1DE bit.

In order to handle the overcapture, it is recommended to read the data before the overcapture flag. This is to avoid missing an overcapture which could happen after reading the flag and before reading the data.

*Note:* IC interrupt and/or DMA requests can be generated by software by setting the corresponding CCxG bit in the TIMx\_EGR register.

#### 43.4.7 PWM input mode (only for TIM15)

This mode is a particular case of input capture mode. The procedure is the same except:

- Two ICx signals are mapped on the same TIx input.
- These 2 ICx signals are active on edges with opposite polarity.
- One of the two TIxFP signals is selected as trigger input and the slave mode controller is configured in reset mode.

For example, one can measure the period (in TIMx\_CCR1 register) and the duty cycle (in TIMx\_CCR2 register) of the PWM applied on TI1 using the following procedure (depending on CK\_INT frequency and prescaler value):

1. Select the proper TI1[x] source (internal or external) with the TI1SEL[3:0] bits in the TIMx\_TISEL register.
2. Select the active input for TIMx\_CCR1: write the CC1S bits to 01 in the TIMx\_CCMR1 register (TI1 selected).
3. Select the active polarity for TI1FP1 (used both for capture in TIMx\_CCR1 and counter clear): write the CC1P and CC1NP bits to '0' (active on rising edge).
4. Select the active input for TIMx\_CCR2: write the CC2S bits to 10 in the TIMx\_CCMR1 register (TI1 selected).
5. Select the active polarity for TI1FP2 (used for capture in TIMx\_CCR2): write the CC2P and CC2NP bits to '1' (active on falling edge).
6. Select the valid trigger input: write the TS bits to 00101 in the TIMx\_SMCR register (TI1FP1 selected).
7. Configure the slave mode controller in reset mode: write the SMS bits to 100 in the TIMx\_SMCR register.
8. Enable the captures: write the CC1E and CC2E bits to '1' in the TIMx\_CCER register.

**Figure 506. PWM input mode timing**

1. The PWM input mode can be used only with the TIMx\_CH1/TIMx\_CH2 signals due to the fact that only TI1FP1 and TI2FP2 are connected to the slave mode controller.

#### 43.4.8 Forced output mode

In output mode (CCxS bits = 00 in the TIMx\_CCMRx register), each output compare signal (OCxREF and then OCx/OCxN) can be forced to active or inactive level directly by software, independently of any comparison between the output compare register and the counter.

To force an output compare signal (OCxREF/OCx) to its active level, one just needs to write 101 in the OCxM bits in the corresponding TIMx\_CCMRx register. Thus OCxREF is forced high (OCxREF is always active high) and OCx get opposite value to CCxP polarity bit.

For example: CCxP=0 (OCx active high) => OCx is forced to high level.

The OCxREF signal can be forced low by writing the OCxM bits to 100 in the TIMx\_CCMRx register.

Anyway, the comparison between the TIMx\_CCRx shadow register and the counter is still performed and allows the flag to be set. Interrupt and DMA requests can be sent accordingly. This is described in the output compare mode section below.

### 43.4.9 Output compare mode

This function is used to control an output waveform or indicating when a period of time has elapsed.

When a match is found between the capture/compare register and the counter, the output compare function:

- Assigns the corresponding output pin to a programmable value defined by the output compare mode (OCxM bits in the TIMx\_CCMRx register) and the output polarity (CCxP bit in the TIMx\_CCER register). The output pin can keep its level (OCxM=000), be set active (OCxM=001), be set inactive (OCxM=010) or can toggle (OCxM=011) on match.
- Sets a flag in the interrupt status register (CCxIF bit in the TIMx\_SR register).
- Generates an interrupt if the corresponding interrupt mask is set (CCxIE bit in the TIMx\_DIER register).
- Sends a DMA request if the corresponding enable bit is set (CCxDE bit in the TIMx\_DIER register, CCDS bit in the TIMx\_CR2 register for the DMA request selection).

The TIMx\_CCRx registers can be programmed with or without preload registers using the OCxPE bit in the TIMx\_CCMRx register.

In output compare mode, the update event UEV has no effect on OCxREF and OCx output. The timing resolution is one count of the counter. Output compare mode can also be used to output a single pulse (in One-pulse mode).

#### Procedure

1. Select the counter clock (internal, external, prescaler).
2. Write the desired data in the TIMx\_ARR and TIMx\_CCRx registers.
3. Set the CCxIE bit if an interrupt request is to be generated.
4. Select the output mode. For example:
  - Write OCxM = 011 to toggle OCx output pin when CNT matches CCRx
  - Write OCxPE = 0 to disable preload register
  - Write CCxP = 0 to select active high polarity
  - Write CCxE = 1 to enable the output
5. Enable the counter by setting the CEN bit in the TIMx\_CR1 register.

The TIMx\_CCRx register can be updated at any time by software to control the output waveform, provided that the preload register is not enabled (OCxPE='0', else TIMx\_CCRx shadow register is updated only at the next update event UEV). An example is given in [Figure 507](#).

Figure 507. Output compare mode, toggle on OC1

#### 43.4.10 PWM mode

Pulse Width Modulation mode allows a signal to be generated with a frequency determined by the value of the TIMx\_ARR register and a duty cycle determined by the value of the TIMx\_CCRx register.

The PWM mode can be selected independently on each channel (one PWM per OCx output) by writing '110' (PWM mode 1) or '111' (PWM mode 2) in the OCxM bits in the TIMx\_CCMRx register. The corresponding preload register must be enabled by setting the OCxPE bit in the TIMx\_CCMRx register, and eventually the auto-reload preload register (in upcounting or center-aligned modes) by setting the ARPE bit in the TIMx\_CR1 register.

As the preload registers are transferred to the shadow registers only when an update event occurs, before starting the counter, all registers must be initialized by setting the UG bit in the TIMx\_EGR register.

OCx polarity is software programmable using the CCxP bit in the TIMx\_CCER register. It can be programmed as active high or active low. OCx output is enabled by a combination of the CCxE, CCxNE, MOE, OSSI and OSSR bits (TIMx\_CCER and TIMx\_BDTR registers). Refer to the TIMx\_CCER register description for more details.

In PWM mode (1 or 2), TIMx\_CNT and TIMx\_CCRx are always compared to determine whether  $TIMx\_CCRx \leq TIMx\_CNT$  or  $TIMx\_CNT \leq TIMx\_CCRx$  (depending on the direction of the counter).

The TIM15/TIM16/TIM17 are capable of upcounting only. Refer to [Upcounting mode on page 2280](#).

In the following example, we consider PWM mode 1. The reference PWM signal OCxREF is high as long as  $TIMx\_CNT < TIMx\_CCRx$  else it becomes low. If the compare value in TIMx\_CCRx is greater than the auto-reload value (in TIMx\_ARR) then OCxREF is held at

'1'. If the compare value is 0 then OCxRef is held at '0'. [Figure 508](#) shows some edge-aligned PWM waveforms in an example where TIMx\_ARR=8.

**Figure 508. Edge-aligned PWM waveforms (ARR=8)**

MS31093V1

#### 43.4.11 Combined PWM mode (TIM15 only)

Combined PWM mode allows two edge or center-aligned PWM signals to be generated with programmable delay and phase shift between respective pulses. While the frequency is determined by the value of the TIMx\_ARR register, the duty cycle and delay are determined by the two TIMx\_CCRx registers. The resulting signals, OCxREFC, are made of an OR or AND logical combination of two reference PWMs:

- OC1REFC (or OC2REFC) is controlled by the TIMx\_CCR1 and TIMx\_CCR2 registers

Combined PWM mode can be selected independently on two channels (one OCx output per pair of CCR registers) by writing '1100' (Combined PWM mode 1) or '1101' (Combined PWM mode 2) in the OCxM bits in the TIMx\_CCMRx register.

When a given channel is used as a combined PWM channel, its complementary channel must be configured in the opposite PWM mode (for instance, one in Combined PWM mode 1 and the other in Combined PWM mode 2).

*Note:* The OCxM[3:0] bit field is split into two parts for compatibility reasons, the most significant bit is not contiguous with the 3 least significant ones.

[Figure 509](#) represents an example of signals that can be generated using Asymmetric PWM mode, obtained with the following configuration:

- Channel 1 is configured in Combined PWM mode 2,
- Channel 2 is configured in PWM mode 1,

Figure 509. Combined PWM mode on channel 1 and 2

#### 43.4.12 Complementary outputs and dead-time insertion

The TIM15/TIM16/TIM17 general-purpose timers can output one complementary signal and manage the switching-off and switching-on of the outputs.

This time is generally known as dead-time and it has to be adjusted depending on the devices that are connected to the outputs and their characteristics (intrinsic delays of level-shifters, delays due to power switches...)

The polarity of the outputs (main output OCx or complementary OCxN) can be selected independently for each output. This is done by writing to the CCxP and CCxNP bits in the TIMx\_CCER register.

The complementary signals OCx and OCxN are activated by a combination of several control bits: the CCxE and CCxNE bits in the TIMx\_CCER register and the MOE, OISx, OISxN, OSSI and OSSR bits in the TIMx\_BDTR and TIMx\_CR2 registers. Refer to [Table 300: Output control bits for complementary OCx and OCxN channels with break feature \(TIM16/17\) on page 2349](#) for more details. In particular, the dead-time is activated when switching to the idle state (MOE falling down to 0).

Dead-time insertion is enabled by setting both CCxE and CCxNE bits, and the MOE bit if the break circuit is present. There is one 10-bit dead-time generator for each channel. From a

reference waveform OCxREF, it generates 2 outputs OCx and OCxN. If OCx and OCxN are active high:

- The OCx output signal is the same as the reference signal except for the rising edge, which is delayed relative to the reference rising edge.
- The OCxN output signal is the opposite of the reference signal except for the rising edge, which is delayed relative to the reference falling edge.

If the delay is greater than the width of the active output (OCx or OCxN) then the corresponding pulse is not generated.

The following figures show the relationships between the output signals of the dead-time generator and the reference signal OCxREF. (we suppose CCxP=0, CCxNP=0, MOE=1, CCxE=1 and CCxNE=1 in these examples)

**Figure 510. Complementary output with dead-time insertion.**

**Figure 511. Dead-time waveforms with delay greater than the negative pulse.**

**Figure 512. Dead-time waveforms with delay greater than the positive pulse.**

The dead-time delay is the same for each of the channels and is programmable with the DTG bits in the TIMx\_BDTR register. Refer to [Section 43.6.14: TIMx break and dead-time register \(TIMx\\_BDTR\)\(x = 16 to 17\) on page 2352](#) for delay calculation.

### Re-directing OCxREF to OCx or OCxN

In output mode (forced, output compare or PWM), OCxREF can be re-directed to the OCx output or to OCxN output by configuring the CCxE and CCxNE bits in the TIMx\_CCER register.

This allows a specific waveform to be sent (such as PWM or static active level) on one output while the complementary remains at its inactive level. Other alternative possibilities are to have both outputs at inactive level or both outputs active and complementary with dead-time.

**Note:** *When only OCxN is enabled (CCxE=0, CCxNE=1), it is not complemented and becomes active as soon as OCxREF is high. For example, if CCxNP=0 then OCxN=OCxRef. On the other hand, when both OCx and OCxN are enabled (CCxE=CCxNE=1) OCx becomes active when OCxREF is high whereas OCxN is complemented and becomes active when OCxREF is low.*

### 43.4.13 Using the break function

The purpose of the break function is to protect power switches driven by PWM signals generated with the TIM15/TIM16/TIM17 timers. The break input is usually connected to fault outputs of power stages and 3-phase inverters. When activated, the break circuitry shuts down the PWM outputs and forces them to a predefined safe state.

The break channel gathers both system-level fault (clock failure, parity error,...) and application fault (from input pins and built-in comparator), and can force the outputs to a predefined level (either active or inactive) after a deadtime duration.

The output enable signal and output levels during break are depending on several control bits:

- the MOE bit in TIMx\_BDTR register allows to enable /disable the outputs by software and is reset in case of break or break2 event.
- the OSSI bit in the TIMx\_BDTR register defines whether the timer controls the output in inactive state or releases the control to the GPIO controller (typically to have it in Hi-Z mode)
- the OISx and OISxN bits in the TIMx\_CR2 register which are setting the output shut-down level, either active or inactive. The OCx and OCxN outputs cannot be set both to active level at a given time, whatever the OISx and OISxN values. Refer to [Table 298: Output control bits for complementary OCx and OCxN channels with break feature \(TIM15\) on page 2328](#) for more details.

When exiting from reset, the break circuit is disabled and the MOE bit is low. The break function is enabled by setting the BKE bit in the TIMx\_BDTR register. The break input polarity can be selected by configuring the BKP bit in the same register. BKE and BKP can be modified at the same time. When the BKE and BKP bits are written, a delay of 1 APB clock cycle is applied before the writing is effective. Consequently, it is necessary to wait 1 APB clock period to correctly read back the bit after the write operation.

Because MOE falling edge can be asynchronous, a resynchronization circuit has been inserted between the actual signal (acting on the outputs) and the synchronous control bit (accessed in the TIMx\_BDTR register). It results in some delays between the asynchronous and the synchronous signals. In particular, if MOE is set to 1 whereas it was low, a delay must be inserted (dummy instruction) before reading it correctly. This is because the write acts on the asynchronous signal whereas the read reflects the synchronous signal.

A programmable filter (BKF[3:0] bits in the TIMx\_BDTR register allows to filter out spurious events.

The break can be generated from multiple sources which can be individually enabled and with programmable edge sensitivity, using the TIMx\_OR2 register.

The sources for break (BRK) channel are:

- An external source connected to one of the BKIN pin (as per selection done in the AFIO controller), with polarity selection and optional digital filtering
- An internal source:
  - the analog watchdog output of the DFSDM1 peripheral
  - A system break:
    - the Cortex®-M4 with FPU LOCKUP output
    - the PVD output

Figure 513. Break circuitry overview

**Caution:** An asynchronous (clockless) operation is only guaranteed when the programmable filter is disabled. If it is enabled, a fail safe clock mode (example, using the internal PLL and/or the CSS) must be used to guarantee that break events are handled.

When a break occurs (selected level on the break input):

- The MOE bit is cleared asynchronously, putting the outputs in inactive state, idle state or even releasing the control to the AFIO controller (selected by the OSS1 bit). This feature functions even if the MCU oscillator is off.
- Each output channel is driven with the level programmed in the OISx bit in the TIMx\_CR2 register as soon as MOE=0. If OSS1=0, the timer releases the output control (taken over by the AFIO controller) else the enable output remains high.
- When complementary outputs are used:
  - The outputs are first put in reset state inactive state (depending on the polarity). This is done asynchronously so that it works even if no clock is provided to the timer.
  - If the timer clock is still present, then the dead-time generator is reactivated in order to drive the outputs with the level programmed in the OISx and OISxN bits after a dead-time. Even in this case, OCx and OCxN cannot be driven to their active level together. Note that because of the resynchronization on MOE, the dead-time duration is a bit longer than usual (around 2 ck\_tim clock cycles).
  - If OSS1=0 then the timer releases the enable outputs (taken over by the AFIO controller which forces a Hi-Z state) else the enable outputs remain or become high as soon as one of the CCxE or CCxNE bits is high.
- The break status flag (BIF bit in the TIMx\_SR register) is set. An interrupt can be generated if the BIE bit in the TIMx\_DIER register is set.
- If the AOE bit in the TIMx\_BDTR register is set, the MOE bit is automatically set again at the next update event UEV. This can be used to perform a regulation, for instance. Else, MOE remains low until it is written with 1 again. In this case, it can be used for security and the break input can be connected to an alarm from power drivers, thermal sensors or any security components.

**Note:** The break inputs is acting on level. Thus, the MOE cannot be set while the break input is active (neither automatically nor by software). In the meantime, the status flag BIF cannot be cleared.

The break can be generated by the BRK input which has a programmable polarity and an enable bit BKE in the TIMx\_BDTR Register.

In addition to the break input and the output management, a write protection has been implemented inside the break circuit to safeguard the application. It allows the configuration of several parameters to be frozen (dead-time duration, OCx/OCxN polarities and state when disabled, OCxM configurations, break enable and polarity). The protection can be selected among 3 levels with the LOCK bits in the TIMx\_BDTR register. Refer to [Section 43.6.14: TIMx break and dead-time register \(TIMx\\_BDTR\)\(x = 16 to 17\) on page 2352](#). The LOCK bits can be written only once after an MCU reset.

The [Figure 514](#) shows an example of behavior of the outputs in response to a break.

Figure 514. Output behavior in response to a break

### 43.4.14 Bidirectional break inputs

The TIM15/TIM16/TIM17 are featuring bidirectional break I/Os, as represented on [Figure 515](#).

They allow the following:

- A board-level global break signal available for signaling faults to external MCUs or gate drivers, with a unique pin being both an input and an output status pin
- Internal break sources and multiple external open drain comparator outputs ORed together to trigger a unique break event, when multiple internal and external break sources must be merged

The break input is configured in bidirectional mode using the BKBID bit in the TIMxBDTR register. The BKBID programming bit can be locked in read-only mode using the LOCK bits in the TIMxBDTR register (in LOCK level 1 or above).

The bidirectional mode requires the I/O to be configured in open-drain mode with active low polarity (using BKINP and BKP bits). Any break request coming either from system (e.g. CSS), from on-chip peripherals or from break inputs forces a low level on the break input to signal the fault event. The bidirectional mode is inhibited if the polarity bits are not correctly set (active high polarity), for safety purposes.

The break software event (BG) also causes the break I/O to be forced to '0' to indicate to the external components that the timer has entered in break state. However, this is valid only if the break is enabled (BKE = 1). When a software break event is generated with BKE = 0, the outputs are put in safe state and the break flag is set, but there is no effect on the break I/O.

A safe disarming mechanism prevents the system to be definitively locked-up (a low level on the break input triggers a break which enforces a low level on the same input).

When the BKDSRM bit is set to 1, this releases the break output to clear a fault signal and to give the possibility to re-arm the system.

At no point the break protection circuitry can be disabled:

- The break input path is always active: a break event is active even if the BKDSRM bit is set and the open drain control is released. This prevents the PWM output to be re-started as long as the break condition is present.
- The BKDSRM bit cannot disarm the break protection as long as the outputs are enabled (MOE bit is set) (see [Table 296](#))

**Table 296. Break protection disarming conditions**

| MOE | BKDIR | BKDSRM | Break protection state |
|-----|-------|--------|------------------------|
| 0   | 0     | X      | Armed                  |
| 0   | 1     | 0      | Armed                  |
| 0   | 1     | 1      | Disarmed               |
| 1   | X     | X      | Armed                  |

#### Arming and re-arming break circuitry

The break circuitry (in input or bidirectional mode) is armed by default (peripheral reset configuration).

The following procedure must be followed to re-arm the protection after a break event:

- The BKDSRM bit must be set to release the output control
- The software must wait until the system break condition disappears (if any) and clear the SBIF status flag (or clear it systematically before re-arming)
- The software must poll the BKDSRM bit until it is cleared by hardware (when the application break condition disappears)

From this point, the break circuitry is armed and active, and the MOE bit can be set to re-enable the PWM outputs.

**Figure 515. Output redirection**

#### 43.4.15 One-pulse mode

One-pulse mode (OPM) is a particular case of the previous modes. It allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length after a programmable delay.

Starting the counter can be controlled through the slave mode controller. Generating the waveform can be done in output compare mode or PWM mode. One-pulse mode is selected by setting the OPM bit in the TIMx\_CR1 register. This makes the counter stop automatically at the next update event UEV.

A pulse can be correctly generated only if the compare value is different from the counter initial value. Before starting (when the timer is waiting for the trigger), the configuration must be:

- $CNT < CCRx \leq ARR$  (in particular,  $0 < CCRx$ )

Figure 516. Example of one pulse mode

For example one may want to generate a positive pulse on OC1 with a length of  $t_{PULSE}$  and after a delay of  $t_{DELAY}$  as soon as a positive edge is detected on the TI2 input pin.

Let's use TI2FP2 as trigger 1:

1. Select the proper TI2[x] source (internal or external) with the TI2SEL[3:0] bits in the TIMx\_TISEL register.
2. Map TI2FP2 to TI2 by writing CC2S='01' in the TIMx\_CCMR1 register.
3. TI2FP2 must detect a rising edge, write CC2P='0' and CC2NP='0' in the TIMx\_CCER register.
4. Configure TI2FP2 as trigger for the slave mode controller (TRGI) by writing TS='00110' in the TIMx\_SMCR register.
5. TI2FP2 is used to start the counter by writing SMS to '110' in the TIMx\_SMCR register (trigger mode).

The OPM waveform is defined by writing the compare registers (taking into account the clock frequency and the counter prescaler).

- The  $t_{DELAY}$  is defined by the value written in the TIMx\_CCR1 register.
- The  $t_{PULSE}$  is defined by the difference between the auto-reload value and the compare value (TIMx\_ARR - TIMx\_CCR1).
- Let's say one want to build a waveform with a transition from '0' to '1' when a compare match occurs and a transition from '1' to '0' when the counter reaches the auto-reload value. To do this PWM mode 2 must be enabled by writing OC1M=111 in the TIMx\_CCMR1 register. Optionally the preload registers can be enabled by writing OC1PE='1' in the TIMx\_CCMR1 register and ARPE in the TIMx\_CR1 register. In this case one has to write the compare value in the TIMx\_CCR1 register, the auto-reload value in the TIMx\_ARR register, generate an update by setting the UG bit and wait for external trigger event on TI2. CC1P is written to '0' in this example.

Since only 1 pulse is needed, a 1 must be written in the OPM bit in the TIMx\_CR1 register to stop the counter at the next update event (when the counter rolls over from the auto-reload value back to 0).

Particular case: OCx fast enable

In One-pulse mode, the edge detection on TIx input set the CEN bit which enables the counter. Then the comparison between the counter and the compare value makes the output toggle. But several clock cycles are needed for these operations and it limits the minimum delay  $t_{\text{DELAY min}}$  we can get.

If one wants to output a waveform with the minimum delay, the OCxFE bit can be set in the TIMx\_CCMRx register. Then OCxRef (and OCx) are forced in response to the stimulus, without taking in account the comparison. Its new level is the same as if a compare match had occurred. OCxFE acts only if the channel is configured in PWM1 or PWM2 mode.

#### 43.4.16 Retriggerable one pulse mode (OPM) (TIM15 only)

This mode allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length, but with the following differences with Non-retriggerable one pulse mode described in [Section 43.4.15](#):

- The pulse starts as soon as the trigger occurs (no programmable delay)
- The pulse is extended if a new trigger occurs before the previous one is completed

The timer must be in Slave mode, with the bits SMS[3:0] = '1000' (Combined Reset + trigger mode) in the TIMx\_SMCR register, and the OCxM[3:0] bits set to '1000' or '1001' for Retriggerable OPM mode 1 or 2.

If the timer is configured in Up-counting mode, the corresponding CCRx must be set to 0 (the ARR register sets the pulse length). If the timer is configured in Down-counting mode, CCRx must be above or equal to ARR.

*Note:* The OCxM[3:0] and SMS[3:0] bit fields are split into two parts for compatibility reasons, the most significant bit are not contiguous with the 3 least significant ones.

*This mode must not be used with center-aligned PWM modes. It is mandatory to have CMS[1:0] = 00 in TIMx\_CR1.*

**Figure 517. Retriggerable one pulse mode**

#### 43.4.17 UIF bit remapping

The IUFREMAP bit in the TIMx\_CR1 register forces a continuous copy of the Update Interrupt Flag UIF into bit 31 of the timer counter register (TIMxCNT[31]). This allows both

the counter value and a potential roll-over condition signaled by the UIFCPY flag, to be atomically read. In particular cases, it can ease the calculations by avoiding race conditions caused for instance by a processing shared between a background task (counter reading) and an interrupt (Update Interrupt).

There is no latency between the assertions of the UIF and UIFCPY flags.

#### 43.4.18 Timer input XOR function (TIM15 only)

The TI1S bit in the TIMx\_CR2 register, allows the input filter of channel 1 to be connected to the output of a XOR gate, combining the two input pins TIMx\_CH1 and TIMx\_CH2.

The XOR output can be used with all the timer input functions such as trigger or input capture. It is useful for measuring the interval between the edges on two input signals, as shown in [Figure 518](#).

**Figure 518. Measuring time interval between edges on 2 signals**

### 43.4.19 External trigger synchronization (TIM15 only)

The TIM timers are linked together internally for timer synchronization or chaining.

The TIM15 timer can be synchronized with an external trigger in several modes: Reset mode, Gated mode and Trigger mode.

#### Slave mode: Reset mode

The counter and its prescaler can be reinitialized in response to an event on a trigger input. Moreover, if the URS bit from the TIMx\_CR1 register is low, an update event UEV is generated. Then all the preloaded registers (TIMx\_ARR, TIMx\_CCRx) are updated.

In the following example, the upcounter is cleared in response to a rising edge on TI1 input:

1. Configure the channel 1 to detect rising edges on TI1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F=0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in the TIMx\_CCMR1 register. Write CC1P='0' and CC1NP='0' in the TIMx\_CCER register to validate the polarity (and detect rising edges only).
2. Configure the timer in reset mode by writing SMS=100 in TIMx\_SMCR register. Select TI1 as the input source by writing TS=00101 in TIMx\_SMCR register.
3. Start the counter by writing CEN=1 in the TIMx\_CR1 register.

The counter starts counting on the internal clock, then behaves normally until TI1 rising edge. When TI1 rises, the counter is cleared and restarts from 0. In the meantime, the trigger flag is set (TIF bit in the TIMx\_SR register) and an interrupt request, or a DMA request can be sent if enabled (depending on the TIE and TDE bits in TIMx\_DIER register).

The following figure shows this behavior when the auto-reload register TIMx\_ARR=0x36. The delay between the rising edge on TI1 and the actual reset of the counter is due to the resynchronization circuit on TI1 input.

**Figure 519. Control circuit in reset mode**

### Slave mode: Gated mode

The counter can be enabled depending on the level of a selected input.

In the following example, the upcounter counts only when TI1 input is low:

1. Configure the channel 1 to detect low levels on TI1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F=0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S=01 in TIMx\_CCMR1 register. Write CC1P=1 and CC1NP = '0' in the TIMx\_CCER register to validate the polarity (and detect low level only).
2. Configure the timer in gated mode by writing SMS=101 in TIMx\_SMCR register. Select TI1 as the input source by writing TS=00101 in TIMx\_SMCR register.
3. Enable the counter by writing CEN=1 in the TIMx\_CR1 register (in gated mode, the counter doesn't start if CEN=0, whatever is the trigger input level).

The counter starts counting on the internal clock as long as TI1 is low and stops as soon as TI1 becomes high. The TIF flag in the TIMx\_SR register is set both when the counter starts or stops.

The delay between the rising edge on TI1 and the actual stop of the counter is due to the resynchronization circuit on TI1 input.

**Figure 520. Control circuit in gated mode**

### Slave mode: Trigger mode

The counter can start in response to an event on a selected input.

In the following example, the upcounter starts in response to a rising edge on TI2 input:

1. Configure the channel 2 to detect rising edges on TI2. Configure the input filter duration (in this example, we do not need any filter, so we keep IC2F=0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC2S bits are configured to select the input capture source only, CC2S=01 in TIMx\_CCMR1 register. Write CC2P='1' and CC2NP='0' in the TIMx\_CCER register to validate the polarity (and detect low level only).
2. Configure the timer in trigger mode by writing SMS=110 in the TIMx\_SMCR register. Select TI2 as the input source by writing TS=00110 in the TIMx\_SMCR register.

When a rising edge occurs on TI2, the counter starts counting on the internal clock and the TIF flag is set.

The delay between the rising edge on TI2 and the actual start of the counter is due to the resynchronization circuit on TI2 input.

**Figure 521. Control circuit in trigger mode**

#### 43.4.20 Slave mode – combined reset + trigger mode

In this case, a rising edge of the selected trigger input (TRGI) reinitializes the counter, generates an update of the registers, and starts the counter.

This mode is used for one-pulse mode.

#### 43.4.21 DMA burst mode

The TIMx timers have the capability to generate multiple DMA requests on a single event. The main purpose is to be able to re-program several timer registers multiple times without software overhead, but it can also be used to read several registers in a row, at regular intervals.

The DMA controller destination is unique and must point to the virtual register TIMx\_DMAR. On a given timer event, the timer launches a sequence of DMA requests (burst). Each write into the TIMx\_DMAR register is actually redirected to one of the timer registers.

The DBL[4:0] bits in the TIMx\_DCR register set the DMA burst length. The timer recognizes a burst transfer when a read or a write access is done to the TIMx\_DMAR address), i.e. the number of transfers (either in half-words or in bytes).

The DBA[4:0] bits in the TIMx\_DCR registers define the DMA base address for DMA transfers (when read/write access are done through the TIMx\_DMAR address). DBA is defined as an offset starting from the address of the TIMx\_CR1 register.

Example:

00000: TIMx\_CR1,  
00001: TIMx\_CR2,  
00010: TIMx\_SMCR,

For example, the timer DMA burst feature could be used to update the contents of the CCRx registers (x = 2, 3, 4) on an update event, with the DMA transferring half words into the CCRx registers.

This is done in the following steps:

1. Configure the corresponding DMA channel as follows:
  - DMA channel peripheral address is the DMAR register address
  - DMA channel memory address is the address of the buffer in the RAM containing the data to be transferred by DMA into the CCRx registers.
  - Number of data to transfer = 3 (See note below).
  - Circular mode disabled.
2. Configure the DCR register by configuring the DBA and DBL bit fields as follows:  
DBL = 3 transfers, DBA = 0xE.
3. Enable the TIMx update DMA request (set the UDE bit in the DIER register).
4. Enable TIMx
5. Enable the DMA channel

This example is for the case where every CCRx register is to be updated once. If every CCRx register is to be updated twice for example, the number of data to transfer should be 6. Let's take the example of a buffer in the RAM containing data1, data2, data3, data4, data5 and data6. The data is transferred to the CCRx registers as follows: on the first update DMA request, data1 is transferred to CCR2, data2 is transferred to CCR3, data3 is transferred to CCR4 and on the second update DMA request, data4 is transferred to CCR2, data5 is transferred to CCR3 and data6 is transferred to CCR4.

*Note: A null value can be written to the reserved registers.*

#### 43.4.22 Timer synchronization (TIM15)

The TIMx timers are linked together internally for timer synchronization or chaining. Refer to [Section 41.3.19: Timer synchronization](#) for details.

*Note:* The clock of the slave peripherals (timer, ADC, ...) receiving the TRGO or the TRGO2 signals must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

#### 43.4.23 Debug mode

When the system enters debug mode (processor core halted), the TIMx counter either continues to work normally or stops, depending on TIMx bit in DBGMCU module. For more details, refer to [Section 66.10.9: Microprocessor debug unit \(DBGMCU\)](#).

For safety purposes, when the counter is stopped (TIMx = 1 in DBGMCU\_D2APB2FZ1), the outputs are disabled (as if the MOE bit was reset). The outputs can either be forced to an inactive state (OSSI bit = 1), or have their control taken over by the GPIO controller (OSSI bit = 0) to force them to Hi-Z.

## 43.5 TIM15 registers

Refer to [Section 1.2](#) for a list of abbreviations used in register descriptions.

The peripheral registers can be accessed by half-words (16-bit) or words (32-bit).

### 43.5.1 TIM15 control register 1 (TIM15\_CR1)

Address offset: 0x00

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11           | 10   | 9        | 8  | 7    | 6    | 5    | 4    | 3   | 2   | 1    | 0   |
|------|------|------|------|--------------|------|----------|----|------|------|------|------|-----|-----|------|-----|
| Res. | Res. | Res. | Res. | UIFRE<br>MAP | Res. | CKD[1:0] |    | ARPE | Res. | Res. | Res. | OPM | URS | UDIS | CEN |
|      |      |      |      | rw           |      | rw       | rw | rw   |      |      |      | rw  | rw  | rw   | rw  |

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **UIFREMAP**: UIF status bit remapping

0: No remapping. UIF status bit is not copied to TIMx\_CNT register bit 31.

1: Remapping enabled. UIF status bit is copied to TIMx\_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division

This bitfield indicates the division ratio between the timer clock (CK\_INT) frequency and the dead-time and sampling clock ( $t_{DTS}$ ) used by the dead-time generators and the digital filters (TIMx)

00:  $t_{DTS} = t_{CK\_INT}$

01:  $t_{DTS} = 2 * t_{CK\_INT}$

10:  $t_{DTS} = 4 * t_{CK\_INT}$

11: Reserved, do not program this value

Bit 7 **ARPE**: Auto-reload preload enable

0: TIMx\_ARR register is not buffered

1: TIMx\_ARR register is buffered

Bits 6:4 Reserved, must be kept at reset value.

Bit 3 **OPM**: One-pulse mode

0: Counter is not stopped at update event

1: Counter stops counting at the next update event (clearing the bit CEN)

Bit 2 **URS**: Update request source

This bit is set and cleared by software to select the UEV event sources.

0: Any of the following events generate an update interrupt if enabled. These events can be:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

1: Only counter overflow/underflow generates an update interrupt if enabled

Bit 1 **UDIS**: Update disable

This bit is set and cleared by software to enable/disable UEV event generation.

0: UEV enabled. The Update (UEV) event is generated by one of the following events:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

Buffered registers are then loaded with their preload values.

1: UEV disabled. The Update event is not generated, shadow registers keep their value (ARR, PSC, CCRx). However the counter and the prescaler are reinitialized if the UG bit is set or if a hardware reset is received from the slave mode controller.

Bit 0 **CEN**: Counter enable

0: Counter disabled

1: Counter enabled

*Note: External clock and gated mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.*

### 43.5.2 TIM15 control register 2 (TIM15\_CR2)

Address offset: 0x04

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9     | 8    | 7    | 6        | 5  | 4  | 3    | 2    | 1    | 0    |
|------|------|------|------|------|------|-------|------|------|----------|----|----|------|------|------|------|
| Res. | Res. | Res. | Res. | Res. | OIS2 | OIS1N | OIS1 | TI1S | MMS[2:0] |    |    | CCDS | CCUS | Res. | CCPC |
|      |      |      |      |      | rw   | rw    | rw   | rw   | rw       | rw | rw | rw   | rw   |      | rw   |

Bits 15:11 Reserved, must be kept at reset value.

Bit 10 **OIS2**: Output idle state 2 (OC2 output)

0: OC2=0 when MOE=0

1: OC2=1 when MOE=0

*Note: This bit cannot be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in the TIM15\_BDTR register).*

Bit 9 **OIS1N**: Output Idle state 1 (OC1N output)

0: OC1N=0 after a dead-time when MOE=0

1: OC1N=1 after a dead-time when MOE=0

*Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM15\_BDTR register).*

Bit 8 **OIS1**: Output Idle state 1 (OC1 output)

0: OC1=0 (after a dead-time if OC1N is implemented) when MOE=0

1: OC1=1 (after a dead-time if OC1N is implemented) when MOE=0

*Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM15\_BDTR register).*

Bit 7 **TI1S**: TI1 selection

- 0: The TIMx\_CH1 pin is connected to TI1 input
- 1: The TIMx\_CH1, CH2 pins are connected to the TI1 input (XOR combination)

Bits 6:4 **MMS[2:0]**: Master mode selection

These bits allow to select the information to be sent in master mode to slave timers for synchronization (TRGO). The combination is as follows:

- 000: **Reset** - the UG bit from the TIMx\_EGR register is used as trigger output (TRGO). If the reset is generated by the trigger input (slave mode controller configured in reset mode) then the signal on TRGO is delayed compared to the actual reset.
- 001: **Enable** - the Counter Enable signal CNT\_EN is used as trigger output (TRGO). It is useful to start several timers at the same time or to control a window in which a slave timer is enable. The Counter Enable signal is generated by a logic AND between CEN control bit and the trigger input when configured in gated mode. When the Counter Enable signal is controlled by the trigger input, there is a delay on TRGO, except if the master/slave mode is selected (see the MSM bit description in TIMx\_SMCR register).
- 010: **Update** - The update event is selected as trigger output (TRGO). For instance a master timer can then be used as a prescaler for a slave timer.
- 011: **Compare Pulse** - The trigger output send a positive pulse when the CC1IF flag is to be set (even if it was already high), as soon as a capture or a compare match occurred. (TRGO).
- 100: **Compare** - OC1REF signal is used as trigger output (TRGO).
- 101: **Compare** - OC2REF signal is used as trigger output (TRGO).

Bit 3 **CCDS**: Capture/compare DMA selection

- 0: CCx DMA request sent when CCx event occurs
- 1: CCx DMA requests sent when update event occurs

Bit 2 **CCUS**: Capture/compare control update selection

- 0: When capture/compare control bits are preloaded (CCPC=1), they are updated by setting the COMG bit only.
- 1: When capture/compare control bits are preloaded (CCPC=1), they are updated by setting the COMG bit or when an rising edge occurs on TRGI.

*Note: This bit acts only on channels that have a complementary output.*

Bit 1 Reserved, must be kept at reset value.

Bit 0 **CCPC**: Capture/compare preloaded control

- 0: CCxE, CCxNE and OCxM bits are not preloaded
- 1: CCxE, CCxNE and OCxM bits are preloaded, after having been written, they are updated only when a commutation event (COM) occurs (COMG bit set or rising edge detected on TRGI, depending on the CCUS bit).

*Note: This bit acts only on channels that have a complementary output.*

### 43.5.3 TIM15 slave mode control register (TIM15\_SMCR)

Bits 31:22 Reserved, must be kept at reset value.

Bits 19:17 Reserved, must be kept at reset value.

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **MSM**: Master/slave mode

0: No action

1: The effect of an event on the trigger input (TRGI) is delayed to allow a perfect synchronization between the current timer and its slaves (through TRGO). It is useful if we want to synchronize several timers on a single external event.

Bits 21, 20, 6, 5, 4 **TS[4:0]**: Trigger selection

This bit field selects the trigger input to be used to synchronize the counter.

00000: Internal Trigger 0 (ITR0)

00001: Internal Trigger 1 (ITR1)

00010: Internal Trigger 2 (ITR2)

00011: Internal Trigger 3 (ITR3)

00100: TI1 Edge Detector (TI1F\_ED)

00101: Filtered Timer Input 1 (TI1FP1)

00110: Filtered Timer Input 2 (TI2FP2)

Other: Reserved

See [Table 297: TIMx Internal trigger connection on page 2318](#) for more details on ITRx meaning for each Timer.

*Note: These bits must be changed only when they are not used (e.g. when SMS=000) to avoid wrong edge detections at the transition.*

Bit 3 Reserved, must be kept at reset value.

Bits 16, 2, 1, 0 **SMS[3:0]**: Slave mode selection

When external signals are selected the active edge of the trigger signal (TRGI) is linked to the polarity selected on the external input (see Input Control register and Control Register description).

0000: Slave mode disabled - if CEN = '1' then the prescaler is clocked directly by the internal clock.

0001: Reserved

0010: Reserved

0011: Reserved

0100: Reset Mode - Rising edge of the selected trigger input (TRGI) reinitializes the counter and generates an update of the registers.

0101: Gated Mode - The counter clock is enabled when the trigger input (TRGI) is high. The counter stops (but is not reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

0110: Trigger Mode - The counter starts at a rising edge of the trigger TRGI (but it is not reset). Only the start of the counter is controlled.

0111: External Clock Mode 1 - Rising edges of the selected trigger (TRGI) clock the counter.

1000: Combined reset + trigger mode - Rising edge of the selected trigger input (TRGI) reinitializes the counter, generates an update of the registers and starts the counter.

Other codes: reserved.

*Note: The gated mode must not be used if TI1F\_ED is selected as the trigger input (TS='00100'). Indeed, TI1F\_ED outputs 1 pulse for each transition on TI1F, whereas the gated mode checks the level of the trigger signal.*

*Note: The clock of the slave peripherals (timer, ADC, ...) receiving the TRGO or the TRGO2 signals must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.*

**Table 297. TIMx Internal trigger connection**

| Slave TIM | ITR0 (TS = 00000) | ITR1 (TS = 00001) | ITR2 (TS = 00010) | ITR3 (TS = 00011) |
|-----------|-------------------|-------------------|-------------------|-------------------|
| TIM15     | TIM1              | TIM3              | TIM16 OC1         | TIM17 OC1         |

#### 43.5.4 TIM15 DMA/interrupt enable register (TIM15\_DIER)

Address offset: 0x0C

Reset value: 0x0000

| 15   | 14  | 13    | 12   | 11   | 10    | 9     | 8   | 7   | 6   | 5     | 4    | 3    | 2     | 1     | 0   |

Bit 15 Reserved, must be kept at reset value.

Bit 14 **TDE**: Trigger DMA request enable

0: Trigger DMA request disabled

1: Trigger DMA request enabled

Bit 13 **COMDE**: COM DMA request enable

0: COM DMA request disabled

1: COM DMA request enabled

Bits 12:11 Reserved, must be kept at reset value.

Bit 10 **CC2DE**: Capture/Compare 2 DMA request enable

0: CC2 DMA request disabled  
1: CC2 DMA request enabled

Bit 9 **CC1DE**: Capture/Compare 1 DMA request enable

0: CC1 DMA request disabled  
1: CC1 DMA request enabled

Bit 8 **UDE**: Update DMA request enable

0: Update DMA request disabled  
1: Update DMA request enabled

Bit 7 **BIE**: Break interrupt enable

0: Break interrupt disabled  
1: Break interrupt enabled

Bit 6 **TIE**: Trigger interrupt enable

0: Trigger interrupt disabled  
1: Trigger interrupt enabled

Bit 5 **COMIE**: COM interrupt enable

0: COM interrupt disabled  
1: COM interrupt enabled

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **CC2IE**: Capture/Compare 2 interrupt enable

0: CC2 interrupt disabled  
1: CC2 interrupt enabled

Bit 1 **CC1IE**: Capture/Compare 1 interrupt enable

0: CC1 interrupt disabled  
1: CC1 interrupt enabled

Bit 0 **UIE**: Update interrupt enable

0: Update interrupt disabled  
1: Update interrupt enabled

### 43.5.5 TIM15 status register (TIM15\_SR)

Address offset: 0x10

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10    | 9     | 8    | 7     | 6     | 5     | 4    | 3    | 2     | 1     | 0     |
|------|------|------|------|------|-------|-------|------|-------|-------|-------|------|------|-------|-------|-------|
| Res. | Res. | Res. | Res. | Res. | CC2OF | CC1OF | Res. | BIF   | TIF   | COMIF | Res. | Res. | CC2IF | CC1IF | UIF   |
|      |      |      |      |      | rc_w0 | rc_w0 |      | rc_w0 | rc_w0 | rc_w0 |      |      | rc_w0 | rc_w0 | rc_w0 |

Bits 15:11 Reserved, must be kept at reset value.

Bit 10 **CC2OF**: Capture/Compare 2 overcapture flag  
Refer to CC1OF description

Bit 9 **CC1OF**: Capture/Compare 1 overcapture flag  
This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to '0'.  
0: No overcapture has been detected  
1: The counter value has been captured in TIMx\_CCR1 register while CC1IF flag was already set

Bit 8 Reserved, must be kept at reset value.

Bit 7 **BIF**: Break interrupt flag  
This flag is set by hardware as soon as the break input goes active. It can be cleared by software if the break input is not active.  
0: No break event occurred  
1: An active level has been detected on the break input

Bit 6 **TIF**: Trigger interrupt flag  
This flag is set by hardware on the TRG trigger event (active edge detected on TRGI input when the slave mode controller is enabled in all modes but gated mode, both edges in case gated mode is selected). It is set when the counter starts or stops when gated mode is selected. It is cleared by software.  
0: No trigger event occurred  
1: Trigger interrupt pending

Bit 5 **COMIF**: COM interrupt flag  
This flag is set by hardware on a COM event (once the capture/compare control bits –CCxE, CCxNE, OCxM– have been updated). It is cleared by software.  
0: No COM event occurred  
1: COM interrupt pending

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **CC2IF**: Capture/Compare 2 interrupt flag  
refer to CC1IF description

Bit 1 **CC1IF**: Capture/Compare 1 interrupt flag

This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIMx\_CCR1 register (input capture mode only).

0: No compare match / No input capture occurred

1: A compare match or an input capture occurred

**If channel CC1 is configured as output:** this flag is set when the content of the counter TIMx\_CNT matches the content of the TIMx\_CCR1 register. When the content of TIMx\_CCR1 is greater than the content of TIMx\_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in down-counting mode). There are 3 possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIMx\_CR1 register for the full description.

**If channel CC1 is configured as input:** this bit is set when counter value has been captured in TIMx\_CCR1 register (an edge has been detected on IC1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIMx\_CCER).

Bit 0 **UIF**: Update interrupt flag

This bit is set by hardware on an update event. It is cleared by software.

0: No update occurred.

1: Update interrupt pending. This bit is set by hardware when the registers are updated:

- At overflow regarding the repetition counter value (update if repetition counter = 0) and if the UDIS=0 in the TIMx\_CR1 register.
- When CNT is reinitialized by software using the UG bit in TIMx\_EGR register, if URS=0 and UDIS=0 in the TIMx\_CR1 register.
- When CNT is reinitialized by a trigger event (refer to [Section 43.5.3: TIM15 slave mode control register \(TIM15\\_SMCR\)](#)), if URS=0 and UDIS=0 in the TIMx\_CR1 register.

### 43.5.6 TIM15 event generation register (TIM15\_EGR)

Address offset: 0x14

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7  | 6  | 5    | 4    | 3    | 2    | 1    | 0  |
|------|------|------|------|------|------|------|------|----|----|------|------|------|------|------|----|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | BG | TG | COMG | Res. | Res. | CC2G | CC1G | UG |
|      |      |      |      |      |      |      |      | w  | w  | rw   |      |      | w    | w    | w  |

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **BG**: Break generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action

1: A break event is generated. MOE bit is cleared and BIF flag is set. Related interrupt or DMA transfer can occur if enabled.

Bit 6 **TG**: Trigger generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action

1: The TIF flag is set in TIMx\_SR register. Related interrupt or DMA transfer can occur if enabled

Bit 5 **COMG**: Capture/Compare control update generation

This bit can be set by software, it is automatically cleared by hardware.

0: No action

1: When the CCPC bit is set, it is possible to update the CCxE, CCxNE and OCxM bits

*Note: This bit acts only on channels that have a complementary output.*

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **CC2G**: Capture/Compare 2 generation

Refer to CC1G description

Bit 1 **CC1G**: Capture/Compare 1 generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action

1: A capture/compare event is generated on channel 1:

**If channel CC1 is configured as output:**

CC1IF flag is set, Corresponding interrupt or DMA request is sent if enabled.

**If channel CC1 is configured as input:**

The current value of the counter is captured in TIMx\_CCR1 register. The CC1IF flag is set, the corresponding interrupt or DMA request is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation

This bit can be set by software, it is automatically cleared by hardware.

0: No action

1: Reinitialize the counter and generates an update of the registers. Note that the prescaler counter is cleared too (anyway the prescaler ratio is not affected).

### 43.5.7 TIM15 capture/compare mode register 1 [alternate] (TIM15\_CCMR1)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function in input and in output mode.

**Input capture mode:**

|           |      |      |      |             |      |           |      |           |      |      |      |             |      |           |      |
|-----------|------|------|------|-------------|------|-----------|------|-----------|------|------|------|-------------|------|-----------|------|
| 31        | 30   | 29   | 28   | 27          | 26   | 25        | 24   | 23        | 22   | 21   | 20   | 19          | 18   | 17        | 16   |
| Res.      | Res. | Res. | Res. | Res.        | Res. | Res.      | Res. | Res.      | Res. | Res. | Res. | Res.        | Res. | Res.      | Res. |
| 15        | 14   | 13   | 12   | 11          | 10   | 9         | 8    | 7         | 6    | 5    | 4    | 3           | 2    | 1         | 0    |
| IC2F[3:0] |      |      |      | IC2PSC[1:0] |      | CC2S[1:0] |      | IC1F[3:0] |      |      |      | IC1PSC[1:0] |      | CC1S[1:0] |      |
| rw        | rw   | rw   | rw   | rw          | rw   | rw        | rw   | rw        | rw   | rw   | rw   | rw          | rw   | rw        | rw   |

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC2F[3:0]**: Input capture 2 filter

Bits 11:10 **IC2PSC[1:0]**: Input capture 2 prescaler

Bits 9:8 **CC2S[1:0]**: Capture/Compare 2 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output

01: CC2 channel is configured as input, IC2 is mapped on TI2

10: CC2 channel is configured as input, IC2 is mapped on TI1

11: CC2 channel is configured as input, IC2 is mapped on TRC. This mode is working only if an internal trigger input is selected through TS bit (TIMx\_SMCR register)

*Note:* CC2S bits are writable only when the channel is OFF (CC2E = '0' in TIMx\_CCER).

Bits 7:4 **IC1F[3:0]**: Input capture 1 filter

This bit-field defines the frequency used to sample TI1 input and the length of the digital filter applied to TI1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at  $f_{DTS}$

0001:  $f_{SAMPLING}=f_{CK\_INT}$ , N=2

0010:  $f_{SAMPLING}=f_{CK\_INT}$ , N=4

0011:  $f_{SAMPLING}=f_{CK\_INT}$ , N=8

0100:  $f_{SAMPLING}=f_{DTS}/2$ , N=6

0101:  $f_{SAMPLING}=f_{DTS}/2$ , N=8

0110:  $f_{SAMPLING}=f_{DTS}/4$ , N=6

0111:  $f_{SAMPLING}=f_{DTS}/4$ , N=8

1000:  $f_{SAMPLING}=f_{DTS}/8$ , N=6

1001:  $f_{SAMPLING}=f_{DTS}/8$ , N=8

1010:  $f_{SAMPLING}=f_{DTS}/16$ , N=5

1011:  $f_{SAMPLING}=f_{DTS}/16$ , N=6

1100:  $f_{SAMPLING}=f_{DTS}/16$ , N=8

1101:  $f_{SAMPLING}=f_{DTS}/32$ , N=5

1110:  $f_{SAMPLING}=f_{DTS}/32$ , N=6

1111:  $f_{SAMPLING}=f_{DTS}/32$ , N=8

Bits 3:2 **IC1PSC[1:0]**: Input capture 1 prescaler

This bit-field defines the ratio of the prescaler acting on CC1 input (IC1). The prescaler is reset as soon as CC1E='0' (TIMx\_CCER register).

00: no prescaler, capture is done each time an edge is detected on the capture input

01: capture is done once every 2 events

10: capture is done once every 4 events

11: capture is done once every 8 events

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 Selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, IC1 is mapped on TI1

10: CC1 channel is configured as input, IC1 is mapped on TI2

11: CC1 channel is configured as input, IC1 is mapped on TRC. This mode is working only if an internal trigger input is selected through TS bit (TIMx\_SMCR register)

*Note:* CC1S bits are writable only when the channel is OFF (CC1E = '0' in TIMx\_CCER).

## 43.5.8 TIM15 capture/compare mode register 1 [alternate] (TIM15\_CCMR1)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the

corresponding CCxS bits. All the other bits of this register have a different function in input and in output mode.

#### Output compare mode:

|      |           |      |      |           |           |           |             |      |           |      |      |           |           |           |             |
|------|-----------|------|------|-----------|-----------|-----------|-------------|------|-----------|------|------|-----------|-----------|-----------|-------------|

| 15   | 14        | 13   | 12   | 11        | 10        | 9         | 8           | 7    | 6         | 5    | 4    | 3         | 2         | 1         | 0           |
| Res. | OC2M[2:0] |      |      | OC2<br>PE | OC2<br>FE | CC2S[1:0] |             | Res. | OC1M[2:0] |      |      | OC1<br>PE | OC1<br>FE | CC1S[1:0] |             |
|      | rw        | rw   | rw   | rw        | rw        | rw        | rw          |      | rw        | rw   | rw   | rw        | rw        | rw        | rw          |

Bits 31:25 Reserved, must be kept at reset value.

Bits 23:17 Reserved, must be kept at reset value.

Bit 15 Reserved, must be kept at reset value.

Bits 24, 14:12 **OC2M[3:0]**: Output Compare 2 mode

Bit 11 **OC2PE**: Output Compare 2 preload enable

Bit 10 **OC2FE**: Output Compare 2 fast enable

Bits 9:8 **CC2S[1:0]**: Capture/Compare 2 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output.

01: CC2 channel is configured as input, IC2 is mapped on TI2.

10: CC2 channel is configured as input, IC2 is mapped on TI1.

11: CC2 channel is configured as input, IC2 is mapped on TRC. This mode is working only if an internal trigger input is selected through the TS bit (TIMx\_SMCR register)

*Note: CC2S bits are writable only when the channel is OFF (CC2E = '0' in TIMx\_CCER).*

Bit 7 Reserved, must be kept at reset value.

Bits 16, 6:4 **OC1M[3:0]**: Output Compare 1 mode

These bits define the behavior of the output reference signal OC1REF from which OC1 and OC1N are derived. OC1REF is active high whereas OC1 and OC1N active level depends on CC1P and CC1NP bits.

0000: Frozen - The comparison between the output compare register TIMx\_CCR1 and the counter TIMx\_CNT has no effect on the outputs.

0001: Set channel 1 to active level on match. OC1REF signal is forced high when the counter TIMx\_CNT matches the capture/compare register 1 (TIMx\_CCR1).

0010: Set channel 1 to inactive level on match. OC1REF signal is forced low when the counter TIMx\_CNT matches the capture/compare register 1 (TIMx\_CCR1).

0011: Toggle - OC1REF toggles when TIMx\_CNT=TIMx\_CCR1.

0100: Force inactive level - OC1REF is forced low.

0101: Force active level - OC1REF is forced high.

0110: PWM mode 1 - Channel 1 is active as long as TIMx\_CNT<TIMx\_CCR1 else inactive.

0111: PWM mode 2 - Channel 1 is inactive as long as TIMx\_CNT<TIMx\_CCR1 else active.

1000: Retriggerable OPM mode 1 - In up-counting mode, the channel is active until a trigger event is detected (on TRGI signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update. In down-counting mode, the channel is inactive until a trigger event is detected (on TRGI signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update.

1001: Retriggerable OPM mode 2 - In up-counting mode, the channel is inactive until a trigger event is detected (on TRGI signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update. In down-counting mode, the channel is active until a trigger event is detected (on TRGI signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

1010: Reserved

1011: Reserved

1100: Combined PWM mode 1 - OC1REF has the same behavior as in PWM mode 1. OC1REFC is the logical OR between OC1REF and OC2REF.

1101: Combined PWM mode 2 - OC1REF has the same behavior as in PWM mode 2. OC1REFC is the logical AND between OC1REF and OC2REF.

1110: Reserved,

1111: Reserved,

*Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIMx\_BDTR register) and CC1S='00' (the channel is configured in output).*

*In PWM mode, the OCREF level changes only when the result of the comparison changes or when the output compare mode switches from "frozen" mode to "PWM" mode.*

*On channels that have a complementary output, this bit field is preloaded. If the CCPC bit is set in the TIMx\_CR2 register then the OC1M active bits take the new value from the preloaded bits only when a COM event is generated.*

Bit 3 **OC1PE**: Output Compare 1 preload enable

- 0: Preload register on TIMx\_CCR1 disabled. TIMx\_CCR1 can be written at anytime, the new value is taken in account immediately.
- 1: Preload register on TIMx\_CCR1 enabled. Read/Write operations access the preload register. TIMx\_CCR1 preload value is loaded in the active register at each update event.

*Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIMx\_BDTR register) and CC1S='00' (the channel is configured in output).*

*The PWM mode can be used without validating the preload register only in one pulse mode (OPM bit set in TIMx\_CR1 register). Else the behavior is not guaranteed.*

Bit 2 **OC1FE**: Output Compare 1 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIMx\_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

- 0: CC1 behaves normally depending on counter and CCR1 values even when the trigger is ON. The minimum delay to activate CC1 output when an edge occurs on the trigger input is 5 clock cycles.
- 1: An active edge on the trigger input acts like a compare match on CC1 output. Then, OC is set to the compare level independently of the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to 3 clock cycles. OC1FE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

- 00: CC1 channel is configured as output.
- 01: CC1 channel is configured as input, IC1 is mapped on TI1.
- 10: CC1 channel is configured as input, IC1 is mapped on TI2.
- 11: CC1 channel is configured as input, IC1 is mapped on TRC. This mode is working only if an internal trigger input is selected through TS bit (TIMx\_SMCR register)

*Note: CC1S bits are writable only when the channel is OFF (CC1E = '0' in TIMx\_CCER).*

### 43.5.9 TIM15 capture/compare enable register (TIM15\_CCER)

Address offset: 0x20

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7     | 6    | 5    | 4    | 3     | 2     | 1    | 0    |
|------|------|------|------|------|------|------|------|-------|------|------|------|-------|-------|------|------|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CC2NP | Res. | CC2P | CC2E | CC1NP | CC1NE | CC1P | CC1E |
|      |      |      |      |      |      |      |      | rw    |      | rw   | rw   | rw    | rw    | rw   | rw   |

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **CC2NP**: Capture/Compare 2 complementary output polarity  
Refer to CC1NP description

Bit 6 Reserved, must be kept at reset value.

Bit 5 **CC2P**: Capture/Compare 2 output polarity  
Refer to CC1P description

Bit 4 **CC2E**: Capture/Compare 2 output enable  
Refer to CC1E description

Bit 3 **CC1NP**: Capture/Compare 1 complementary output polarity

CC1 channel configured as output:

0: OC1N active high

1: OC1N active low

CC1 channel configured as input:

This bit is used in conjunction with CC1P to define the polarity of TI1FP1 and TI2FP1. Refer to CC1P description.

*Note: This bit is not writable as soon as LOCK level 2 or 3 has been programmed (LOCK bits in TIMx\_BDTR register) and CC1S="00" (the channel is configured in output).*

*On channels that have a complementary output, this bit is preloaded. If the CCPC bit is set in the TIMx\_CR2 register then the CC1NP active bit takes the new value from the preloaded bit only when a Commutation event is generated.*

Bit 2 **CC1NE**: Capture/Compare 1 complementary output enable

0: Off - OC1N is not active. OC1N level is then function of MOE, OSS1, OSSR, OIS1, OIS1N and CC1E bits.

1: On - OC1N signal is output on the corresponding output pin depending on MOE, OSS1, OSSR, OIS1, OIS1N and CC1E bits.

Bit 1 **CC1P**: Capture/Compare 1 output polarity

0: OC1 active high (output mode) / Edge sensitivity selection (input mode, see below)

1: OC1 active low (output mode) / Edge sensitivity selection (input mode, see below)

**When CC1 channel is configured as input**, both CC1NP/CC1P bits select the active polarity of TI1FP1 and TI2FP1 for trigger or capture operations.

CC1NP=0, CC1P=0: non-inverted/rising edge. The circuit is sensitive to TIxFP1 rising edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode or encoder mode).

CC1NP=0, CC1P=1: inverted/falling edge. The circuit is sensitive to TIxFP1 falling edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is inverted (trigger operation in gated mode or encoder mode).

CC1NP=1, CC1P=1: non-inverted/both edges/ The circuit is sensitive to both TIxFP1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode). This configuration must not be used in encoder mode.

CC1NP=1, CC1P=0: this configuration is reserved, it must not be used.

*Note: This bit is not writable as soon as LOCK level 2 or 3 has been programmed (LOCK bits in TIMx\_BDTR register).*

*On channels that have a complementary output, this bit is preloaded. If the CCPC bit is set in the TIMx\_CR2 register then the CC1P active bit takes the new value from the preloaded bit only when a Commutation event is generated.*

Bit 0 **CC1E**: Capture/Compare 1 output enable

0: Capture mode disabled / OC1 is not active (see below)

1: Capture mode enabled / OC1 signal is output on the corresponding output pin

**When CC1 channel is configured as output**, the OC1 level depends on MOE, OSS1, OSSR, OIS1, OIS1N and CC1NE bits, regardless of the CC1E bits state. Refer to [Table 298](#) for details.

**Table 298. Output control bits for complementary OCx and OCxN channels with break feature (TIM15)**

| Control bits |          |          |          |           | Output states <sup>(1)</sup>                                                                                                                                                                                                                           |                                                                         |

|              |          |          | 0        | 1         | Off-State (output enabled with inactive state)<br>Asynchronously: OCx=CCxP, OCxN=CCxNP<br>Then if the clock is present: OCx=OISx and OCxN=OISxN after a dead-time, assuming that OISx and OISxN do not correspond to OCX and OCxN both in active state |                                                                         |
|              |          |          | 1        | 0         |                                                                                                                                                                                                                                                        |                                                                         |
|              |          |          | 1        | 1         |                                                                                                                                                                                                                                                        |                                                                         |

1. When both outputs of a channel are not used (control taken over by GPIO controller), the OISx, OISxN, CCxP and CCxNP bits must be kept cleared.

**Note:** *The state of the external I/O pins connected to the complementary OCx and OCxN channels depends on the OCx and OCxN channel state and AFIO registers.*

### 43.5.10 TIM15 counter (TIM15\_CNT)

Address offset: 0x24

Reset value: 0x0000 0000

|            |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
|------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|

| r          |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| 15         | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
| CNT[15:0]  |      |      |      |      |      |      |      |      |      |      |      |      |      |      |      |
| rw         | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   | rw   |

Bit 31 **UIFCPY**: UIF Copy

This bit is a read-only copy of the UIF bit in the TIMx\_ISR register.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]**: Counter value

### 43.5.11 TIM15 prescaler (TIM15\_PSC)

Address offset: 0x28

Reset value: 0x0000

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| PSC[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **PSC[15:0]**: Prescaler value

The counter clock frequency (CK\_CNT) is equal to  $f_{CK\_PSC} / (PSC[15:0] + 1)$ .

PSC contains the value to be loaded in the active prescaler register at each update event (including when the counter is cleared through UG bit of TIMx\_EGR register or through trigger controller when configured in “reset mode”).

### 43.5.12 TIM15 auto-reload register (TIM15\_ARR)

Address offset: 0x2C

Reset value: 0xFFFF

|           |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15        | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| ARR[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw        | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **ARR[15:0]**: Auto-reload value

ARR is the value to be loaded in the actual auto-reload register.

Refer to the [Section 43.4.1: Time-base unit on page 2278](#) for more details about ARR update and behavior.

The counter is blocked while the auto-reload value is null.

### 43.5.13 TIM15 repetition counter register (TIM15\_RCR)

Address offset: 0x30

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7        | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|------|------|------|------|------|------|------|------|----------|----|----|----|----|----|----|----|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | REP[7:0] |    |    |    |    |    |    |    |
|      |      |      |      |      |      |      |      | rw       | rw | rw | rw | rw | rw | rw | rw |

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **REP[7:0]**: Repetition counter value

These bits allow the user to set-up the update rate of the compare registers (i.e. periodic transfers from preload to active registers) when preload registers are enable, as well as the update interrupt generation rate, if this interrupt is enable.

Each time the REP\_CNT related downcounter reaches zero, an update event is generated and it restarts counting from REP value. As REP\_CNT is reloaded with REP value only at the repetition update event U\_RC, any write to the TIMx\_RCR register is not taken in account until the next repetition update event.

It means in PWM mode (REP+1) corresponds to the number of PWM periods in edge-aligned mode.

### 43.5.14 TIM15 capture/compare register 1 (TIM15\_CCR1)

Address offset: 0x34

Reset value: 0x0000

| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| CCR1[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **CCR1[15:0]**: Capture/Compare 1 value

**If channel CC1 is configured as output:**

CCR1 is the value to be loaded in the actual capture/compare 1 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIMx\_CCMR1 register (bit OC1PE). Else the preload value is copied in the active capture/compare 1 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx\_CNT and signaled on OC1 output.

**If channel CC1 is configured as input:**

CCR1 is the counter value transferred by the last input capture 1 event (IC1).

### 43.5.15 TIM15 capture/compare register 2 (TIM15\_CCR2)

Address offset: 0x38

Reset value: 0x0000

|            |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| CCR2[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **CCR2[15:0]**: Capture/Compare 2 value

**If channel CC2 is configured as output:**

CCR2 is the value to be loaded in the actual capture/compare 2 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIMx\_CCMR2 register (bit OC2PE). Else the preload value is copied in the active capture/compare 2 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx\_CNT and signalled on OC2 output.

**If channel CC2 is configured as input:**

CCR2 is the counter value transferred by the last input capture 2 event (IC2).

### 43.5.16 TIM15 break and dead-time register (TIM15\_BDTR)

Address offset: 0x44

Reset value: 0x0000 0000

|      |      |      |       |      |        |           |      |          |      |      |      |          |    |    |    |
|------|------|------|-------|------|--------|-----------|------|----------|------|------|------|----------|----|----|----|
| 31   | 30   | 29   | 28    | 27   | 26     | 25        | 24   | 23       | 22   | 21   | 20   | 19       | 18 | 17 | 16 |
| Res. | Res. | Res. | BKBID | Res. | BKDSRM | Res.      | Res. | Res.     | Res. | Res. | Res. | BKF[3:0] |    |    |    |
|      |      |      | rw    |      | rw     |           |      |          |      |      |      | rw       | rw | rw | rw |
| 15   | 14   | 13   | 12    | 11   | 10     | 9         | 8    | 7        | 6    | 5    | 4    | 3        | 2  | 1  | 0  |
| MOE  | AOE  | BKP  | BKE   | OSSR | OSSI   | LOCK[1:0] |      | DTG[7:0] |      |      |      |          |    |    |    |
| rw   | rw   | rw   | rw    | rw   | rw     | rw        | rw   | rw       | rw   | rw   | rw   | rw       | rw | rw | rw |

**Note:** As the BKBID, BKDSRM, BKF[3:0], AOE, BKP, BKE, OSSI, OSSR and DTG[7:0] bits may be write-locked depending on the LOCK configuration, it may be necessary to configure all of them during the first write access to the TIMx\_BDTR register.

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **BKBID**: Break Bidirectional

0: Break input BRK in input mode

1: Break input BRK in bidirectional mode

In the bidirectional mode (BKBID bit set to 1), the break input is configured both in input mode and in open drain output mode. Any active break event asserts a low logic level on the Break input to indicate an internal break event to external devices.

**Note:** This bit cannot be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).

**Note:** Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bit 27 Reserved, must be kept at reset value.

Bit 26 **BKDSRM**: Break Disarm

- 0: Break input BRK is armed
- 1: Break input BRK is disarmed

This bit is cleared by hardware when no break source is active.

The BKDSRM bit must be set by software to release the bidirectional output control (open-drain output in Hi-Z state) and then be polled it until it is reset by hardware, indicating that the fault condition has disappeared.

*Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.*

Bits 25:20 Reserved, must be kept at reset value.

Bits 19:16 **BKF[3:0]**: Break filter

This bit-field defines the frequency used to sample the BRK input signal and the length of the digital filter applied to BRK. The digital filter is made of an event counter in which N events are needed to validate a transition on the output:

0000: No filter, BRK acts asynchronously

0001:  $f_{\text{SAMPLING}} = f_{\text{CK\_INT}}$ , N=2

0010:  $f_{\text{SAMPLING}} = f_{\text{CK\_INT}}$ , N=4

0011:  $f_{\text{SAMPLING}} = f_{\text{CK\_INT}}$ , N=8

0100:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/2$ , N=6

0101:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/2$ , N=8

0110:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/4$ , N=6

0111:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/4$ , N=8

1000:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/8$ , N=6

1001:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/8$ , N=8

1010:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/16$ , N=5

1011:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/16$ , N=6

1100:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/16$ , N=8

1101:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/32$ , N=5

1110:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/32$ , N=6

1111:  $f_{\text{SAMPLING}} = f_{\text{DTS}}/32$ , N=8

*Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bit 15 **MOE**: Main output enable

This bit is cleared asynchronously by hardware as soon as the break input is active. It is set by software or automatically depending on the AOE bit. It is acting only on the channels which are configured in output.

0: OC and OCN outputs are disabled or forced to idle state depending on the OSSI bit.

1: OC and OCN outputs are enabled if their respective enable bits are set (CCxE, CCxNE in TIMx\_CCER register)

See OC/OCN enable description for more details ([Section 43.5.9: TIM15 capture/compare enable register \(TIM15\\_CCER\) on page 2326](#)).

Bit 14 **AOE**: Automatic output enable

0: MOE can be set only by software

1: MOE can be set by software or automatically at the next update event (if the break input is not be active)

*Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bit 13 **BKP**: Break polarity

- 0: Break input BRK is active low
- 1: Break input BRK is active high

*Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

*Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.*

Bit 12 **BKE**: Break enable

- 0: Break inputs (BRK and CCS clock failure event) disabled
- 1: Break inputs (BRK and CCS clock failure event) enabled

This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).

*Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.*

Bit 11 **OSSR**: Off-state selection for Run mode

This bit is used when MOE=1 on channels that have a complementary output which are configured as outputs. OSSR is not implemented if no complementary output is implemented in the timer.

See OC/OCN enable description for more details ([Section 43.5.9: TIM15 capture/compare enable register \(TIM15\\_CCER\) on page 2326](#)).

- 0: When inactive, OC/OCN outputs are disabled (the timer releases the output control which is taken over by the AFIO logic, which forces a Hi-Z state)
- 1: When inactive, OC/OCN outputs are enabled with their inactive level as soon as CCxE=1 or CCxNE=1 (the output is still controlled by the timer).

*Note: This bit can not be modified as soon as the LOCK level 2 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bit 10 **OSSI**: Off-state selection for Idle mode

This bit is used when MOE=0 on channels configured as outputs.

See OC/OCN enable description for more details ([Section 43.5.9: TIM15 capture/compare enable register \(TIM15\\_CCER\) on page 2326](#)).

- 0: When inactive, OC/OCN outputs are disabled (OC/OCN enable output signal=0)
- 1: When inactive, OC/OCN outputs are forced first with their idle level as soon as CCxE=1 or CCxNE=1. OC/OCN enable output signal=1)

*Note: This bit can not be modified as soon as the LOCK level 2 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bits 9:8 **LOCK[1:0]**: Lock configuration

These bits offer a write protection against software errors.

- 00: LOCK OFF - No bit is write protected
- 01: LOCK Level 1 = DTG bits in TIMx\_BDTR register, OISx and OISxN bits in TIMx\_CR2 register and BKE/BKP/AOE bits in TIMx\_BDTR register can no longer be written
- 10: LOCK Level 2 = LOCK Level 1 + CC Polarity bits (CCxP/CCxNP bits in TIMx\_CCER register, as long as the related channel is configured in output through the CCxS bits) as well as OSSR and OSSI bits can no longer be written.
- 11: LOCK Level 3 = LOCK Level 2 + CC Control bits (OCxM and OCxPE bits in TIMx\_CCMRx registers, as long as the related channel is configured in output through the CCxS bits) can no longer be written.

*Note: The LOCK bits can be written only once after the reset. Once the TIMx\_BDTR register has been written, their content is frozen until the next reset.*

Bits 7:0 **DTG[7:0]**: Dead-time generator setup

This bit-field defines the duration of the dead-time inserted between the complementary outputs. DT correspond to this duration.

$DTG[7:5]=0xx \Rightarrow DT=DTG[7:0] \times t_{dtg}$  with  $t_{dtg}=t_{DTS}$

$DTG[7:5]=10x \Rightarrow DT=(64+DTG[5:0]) \times t_{dtg}$  with  $T_{dtg}=2 \times t_{DTS}$

$DTG[7:5]=110 \Rightarrow DT=(32+DTG[4:0]) \times t_{dtg}$  with  $T_{dtg}=8 \times t_{DTS}$

$DTG[7:5]=111 \Rightarrow DT=(32+DTG[4:0]) \times t_{dtg}$  with  $T_{dtg}=16 \times t_{DTS}$

Example if  $T_{DTS}=125\text{ns}$  (8MHz), dead-time possible values are:

0 to 15875 ns by 125 ns steps,

16  $\mu\text{s}$  to 31750 ns by 250 ns steps,

32  $\mu\text{s}$  to 63  $\mu\text{s}$  by 1  $\mu\text{s}$  steps,

64  $\mu\text{s}$  to 126  $\mu\text{s}$  by 2  $\mu\text{s}$  steps

*Note: This bit-field can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx\_BDTR register).*

### 43.5.17 TIM15 DMA control register (TIM15\_DCR)

Address offset: 0x48

Reset value: 0x0000

| 15   | 14   | 13   | 12       | 11 | 10 | 9  | 8  | 7    | 6    | 5    | 4        | 3  | 2  | 1  | 0  |
|------|------|------|----------|----|----|----|----|------|------|------|----------|----|----|----|----|
| Res. | Res. | Res. | DBL[4:0] |    |    |    |    | Res. | Res. | Res. | DBA[4:0] |    |    |    |    |
|      |      |      | rw       | rw | rw | rw | rw |      |      |      | rw       | rw | rw | rw | rw |

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **DBL[4:0]**: DMA burst length

This 5-bit field defines the length of DMA transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIMx\_DMAR address).

00000: 1 transfer,

00001: 2 transfers,

00010: 3 transfers,

...

10001: 18 transfers.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **DBA[4:0]**: DMA base address

This 5-bit field defines the base-address for DMA transfers (when read/write access are done through the TIMx\_DMAR address). DBA is defined as an offset starting from the address of the TIMx\_CR1 register.

Example:

00000: TIMx\_CR1,

00001: TIMx\_CR2,

00010: TIMx\_SMCR,

...

### 43.5.18 TIM15 DMA address for full transfer (TIM15\_DMAR)

Address offset: 0x4C

Reset value: 0x0000

| 15         | 14 | 13 | 12 | 11 | 10 | 9  | 8  | 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| DMAB[15:0] |    |    |    |    |    |    |    |    |    |    |    |    |    |    |    |
| rw         | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw | rw |

Bits 15:0 **DMAB[15:0]**: DMA register for burst accesses

A read or write operation to the DMAR register accesses the register located at the address  
 $(\text{TIMx\_CR1 address}) + (\text{DBA} + \text{DMA index}) \times 4$

where TIMx\_CR1 address is the address of the control register 1, DBA is the DMA base address configured in TIMx\_DCR register, DMA index is automatically controlled by the DMA transfer, and ranges from 0 to DBL (DBL configured in TIMx\_DCR).

### 43.5.19 TIM15 alternate register 1 (TIM15\_AF1)

Address offset: 0x60

Reset value: 0x0000 0001

|      |      |      |      |      |      |       |               |      |      |      |      |      |      |      |       |
|------|------|------|------|------|------|-------|---------------|------|------|------|------|------|------|------|-------|
| 31   | 30   | 29   | 28   | 27   | 26   | 25    | 24            | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16    |
| Res. | Res. | Res. | Res. | Res. | Res. | Res.  | Res.          | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res.  |
|      |      |      |      |      |      |       |               |      |      |      |      |      |      |      |       |
| 15   | 14   | 13   | 12   | 11   | 10   | 9     | 8             | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0     |
| Res. | Res. | Res. | Res. | Res. | Res. | BKINP | BKDF1<br>BKOE | Res. | Res. | Res. | Res. | Res. | Res. | Res. | BKINE |
|      |      |      |      |      |      | rw    | rw            |      |      |      |      |      |      |      | rw    |

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **BKINP**: BRK BKIN input polarity

This bit selects the BKIN alternate function input sensitivity. It must be programmed together with the BKP polarity bit.

0: BKIN input is active low

1: BKIN input is active high

*Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bit 8 **BKDF1BKOE**: BRK dfsdm1\_break[0] enable

This bit enables the dfsdm1\_break[0] for the timer's BRK input. dfsdm1\_break[0] output is 'ORed' with the other BRK sources.

0: dfsdm1\_break[0]input disabled

1: dfsdm1\_break[0]input enabled

*Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **BKINE**: BRK BKIN input enable

This bit enables the BKIN alternate function input for the timer's BRK input. BKIN input is 'ORed' with the other BRK sources.

0: BKIN input disabled

1: BKIN input enabled

*Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx\_BDTR register).*

### 43.5.20 TIM15 input selection register (TIM15\_TISEL)

Address offset: 0x68

Reset value: 0x0000 0000

|      |      |      |      |             |      |      |      |      |      |      |      |             |      |      |      |
|------|------|------|------|-------------|------|------|------|------|------|------|------|-------------|------|------|------|

|      |      |      |      | rw          | rw   | rw   | rw   |      |      |      |      | rw          | rw   | rw   | rw   |

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **T12SEL[3:0]**: selects TI2[0] to TI2[15] input

0000: TIM15\_CH2 input

0001: TIM2\_CH2 input

0010: TIM3\_CH2 input

0011: TIM4\_CH2 input

Others: Reserved

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **T11SEL[3:0]**: selects TI1[0] to TI1[15] input

0000: TIM15\_CH1 input

0001: TIM2\_CH1 input

0010: TIM3\_CH1 input

0011: TIM4\_CH1 input

0100: LSE

0101: CSI

0110: MCO2

0111: hsi\_cal\_ck

1000: csi\_cal\_ck

Other: Reserved

### 43.5.21 TIM15 register map

TIM15 registers are mapped as 16-bit addressable registers as described in the table below:

Table 299. TIM15 register map and reset values

| Offset | Register name    | 31   | 30   | 29   | 28   | 27   | 26   | 25   | 24   | 23   | 22   | 21   | 20   | 19   | 18   | 17   | 16   | 15   | 14   | 13   | 12   | 11      | 10   | 9         | 8 | 7    | 6    | 5    | 4    | 3   | 2   | 1    | 0   |
|--------|------------------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|---------|------|-----------|---|------|------|------|------|-----|-----|------|-----|

Refer to [Section 2.5 on page 157](#) for the register boundary addresses.

## 43.6 TIM16/TIM17 registers

Refer to [Section 1.2](#) for a list of abbreviations used in register descriptions.

The peripheral registers can be accessed by half-words (16-bit) or words (32-bit).

### 43.6.1 TIMx control register 1 (TIMx\_CR1)(x = 16 to 17)

Address offset: 0x00

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11           | 10   | 9        | 8  | 7    | 6    | 5    | 4    | 3   | 2   | 1    | 0   |
|------|------|------|------|--------------|------|----------|----|------|------|------|------|-----|-----|------|-----|
| Res. | Res. | Res. | Res. | UIFRE<br>MAP | Res. | CKD[1:0] |    | ARPE | Res. | Res. | Res. | OPM | URS | UDIS | CEN |
|      |      |      |      | rw           |      | rw       | rw | rw   |      |      |      | rw  | rw  | rw   | rw  |

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **UIFREMAP**: UIF status bit remapping

0: No remapping. UIF status bit is not copied to TIMx\_CNT register bit 31.

1: Remapping enabled. UIF status bit is copied to TIMx\_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division

This bit-field indicates the division ratio between the timer clock (CK\_INT) frequency and the dead-time and sampling clock ( $t_{DTS}$ ) used by the dead-time generators and the digital filters (Tlx),

00:  $t_{DTS}=t_{CK\_INT}$

01:  $t_{DTS}=2*t_{CK\_INT}$

10:  $t_{DTS}=4*t_{CK\_INT}$

11: Reserved, do not program this value

Bit 7 **ARPE**: Auto-reload preload enable

0: TIMx\_ARR register is not buffered

1: TIMx\_ARR register is buffered

Bits 6:4 Reserved, must be kept at reset value.

Bit 3 **OPM**: One pulse mode

0: Counter is not stopped at update event

1: Counter stops counting at the next update event (clearing the bit CEN)

Bit 2 **URS**: Update request source

This bit is set and cleared by software to select the UEV event sources.

0: Any of the following events generate an update interrupt or DMA request if enabled.

These events can be:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

1: Only counter overflow/underflow generates an update interrupt or DMA request if enabled.

Bit 1 **UDIS**: Update disable

This bit is set and cleared by software to enable/disable UEV event generation.

0: UEV enabled. The Update (UEV) event is generated by one of the following events:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

Buffered registers are then loaded with their preload values.

1: UEV disabled. The Update event is not generated, shadow registers keep their value (ARR, PSC, CCRx). However the counter and the prescaler are reinitialized if the UG bit is set or if a hardware reset is received from the slave mode controller.

Bit 0 **CEN**: Counter enable

0: Counter disabled

1: Counter enabled

*Note: External clock and gated mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.*

### 43.6.2 TIMx control register 2 (TIMx\_CR2)(x = 16 to 17)

Address offset: 0x04

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9     | 8    | 7    | 6    | 5    | 4    | 3    | 2    | 1    | 0    |
|------|------|------|------|------|------|-------|------|------|------|------|------|------|------|------|------|
| Res. | Res. | Res. | Res. | Res. | Res. | OIS1N | OIS1 | Res. | Res. | Res. | Res. | CCDS | CCUS | Res. | CCPC |
|      |      |      |      |      |      | rw    | rw   |      |      |      |      | rw   | rw   |      | rw   |

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **OIS1N**: Output Idle state 1 (OC1N output)

0: OC1N=0 after a dead-time when MOE=0

1: OC1N=1 after a dead-time when MOE=0

*Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bit 8 **OIS1**: Output Idle state 1 (OC1 output)

0: OC1=0 (after a dead-time if OC1N is implemented) when MOE=0

1: OC1=1 (after a dead-time if OC1N is implemented) when MOE=0

*Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx\_BDTR register).*

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **CCDS**: Capture/compare DMA selection

0: CCx DMA request sent when CCx event occurs

1: CCx DMA requests sent when update event occurs

Bit 2 **CCUS**: Capture/compare control update selection

0: When capture/compare control bits are preloaded (CCPC=1), they are updated by setting the COMG bit only.

1: When capture/compare control bits are preloaded (CCPC=1), they are updated by setting the COMG bit or when an rising edge occurs on TRGI.

*Note: This bit acts only on channels that have a complementary output.*

Bit 1 Reserved, must be kept at reset value.

Bit 0 **CCPC**: Capture/compare preloaded control

0: CCxE, CCxNE and OCxM bits are not preloaded

1: CCxE, CCxNE and OCxM bits are preloaded, after having been written, they are updated only when COM bit is set.

*Note: This bit acts only on channels that have a complementary output.*

### 43.6.3 TIMx DMA/interrupt enable register (TIMx\_DIER)(x = 16 to 17)

Address offset: 0x0C

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9     | 8   | 7   | 6    | 5     | 4    | 3    | 2    | 1     | 0   |
|------|------|------|------|------|------|-------|-----|-----|------|-------|------|------|------|-------|-----|
| Res. | Res. | Res. | Res. | Res. | Res. | CC1DE | UDE | BIE | Res. | COMIE | Res. | Res. | Res. | CC1IE | UIE |
|      |      |      |      |      |      | rw    | rw  | rw  |      | rw    |      |      |      | rw    | rw  |

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **CC1DE**: Capture/Compare 1 DMA request enable

0: CC1 DMA request disabled

1: CC1 DMA request enabled

Bit 8 **UDE**: Update DMA request enable

0: Update DMA request disabled

1: Update DMA request enabled

Bit 7 **BIE**: Break interrupt enable

0: Break interrupt disabled

1: Break interrupt enabled

Bit 6 Reserved, must be kept at reset value.

Bit 5 **COMIE**: COM interrupt enable

0: COM interrupt disabled

1: COM interrupt enabled

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **CC1IE**: Capture/Compare 1 interrupt enable

0: CC1 interrupt disabled

1: CC1 interrupt enabled

Bit 0 **UIE**: Update interrupt enable

0: Update interrupt disabled

1: Update interrupt enabled

### 43.6.4 TIMx status register (TIMx\_SR)(x = 16 to 17)

Address offset: 0x10

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9     | 8    | 7     | 6    | 5     | 4    | 3    | 2    | 1     | 0     |
|------|------|------|------|------|------|-------|------|-------|------|-------|------|------|------|-------|-------|
| Res. | Res. | Res. | Res. | Res. | Res. | CC1OF | Res. | BIF   | Res. | COMIF | Res. | Res. | Res. | CC1IF | UIF   |
|      |      |      |      |      |      | rc_w0 |      | rc_w0 |      | rc_w0 |      |      |      | rc_w0 | rc_w0 |

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **CC1OF**: Capture/Compare 1 overcapture flag

This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to '0'.

0: No overcapture has been detected

1: The counter value has been captured in TIMx\_CCR1 register while CC1IF flag was already set

Bit 8 Reserved, must be kept at reset value.

Bit 7 **BIF**: Break interrupt flag

This flag is set by hardware as soon as the break input goes active. It can be cleared by software if the break input is not active.

0: No break event occurred

1: An active level has been detected on the break input

Bit 6 Reserved, must be kept at reset value.

Bit 5 **COMIF**: COM interrupt flag

This flag is set by hardware on a COM event (once the capture/compare control bits –CCxE, CCxNE, OCxM– have been updated). It is cleared by software.

0: No COM event occurred

1: COM interrupt pending

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **CC1IF**: Capture/Compare 1 interrupt flag

This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIMx\_CCR1 register (input capture mode only).

0: No compare match / No input capture occurred

1: A compare match or an input capture occurred

**If channel CC1 is configured as output:** this flag is set when the content of the counter TIMx\_CNT matches the content of the TIMx\_CCR1 register. When the content of TIMx\_CCR1 is greater than the content of TIMx\_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in down-counting mode). There are 3 possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIMx\_CR1 register for the full description.

**If channel CC1 is configured as input:** this bit is set when counter value has been captured in TIMx\_CCR1 register (an edge has been detected on IC1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIMx\_CCER).

Bit 0 **UIF**: Update interrupt flag

This bit is set by hardware on an update event. It is cleared by software.

0: No update occurred.

1: Update interrupt pending. This bit is set by hardware when the registers are updated:

- At overflow regarding the repetition counter value (update if repetition counter = 0) and if the UDIS=0 in the TIMx\_CR1 register.
- When CNT is reinitialized by software using the UG bit in TIMx\_EGR register, if URS=0 and UDIS=0 in the TIMx\_CR1 register.

### 43.6.5 TIMx event generation register (TIMx\_EGR)(x = 16 to 17)

Address offset: 0x14

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7  | 6    | 5    | 4    | 3    | 2    | 1    | 0  |
|------|------|------|------|------|------|------|------|----|------|------|------|------|------|------|----|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | BG | Res. | COMG | Res. | Res. | Res. | CC1G | UG |
|      |      |      |      |      |      |      |      | w  |      | w    |      |      |      | w    | w  |

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **BG**: Break generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action.

1: A break event is generated. MOE bit is cleared and BIF flag is set. Related interrupt or DMA transfer can occur if enabled.

Bit 6 Reserved, must be kept at reset value.

Bit 5 **COMG**: Capture/Compare control update generation

This bit can be set by software, it is automatically cleared by hardware.

0: No action

1: When the CCPC bit is set, it is possible to update the CCxE, CCxNE and OCxM bits

*Note: This bit acts only on channels that have a complementary output.*

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **CC1G**: Capture/Compare 1 generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action.

1: A capture/compare event is generated on channel 1:

**If channel CC1 is configured as output:**

CC1IF flag is set, Corresponding interrupt or DMA request is sent if enabled.

**If channel CC1 is configured as input:**

The current value of the counter is captured in TIMx\_CCR1 register. The CC1IF flag is set, the corresponding interrupt or DMA request is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation

This bit can be set by software, it is automatically cleared by hardware.

0: No action.

1: Reinitialize the counter and generates an update of the registers. Note that the prescaler counter is cleared too (anyway the prescaler ratio is not affected).

### 43.6.6 TIMx capture/compare mode register 1 [alternate] (TIMx\_CCMR1) (x = 16 to 17)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function in input and in output mode.

#### Input capture mode:

|      |      |      |      |      |      |      |      |           |      |      |      |             |      |           |      |

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **IC1F[3:0]**: Input capture 1 filter

This bit-field defines the frequency used to sample T11 input and the length of the digital filter applied to T11. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at  $f_{DTS}$

0001:  $f_{SAMPLING}=f_{CK\_INT}$ , N=2

0010:  $f_{SAMPLING}=f_{CK\_INT}$ , N=4

0011:  $f_{SAMPLING}=f_{CK\_INT}$ , N=8

0100:  $f_{SAMPLING}=f_{DTS}/2$ , N=

0101:  $f_{SAMPLING}=f_{DTS}/2$ , N=8

0110:  $f_{SAMPLING}=f_{DTS}/4$ , N=6

0111:  $f_{SAMPLING}=f_{DTS}/4$ , N=8

1000:  $f_{SAMPLING}=f_{DTS}/8$ , N=6

1001:  $f_{SAMPLING}=f_{DTS}/8$ , N=8

1010:  $f_{SAMPLING}=f_{DTS}/16$ , N=5

1011:  $f_{SAMPLING}=f_{DTS}/16$ , N=6

1100:  $f_{SAMPLING}=f_{DTS}/16$ , N=8

1101:  $f_{SAMPLING}=f_{DTS}/32$ , N=5

1110:  $f_{SAMPLING}=f_{DTS}/32$ , N=6

1111:  $f_{SAMPLING}=f_{DTS}/32$ , N=8

Bits 3:2 **IC1PSC[1:0]**: Input capture 1 prescaler

This bit-field defines the ratio of the prescaler acting on CC1 input (IC1).

The prescaler is reset as soon as CC1E='0' (TIMx\_CCER register).

00: no prescaler, capture is done each time an edge is detected on the capture input.

01: capture is done once every 2 events

10: capture is done once every 4 events

11: capture is done once every 8 events

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 Selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, IC1 is mapped on T11

Others: Reserved

*Note: CC1S bits are writable only when the channel is OFF (CC1E = '0' in TIMx\_CCER).*

### 43.6.7 TIMx capture/compare mode register 1 [alternate] (TIMx\_CCMR1) (x = 16 to 17)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function in input and in output mode.

**Output compare mode:**

|      |      |      |      |      |      |      |      |      |           |      |      |       |       |           |         |

Bits 31:17 Reserved, must be kept at reset value.

Bits 15:7 Reserved, must be kept at reset value.

Bits 16, 6:4 **OC1M[3:0]**: Output Compare 1 mode

These bits define the behavior of the output reference signal OC1REF from which OC1 and OC1N are derived. OC1REF is active high whereas OC1 and OC1N active level depends on CC1P and CC1NP bits.

0000: Frozen - The comparison between the output compare register TIMx\_CCR1 and the counter TIMx\_CNT has no effect on the outputs.

0001: Set channel 1 to active level on match. OC1REF signal is forced high when the counter TIMx\_CNT matches the capture/compare register 1 (TIMx\_CCR1).

0010: Set channel 1 to inactive level on match. OC1REF signal is forced low when the counter TIMx\_CNT matches the capture/compare register 1 (TIMx\_CCR1).

0011: Toggle - OC1REF toggles when TIMx\_CNT=TIMx\_CCR1.

0100: Force inactive level - OC1REF is forced low.

0101: Force active level - OC1REF is forced high.

0110: PWM mode 1 - Channel 1 is active as long as TIMx\_CNT<TIMx\_CCR1 else inactive.

0111: PWM mode 2 - Channel 1 is inactive as long as TIMx\_CNT<TIMx\_CCR1 else active.

All other values: Reserved

*Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIMx\_BDTR register) and CC1S='00' (the channel is configured in output).*

*In PWM mode 1 or 2, the OCREF level changes only when the result of the comparison changes or when the output compare mode switches from "frozen" mode to "PWM" mode.*

Bit 3 **OC1PE**: Output Compare 1 preload enable

0: Preload register on TIMx\_CCR1 disabled. TIMx\_CCR1 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIMx\_CCR1 enabled. Read/Write operations access the preload register. TIMx\_CCR1 preload value is loaded in the active register at each update event.

*Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIMx\_BDTR register) and CC1S='00' (the channel is configured in output).*

*The PWM mode can be used without validating the preload register only in one pulse mode (OPM bit set in TIMx\_CR1 register). Else the behavior is not guaranteed.*

Bit 2 **OC1FE**: Output Compare 1 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIMx\_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

0: CC1 behaves normally depending on counter and CCR1 values even when the trigger is ON. The minimum delay to activate CC1 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC1 output. Then, OC is set to the compare level independently of the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to 3 clock cycles. OC1FE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bit-field defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, IC1 is mapped on TI1

Others: Reserved

*Note: CC1S bits are writable only when the channel is OFF (CC1E = '0' in TIMx\_CCER).*

### 43.6.8 TIMx capture/compare enable register (TIMx\_CCER)(x = 16 to 17)

Address offset: 0x20

Reset value: 0x0000

| 15   | 14   | 13   | 12   | 11   | 10   | 9    | 8    | 7    | 6    | 5    | 4    | 3     | 2     | 1    | 0    |
|------|------|------|------|------|------|------|------|------|------|------|------|-------|-------|------|------|
| Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | Res. | CC1NP | CC1NE | CC1P | CC1E |
|      |      |      |      |      |      |      |      |      |      |      |      | rw    | rw    | rw   | rw   |

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **CC1NP**: Capture/Compare 1 complementary output polarity

CC1 channel configured as output:

0: OC1N active high

1: OC1N active low

CC1 channel configured as input:

This bit is used in conjunction with CC1P to define the polarity of TI1FP1 and TI2FP1. Refer to the description of CC1P.

*Note: This bit is not writable as soon as LOCK level 2 or 3 has been programmed (LOCK bits in TIMx\_BDTR register) and CC1S="00" (the channel is configured in output).*

*On channels that have a complementary output, this bit is preloaded. If the CCPC bit is set in the TIMx\_CR2 register then the CC1NP active bit takes the new value from the preloaded bit only when a commutation event is generated.*

Bit 2 **CC1NE**: Capture/Compare 1 complementary output enable

0: Off - OC1N is not active. OC1N level is then function of MOE, OSSI, OSSR, OIS1, OIS1N and CC1E bits.

1: On - OC1N signal is output on the corresponding output pin depending on MOE, OSSI, OSSR, OIS1, OIS1N and CC1E bits.

Bit 1 **CC1P**: Capture/Compare 1 output polarity

0: OC1 active high (output mode) / Edge sensitivity selection (input mode, see below)

1: OC1 active low (output mode) / Edge sensitivity selection (input mode, see below)

**When CC1 channel is configured as input**, both CC1NP/CC1P bits select the active polarity of TI1FP1 and TI2FP1 for trigger or capture operations.

CC1NP=0, CC1P=0: non-inverted/rising edge. The circuit is sensitive to TIxFP1 rising edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode or encoder mode).

CC1NP=0, CC1P=1: inverted/falling edge. The circuit is sensitive to TIxFP1 falling edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is inverted (trigger operation in gated mode or encoder mode).

CC1NP=1, CC1P=1: non-inverted/both edges/ The circuit is sensitive to both TIxFP1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode). This configuration must not be used in encoder mode.

CC1NP=1, CC1P=0: this configuration is reserved, it must not be used.

*Note: This bit is not writable as soon as LOCK level 2 or 3 has been programmed (LOCK bits in TIMx\_BDTR register).*

*On channels that have a complementary output, this bit is preloaded. If the CCPC bit is set in the TIMx\_CR2 register then the CC1P active bit takes the new value from the preloaded bit only when a Commutation event is generated.*

Bit 0 **CC1E**: Capture/Compare 1 output enable

0: Capture mode disabled / OC1 is not active (see below)

1: Capture mode enabled / OC1 signal is output on the corresponding output pin

**When CC1 channel is configured as output**, the OC1 level depends on MOE, OSSI, OSSR, OIS1, OIS1N and CC1NE bits, regardless of the CC1E bits state. Refer to [Table 300](#) for details.

Table 300. Output control bits for complementary OCx and OCxN channels with break feature (TIM16/17)

| Control bits |          |          |          |           | Output states <sup>(1)</sup>                                                                                                                                                                                                                           |                                                                         |

|              |          |          | 0        | 1         | Off-State (output enabled with inactive state)<br>Asynchronously: OCx=CCxP, OCxN=CCxNP<br>Then if the clock is present: OCx=OISx and OCxN=OISxN after a dead-time, assuming that OISx and OISxN do not correspond to OCx and OCxN both in active state |                                                                         |
|              |          |          | 1        | 0         |                                                                                                                                                                                                                                                        |                                                                         |
|              |          |          | 1        | 1         |                                                                                                                                                                                                                                                        |                                                                         |

1. When both outputs of a channel are not used (control taken over by GPIO controller), the OISx, OISxN, CCxP and CCxNP bits must be kept cleared.

**Note:** The state of the external I/O pins connected to the complementary OCx and OCxN channels depends on the OCx and OCxN channel state and AFIO registers.

### 43.6.9 TIMx counter (TIMx\_CNT)(x = 16 to 17)

Address offset: 0x24

Reset value: 0x0000 0000
