

2M x 8 SRAM MODULE

SYS82000RKXD - 85/10/12

Issue 1.4 : April 2001

Description

The SYS82000RKXD is a plastic 16Mbit Static RAM Module housed in a standard 36 pin Single-In-Line package organised as 2M x 8. This offers an extremely high PCB packing density.

The module is constructed using four 512Kx8 SRAMs in TSOPII packages mounted on a FR4 epoxy substrate. Access times are 85, 100 and 120ns.

The SYS82000RKXD is offered in standard and low power versions, with the -L module having a low voltage data retention mode for battery backed applications.

Features

- Access Times of 85/100/120ns.
- 36 Pin Industry Standard Single-In-Line package.
- 5 Volt Supply $\pm 10\%$.
- Power Dissipation :
 - Operating (min cycle) 610 mW (max).
 - Standby -L Version (CMOS) 2.2 mW (max).
- Completely Static Operation.
- Equal Access and Cycle Times.
- Low Voltage V_{CC} Data Retention.
- Directly TTL Compatible.
- On-board Decoding & Capacitors.
- Compatible with the SYS8512RKX, SYS81000RKXB and SYS82000RKX modules.

DC OPERATING CONDITIONS**Absolute Maximum Ratings**⁽¹⁾

<i>Parameter</i>	<i>Symbol</i>	<i>Min</i>	<i>Typ</i>	<i>Max</i>	<i>Unit</i>
Voltage on any pin relative to V_{SS}	$V_T^{(2)}$	-0.3	-	7.0	V
Power Dissipation	P_T	-	4.0	-	W
Storage Temperature	T_{STG}	-55	-	125	°C

Notes : (1) Stresses above those listed may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Read Cycle Timing Waveform^(1,2)**AC Read Characteristics Notes**

- (1) $\overline{WE}$ is High for Read Cycle.
- (2) All read cycle timing is referenced from the last valid address to the first transition address.
- (3) t_{CHZ} and t_{OHZ} are defined as the time at which the outputs achieve open circuit conditions and are not referenced to output voltage levels.
- (4) At any given temperature and voltage condition, t_{CHZ} (max) is less than t_{CLZ} (min) both for a given module and from module to module.
- (5) These parameters are sampled and not 100% tested.

Write Cycle No.1 Timing Waveform^(1,4)

Write Cycle No.2 Timing Waveform ^(1,5)

AC Write Characteristics Notes

- (1) All write cycle timing is referenced from the last valid address to the first transition address.
- (2) All writes occur during the overlap of $\overline{CS}$ and $\overline{WE}$ low.
- (3) If $\overline{OE}$, $\overline{CS}$, and $\overline{WE}$ are in the Read mode during this period, the I/O pins are low impedance state. Inputs of opposite phase to the output must not be applied because bus contention can occur.
- (4) Dout is the Read data of the new address.
- (5) $\overline{OE}$ is continuously low.
- (6) Address is valid prior to or coincident with $\overline{CS}$ and $\overline{WE}$ low, too avoid inadvertant writes.
- (7) $\overline{CS}$ or $\overline{WE}$ must be high during address transitions.
- (8) When $\overline{CS}$ is low : I/O pins are in the output state. Input signals of opposite phase leading to the output should not be applied.
- (9) Defined as the time at which the outputs achieve open circuit conditions and are not referenced to output voltage levels. These parameters are sampled and not 100% tested.
