## MCCNDD 16BitDest {, CNDF} *Call Conditional Delayed*

### Operands

|           |                                         |
|-----------|-----------------------------------------|
| 16BitDest | 16-bit destination if condition is true |
| CNDF      | Optional condition to be tested         |

### Opcode

LSW: dest dest dest dest  
MSW: 0111 1001 1001 cndf

### Description

If the specified condition is true, then store the return address in the RPC field of MSTF and make the call by adding the signed 16BitDest value to the MPC value. Otherwise, continue code execution without making the call. If the address overflows, it wraps around. Therefore a value of "0xFFFF" will put the MPC back to the MCCNDD instruction.

Please refer to the pipeline section for important information regarding this instruction.

```
if (CNDF == TRUE)
{
    RPC = return address;
    MPC += 16BitDest;
};
```

CNDF is one of the following conditions:

| Encode <sup>(3)</sup> | CNDF                | Description                          | MSTF Flags Tested   |
|-----------------------|---------------------|--------------------------------------|---------------------|
| 0000                  | NEQ                 | Not equal to zero                    | ZF == 0             |
| 0001                  | EQ                  | Equal to zero                        | ZF == 1             |
| 0010                  | GT                  | Greater than zero                    | ZF == 0 AND NF == 0 |
| 0011                  | GEQ                 | Greater than or equal to zero        | NF == 0             |
| 0100                  | LT                  | Less than zero                       | NF == 1             |
| 0101                  | LEQ                 | Less than or equal to zero           | ZF == 1 OR NF == 1  |
| 1010                  | TF                  | Test flag set                        | TF == 1             |
| 1011                  | NTF                 | Test flag not set                    | TF == 0             |
| 1100                  | LU                  | Latched underflow                    | LUF == 1            |
| 1101                  | LV                  | Latched overflow                     | LVF == 1            |
| 1110                  | UNC                 | Unconditional                        | None                |
| 1111                  | UNCF <sup>(4)</sup> | Unconditional with flag modification | None                |

<sup>(3)</sup> Values not shown are reserved.

<sup>(4)</sup> This is the default operation if no CNDF field is specified. This condition will allow the ZF and NF flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

### Restrictions

The MCCNDD instruction is not allowed three instructions before or after a MBCNDD, MCCNDD, or MRCNDD instruction. Refer to the Pipeline section for more details.

### Flags

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

## Pipeline

The MCCNDD instruction by itself is a single-cycle instruction. As shown in [Table 5-15](#), for each call 6 instruction slots are executed; three before the call instruction (I2-I4) and three after the call instruction (I5-I7). The total number of cycles for a call taken or not taken depends on the usage of these slots. That is, the number of cycles depends on how many slots are filled with a MNOP as well as which slots are filled. The effective number of cycles for a call can, therefore, range from 1 to 7 cycles. The number of cycles for a call taken may not be the same as for a call not taken.

Referring to the following code fragment and the pipeline diagrams in [Table 5-15](#) and [Table 5-16](#), the instructions before and after MCCNDD have the following properties:

- **I1**
  - I1 is the last instruction that can effect the CNDF flags for the MCCNDD instruction. The CNDF flags are tested in the D2 phase of the pipeline. That is, a decision is made whether to branch or not when MCCNDD is in the D2 phase.
  - There are no restrictions on the type of instruction for I1.
- **I2, I3 and I4**
  - The three instructions proceeding MCCNDD can change MSTF flags but will have no effect on whether the MCCNDD instruction makes the call or not. This is because the flag modification will occur after the D2 phase of the MCCNDD instruction.
  - These instructions must not be the following: MSTOP, MDEBUGSTOP, MBCNDD, MCCNDD or MRCNDD.
- **I5, I6 and I7**
  - The three instructions following MBCNDD are always executed irrespective of whether the branch is taken or not.
  - These instructions must not be the following: MSTOP, MDEBUGSTOP, MBCNDD, MCCNDD or MRCNDD.

```

<Instruction 1> ; I1 Last instruction that can affect flags for
                ; the MCCNDD operation
<Instruction 2> ; I2 Cannot be stop, branch, call or return

## MCLRC BGINTM *Clear Background Task Interrupt Mask*

### Operands

None      This instruction does not have any operands

### Opcode

LSW: 0000 0000 0000 0000  
MSW: 0111 1111 0111 0000

### Description

This instruction will clear the background task interrupt mask (BGINTM) bit in the MSTSBGRND register, allowing any code thereafter to be interrupted by a higher priority task. This instruction clears the BGINTM bit at the end of its D2 phase.

Note: This instruction does not require the MEALLOW bit to be asserted before or deasserted after clearing BGINTM.

### Flags

This instruction does not modify flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction.

### Example

```
MCLRC BGINTM      ; Allow the background task to be
                   ; interrupted by clearing the
                   ; MSTSBGRND.BGINTM bit
```

### See also

## MCMP32 MRa, MRb 32-Bit Integer Compare for Equal, Less Than or Greater Than

### Operands

|     |                                                 |
|-----|-------------------------------------------------|
| MRa | CLA floating-point source register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3) |

### Opcode

LSW: 0000 0000 0000 bbaa  
MSW: 0111 1111 0010 0000

### Description

Set ZF and NF flags on the result of MRa - MRb where MRa and MRb are 32-bit integers. For a floating point compare refer to [MCMFP32](#).

**NOTE:** A known hardware issue exists in the MCMP32 instruction. Signed integer comparisons using MCMP32 by itself will set the status bits in a way that is not useful for comparison when the difference between the two operands is too large, such as when the inputs have opposite sign and are near the extreme 32-bit signed values. This affects both signed and unsigned integer comparisons.

The compiler (version 18.1.5.LTS or higher) has implemented a workaround for this issue. The compiler can check the upper bits of the operands by performing a floating point comparison before proceeding to do the integer comparison or subtraction.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified based on the integer results of the operation.

```
If(MRa == MRb) {ZF=1; NF=0;}
If(MRa > MRb) {ZF=0; NF=0;}
If(MRa < MRb) {ZF=0; NF=1;}
```

### Pipeline

This is a single-cycle instruction.

### Example

```
; Behavior of ZF and NF flags for different comparisons
;
; Given A = (int32)1
;       B = (int32)2
;       C = (int32)-7
;
MMOV32 MR0, @_A ; MR0 = 1 (0x00000001)
MMOV32 MR1, @_B ; MR1 = 2 (0x00000002)
MMOV32 MR2, @_C ; MR2 = -7 (0xFFFFFFF9)
MCMP32 MR2, MR2 ; NF = 0, ZF = 1
MCMP32 MR0, MR1 ; NF = 1, ZF = 0
MCMP32 MR1, MR0 ; NF = 0, ZF = 0
```

## MCMPF32 MRa, MRb 32-Bit Floating-Point Compare for Equal, Less Than or Greater Than

### Operands

|     |                                                 |
|-----|-------------------------------------------------|
| MRa | CLA floating-point source register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3) |

### Opcode

LSW: 0000 0000 0000 bbaa  
MSW: 0111 1101 0000 0000

### Description

Set ZF and NF flags on the result of MRa - MRb. The MCMPF32 instruction is performed as a logical compare operation. This is possible because of the IEEE format offsetting the exponent. Basically the bigger the binary number, the bigger the floating-point value.

Special cases for inputs:

- Negative zero will be treated as positive zero.
- A denormalized value will be treated as positive zero.
- Not-a-Number (NaN) will be treated as infinity.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified as follows:

```
If(MRa == MRb) {ZF=1; NF=0;}
If(MRa > MRb) {ZF=0; NF=0;}
If(MRa < MRb) {ZF=0; NF=1;}
```

### Pipeline

This is a single-cycle instruction.

### Example

; Behavior of ZF and NF flags for different comparisons

```
MMOVIZ MR1, #-2.0 ; MR1 = -2.0 (0xC0000000)
MMOVIZ MR0, #5.0 ; MR0 = 5.0 (0x40A00000)
MCMPF32 MR1, MR0 ; ZF = 0, NF = 1
MCMPF32 MR0, MR1 ; ZF = 0, NF = 0
MCMPF32 MR0, MR0 ; ZF = 1, NF = 0
```

## MCMPF32 MRa, #16FHi 32-Bit Floating-Point Compare for Equal, Less Than or Greater Than

### Operands

|        |                                                                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MRa    | CLA floating-point source register (MR0 to MR3)                                                                                                             |
| #16FHi | A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. |

### Opcode

LSW: I I I I I I I I I I I I I I  
MSW: 0111 1000 1100 00aa

### Description

Compare the value in MRa with the floating-point value represented by the immediate operand. Set the ZF and NF flags on (MRa - #16FHi:0).

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. This addressing mode is most useful for constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

The MCMPF32 instruction is performed as a logical compare operation. This is possible because of the IEEE floating-point format offsets the exponent. Basically the bigger the binary number, the bigger the floating-point value.

Special cases for inputs:

- Negative zero will be treated as positive zero.
- Denormalized value will be treated as positive zero.
- Not-a-Number (NaN) will be treated as infinity.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified as follows:

```
If(MRa == #16FHi:0) {ZF=1, NF=0;}
If(MRa > #16FHi:0) {ZF=0, NF=0;}
If(MRa < #16FHi:0) {ZF=0, NF=1;}
```

### Pipeline

This is a single-cycle instruction

### Example 1

; Behavior of ZF and NF flags for different comparisons

```
MMOVIZ    MR1, #-2.0 ; MR1 = -2.0 (0xC0000000)
MMOVIZ    MR0, #5.0  ; MR0 = 5.0 (0x40A00000)
MCMPF32   MR1, #-2.2 ; ZF = 0, NF = 0
MCMPF32   MR0, #6.5  ; ZF = 0, NF = 1
MCMPF32   MR0, #5.0  ; ZF = 1, NF = 0
```

**Example 2**

```

; X is an array of 32-bit floating-point values
; and has len elements. Find the maximum value in
; the array and store it in Result
;
; Note: MCMPF32 and MSWAPF can be replaced with MMAXF32
;
_Cla1Task1:
    MMОВI16 MAR1, #_X      ; Start address
    MUI16TOF32 MR0, @_len  ; Length of the array
    MNOP                   ; delay for MAR1 load
    MNOP                   ; delay for MAR1 load
    MMОВ32 MR1, *MAR1[2]++ ; MR1 = X0

    LOOP
        MMОВ32 MR2, *MAR1[2]++ ; MR2 = next element
        MCMPF32 MR2, MR1      ; Compare MR2 with MR1
        MSWAPF MR1, MR2, GT  ; MR1 = MAX(MR1, MR2)
        MADDF32 MR0, MR0, #-1.0 ; Decrement the counter
        MCMPF32 MR0, #0.0    ; Set/clear flags for MBCNDD
        MNOP
        MNOP
        MNOP
        MBCNDD LOOP, NEQ     ; Branch if not equal to zero
        MMОВ32 @_Result, MR1 ; Always executed
        MNOP                 ; Always executed
        MNOP                 ; Always executed
        MSTOP                ; End of task

```

## MDEBUGSTOP

### Debug Stop Task

#### Operands

none This instruction does not have any operands

#### Opcode

LSW: 0000 0000 0000 0000  
MSW: 0111 1111 0110 0000

#### Description

When CLA breakpoints are enabled, the MDEBUGSTOP instruction is used to halt a task so that it can be debugged. That is, MDEBUGSTOP is the CLA breakpoint. If CLA breakpoints are not enabled, the MDEBUGSTOP instruction behaves like a MNOP. Unlike the MSTOP, the MIRUN flag is not cleared and an interrupt is not issued. A single-step or run operation will continue execution of the task.

#### Restrictions

The MDEBUGSTOP instruction cannot be placed 3 instructions before or after a [MBCNDD](#), [MCCNDD](#) or [MRCNDD](#) instruction.

#### Flags

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

#### Pipeline

This is a single-cycle instruction.

#### Example

;

## MDEBUGSTOP1 *Software Breakpoint*

### Operands

none This instruction does not have any operands

### Opcode

LSW: 0000 0000 0000 0000  
MSW: 0111 1111 0011 0000

### Description

The instruction at which a software breakpoint is placed will be replaced by the MDEBUGSTOP1 instruction. It will halt execution once it reaches the D2 phase in the pipeline; at that point the subsequent instructions that were fetched, after the halt, will be flushed from the pipeline. The replace instruction will be re-fetched after this and execution can continue normally (either in run or step mode).

See [Section 5.5.3](#) for a detailed explanation of its operation.

### Restrictions

The MDEBUGSTOP1 instruction cannot be placed 3 instructions before or after a [MBCNDD](#), [MCCNDD](#) or [MRCNDD](#) instruction.

### Flags

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction.

### Example

## MEALLOW *Enable CLA Write Access to EALLOW Protected Registers*

### Operands

|      |                                             |
|------|---------------------------------------------|
| none | This instruction does not have any operands |
|------|---------------------------------------------|

### Opcode

LSW: 0000 0000 0000 0000  
MSW: 0111 1111 1001 0000

### Description

This instruction sets the MEALLOW bit in the CLA status register MSTF. When this bit is set, the CLA is allowed write access to EALLOW protected registers. To again protect against CLA writes to protected registers, use the MEDIS instruction.

MEALLOW and MEDIS only control CLA write access; reads are allowed even if MEALLOW has not been executed. MEALLOW and MEDIS are also independent from the main CPU's EALLOW/EDIS. This instruction does not modify the EALLOW bit in the main CPU's status register. The MEALLOW bit in MSTF only controls access for the CLA while the EALLOW bit in the ST1 register only controls access for the main CPU.

As with EALLOW, the MEALLOW bit is overridden via the JTAG port, allowing full control of register accesses during debug from Code Composer Studio.

### Flags

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction.

### Example

```
; C header file including definition of
; the EPwm1Regs structure
;
; The ePWM TZSEL register is EALLOW protected
;
.cdecls C,LIST,"CLAShared.h"
...
_Cla1Task1:
...
MEALLOW                ; Allow CLA write access
MMOV16 @_EPwm1Regs.TZSEL.all, MR3 ; Write to TZSEL
MEDIS                  ; Disallow CLA write access
...
...
MSTOP
```

### See also

[MEDIS](#)

## MEDIS

### Disable CLA Write Access to EALLOW Protected Registers

#### Operands

|      |                                             |
|------|---------------------------------------------|
| none | This instruction does not have any operands |
|------|---------------------------------------------|

#### Opcode

LSW: 0000 0000 0000 0000  
MSW: 0111 1111 1011 0000

#### Description

This instruction clears the MEALLOW bit in the CLA status register MSTF. When this bit is clear, the CLA is not allowed write access to EALLOW-protected registers. To enable CLA writes to protected registers, use the MEALLOW instruction.

MEALLOW and MEDIS only control CLA write access; reads are allowed even if MEALLOW has not been executed. MEALLOW and MEDIS are also independent from the main CPU's EALLOW/EDIS. This instruction does not modify the EALLOW bit in the main CPU's status register. The MEALLOW bit in MSTF only controls access for the CLA while the EALLOW bit in the ST1 register only controls access for the main CPU.

As with EALLOW, the MEALLOW bit is overridden via the JTAG port, allowing full control of register accesses during debug from Code Composer Studio.

#### Flags

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

#### Pipeline

This is a single-cycle instruction.

#### Example

```
; C header file including definition of
; the EPwm1Regs structure
;
; The ePWM TZSEL register is EALLOW protected
;
.cdecls C,LIST,"CLAShared.h"
...
_Cla1Task1:
...
MEALLOW                ; Allow CLA write access
MMOV16 @_EPwm1Regs.TZSEL.all, MR3 ; Write to TZSEL
MEDIS                  ; Disallow CLA write access
...
...
MSTOP
```

## MEINVF32 MRa, MRb 32-Bit Floating-Point Reciprocal Approximation

### Operands

|     |                                                      |
|-----|------------------------------------------------------|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |

### Opcode

LSW: 0000 0000 0000 bbaa  
MSW: 0111 1111 0000 0000

### Description

This operation generates an estimate of  $1/X$  in 32-bit floating-point format accurate to approximately 8 bits. This value can be used in a Newton-Raphson algorithm to get a more accurate answer. That is:

```
Ye = Estimate(1/X);
Ye = Ye*(2.0 - Ye*X);
Ye = Ye*(2.0 - Ye*X);
```

After two iterations of the Newton-Raphson algorithm, you will get an exact answer accurate to the 32-bit floating-point format. On each iteration the mantissa bit accuracy approximately doubles. The MEINVF32 operation will not generate a negative zero, DeNorm or NaN value.

MRa = Estimate of  $1/MRb$ ;

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MEINVF32 generates an underflow condition.
- LVF = 1 if MEINVF32 generates an overflow condition.

### Pipeline

This is a single-cycle instruction.

### Example

```
; Calculate Num/Den using a Newton-Raphson algorithm for 1/Den
; Ye = Estimate(1/X)
; Ye = Ye*(2.0 - Ye*X)
; Ye = Ye*(2.0 - Ye*X)
;
;_Cla1Task1:
  MMOV32 MR1, @_Den      ; MR1 = Den
  MEINVF32 MR2, MR1      ; MR2 = Ye = Estimate(1/Den)
  MMPYF32 MR3, MR2, MR1  ; MR3 = Ye*Den
  MSUBF32 MR3, #2.0, MR3 ; MR3 = 2.0 - Ye*Den
  MMPYF32 MR2, MR2, MR3  ; MR2 = Ye = Ye*(2.0 - Ye*Den)
  MMPYF32 MR3, MR2, MR1  ; MR3 = Ye*Den
|| MMOV32 MR0, @_Num     ; MR0 = Num
  MSUBF32 MR3, #2.0, MR3 ; MR3 = 2.0 - Ye*Den
  MMPYF32 MR2, MR2, MR3  ; MR2 = Ye = Ye*(2.0 - Ye*Den)
|| MMOV32 MR1, @_Den     ; Reload Den To Set Sign
  MNEGF32 MR0, MR0, EQ   ; if(Den == 0.0) Change Sign Of Num
  MMPYF32 MR0, MR2, MR0  ; MR0 = Y = Ye*Num
  MMOV32 @_Dest, MR0     ; Store result
  MSTOP                  ; end of task
```

## MEISQRTF32 MRa, MRb 32-Bit Floating-Point Square-Root Reciprocal Approximation

### Operands

|     |                                                      |
|-----|------------------------------------------------------|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |

### Opcode

LSW: 0000 0000 0000 bbaa  
MSW: 0111 1110 0100 0000

### Description

This operation generates an estimate of  $1/\sqrt{X}$  in 32-bit floating-point format accurate to approximately 8 bits. This value can be used in a Newton-Raphson algorithm to get a more accurate answer. That is:

```
Ye = Estimate(1/sqrt(X));
Ye = Ye*(1.5 - Ye*Ye*X/2.0);
Ye = Ye*(1.5 - Ye*Ye*X/2.0);
```

After 2 iterations of the Newton-Raphson algorithm, you will get an exact answer accurate to the 32-bit floating-point format. On each iteration the mantissa bit accuracy approximately doubles. The MEISQRTF32 operation will not generate a negative zero, DeNorm or NaN value.

MRa = Estimate of  $1/\sqrt{\text{MRb}}$ ;

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MEISQRTF32 generates an underflow condition.
- LVF = 1 if MEISQRTF32 generates an overflow condition.

### Pipeline

This is a single-cycle instruction.

### Example

```
; Y = sqrt(X)
; Ye = Estimate(1/sqrt(X));
; Ye = Ye*(1.5 - Ye*Ye*X*0.5)
; Ye = Ye*(1.5 - Ye*Ye*X*0.5)
; Y = X*Ye
;
_Cla1Task3:
    MMOV32 MR0, @_x      ; MR0 = X
    MEISQRTF32 MR1, MR0  ; MR1 = Ye = Estimate(1/sqrt(X))
    MMOV32 MR1, @_x, EQ  ; if(X == 0.0) Ye = 0.0
    MMPYF32 MR3, MR0, #0.5 ; MR3 = X*0.5
    MMPYF32 MR2, MR1, MR3 ; MR2 = Ye*X*0.5
    MMPYF32 MR2, MR1, MR2 ; MR2 = Ye*Ye*X*0.5
    MSUBF32 MR2, #1.5, MR2 ; MR2 = 1.5 - Ye*Ye*X*0.5
    MMPYF32 MR1, MR1, MR2 ; MR1 = Ye = Ye*(1.5 - Ye*Ye*X*0.5)
    MMPYF32 MR2, MR1, MR3 ; MR2 = Ye*X*0.5
    MMPYF32 MR2, MR1, MR2 ; MR2 = Ye*Ye*X*0.5
    MSUBF32 MR2, #1.5, MR2 ; MR2 = 1.5 - Ye*Ye*X*0.5
    MMPYF32 MR1, MR1, MR2 ; MR1 = Ye = Ye*(1.5 - Ye*Ye*X*0.5)
    MMPYF32 MR0, MR1, MR0 ; MR0 = Y = Ye*X
    MMOV32 @_y, MR0      ; Store Y = sqrt(X)
    MSTOP                ; end of task
```

|-----|------------------------------------------------------|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |

### Opcode

LSW: 0000 0000 0000 bbaa  
MSW: 0111 1110 1010 0000

### Description

Convert the 32-bit floating point value in MRb to an unsigned 16-bit integer value and truncate to zero. The result will be stored in MRa. To instead round the integer to the nearest even value use the MF32TOUI16R instruction.

MRa(15:0) = F32TOUI16(MRb);  
MRa(31:16) = 0x0000;

### Flags

This instruction does not affect any flags:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction.

### Example

```
MMOVIZ    MR0, #9.0      ; MR0 = 9.0 (0x41100000)
MF32TOUI16 MR1, MR0      ; MR1(15:0) = MF32TOUI16(MR0) = 9 (0x0009)
                        ; MR1(31:16) = 0x0000
MMOVIZ    MR2, #-9.0     ; MR2 = -9.0 (0xC1100000)
MF32TOUI16 MR3, MR2      ; MR3(15:0) = MF32TOUI16(MR2) = 0 (0x0000)
                        ; MR3(31:16) = 0x0000
```

## MF32TOUI16R MRa, MRb *Convert 32-Bit Floating-Point Value to 16-bit Unsigned Integer and Round*

### Operands

|     |                                                      |
|-----|------------------------------------------------------|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |

### Opcode

LSW: 0000 0000 0000 bbaa  
MSW: 0111 1110 1100 0000

### Description

Convert the 32-bit floating-point value in MRb to an unsigned 16-bit integer and round to the closest even value. The result will be stored in MRa. To instead truncate the converted value, use the MF32TOUI16 instruction.

MRa(15:0) = MF32TOUI16round(MRb);  
MRa(31:16) = 0x0000;

### Flags

This instruction does not affect any flags:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction.

### Example

```
MMOVIZ      MR0, #0x412C      ; MR0 = 0x412C
MMOVXI      MR0, #0xCCCD      ; MR0 = 0xCCCD ; MR0 = 10.8 (0x412CCCCD)
MF32TOUI16R MR1, MR0          ; MR1(15:0) = MF32TOUI16round(MR0) = 11 (0x000B)
                                   ; MR1(31:16) = 0x0000
MMOVF32     MR2, #-10.8       ; MR2 = -10.8 (0x0xC12CCCCD)
MF32TOUI16R MR3, MR2          ; MR3(15:0) = MF32TOUI16round(MR2) = 0 (0x0000)
                                   ; MR3(31:16) = 0x0000
```

## MF32TOUI32 MRa, MRb *Convert 32-Bit Floating-Point Value to 32-Bit Unsigned Integer*

### Operands

|     |                                                      |
|-----|------------------------------------------------------|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |

### Opcode

LSW: 0000 0000 0000 bbaa  
MSW: 0111 1101 1010 0000

### Description

Convert the 32-bit floating-point value in MRb to an unsigned 32-bit integer and store the result in MRa.

MRa = F32TOUI32(MRb);

### Flags

This instruction does not affect any flags:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction.

### Example

```
MMOVIZ      MR0, #12.5 ; MR0 = 12.5 (0x41480000)
MF32TOUI32  MR0, MR0   ; MR0 = MF32TOUI32 (MR0) = 12 (0x0000000C)
MMOVIZ      MR1, #-6.5 ; MR1 = -6.5 (0xC0D00000)
MF32TOUI32  MR2, MR1   ; MR2 = MF32TOUI32 (MR1) = 0.0 (0x00000000)
```

## MI16TOF32 MRa, mem16 *Convert 16-Bit Integer to 32-Bit Floating-Point Value*

### Operands

|       |                                                      |
|-------|------------------------------------------------------|
| MRa   | CLA floating-point destination register (MR0 to MR3) |
| mem16 | 16-bit source memory location to be converted        |

### Opcode

LSW: mmmm mmmm mmmm mmmm  
MSW: 0111 0101 00aa addr

### Description

Convert the 16-bit signed integer indicated by the mem16 pointer to a 32-bit floating-point value and store the result in MRa.

MRa = MI16TOF32[mem16];

### Flags

This instruction does not affect any flags:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction:

### Example

```
; Assume A = 4 (0x0004)
;      B = -4 (0xFFFC)

MI16TOF32 MR0, @_A ; MR0 = MI16TOF32(A) = 4.0 (0x40800000)
MI16TOF32 MR1, @_B ; MR1 = MI16TOF32(B) = -4.0 (0xC0800000)
```

## MI32TOF32 MRa, mem32 *Convert 32-Bit Integer to 32-Bit Floating-Point Value*

### Operands

|       |                                                      |
|-------|------------------------------------------------------|
| MRa   | CLA floating-point destination register (MR0 to MR3) |
| mem32 | 32-bit memory source for the MMOV32 operation.       |

### Opcode

LSW: mmmm mmmm mmmm mmmm  
MSW: 0111 0100 01aa addr

### Description

Convert the 32-bit signed integer indicated by mem32 to a 32-bit floating point value and store the result in MRa.

MRa = MI32TOF32[mem32];

### Flags

This instruction does not affect any flags:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction.

### Example

```
; Given X, M and B are IQ24 numbers:
; X = IQ24(+2.5) = 0x02800000
; M = IQ24(+1.5) = 0x01800000
; B = IQ24(-0.5) = 0xFF800000
;
; Calculate Y = X * M + B
;
; Convert M, X and B from IQ24 to float
;

_Cla1Task3:
    MI32TOF32 MR0, @_M      ; MR0 = 0x4BC00000

## MI32TOF32 MRa, MRb *Convert 32-Bit Integer to 32-Bit Floating-Point Value*

### Operands

|     |                                                      |
|-----|------------------------------------------------------|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |

### Opcode

LSW: 0000 0000 0000 bbaa  
MSW: 0111 1101 1000 0000

### Description

Convert the signed 32-bit integer in MRb to a 32-bit floating-point value and store the result in MRa.

MRa = MI32TOF32(MRb);

### Flags

This instruction does not affect any flags:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction.

### Example

```
; Example1:
;
MMOVIZ    MR2, #0x1111 ; MR2(31:16) = 4369 (0x1111)
MMOVXI    MR2, #0x1111 ; MR2(15:0) = 4369 (0x1111)
; MR2 = +286331153 (0x11111111)
MI32TOF32 MR3, MR2     ; MR3 = MI32TOF32 (MR2) = 286331153.0 (0x4D888888)
```

## MLSL32 MRa, #SHIFT *Logical Shift Left*

### Operands

|        |                                                             |
|--------|-------------------------------------------------------------|
| MRa    | CLA floating-point source/destination register (MR0 to MR3) |
| #SHIFT | Number of bits to shift (1 to 32)                           |

### Opcode

LSW: 0000 0000 0shi ftaa  
MSW: 0111 1011 1100 0000

### Description

Logical shift left of MRa by the number of bits indicated. The number of bits can be 1 to 32.

MARa(31:0) = Logical Shift Left(MARa(31:0) by #SHIFT bits);

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified based on the integer results of the operation.

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1; }
```

### Pipeline

This is a single-cycle instruction.

### Example

```
; Given m2 = (int32)32
;          x2 = (int32)64
;          b2 = (int32)-128
;
; Calculate:
;          m2 = m2*2
;          x2 = x2*4
;          b2 = b2*8
;
_Cla1Task3:
    MOV32 MR0, @_m2 ; MR0 = 32 (0x00000020)
    MOV32 MR1, @_x2 ; MR1 = 64 (0x00000040)
    MOV32 MR2, @_b2 ; MR2 = -128 (0xFFFFF80)
    MLSL32 MR0, #1 ; MR0 = 64 (0x00000040)
    MLSL32 MR1, #2 ; MR1 = 256 (0x00000100)
    MLSL32 MR2, #3 ; MR2 = -1024 (0xFFFFFC00)
    MOV32 @_m2, MR0 ; Store results
    MOV32 @_x2, MR1
    MOV32 @_b2, MR2
    MSTOP ; end of task
```

## MLSR32 MRa, #SHIFT *Logical Shift Right*

### Operands

|        |                                                             |
|--------|-------------------------------------------------------------|
| MRa    | CLA floating-point source/destination register (MR0 to MR3) |
| #SHIFT | Number of bits to shift (1 to 32)                           |

### Opcode

```
LSW: 0000 0000 0shi ftaa
MSW: 0111 1011 1000 0000
```

### Description

Logical shift right of MRa by the number of bits indicated. The number of bits can be 1 to 32. Unlike the arithmetic shift (MASR32), the logical shift does not preserve the number's sign bit. Every bit in the operand is moved the specified number of bit positions, and the vacant bit-positions are filled in with zeros

MARa(31:0) = Logical Shift Right(MARa(31:0) by #SHIFT bits);

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified based on the integer results of the operation.

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1;}
```

### Pipeline

This is a single-cycle instruction.

### Example

; Illustrate the difference between MASR32 and MLSR32

```
MMOVIZ MR0, #0xAAAA ; MR0 = 0xAAAA5555
MMOVXI MR0, #0x5555
```

```
MMOV32 MR1, MR0 ; MR1 = 0xAAAA5555
MMOV32 MR2, MR0 ; MR2 = 0xAAAA5555
```

```
MASR32 MR1, #1 ; MR1 = 0xD5552AAA
MLSR32 MR2, #1 ; MR2 = 0x55552AAA
```

```
MASR32 MR1, #1 ; MR1 = 0xEAAA9555
MLSR32 MR2, #1 ; MR2 = 0x2AAA9555
```

```
MASR32 MR1, #6 ; MR1 = 0xFFAAA555
MLSR32 MR2, #6 ; MR2 = 0x00AAA555
```

| MRf   | CLA floating-point source register (MR0 to MR3) for the multiply operation                                                       |
| MRa   | CLA floating-point destination register for the MMOV32 operation (MR0 to MR3).<br>MRa cannot be MR3 or the same register as MRd. |
| mem32 | 32-bit source for the MMOV32 operation                                                                                           |

### Opcode

LSW: mmmm mmmm mmmm mmmm  
MSW: 0011 ffee ddaa addr

### Description

Multiply and accumulate the contents of floating-point registers and move from register to memory. The destination register for the MMOV32 cannot be the same as the destination registers for the MMACF32.

MR3 = MR3 + MR2;  
MRd = MRe \* MRf;  
MRa = [mem32];

### Restrictions

The destination registers for the MMACF32 and the MMOV32 must be unique. That is, MRa cannot be MR3 and MRa cannot be the same register as MRd.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MMACF32 (add or multiply) generates an underflow condition.
- LVF = 1 if MMACF32 (add or multiply) generates an overflow condition.

MMOV32 sets the NF and ZF flags as follows:

NF = MRa(31);  
ZF = 0;  
if(MRa(30:23) == 0) { ZF = 1; NF = 0; }

### Pipeline

MMACF32 and MMOV32 complete in a single cycle.

**Example 1**

```

; Perform 5 multiply and accumulate operations:
;
; X and Y are 32-bit floating point arrays
;
; 1st multiply: A = X0 * Y0
; 2nd multiply: B = X1 * Y1
; 3rd multiply: C = X2 * Y2
; 4th multiply: D = X3 * Y3
; 5th multiply: E = X3 * Y3
;
; Result = A + B + C + D + E
;
_Cla1Task1:
    MMOVI16 MAR0, #_X          ; MAR0 points to X array
    MMOVI16 MAR1, #_Y          ; MAR1 points to Y array
    MNOP                        ; Delay for MAR0, MAR1 load
    MNOP                        ; Delay for MAR0, MAR1 load

## MMAXF32 MRa, MRb 32-Bit Floating-Point Maximum

### Operands

|     |                                                             |
|-----|-------------------------------------------------------------|
| MRa | CLA floating-point source/destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)             |

### Opcode

LSW: 0000 0000 0000 bbaa  
MSW: 0111 1101 0010 0000

### Description

if(MRa < MRb) MRa = MRb;

Special cases for the output from the MMAXF32 operation:

- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

```
if(MRa == MRb) {ZF=1; NF=0;}
if(MRa > MRb) {ZF=0; NF=0;}
if(MRa < MRb) {ZF=0; NF=1;}
```

### Pipeline

This is a single-cycle instruction.

### Example 1

```
MMOVIZ MR0, #5.0 ; MR0 = 5.0 (0x40A00000)
MMOVIZ MR1, #-2.0 ; MR1 = -2.0 (0xC0000000)
MMOVIZ MR2, #-1.5 ; MR2 = -1.5 (0xBF000000)
MMAXF32 MR2, MR1 ; MR2 = -1.5, ZF = NF = 0
MMAXF32 MR1, MR2 ; MR1 = -1.5, ZF = 0, NF = 1
MMAXF32 MR2, MR0 ; MR2 = 5.0, ZF = 0, NF = 1
MAXF32 MR0, MR2 ; MR2 = 5.0, ZF = 1, NF = 0
```

### Example 2

```
; X is an array of 32-bit floating-point values
; Find the maximum value in an array X
; and store it in Result
;
_ClaiTask1:
  MMOV16 MR1, #_X ; Start address
  MUI16TOF32 MR0, @_len ; Length of the array
  MNOP ; delay for MAR1 load
  MNOP ; delay for MAR1 load
  MMOV32 MR1, *MAR1[2]++ ; MR1 = X0
LOOP
  MMOV32 MR2, *MAR1[2]++ ; MR2 = next element
  MMAXF32 MR1, MR2 ; MR1 = MAX(MR1, MR2)
  MADD32 MR0, MR0, #-1.0 ; Decrememt the counter
  MCMPPF32 MR0 #0.0 ; Set/clear flags for MBCNDD
  MNOP
  MNOP
  MNOP
  MBCNDD LOOP, NEQ ; Branch if not equal to zero
  MMOV32 @_Result, MR1 ; Always executed
  MNOP ; Always executed
  MNOP ; Always executed
  MSTOP ; End of task
```

## MMAXF32 MRa, #16FHi 32-Bit Floating-Point Maximum

### Operands

|        |                                                                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MRa    | CLA floating-point source/destination register (MR0 to MR3)                                                                                                 |
| #16FHi | A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. |

### Opcode

```
LSW: IIII IIII IIII IIII
MSW: 0111 1001 0000 00aa
```

### Description

Compare MRa with the floating-point value represented by the immediate operand. If the immediate value is larger, then load it into MRa.

```
if(MRa < #16FHi:0) MRa = #16FHi:0;
```

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. This addressing mode is most useful for constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

Special cases for the output from the MMAXF32 operation:

- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

```
if(MRa == #16FHi:0) {ZF=1; NF=0;}
if(MRa > #16FHi:0) {ZF=0; NF=0;}
if(MRa < #16FHi:0) {ZF=0; NF=1;}
```

### Pipeline

This is a single-cycle instruction.

### Example

```
MMOVIZ    MR0, #5.0 ; MR0 = 5.0 (0x40A00000)
MMOVIZ    MR1, #4.0 ; MR1 = 4.0 (0x40800000)
MMOVIZ    MR2, #-1.5 ; MR2 = -1.5 (0xBFC00000)
MMAXF32   MR0, #5.5 ; MR0 = 5.5, ZF = 0, NF = 1
MMAXF32   MR1, #2.5 ; MR1 = 4.0, ZF = 0, NF = 0
MMAXF32   MR2, #-1.0 ; MR2 = -1.0, ZF = 0, NF = 1
MMAXF32   MR2, #-1.0 ; MR2 = -1.5, ZF = 1, NF = 0
```

## MMINF32 MRa, MRb 32-Bit Floating-Point Minimum

### Operands

|     |                                                             |
|-----|-------------------------------------------------------------|
| MRa | CLA floating-point source/destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)             |

### Opcode

LSW: 0000 0000 0000 bbaa  
MSW: 0111 1101 0100 0000

### Description

if(MRa > MRb) MRa = MRb;

Special cases for the output from the MMINF32 operation:

- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

```
if(MRa == MRb) {ZF=1; NF=0;}
if(MRa > MRb) {ZF=0; NF=0;}
if(MRa < MRb) {ZF=0; NF=1;}
```

### Pipeline

This is a single-cycle instruction.

### Example 1

```
MMOVIZ MR0, #5.0 ; MR0 = 5.0 (0x40A00000)
MMOVIZ MR1, #4.0 ; MR1 = 4.0 (0x40800000)
MMOVIZ MR2, #-1.5 ; MR2 = -1.5 (0xBFC00000)
MMINF32 MR0, MR1 ; MR0 = 4.0, ZF = 0, NF = 0
MMINF32 MR1, MR2 ; MR1 = -1.5, ZF = 0, NF = 0
MMINF32 MR2, MR1 ; MR2 = -1.5, ZF = 1, NF = 0
MMINF32 MR1, MR0 ; MR2 = -1.5, ZF = 0, NF = 1
```

### Example 2

```
;
; X is an array of 32-bit floating-point values
; Find the minimum value in an array X
; and store it in Result
;

_Cla1Task1:
MMOVI16 MAR1, #_X ; Start address

## MMINF32 MRa, #16FHi 32-Bit Floating-Point Minimum

### Operands

|        |                                                                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MRa    | floating-point source/destination register (MR0 to MR3)                                                                                                     |
| #16FHi | A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. |

### Opcode

```
LSW: IIII IIII IIII IIII
MSW: 0111 1001 0100 00aa
```

### Description

Compare MRa with the floating-point value represented by the immediate operand. If the immediate value is smaller, then load it into MRa.

```
if(MRa > #16FHi:0) MRa = #16FHi:0;
```

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. This addressing mode is most useful for constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

Special cases for the output from the MMINF32 operation:

- NaN output will be converted to infinity
- A denormalized output will be converted to positive zero.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The ZF and NF flags are configured on the result of the operation, not the result stored in the destination register.

```
if(MRa == #16FHi:0) {ZF=1; NF=0;}
if(MRa > #16FHi:0) {ZF=0; NF=0;}
if(MRa < #16FHi:0) {ZF=0; NF=1;}
```

### Pipeline

This is a single-cycle instruction.

### Example

```
MMOVIZ MR0, #5.0 ; MR0 = 5.0 (0x40A00000)
MMOVIZ MR1, #4.0 ; MR1 = 4.0 (0x40800000)
MMOVIZ MR2, #-1.5 ; MR2 = -1.5 (0xBFC00000)
MMINF32 MR0, #5.5 ; MR0 = 5.0, ZF = 0, NF = 1
MMINF32 MR1, #2.5 ; MR1 = 2.5, ZF = 0, NF = 0
MMINF32 MR2, #-1.0 ; MR2 = -1.5, ZF = 0, NF = 1
MMINF32 MR2, #-1.5 ; MR2 = -1.5, ZF = 1, NF = 0
```

**MMOV16 MARx, MRa, #16I Load the Auxiliary Register with MRa + 16-bit Immediate Value**
**Operands**

|      |                                          |
|------|------------------------------------------|
| MARx | Auxiliary register MAR0 or MAR1          |
| MRa  | CLA Floating-point register (MR0 to MR3) |
| #16I | 16-bit immediate value                   |

**Opcode**

LSW: I I I I I I I I I I I I I I (opcode of MMOV16 MAR0, MRa, #16I)  
MSW: 0111 1111 1101 00AA

LSW: I I I I I I I I I I I I I I (opcode of MMOV16 MAR1, MRa, #16I)  
MSW: 0111 1111 1111 00AA

**Description**

Load the auxiliary register, MAR0 or MAR1, with MRa(15:0) + 16-bit immediate value. Refer to the pipeline section for important information regarding this instruction.

MARx = MRa(15:0) + #16I;

**Flags**

This instruction does not modify flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

**Pipeline**

This is a single-cycle instruction. The load of MAR0 or MAR1 will occur in the EXE phase of the pipeline. Any post increment of MAR0 or MAR1 using indirect addressing will occur in the D2 phase of the pipeline. Therefore the following applies when loading the auxiliary registers:

- I1 and I2**

The two instructions following MMOV16 will use MAR0/MAR1 before the update occurs. Thus these two instructions will use the old value of MAR0 or MAR1.

- I3**

Loading of an auxiliary register occurs in the EXE phase while updates due to post-increment addressing occur in the D2 phase. Thus I3 cannot use the auxiliary register or there will be a conflict. In the case of a conflict, the update due to address-mode post increment will win and the auxiliary register will not be updated with #\_X.

- I4**

Starting with the 4th instruction MAR0 or MAR1 will be the new value loaded with MMOV16.

; Assume MAR0 is 50, MR0 is 10, and #\_X is 20

```
MMOV16 MAR0, MR0, #_X      ; Load MAR0 with address of X (20) + MR0 (10)
<Instruction 1>              ; I1 Will use the old value of MAR0 (50)
<Instruction 2>              ; I2 Will use the old value of MAR0 (50)
<Instruction 3>              ; I3 Cannot use MAR0
<Instruction 4>              ; I4 Will use the new value of MAR0 (30)
<Instruction 5>              ; I5
```

**Table 5-17. Pipeline Activity For MMOV16 MARx, MRa , #16I**

| Instruction           | F1     | F2     | D1     | D2     | R1     | R2     | E      | W |
|-----------------------|--------|--------|--------|--------|--------|--------|--------|---|
| MMOV16 MAR0, MR0, #_X | MMOV16 |        |        |        |        |        |        |   |

## MMOV16 MARx, mem16 *Load MAR1 with 16-bit Value*

### Operands

|       |                                                                                |
|-------|--------------------------------------------------------------------------------|
| MARx  | CLA auxiliary register MAR0 or MAR1                                            |
| mem16 | 16-bit destination memory accessed using one of the available addressing modes |

### Opcode

LSW: mmmm mmmm mmmm mmmm (Opcode for MMOV16 MAR0, mem16)  
MSW: 0111 0110 0000 addr

LSW: mmmm mmmm mmmm mmmm (Opcode for MMOV16 MAR1, mem16)  
MSW: 0111 0110 0100 addr

### Description

Load MAR0 or MAR1 with the 16-bit value pointed to by mem16. Refer to the pipeline section for important information regarding this instruction.

MAR1 = [mem16];

### Flags

No flags MSTF flags are affected.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction. The load of MAR0 or MAR1 will occur in the EXE phase of the pipeline. Any post increment of MAR0 or MAR1 using indirect addressing will occur in the D2 phase of the pipeline. Therefore the following applies when loading the auxiliary registers:

#### • I1 and I2

The two instructions following MMOV16 will use MAR0/MAR1 before the update occurs. Thus these two instructions will use the old value of MAR0 or MAR1.

#### • I3

Loading of an auxiliary register occurs in the EXE phase while updates due to post-increment addressing occur in the D2 phase. Thus I3 cannot use the auxiliary register or there will be a conflict. In the case of a conflict, the update due to address-mode post increment will win send the auxiliary register will not be updated with #\_X.

#### • I4

Starting with the 4th instruction MAR0 or MAR1 will be the new value loaded with MMOV16.

; Assume MAR0 is 50 and @\_X is 20

```
MMOV16 MAR0, @_X ; Load MAR0 with the contents of X (20)
<Instruction 1>   ; I1 Will use the old value of MAR0 (50)
<Instruction 2>   ; I2 Will use the old value of MAR0 (50)
<Instruction 3>   ; I3 Cannot use MAR0
<Instruction 4>   ; I4 Will use the new value of MAR0 (20)
<Instruction 5>   ; I5
....
```

**Table 5-18. Pipeline Activity For MMOV16 MAR0/MAR1, mem16**

| Instruction      | F1     | F2     | D1     | D2     | R1     | R2     | E      | W |

## MMOV32 mem32, MRa *Move 32-Bit Floating-Point Register Contents to Memory*

### Operands

|       |                                                                                |
|-------|--------------------------------------------------------------------------------|
| MRa   | floating-point register (MR0 to MR3)                                           |
| mem32 | 32-bit destination memory accessed using one of the available addressing modes |

### Opcode

LSW: mmmm mmmm mmmm mmmm  
MSW: 0111 0100 11aa addr

### Description

Move from MRa to 32-bit memory location indicated by mem32.

[mem32] = MRa;

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

No flags affected.

### Pipeline

This is a single-cycle instruction.

### Example

```
; Perform 5 multiply and accumulate operations:
;
; X and Y are 32-bit floating point arrays;
; 1st multiply: A = X0 * Y0
; 2nd multiply: B = X1 * Y1
; 3rd multiply: C = X2 * Y2
; 4th multiply: D = X3 * Y3
; 5th multiply: E = X3 * Y3;
; Result = A + B + C + D + E
;
_Cla1Task1:

**MMOV32 MRa, mem32 {, CNDF} Conditional 32-Bit Move**
**Operands**

|       |                                                                             |
|-------|-----------------------------------------------------------------------------|
| MRa   | CLA floating-point destination register (MR0 to MR3)                        |
| mem32 | 32-bit memory location accessed using one of the available addressing modes |
| CNDF  | optional condition.                                                         |

**Opcode**

LSW: mmmm mmmm mmmm mmmm  
MSW: 0111 00cn dfaa addr

**Description**

If the condition is true, then move the 32-bit value referenced by mem32 to the floating-point register indicated by MRa.

```
if (CNDF == TRUE) MRa = [mem32];
```

CNDF is one of the following conditions:

| Encode <sup>(1)</sup> | CNDF                | Description                          | MSTF Flags Tested   |
|-----------------------|---------------------|--------------------------------------|---------------------|
| 0000                  | NEQ                 | Not equal to zero                    | ZF == 0             |
| 0001                  | EQ                  | Equal to zero                        | ZF == 1             |
| 0010                  | GT                  | Greater than zero                    | ZF == 0 AND NF == 0 |
| 0011                  | GEQ                 | Greater than or equal to zero        | NF == 0             |
| 0100                  | LT                  | Less than zero                       | NF == 1             |
| 0101                  | LEQ                 | Less than or equal to zero           | ZF == 1 OR NF == 1  |
| 1010                  | TF                  | Test flag set                        | TF == 1             |
| 1011                  | NTF                 | Test flag not set                    | TF == 0             |
| 1100                  | LU                  | Latched underflow                    | LUF == 1            |
| 1101                  | LV                  | Latched overflow                     | LVF == 1            |
| 1110                  | UNC                 | Unconditional                        | None                |
| 1111                  | UNCF <sup>(2)</sup> | Unconditional with flag modification | None                |

<sup>(1)</sup> Values not shown are reserved.

<sup>(2)</sup> This is the default operation if no CNDF field is specified. This condition will allow the ZF and NF flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

```
if(CNDF == UNCF)
{
    NF = MRa(31);
    ZF = 0;
    if(MRa(30:23) == 0) { ZF = 1; NF = 0; }
}
else No flags modified;
```

**Pipeline**

This is a single-cycle instruction.

**Example**

```

; Given A, B, X, M1 and M2 are 32-bit floating-point
; numbers
;
; if(A == B) calculate Y = X*M1
; if(A != B) calculate Y = X*M2
;
_Cla1Task5:
    MMOV32    MR0, @_A
    MMOV32    MR1, @_B

## MMOV32 MRa, MRb {, CNDF} *Conditional 32-Bit Move*

### Operands

|      |                                                      |
|------|------------------------------------------------------|
| MRa  | CLA floating-point destination register (MR0 to MR3) |
| MRb  | CLA floating-point source register (MR0 to MR3)      |
| CNDF | optional condition.                                  |

### Opcode

LSW: 0000 0000 cndf bbaa  
MSW: 0111 1010 1100 0000

### Description

If the condition is true, then move the 32-bit value in MRb to the floating-point register indicated by MRa.

if (CNDF == TRUE) MRa = MRb;

CNDF is one of the following conditions:

| Encode <sup>(3)</sup> | CNDF                | Description                          | MSTF Flags Tested   |
|-----------------------|---------------------|--------------------------------------|---------------------|
| 0000                  | NEQ                 | Not equal to zero                    | ZF == 0             |
| 0001                  | EQ                  | Equal to zero                        | ZF == 1             |
| 0010                  | GT                  | Greater than zero                    | ZF == 0 AND NF == 0 |
| 0011                  | GEQ                 | Greater than or equal to zero        | NF == 0             |
| 0100                  | LT                  | Less than zero                       | NF == 1             |
| 0101                  | LEQ                 | Less than or equal to zero           | ZF == 1 OR NF == 1  |
| 1010                  | TF                  | Test flag set                        | TF == 1             |
| 1011                  | NTF                 | Test flag not set                    | TF == 0             |
| 1100                  | LU                  | Latched underflow                    | LUF == 1            |
| 1101                  | LV                  | Latched overflow                     | LVF == 1            |
| 1110                  | UNC                 | Unconditional                        | None                |
| 1111                  | UNCF <sup>(4)</sup> | Unconditional with flag modification | None                |

<sup>(3)</sup> Values not shown are reserved.

<sup>(4)</sup> This is the default operation if no CNDF field is specified. This condition will allow the ZF, and NF flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

```
if(CNDF == UNCF)
{
    NF = MRa(31); ZF = 0;
    if(MRa(30:23) == 0) {ZF = 1; NF = 0;}
}
else No flags modified;
```

### Pipeline

This is a single-cycle instruction.

```

Example           ; Given: X = 8.0
                    ;           Y = 7.0
                    ;           A = 2.0
                    ;           B = 5.0
                    ; _ClaTask1
                    MMOV32 MR3, @_X      ; MR3 = X = 8.0
                    MMOV32 MR0, @_Y      ; MR0 = Y = 7.0

**MMOV32 MSTF, mem32** *Move 32-Bit Value from Memory to the MSTF Register*
**Operands**

|       |                               |
|-------|-------------------------------|
| MSTF  | CLA status register           |
| mem32 | 32-bit source memory location |

**Opcode**

LSW: mmmm mmmm mmmm mmmm  
MSW: 0111 0111 0000 addr

**Description**

Move from memory to the CLA's status register MSTF. This instruction is most useful when nesting function calls (via MCCNDD).

MSTF = [mem32];

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF  | ZF  | NF  | LUF | LVF |
|----------|-----|-----|-----|-----|-----|
| Modified | Yes | Yes | Yes | Yes | Yes |

Loading the status register will overwrite all flags and the RPC field. The MEALLOW field is not affected.

**Pipeline**

This is a single-cycle instruction.

**Example**

## MMOVD32 MRa, mem32 *Move 32-Bit Value from Memory with Data Copy*

### Operands

|       |                                                                             |
|-------|-----------------------------------------------------------------------------|
| MRa   | CLA floating-point register (MR0 to MR3)                                    |
| mem32 | 32-bit memory location accessed using one of the available addressing modes |

### Opcode

LSW: mmmm mmmm mmmm mmmm  
MSW: 0111 0100 00aa addr

### Description

Move the 32-bit value referenced by mem32 to the floating-point register indicated by MRa.

MRa = [mem32];  
[mem32+2] = [mem32];

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

NF = MRa(31);  
ZF = 0;  
if(MRa(30:23) == 0){ ZF = 1; NF = 0; }

### Pipeline

This is a single-cycle instruction.

### Example

```
; sum = X0*B0 + X1*B1 + X2*B2 + Y1*A1 + Y2*B2
;
;      X2 = X1
;      X1 = X0
;      Y2 = Y1
;      Y1 = sum
;

[MMOV32 MRa, mem32 {,CNDF}](#)

## MMOVF32 MRa, #32F *Load the 32-Bits of a 32-Bit Floating-Point Register*

### Operands

This instruction is an alias for MMOVIZ and MMOVXI instructions. The second operand is translated by the assembler such that the instruction becomes:

MMOVIZ MRa, #16FHiHex    MMOVXI MRa, #16FLoHex

MRa                      CLA floating-point destination register (MR0 to MR3)

#32F                      immediate float value represented in floating-point representation

### Opcode

LSW: IIII IIII IIII IIII (opcode of MMOVIZ MRa, #16FHiHex)

MSW: 0111 1000 0100 00aa

LSW: IIII IIII IIII IIII (opcode of MMOVXI MRa, #16FLoHex)

MSW: 0111 1000 1000 00aa

### Description

Note: This instruction accepts the immediate operand only in floating-point representation. To specify the immediate value as a hex value (IEEE 32-bit floating-point format) use the MOVI32 MRa, #32FHex instruction.

Load the 32-bits of MRa with the immediate float value represented by #32F.

#32F is a float value represented in floating-point representation. The assembler will only accept a float value represented in floating-point representation. That is, 3.0 can only be represented as #3.0. #0x40400000 will result in an error.

MRa = #32F;

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

Depending on #32FH, this instruction takes one or two cycles. If all of the lower 16-bits of the IEEE 32-bit floating-point format of #32F are zeros, then the assembler will convert MMOV32 into only MMOVIZ instruction. If the lower 16-bits of the IEEE 32-bit floating-point format of #32F are not zeros, then the assembler will convert MMOV32 into MMOVIZ and MMOVXI instructions.

### Example

```
MMOVF32 MR1, #3.0      ; MR1 = 3.0 (0x40400000)
                        ; Assembler converts this instruction as
                        ; MMOVIZ MR1, #0x4040

MMOVF32 MR2, #0.0      ; MR2 = 0.0 (0x00000000)
                        ; Assembler converts this instruction as
                        ; MMOVIZ MR2, #0x0

MMOVF32 MR3, #12.265   ; MR3 = 12.625 (0x41443D71)
                        ; Assembler converts this instruction as
                        ; MMOVIZ MR3, #0x4144
                        ; MMOVXI MR3, #0x3D71
```

## MMOVI16 MARx, #16I Load the Auxiliary Register with the 16-Bit Immediate Value

### Operands

|      |                                 |
|------|---------------------------------|
| MARx | Auxiliary register MAR0 or MAR1 |
| #16I | 16-bit immediate value          |

### Opcode

LSW: IIII IIII IIII IIII (opcode of MMOVI16 MAR0, #16I)  
MSW: 0111 1111 1100 0000

LSW: IIII IIII IIII IIII (opcode of MMOVI16 MAR1, #16I)  
MSW: 0111 1111 1110 0000

### Description

Load the auxiliary register, MAR0 or MAR1, with a 16-bit immediate value. Refer to the pipeline section for important information regarding this instruction.

MARx = #16I;

### Flags

This instruction does not modify flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction. The immediate load of MAR0 or MAR1 will occur in the EXE phase of the pipeline. Any post increment of MAR0 or MAR1 using indirect addressing will occur in the D2 phase of the pipeline. Therefore the following applies when loading the auxiliary registers:

#### • I1 and I2

The two instructions following MMOVI16 will use MAR0/MAR1 before the update occurs. Thus these two instructions will use the old value of MAR0 or MAR1.

#### • I3

Loading of an auxiliary register occurs in the EXE phase while updates due to post-increment addressing occur in the D2 phase. Thus I3 cannot use the auxiliary register or there will be a conflict. In the case of a conflict, the update due to address-mode post increment will win and the auxiliary register will not be updated with #\_X.

#### • I4

Starting with the 4th instruction MAR0 or MAR1 will be the new value loaded with MMOVI16.

; Assume MAR0 is 50 and #\_X is 20

```
MMOVI16 MAR0, #_X           ; Load MAR0 with address of X (20)
<Instruction 1>              ; I1 Will use the old value of MAR0 (50)
<Instruction 2>              ; I2 Will use the old value of MAR0 (50)
<Instruction 3>              ; I3 Cannot use MAR0
<Instruction 4>              ; I4 Will use the new value of MAR0 (20)
<Instruction 5>              ; I5
....
```

**Table 5-19. Pipeline Activity For MMOVI16 MAR0/MAR1, #16I**

| Instruction       | F1      | F2      | D1      | D2      | R1      | R2      | E       | W |
|-------------------|---------|---------|---------|---------|---------|---------|---------|---|
| MMOVI16 MAR0, #_X | MMOVI16 |         |         |         |         |         |         |   |
| I1                | I1      | MMOVI16 |         |         |         |         |         |   |

## MMOVI32 MRa, #32FHex *Load the 32-Bits of a 32-Bit Floating-Point Register with the Immediate*

### Operands

|         |                                                                               |
|---------|-------------------------------------------------------------------------------|
| MRa     | floating-point register (MR0 to MR3)                                          |
| #32FHex | A 32-bit immediate value that represents an IEEE 32-bit floating-point value. |

This instruction is an alias for MMOVIZ and MMOVXI instructions. The second operand is translated by the assembler such that the instruction becomes:

```
MMOVIZ MRa, #16FHiHex
MMOVXI MRa, #16FLoHex
```

### Opcode

```
LSW: IIII IIII IIII IIII (opcode of MMOVIZ MRa, #16FHiHex)
MSW: 0111 1000 0100 00aa
```

```
LSW: IIII IIII IIII IIII (opcode of MMOVXI MRa, #16FLoHex)
MSW: 0111 1000 1000 00aa
```

### Description

Note: This instruction only accepts a hex value as the immediate operand. To specify the immediate value with a floating-point representation use the MMOVF32 MRa, #32F instruction.

Load the 32-bits of MRa with the immediate 32-bit hex value represented by #32FHex.

#32Fhex is a 32-bit immediate hex value that represents the IEEE 32-bit floating-point value of a floating-point number. The assembler will only accept a hex immediate value. That is, 3.0 can only be represented as #0x40400000. #3.0 will result in an error.

MRa = #32FHex;

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

Depending on #32FHex, this instruction takes one or two cycles. If all of the lower 16-bits of #32FHex are zeros, then assembler will convert MOVIZ to the MMOVIZ instruction. If the lower 16-bits of #32FHex are not zeros, then assembler will convert MOVIZ to a MMOVIZ and a MMOVXI instruction.

### Example

```
MOVI32 MR1, #0x40400000 ; MR1 = 0x40400000
                        ; Assembler converts this instruction as
                        ; MMOVIZ MR1, #0x4040

MOVI32 MR2, #0x00000000 ; MR2 = 0x00000000
                        ; Assembler converts this instruction as
                        ; MMOVIZ MR2, #0x0

MOVI32 MR3, #0x40004001 ; MR3 = 0x40004001
                        ; Assembler converts this instruction as
                        ; MMOVIZ MR3, #0x4000
                        ; MMOVXI MR3, #0x4001

MOVI32 MR0, #0x00004040 ; MR0 = 0x00004040
                        ; Assembler converts this instruction as
                        ; MMOVIZ MR0, #0x0000
                        ; MMOVXI MR0, #0x4040
```

## MMOVIZ MRa, #16FHi *Load the Upper 16-Bits of a 32-Bit Floating-Point Register*

### Operands

|        |                                                                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MRa    | floating-point register (MR0 to MR3)                                                                                                                        |
| #16FHi | A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. |

### Opcode

LSW: I I I I I I I I I I I I I I  
MSW: 0111 1000 0100 00aa

### Description

Load the upper 16-bits of MRa with the immediate value #16FHi and clear the low 16-bits of MRa.

#16FHiHex is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. The assembler will only accept a decimal or hex immediate value. That is, -1.5 can be represented as #-1.5 or #0xBFC0.

By itself, MMOVIZ is useful for loading a floating-point register with a constant in which the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). If a constant requires all 32-bits of a floating-point register to be initialized, then use MMOVIZ along with the MMOVXI instruction.

MRa(31:16) = #16FHi;  
MRa(15:0) = 0;

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction.

### Example

```
; Load MR0 and MR1 with -1.5 (0xBFC00000)
    MMOVIZ    MR0, #0xBFC0    ; MR0 = 0xBFC00000 (1.5)
    MMOVIZ    MR1, #-1.5      ; MR1 = -1.5 (0xBFC00000)

; Load MR2 with pi = 3.141593 (0x40490FDB)
    MMOVIZ    MR2, #0x4049    ; MR2 = 0x40490000
    MMOVXI    MR2, #0x0FDB    ; MR2 = 0x40490FDB
```

**Opcode**

LSW: mmmm mmmm mmmm mmmm  
MSW: 0111 0101 10aa addr

**Description**

Move the 16-bit value referenced by mem16 to the floating-point register indicated by MRa.

MRa(31:16) = 0;  
MRa(15:0) = [mem16];

**Flags**

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified based on the integer results of the operation.

NF = 0;  
if (MRa(31:0) == 0) { ZF = 1; }

**Pipeline**

This is a single-cycle instruction.

## MMOVXI MRa, #16FLoHex *Move Immediate to the Low 16-Bits of a Floating-Point Register*

### Operands

|           |                                                                                                                                                |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------|
| MRa       | CLA floating-point register (MR0 to MR3)                                                                                                       |
| #16FLoHex | A 16-bit immediate hex value that represents the lower 16-bits of an IEEE 32-bit floating-point value. The upper 16-bits will not be modified. |

### Opcode

LSW: I I I I I I I I I I I I I I  
MSW: 0111 1000 1000 00aa

### Description

Load the low 16-bits of MRa with the immediate value #16FLoHex. #16FLoHex represents the lower 16-bits of an IEEE 32-bit floating-point value. The upper 16-bits of MRa will not be modified. MMOVXI can be combined with the MMOVIZ instruction to initialize all 32-bits of a MRa register.

MRa(15:0) = #16FLoHex;  
MRa(31:16) = Unchanged;

### Flags

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction.

### Example

```
; Load MR0 with pi = 3.141593 (0x40490FDB)
MMOVIZ    MR0, #0x4049    ; MR0 = 0x40490000
MMOVXI    MR0, #0x0FDB    ; MR0 = 0x40490FDB
```

## MMPYF32 MRa, MRb, MRc 32-Bit Floating-Point Multiply

### Operands

|     |                                                      |
|-----|------------------------------------------------------|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |
| MRc | CLA floating-point source register (MR0 to MR3)      |

### Opcode

LSW: 0000 0000 00cc bbaa  
MSW: 0111 1100 0000 0000

### Description

Multiply the contents of two floating-point registers.

MRa = MRb \* MRc;

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MMPYF32 generates an underflow condition.
- LVF = 1 if MMPYF32 generates an overflow condition.

### Pipeline

This is a single-cycle instruction.

### Example

```
; Calculate Num/Den using a Newton-Raphson algorithm for 1/Den

### Opcode

LSW: I I I I I I I I I I I I I I I I  
MSW: 0111 0111 1000 bbaa

### Description

Multiply MRb with the floating-point value represented by the immediate operand. Store the result of the addition in MRa.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

MRa = MRb \* #16FHi:0;

This instruction can also be written as MMPYF32 MRa, MRb, #16FHi.

### Flags

This instruction modifies the following flags in the MSTF register:.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MMPYF32 generates an underflow condition.
- LVF = 1 if MMPYF32 generates an overflow condition.

### Pipeline

This is a single-cycle instruction.

### Example 1

```
; Same as example 2 but #16FHi is represented in float
MMOVIZ    MR3, #2.0      ; MR3 = 2.0 (0x40000000)
MMPYF32    MR0, #3.0, MR3 ; MR0 = 3.0 * MR3 = 6.0 (0x40C00000)
MMOV32     @_X, MR0      ; Save the result in variable X
```

### Example 2

```
; Same as example 1 but #16FHi is represented in Hex
MMOVIZ    MR3, #2.0      ; MR3 = 2.0 (0x40000000)
MMPYF32    MR0, #0x4040, MR3 ; MR0 = 0x4040 * MR3 = 6.0 (0x40C00000)
MMOV32     @_X, MR0      ; Save the result in variable X
```

**Example 3**

```

; Given X, M and B are IQ24 numbers:

| #16FHi | A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. |

### Opcode

LSW: I I I I I I I I I I I I I I I I  
MSW: 0111 0111 1000 bbaa

### Description

Multiply MRb with the floating-point value represented by the immediate operand. Store the result of the addition in MRa.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

MRa = MRb \* #16FHi:0;

This instruction can also be written as MMPYF32 MRa, #16FHi, MRb.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MMPYF32 generates an underflow condition.
- LVF = 1 if MMPYF32 generates an overflow condition.

### Pipeline

This is a single-cycle instruction.

### Example 1

```
;Same as example 2 but #16FHi is represented in float
MMOVIZ MR3, #2.0 ; MR3 = 2.0 (0x40000000)
MMPYF32 MR0, MR3, #3.0 ; MR0 = MR3 * 3.0 = 6.0 (0x40C00000)
MMOV32 @_X, MR0 ; Save the result in variable X
```

### Example 2

```
;Same as above example but #16FHi is represented in Hex
MMOVIZ MR3, #2.0 ; MR3 = 2.0 (0x40000000)
MMPYF32 MR0, MR3, #0x4040 ; MR0 = MR3 * 0x4040 = 6.0 (0x40C00000)
MMOV32 @_X, MR0 ; Save the result in variable X
```

**Example 3**

```

; Given X, M and B are IQ24 numbers:
; X = IQ24(+2.5) = 0x02800000
; M = IQ24(+1.5) = 0x01800000
; B = IQ24(-0.5) = 0xFF800000
;
; Calculate Y = X * M + B
;
_Cla1Task2:
;
; Convert M, X and B from IQ24 to float

### Opcode

LSW: 0000 ffee ddcc bbaa  
MSW: 0111 1010 0000 0000

### Description

Multiply the contents of two floating-point registers with parallel addition of two registers.

MRa = MRb \* MRC;  
MRd = MRe + MRf;

### Restrictions

The destination register for the MMPYF32 and the MADDF32 must be unique. That is, MRa cannot be the same register as MRd.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MMPYF32 or MADDF32 generates an underflow condition.
- LVF = 1 if MMPYF32 or MADDF32 generates an overflow condition.

### Pipeline

Both MMPYF32 and MADDF32 complete in a single cycle.

**Example**

```

; Perform 5 multiply and accumulate operations:
;
; X and Y are 32-bit floating point arrays
;
; 1st multiply: A = X0 * Y0
; 2nd multiply: B = X1 * Y1
; 3rd multiply: C = X2 * Y2
; 4th multiply: D = X3 * Y3
; 5th multiply: E = X3 * Y3
;
; Result = A + B + C + D + E
;

### Opcode

LSW: mmmm mmmm mmmm mmmm  
MSW: 0000 ffee ddaa addr

### Description

Multiply the contents of two floating-point registers and load another.

MRd = MRe \* MRf;  
MRa = [mem32];

### Restrictions

The destination register for the MMPYF32 and the MMOV32 must be unique. That is, MRa cannot be the same register as MRd.

### Flags

This instruction modifies the following flags in the MSTF register:.

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MMPYF32 generates an underflow condition.
- LVF = 1 if MMPYF32 generates an overflow condition.

The MMOV32 Instruction will set the NF and ZF flags as follows:

NF = MRa(31);  
ZF = 0;  
if(MRa(30:23) == 0) { ZF = 1; NF = 0; }

### Pipeline

Both MMPYF32 and MMOV32 complete in a single cycle.

### Example 1

```
; Given M1, X1 and B1 are 32-bit floating point
; Calculate Y1 = M1*X1+B1
;
_Cla1Task1:
    MMOV32    MR0, @M1        ; Load MR0 with M1
    MMOV32    MR1, @X1        ; Load MR1 with X1
    MMPYF32   MR1, MR1, MR0    ; Multiply M1*X1
    || MMOV32  MR0, @B1        ; and in parallel load MR0 with B1
    MADD32    MR1, MR1, MR0    ; Add M*X1 to B1 and store in MR1
    MMOV32    @Y1, MR1        ; Store the result
    MSTOP
```

**Example 2**

```

; Given A, B and C are 32-bit floating-point numbers
; Calculate Y2 = (A * B)
;           Y3 = (A * B) * C
;
_Cla1Task2:
    MMOV32    MR0, @A          ; Load MR0 with A

### Opcode

LSW: mmmm mmmm mmmm mmmm  
MSW: 0100 ffee ddaa addr

### Description

Multiply the contents of two floating-point registers and move from memory to register.

MRd = MRe \* MRf;  
[mem32] = MRa;

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MMPYF32 generates an underflow condition.
- LVF = 1 if MMPYF32 generates an overflow condition.

### Pipeline

MMPYF32 and MMOV32 both complete in a single cycle.

### Example

```
; Given A, B and C are 32-bit floating-point numbers
; Calculate Y2 = (A * B)
;           Y3 = (A * B) * C
;
_Cla1Task2:

### Opcode

LSW: 0000 0000 cndf bbaa  
MSW: 0111 1010 1000 0000

### Description

```
if (CNDF == true) {MRa = - MRb; }
else {MRa = MRb; }
```

CNDF is one of the following conditions:

| Encode <sup>(5)</sup> | CNDF                | Description                          | MSTF Flags Tested   |
|-----------------------|---------------------|--------------------------------------|---------------------|
| 0000                  | NEQ                 | Not equal to zero                    | ZF == 0             |
| 0001                  | EQ                  | Equal to zero                        | ZF == 1             |
| 0010                  | GT                  | Greater than zero                    | ZF == 0 AND NF == 0 |
| 0011                  | GEQ                 | Greater than or equal to zero        | NF == 0             |
| 0100                  | LT                  | Less than zero                       | NF == 1             |
| 0101                  | LEQ                 | Less than or equal to zero           | ZF == 1 OR NF == 1  |
| 1010                  | TF                  | Test flag set                        | TF == 1             |
| 1011                  | NTF                 | Test flag not set                    | TF == 0             |
| 1100                  | LU                  | Latched underflow                    | LUF == 1            |
| 1101                  | LV                  | Latched overflow                     | LVF == 1            |
| 1110                  | UNC                 | Unconditional                        | None                |
| 1111                  | UNCF <sup>(6)</sup> | Unconditional with flag modification | None                |

<sup>(5)</sup> Values not shown are reserved.

<sup>(6)</sup> This is the default operation if no CNDF field is specified. This condition will allow the ZF, and NF flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

### Pipeline

This is a single-cycle instruction.

### Example 1

```
; Show the basic operation of MNEGF32
;

## MNOP *No Operation*

### Operands

none                      This instruction does not have any operands

### Opcode

LSW: 0000 0000 0000 0000  
MSW: 0111 1111 1010 0000

### Description

Do nothing. This instruction is used to fill required pipeline delay slots when other instructions are not available to fill the slots.

### Flags

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction.

### Example

```
; X is an array of 32-bit floating-point values
; Find the maximum value in an array X
; and store it in Result
;
_Cla1Task1:
    MMOVI16    MAR1, #_X          ; Start address
    MUI16TOF32 MR0, @_len         ; Length of the array
    MNOP                          ; delay for MAR1 load
    MNOP                          ; delay for MAR1 load
    MMOV32     MR1, *MAR1[2]++    ; MR1 = X0
LOOP
    MMOV32     MR2, *MAR1[2]++    ; MR2 = next element
    MMAXF32    MR1, MR2           ; MR1 = MAX(MR1, MR2)
    MADDF32    MR0, MR0, #-1.0    ; Decrement the counter
    MCMPF32    MR0 #0.0           ; Set/clear flags for MBCNDD
    MNOP                          ; Too late to affect MBCNDD
    MNOP                          ; Too late to affect MBCNDD
    MNOP                          ; Too late to affect MBCNDD
    MBCNDD     LOOP, NEQ          ; Branch if not equal to zero
    MMOV32     @_Result, MR1      ; Always executed
    MNOP                          ; Pad to separate MBCNDD and MSTOP
    MNOP                          ; Pad to separate MBCNDD and MSTOP
    MSTOP
```

## MOR32 MRa, MRb, MRc *Bitwise OR*

### Operands

|     |                                                      |
|-----|------------------------------------------------------|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |
| MRC | CLA floating-point source register (MR0 to MR3)      |

### Opcode

LSW: 0000 0000 00cc bbaa  
MSW: 0111 1100 1000 0000

### Description

Bitwise OR of MRb with MRc.

MARa(31:0) = MARb(31:0) OR MRC(31:0);

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified based on the integer results of the operation.

NF = MRa(31);

ZF = 0;

if(MRa(31:0) == 0) { ZF = 1; }

### Pipeline

This is a single-cycle instruction.

### Example

```
MMOVIZ    MR0, #0x5555 ; MR0 = 0x5555AAAA
MMOVXI    MR0, #0xAAAA
```

```
MMOVIZ    MR1, #0x5432 ; MR1 = 0x5432FEDC
MMOVXI    MR1, #0xFEDC
```

```
; 0101 OR 0101 = 0101 (5)
; 0101 OR 0100 = 0101 (5)
; 0101 OR 0011 = 0111 (7)
; 0101 OR 0010 = 0111 (7)
; 1010 OR 1111 = 1111 (F)
; 1010 OR 1110 = 1110 (E)
; 1010 OR 1101 = 1111 (F)
; 1010 OR 1100 = 1110 (E)
```

```
MOR32 MR2, MR1, MR0 ; MR3 = 0x5555FEFE
```

**MRCNDD {CNDF}      *Return Conditional Delayed***
**Operands**

CNDF                      optional condition.

**Opcode**

LSW: 0000 0000 0000 0000  
MSW: 0111 1001 1010 cndf

**Description**

If the specified condition is true, then the RPC field of MSTF is loaded into MPC and fetching continues from that location. Otherwise program fetches will continue without the return.

Please refer to the pipeline section for important information regarding this instruction.

if (CNDF == TRUE) MPC = RPC;

CNDF is one of the following conditions:

| Encode <sup>(7)</sup> | CNDF                | Description                          | MSTF Flags Tested   |
|-----------------------|---------------------|--------------------------------------|---------------------|
| 0000                  | NEQ                 | Not equal to zero                    | ZF == 0             |
| 0001                  | EQ                  | Equal to zero                        | ZF == 1             |
| 0010                  | GT                  | Greater than zero                    | ZF == 0 AND NF == 0 |
| 0011                  | GEQ                 | Greater than or equal to zero        | NF == 0             |
| 0100                  | LT                  | Less than zero                       | NF == 1             |
| 0101                  | LEQ                 | Less than or equal to zero           | ZF == 1 OR NF == 1  |
| 1010                  | TF                  | Test flag set                        | TF == 1             |
| 1011                  | NTF                 | Test flag not set                    | TF == 0             |
| 1100                  | LU                  | Latched underflow                    | LUF == 1            |
| 1101                  | LV                  | Latched overflow                     | LVF == 1            |
| 1110                  | UNC                 | Unconditional                        | None                |
| 1111                  | UNCF <sup>(8)</sup> | Unconditional with flag modification | None                |

<sup>(7)</sup> Values not shown are reserved.

<sup>(8)</sup> This is the default operation if no CNDF field is specified. This condition will allow the ZF and NF flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

**Flags**

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

## Pipeline

The MRCNDD instruction by itself is a single-cycle instruction. As shown in [Table 5-20](#), for each return 6 instruction slots are executed; three before the return instruction (d5-d7) and three after the return instruction (d8-d10). The total number of cycles for a return taken or not taken depends on the usage of these slots. That is, the number of cycles depends on how many slots are filled with a MNOP as well as which slots are filled. The effective number of cycles for a return can, therefore, range from 1 to 7 cycles. The number of cycles for a return taken may not be the same as for a return not taken.

Referring to the following code fragment and the pipeline diagrams in [Table 5-20](#) and [Table 5-21](#), the instructions before and after MRCNDD have the following properties:

```

;
;
<Instruction 1>    ; I1 Last instruction that can affect flags for
                  ; the MCCNDD operation
<Instruction 2>    ; I2 Cannot be stop, branch, call or return
<Instruction 3>    ; I3 Cannot be stop, branch, call or return
<Instruction 4>    ; I4 Cannot be stop, branch, call or return

MCCNDD _func, NEQ ; Call to func if not equal to zero
                  ; Three instructions after MCCNDD are always
                  ; executed whether the call is taken or not
<Instruction 5>    ; I5 Cannot be stop, branch, call or return
<Instruction 6>    ; I6 Cannot be stop, branch, call or return
<Instruction 7>    ; I7 Cannot be stop, branch, call or return
<Instruction 8>    ; I8 The address of this instruction is saved
                  ; in the RPC field of the MSTF register.
                  ; Upon return this value is loaded into MPC
                  ; and fetching continues from this point.
<Instruction 9>    ; I9
<Instruction 10>   ; I10
....
....
_func:
<Destination 1>   ; d1 Can be any instruction
<Destination 2>   ; d2
<Destination 3>   ; d3
<Destination 4>   ; d4 Last instruction that can affect flags for
                  ; the MRCNDD operation
<Destination 5>   ; d5 Cannot be stop, branch, call or return
<Destination 6>   ; d6 Cannot be stop, branch, call or return
<Destination 7>   ; d7 Cannot be stop, branch, call or return

MRCNDD NEQ        ; Return to <Instruction 8> if not equal to zero
                  ; Three instructions after MRCNDD are always
                  ; executed whether the return is taken or not
<Destination 8>   ; d8 Cannot be stop, branch, call or return
<Destination 9>   ; d9 Cannot be stop, branch, call or return
<Destination 10>  ; d10 Cannot be stop, branch, call or return
<Destination 11>  ; d11
<Destination 12>  ; d12
....
....
MSTOP
....

```

- **d4**

- d4 is the last instruction that can effect the CNDF flags for the MRCNDD instruction. The CNDF flags are tested in the D2 phase of the pipeline. That is, a decision is made whether to return or not when MRCNDD is in the D2 phase.
- There are no restrictions on the type of instruction for d4.

- **d5, d6 and d7**

- The three instructions proceeding MRCNDD can change MSTF flags but will have no effect on whether the MRCNDD instruction makes the return or not. This is

because the flag modification will occur after the D2 phase of the MRCNDD instruction.

- These instructions must not be the following: MSTOP, MDEBUGSTOP, MBCNDD, MCCNDD or MRCNDD.
- **d8, d9 and d10**
  - The three instructions following MRCNDD are always executed irrespective of whether the return is taken or not.
  - These instructions must not be the following: MSTOP, MDEBUGSTOP, MBCNDD, MCCNDD or MRCNDD.

**Table 5-20. Pipeline Activity For MRCNDD, Return Not Taken**

| Instruction | F1     | F2     | D1     | D2     | R1  | R2  | E   | W |
|-------------|--------|--------|--------|--------|-----|-----|-----|---|
| d4          | d4     | d3     | d2     | d1     | I7  | I6  | I5  |   |
| d5          | d5     | d4     | d3     | d2     | d1  | I7  | I6  |   |
| d6          | d6     | d5     | d4     | d3     | d2  | d1  | I7  |   |
| d7          | d7     | d6     | d5     | d4     | d3  | d2  | d1  |   |

## MSETC BGINTM *Set Background Task Interrupt Mask*

### Operands

none This instruction does not have any operands

### Opcode

LSW: 0000 0000 0000 0000  
MSW: 0111 1111 0101 0000

### Description

This instruction will set the background task interrupt mask (BGINTM) bit in the MSTSBGRND register, making any code thereafter un-interruptible. No other higher priority task will be able to interrupt the background task until the BGINTM is cleared. This instruction sets the BGINTM bit at the end of its D2 phase.

Note: This instruction does not require the MEALLOW bit to be asserted before, or de-asserted after, setting BGINTM.

### Flags

This instruction does not modify the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction.

### Example

```
MSETC BGINTM      ; Set the MSTSBGRND.BGINTM bit
                   ; to prevent any other tasks from
                   ; interrupting the background task
```

## MSETFLG FLAG, VALUE *Set or Clear Selected Floating-Point Status Flags*

### Operands

|       |                                                                    |
|-------|--------------------------------------------------------------------|
| FLAG  | 8 bit mask indicating which floating-point status flags to change. |
| VALUE | 8 bit mask indicating the flag value; 0 or 1.                      |

### Opcode

LSW: FFFF FFFF VVVV VVVV  
MSW: 0111 1001 1100 0000

### Description

The MSETFLG instruction is used to set or clear selected floating-point status flags in the MSTF register. The FLAG field is an 11-bit value that indicates which flags will be changed. That is, if a FLAG bit is set to 1 it indicates that flag will be changed; all other flags will not be modified. The bit mapping of the FLAG field is shown below:

|            |              |              |    |              |          |    |    |     |     |
|------------|--------------|--------------|----|--------------|----------|----|----|-----|-----|
| RNDF3<br>2 | reserve<br>d | reserve<br>d | TF | reserve<br>d | reserved | ZF | NF | LUF | LVF |
| 9          | 8            | 7            | 6  | 5            | 4        | 3  | 2  | 1   | 0   |

The VALUE field indicates the value the flag should be set to; 0 or 1.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF  | ZF  | NF  | LUF | LVF |
|----------|-----|-----|-----|-----|-----|
| Modified | Yes | Yes | Yes | Yes | Yes |

Any flag can be modified by this instruction. The MEALLOW and RPC fields cannot be modified with this instruction.

### Pipeline

This is a single-cycle instruction.

### Example

To make it easier and legible, the assembler accepts a FLAG=VALUE syntax for the MSTFLG operation as shown below:

```
MSETFLG RNDF32=0, TF=0, NF=1; FLAG = 11000100; VALUE = 00XXX1XX;
```

## MSTOP

### Stop Task

#### Operands

|      |                                             |
|------|---------------------------------------------|
| none | This instruction does not have any operands |
|------|---------------------------------------------|

#### Opcode

LSW: 0000 0000 0000 0000  
MSW: 0111 1111 1000 0000

#### Description

The MSTOP instruction must be placed to indicate the end of each task. In addition, placing MSTOP in unused memory locations within the CLA program RAM can be useful for debugging and preventing run away CLA code. When MSTOP enters the D2 phase of the pipeline, the MIRUN flag for the task is cleared and the associated interrupt is flagged in the PIE vector table.

There are three special cases that can occur when single-stepping a task such that the MPC reaches the MSTOP instruction.

1. If you are single-stepping or halted in "task A" and "task B" comes in before the MPC reaches the MSTOP, then "task B" will start if you continue to step through the MSTOP instruction. Basically if "task B" is pending before the MPC reaches MSTOP in "task A" then there is no issue in "task B" starting and no special action is required.
2. In this case you have single-stepped or halted in "task A" and the MPC has reached the MSTOP with no tasks pending. If "task B" comes in at this point, it will be flagged in the MIFR register but it may or may not start if you continue to single-step through the MSTOP instruction of "task A". It depends on exactly when the new task comes in. To reliably start "task B" perform a soft reset and reconfigure the MIER bits. Once this is done, you can start single-stepping "task B".
3. Case 2 can be handled slightly differently if there is control over when "task B" comes in (for example using the IACK instruction to start the task). In this case you have single-stepped or halted in "task A" and the MPC has reached the MSTOP with no tasks pending. Before forcing "task B", run free to force the CLA out of the debug state. Once this is done you can force "task B" and continue debugging.

#### Restrictions

The MSTOP instruction cannot be placed 3 instructions before or after a [MBCNDD](#), [MCCNDD](#) or [MRCNDD](#) instruction.

#### Flags

This instruction does not modify flags in the MSTF register.

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

#### Pipeline

This is a single-cycle instruction. [Table 5-22](#) shows the pipeline behavior of the MSTOP instruction. The MSTOP instruction cannot be placed with 3 instructions of a [MBCNDD](#), [MCCNDD](#) or [MRCNDD](#) instruction.

**Table 5-22. Pipeline Activity For MSTOP**

| Instruction                        | F1    | F2    | D1    | D2    | R1 | R2 | E  | W |

## MSUB32 MRa, MRb, MRc 32-Bit Integer Subtraction

### Operands

|     |                                                      |
|-----|------------------------------------------------------|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point destination register (MR0 to MR3) |
| MRC | CLA floating-point destination register (MR0 to MR3) |

### Opcode

LSW: 0000 0000 00cc bbaa  
MSW: 0111 1100 1110 0000

### Description

32-bit integer addition of MRb and MRc.

$MARa(31:0) = MARb(31:0) - MRC(31:0);$

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified as follows:

```
NF = MRa(31);
ZF = 0;
if(MRa(31:0) == 0) { ZF = 1; }
```

### Pipeline

This is a single-cycle instruction.

### Example

```
; Given A = (int32)1
;      B = (int32)2
;      C = (int32)-7
;
;
; Calculate Y2 = A - B - C
;
_Cla1Task3:
    MOV32    MR0, @_A      ; MR0 = 1 (0x00000001)
    MOV32    MR1, @_B      ; MR1 = 2 (0x00000002)
    MOV32    MR2, @_C      ; MR2 = -7 (0xFFFFFFFF9)
    MSUB32   MR3, MR0, MR1  ; A + B
    MSUB32   MR3, MR3, MR2  ; A + B + C = 6 (0x00000006)
    MOV32    @_y2, MR3      ; Store y2
    MSTOP
```

## MSUBF32 MRa, MRb, MRc 32-Bit Floating-Point Subtraction

### Operands

|     |                                                     |
|-----|-----------------------------------------------------|
| MRa | CLA floating-point destination register (MR0 to R1) |
| MRb | CLA floating-point source register (MR0 to R1)      |
| MRC | CLA floating-point source register (MR0 to R1)      |

### Opcode

LSW: 0000 0000 00cc bbaa  
MSW: 0111 1100 0100 0000

### Description

Subtract the contents of two floating-point registers

MRa = MRb - MRC;

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MSUBF32 generates an underflow condition.
- LVF = 1 if MSUBF32 generates an overflow condition.

### Pipeline

This is a single-cycle instruction.

### Example

```
; Given A, B and C are 32-bit floating-point numbers
; Calculate Y2 = A + B - C
;
_Cla1Task5:
    MOV32    MR0, @_A      ; Load MR0 with A
    MOV32    MR1, @_B      ; Load MR1 with B
    MADDF32   MR0, MR1, MR0 ; Add A + B
||  MOV32    MR1, @_C      ; and in parallel load C
    MSUBF32   MR0, MR0, MR1 ; Subtract C from (A + B)
    MOV32     @Y, MR0      ; (A+B) - C
    MSTOP
```

## MSUBF32 MRa, #16FHi, MRb 32-Bit Floating-Point Subtraction

### Operands

|        |                                                                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MRa    | CLA floating-point destination register (MR0 to R1)                                                                                                         |
| #16FHi | A 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. |
| MRb    | CLA floating-point source register (MR0 to R1)                                                                                                              |

### Opcode

LSW: I I I I I I I I I I I I I I I I  
MSW: 0111 1000 0000 baaa

### Description

Subtract MRb from the floating-point value represented by the immediate operand. Store the result of the addition in MRa.

#16FHi is a 16-bit immediate value that represents the upper 16-bits of an IEEE 32-bit floating-point value. The low 16-bits of the mantissa are assumed to be all 0. #16FHi is most useful for representing constants where the lowest 16-bits of the mantissa are 0. Some examples are 2.0 (0x40000000), 4.0 (0x40800000), 0.5 (0x3F000000), and -1.5 (0xBFC00000). The assembler will accept either a hex or float as the immediate value. That is, the value -1.5 can be represented as #-1.5 or #0xBFC0.

MRa = #16FHi:0 - MRb;

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MSUBF32 generates an underflow condition.
- LVF = 1 if MSUBF32 generates an overflow condition.

### Pipeline

This is a single-cycle instruction.

### Example

```
; Y = sqrt(X)
; Ye = Estimate(1/sqrt(X));
; Ye = Ye*(1.5 - Ye*Ye*X*0.5)
; Ye = Ye*(1.5 - Ye*Ye*X*0.5)
; Y = X*Ye
;
_Cla1Task3:
    MOV32    MR0, @_x          ; MR0 = X
    MEISQRTF32 MR1, MR0        ; MR1 = Ye = Estimate(1/sqrt(X))
    MOV32    MR1, @_x, EQ       ; if(X == 0.0) Ye = 0.0
    MPYF32   MR3, MR0, #0.5     ; MR3 = X*0.5
    MPYF32   MR2, MR1, MR3      ; MR2 = Ye*X*0.5
    MPYF32   MR2, MR1, MR2      ; MR2 = Ye*Ye*X*0.5
    MSUBF32  MR2, #1.5, MR2     ; MR2 = 1.5 - Ye*Ye*X*0.5
    MPYF32   MR1, MR1, MR2      ; MR1 = Ye = Ye*(1.5 - Ye*Ye*X*0.5)
    MPYF32   MR2, MR1, MR3      ; MR2 = Ye*X*0.5
    MPYF32   MR2, MR1, MR2      ; MR2 = Ye*Ye*X*0.5
    MSUBF32  MR2, #1.5, MR2     ; MR2 = 1.5 - Ye*Ye*X*0.5
    MPYF32   MR1, MR1, MR2      ; MR1 = Ye = Ye*(1.5 - Ye*Ye*X*0.5)
    MPYF32   MR0, MR1, MR0      ; MR0 = Y = Ye*X
    MOV32    @_y, MR0          ; Store Y = sqrt(X)
    MSTOP
```

| MRf   | CLA floating-point source register (MR0 to MR3) for the MSUBF32 operation                                                |
| MRa   | CLA floating-point destination register (MR0 to MR3) for the MMOV32 operation<br>MRa cannot be the same register as MRd  |
| mem32 | 32-bit memory location accessed using one of the available addressing modes. Source for the MMOV32 operation.            |

### Opcode

LSW: mmmm mmmm mmmm mmmm  
MSW: 0010 ffee ddaa addr

### Description

Subtract the contents of two floating-point registers and move from memory to a floating-point register.

MRd = MRe - MRf;  
MRa = [mem32];

### Restrictions

The destination register for the MSUBF32 and the MMOV32 must be unique. That is, MRa cannot be the same register as MRd.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MSUBF32 generates an underflow condition.
- LVF = 1 if MSUBF32 generates an overflow condition.

The MMOV32 Instruction will set the NF and ZF flags as follows:

### Pipeline

Both MSUBF32 and MMOV32 complete in a single cycle.

### Example

```
NF = MRa(31);
ZF = 0;
if(MRa(30:23) == 0) { ZF = 1; NF = 0; }
```

| MRf   | CLA floating-point source register (MR0 to MR3) for the MSUBF32 operation      |
| mem32 | 32-bit destination memory location for the MMOV32 operation                    |
| MRa   | CLA floating-point source register (MR0 to MR3) for the MMOV32 operation       |

### Opcode

LSW: mmmm mmmm mmmm mmmm  
MSW: 0110 ffee ddaa addr

### Description

Subtract the contents of two floating-point registers and move from a floating-point register to memory.

MRd = MRe - MRf;  
[mem32] = MRa;

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | Yes | Yes |

The MSTF register flags are modified as follows:

- LUF = 1 if MSUBF32 generates an underflow condition.
- LVF = 1 if MSUBF32 generates an overflow condition.

### Pipeline

Both MSUBF32 and MMOV32 complete in a single cycle.

| 0010                  | GT                  | Greater than zero                    | ZF == 0 AND NF == 0 |
| 0011                  | GEQ                 | Greater than or equal to zero        | NF == 0             |
| 0100                  | LT                  | Less than zero                       | NF == 1             |
| 0101                  | LEQ                 | Less than or equal to zero           | ZF == 1 OR NF == 1  |
| 1010                  | TF                  | Test flag set                        | TF == 1             |
| 1011                  | NTF                 | Test flag not set                    | TF == 0             |
| 1100                  | LU                  | Latched underflow                    | LUF == 1            |
| 1101                  | LV                  | Latched overflow                     | LVF == 1            |
| 1110                  | UNC                 | Unconditional                        | None                |
| 1111                  | UNCF <sup>(2)</sup> | Unconditional with flag modification | None                |

<sup>(1)</sup> Values not shown are reserved.

<sup>(2)</sup> This is the default operation if no CNDF field is specified. This condition will allow the ZF and NF flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

No flags affected

### Pipeline

This is a single-cycle instruction.

**Example**

```

; X is an array of 32-bit floating-point values
; and has len elements. Find the maximum value in
; the array and store it in Result
;
; Note: MCMPPF32 and MSWAPF can be replaced by MMAXF32
;
_Cla1Task1:
    MMOV16    MAR1, #_X          ; Start address
    MUI16TOF32 MR0, @_len        ; Length of the array
    MNOP                      ; delay for MAR1 load
    MNOP                      ; delay for MAR1 load
    MMOV32    MR1, *MAR1[2]++    ; MR1 = X0
LOOP
    MMOV32    MR2, *MAR1[2]++    ; MR2 = next element
    MCMPPF32  MR2, MR1           ; Compare MR2 with MR1
    MSWAPF    MR1, MR2, GT       ; MR1 = MAX(MR1, MR2)
    MADD32    MR0, MR0, #-1.0    ; Decrement the counter
    MCMPPF32  MR0, #0.0          ; Set/clear flags for MBCNDD
    MNOP
    MNOP
    MNOP
    MBCNDD    LOOP, NEQ          ; Branch if not equal to zero
    MMOV32    @_Result, MR1      ; Always executed
    MNOP                      ; Always executed
    MNOP                      ; Always executed
    MSTOP                      ; End of task

```

## MTESTTF CNDF *Test MSTF Register Flag Condition*

### Operands

CNDF                      condition to test based on MSTF flags

### Opcode

LSW: 0000 0000 0000 cndf  
MSW: 0111 1111 0100 0000

### Description

Test the CLA floating-point condition and if true, set the MSTF[TF] flag. If the condition is false, clear the MSTF[TF] flag. This is useful for temporarily storing a condition for later use.

```
if (CNDF == true) TF = 1;
else TF = 0;
```

CNDF is one of the following conditions:

| Encode <sup>(3)</sup> | CNDF                | Description                          | MSTF Flags Tested   |
|-----------------------|---------------------|--------------------------------------|---------------------|
| 0000                  | NEQ                 | Not equal to zero                    | ZF == 0             |
| 0001                  | EQ                  | Equal to zero                        | ZF == 1             |
| 0010                  | GT                  | Greater than zero                    | ZF == 0 AND NF == 0 |
| 0011                  | GEQ                 | Greater than or equal to zero        | NF == 0             |
| 0100                  | LT                  | Less than zero                       | NF == 1             |
| 0101                  | LEQ                 | Less than or equal to zero           | ZF == 1 OR NF == 1  |
| 1010                  | TF                  | Test flag set                        | TF == 1             |
| 1011                  | NTF                 | Test flag not set                    | TF == 0             |
| 1100                  | LU                  | Latched underflow                    | LUF == 1            |
| 1101                  | LV                  | Latched overflow                     | LVF == 1            |
| 1110                  | UNC                 | Unconditional                        | None                |
| 1111                  | UNCF <sup>(4)</sup> | Unconditional with flag modification | None                |

<sup>(3)</sup> Values not shown are reserved.

<sup>(4)</sup> This is the default operation if no CNDF field is specified. This condition will allow the ZF and NF flags to be modified when a conditional operation is executed. All other conditions will not modify these flags.

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF  | ZF | NF | LUF | LVF |
|----------|-----|----|----|-----|-----|
| Modified | Yes | No | No | No  | No  |

```
TF = 0;
if (CNDF == true) TF = 1;
```

Note: If (CNDF == UNC or UNCF), the TF flag will be set to 1.

### Pipeline

This is a single-cycle instruction.

**Example**

```

; if (State == 0.1)
;   RampState = RampState || RAMPMASK
; else if (State == 0.01)
;   CoastState = CoastState || COASTMASK
; else
;   SteadyState = SteadyState || STEADYMASK
;
_Cla1Task2:
    MOV32    MR0, @_State
    MCMPIF32 MR0, #0.1      ; Affects flags for 1st MBCNDD (A)
    MCMPIF32 MR0, #0.01     ; Check used by 2nd MBCNDD (B)
    MTESTTF  EQ             ; Store EQ flag in TF for 2nd MBCNDD (B)
    MNOP
    MBCNDD   _Skip1, NEQ     ; (A) If State != 0.1, go to Skip1
    MOV32    MR1, @_RampState ; Always executed
    MOVXI    MR2, #RAMPMASK  ; Always executed
    MOR32    MR1, MR2        ; Always executed
    MOV32    @_RampState, MR1 ; Execute if (A) branch not taken
    MSTOP    ; end of task if (A) branch not taken

_Skip1:
    MOV32    MR3, @_SteadyState
    MOVXI    MR2, #STEADYMASK
    MOR32    MR3, MR2
    MBCNDD   _Skip2, NTF     ; (B) if State != .01, go to Skip2
    MOV32    MR1, @_CoastState ; Always executed
    MOVXI    MR2, #COASTMASK  ; Always executed
    MOR32    MR1, MR2        ; Always executed
    MOV32    @_CoastState, MR1 ; Execute if (B) branch not taken
    MSTOP    ; end of task if (B) branch not taken

_Skip2:
    MOV32    @_SteadyState, MR3 ; Executed if (B) branch taken
    MSTOP

```

**MUI16TOF32 MRa, mem16    *Convert Unsigned 16-Bit Integer to 32-Bit Floating-Point Value***

---

**Operands**

|       |                                                      |
|-------|------------------------------------------------------|
| MRa   | CLA floating-point destination register (MR0 to MR3) |
| mem16 | 16-bit source memory location                        |

---

**Opcode**

LSW: mmmm mmmm mmmm mmmm  
MSW: 0111 0101 01aa addr

**Description**

When converting F32 to I16/UI16 data format, the MF32TOI16/UI16 operation truncates to zero while the MF32TOI16R/UI16R operation will round to nearest (even) value.

MRa = UI16TOF32[mem16];

**Flags**

This instruction does not affect any flags:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

---

**Pipeline**

This is a single-cycle instruction.

## MUI16TOF32 MRa, MRb *Convert Unsigned 16-Bit Integer to 32-Bit Floating-Point Value*

### Operands

|     |                                                      |
|-----|------------------------------------------------------|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |

### Opcode

LSW: 0000 0000 0000 bbaa  
MSW: 0111 1110 1110 0000

### Description

Convert an unsigned 16-bit integer to a 32-bit floating-point value. When converting float32 to I16/UI16 data format, the MF32TOI16/UI16 operation truncates to zero while the MF32TOI16R/UI16R operation will round to nearest (even) value.

MRa = UI16TOF32[MRb];

### Flags

This instruction does not affect any flags:

| Flag     | TF | ZF | NF | LUF | LVF |
|----------|----|----|----|-----|-----|
| Modified | No | No | No | No  | No  |

### Pipeline

This is a single-cycle instruction.

### Example

```
MMOVXI MR1, #0x800F ; MR1(15:0) = 32783 (0x800F)
MUI16TOF32 MR0, MR1 ; MR0 = UI16TOF32 (MR1(15:0))
                      ; = 32783.0 (0x47000F00)
```

## MXOR32 MRa, MRb, MRc *Bitwise Exclusive Or*

### Operands

|     |                                                      |
|-----|------------------------------------------------------|
| MRa | CLA floating-point destination register (MR0 to MR3) |
| MRb | CLA floating-point source register (MR0 to MR3)      |
| MRc | CLA floating-point source register (MR0 to MR3)      |

### Opcode

LSW: 0000 0000 00cc bbaa  
MSW: 0111 1100 1010 0000

### Description

Bitwise XOR of MRb with MRc.

MARa(31:0) = MARb(31:0) XOR MRc(31:0);

### Flags

This instruction modifies the following flags in the MSTF register:

| Flag     | TF | ZF  | NF  | LUF | LVF |
|----------|----|-----|-----|-----|-----|
| Modified | No | Yes | Yes | No  | No  |

The MSTF register flags are modified based on the integer results of the operation.

NF = MRa(31);

ZF = 0;

if(MRa(31:0) == 0) { ZF = 1; }

### Pipeline

This is a single-cycle instruction.

### Example

```
MMOVIZ MR0, #0x5555 ; MR0 = 0x5555AAAA
MMOVXI MR0, #0xAAAA

MMOVIZ MR1, #0x5432 ; MR1 = 0x5432FEDC
MMOVXI MR1, #0xFEDC

; 0101 XOR 0101 = 0000 (0)
; 0101 XOR 0100 = 0001 (1)
; 0101 XOR 0011 = 0110 (6)
; 0101 XOR 0010 = 0111 (7)
; 1010 XOR 1111 = 0101 (5)
; 1010 XOR 1110 = 0100 (4)
; 1010 XOR 1101 = 0111 (7)
; 1010 XOR 1100 = 0110 (6)

MXOR32 MR2, MR1, MR0 ; MR3 = 0x01675476
```

## 5.8 CLA Registers

This section describes the Control Law Accelerator registers.

### 5.8.1 CLA Base Addresses

**Table 5-23. CLA Base Address Table**

| Device Registers | Register Name    | Start Address | End Address |
|------------------|------------------|---------------|-------------|
| Cla1OnlyRegs     | CLA_ONLY_REGS    | 0x0000_0C00   | 0x0000_0CFF |
| Cla1SoftIntRegs  | CLA_SOFTINT_REGS | 0x0000_0CE0   | 0x0000_0CFF |
| Cla1Regs         | CLA_REGS         | 0x0000_1400   | 0x0000_147F |

## 5.8.2 CLA\_ONLY\_REGS Registers

Table 5-24 lists the CLA\_ONLY\_REGS registers. All register offset addresses not listed in Table 5-24 should be considered as reserved locations and the register contents should not be modified.

**Table 5-24. CLA\_ONLY\_REGS Registers**

| Offset | Acronym           | Register Name                          | Write Protection | Section            |
|--------|-------------------|----------------------------------------|------------------|--------------------|
| 80h    | _MVECTBGRNDACTIVE | Active register for MVECTBGRND.        | EALLOW           | <a href="#">Go</a> |
| C0h    | _MPSACTL          | CLA PSA Control Register               | EALLOW           | <a href="#">Go</a> |
| C2h    | _MPSA1            | CLA PSA1 Register                      | EALLOW           | <a href="#">Go</a> |
| C4h    | _MPSA2            | CLA PSA2 Register                      | EALLOW           | <a href="#">Go</a> |
| E0h    | SOFTINTEN         | CLA Software Interrupt Enable Register |                  | <a href="#">Go</a> |
| E2h    | SOFTINTFRC        | CLA Software Interrupt Force Register  |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 5-25 shows the codes that are used for access types in this section.

**Table 5-25. CLA\_ONLY\_REGS Access Type Codes**

| Access Type                     | Code    | Description                                                                                                                                                                                                                                                                          |
|---------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Register Array Variables</b> |         |                                                                                                                                                                                                                                                                                      |
| i,j,k,l,m,n                     |         | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                               |         | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.                                                                                                                                                                  |

### 5.8.2.1 \_MVECTBGRNDACTIVE Register (Offset = 80h) [reset = 0h]

\_MVECTBGRNDACTIVE is shown in [Figure 5-2](#) and described in [Table 5-26](#).

Return to the [Summary Table](#).

Gives the current interrupted MPC value of the background task, if the background task was running and interrupted, or reflects the MVECTBGRND value, if MCTLBGRND.BGSTART bit is 0.

### 5.8.2.5 SOFTINTEN Register (Offset = E0h) [reset = 0h]

SOFTINTEN is shown in [Figure 5-6](#) and described in [Table 5-30](#).

Return to the [Summary Table](#).

Enables the ability to generate CLA task interrupt from within the task, by writing to SOFTINTFRC register. SOFTINTFRC register can only be written from CLA.

**Figure 5-6. SOFTINTEN Register**

### 5.8.2.6 SOFTINTFRC Register (Offset = E2h) [reset = 0h]

SOFTINTFRC is shown in [Figure 5-7](#) and described in [Table 5-31](#).

Return to the [Summary Table](#).

Writing a value of 1 in a bit will generate the corresponding task interrupt.

**Figure 5-7. SOFTINTFRC Register**

### 5.8.3 CLA\_SOFTINT\_REGS Registers

Table 5-32 lists the CLA\_SOFTINT\_REGS registers. All register offset addresses not listed in Table 5-32 should be considered as reserved locations and the register contents should not be modified.

**Table 5-32. CLA\_SOFTINT\_REGS Registers**

| Offset | Acronym    | Register Name                          | Write Protection | Section            |
|--------|------------|----------------------------------------|------------------|--------------------|
| 0h     | SOFTINTEN  | CLA Software Interrupt Enable Register |                  | <a href="#">Go</a> |
| 2h     | SOFTINTFRC | CLA Software Interrupt Force Register  |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 5-33 shows the codes that are used for access types in this section.

**Table 5-33. CLA\_SOFTINT\_REGS Access Type Codes**

| Access Type                     | Code | Description                                                                                                                                                                                                                                                                          |
|---------------------------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Read Type</b>                |      |                                                                                                                                                                                                                                                                                      |
| R                               | R    | Read                                                                                                                                                                                                                                                                                 |

| -n                              |      | Value after reset or the default value                                                                                                                                                                                                                                               |
| <b>Register Array Variables</b> |      |                                                                                                                                                                                                                                                                                      |
| i,j,k,l,m,n                     |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                               |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.                                                                                                                                                                  |

### 5.8.3.1 SOFTINTEN Register (Offset = 0h) [reset = 0h]

SOFTINTEN is shown in [Figure 5-8](#) and described in [Table 5-34](#).

Return to the [Summary Table](#).

Enables the ability to generate CLA task interrupt from within the task, by writing to SOFTINTFRC register. SOFTINTFRC register can only be written from CLA.

**Figure 5-8. SOFTINTEN Register**

### 5.8.3.2 SOFTINTFRC Register (Offset = 2h) [reset = 0h]

SOFTINTFRC is shown in [Figure 5-9](#) and described in [Table 5-35](#).

Return to the [Summary Table](#).

Writing a value of 1 in a bit will generate the corresponding task interrupt. This register is only accessible by the CLA (not the CPU).

Complex bit access types are encoded to fit into small table cells. Table 5-37 shows the codes that are used for access types in this section.

**Table 5-37. CLA\_REGS Access Type Codes**

| Access Type       | Code | Description     |
|-------------------|------|-----------------|
| <b>Read Type</b>  |      |                 |
| R                 | R    | Read            |
| R-0               | R-0  | Read Returns 0s |
| <b>Write Type</b> |      |                 |
| W                 | W    | Write           |

**Table 5-37. CLA\_REGS Access Type Codes (continued)**

| Access Type                     | Code    | Description                                                                                                                                                                                                                                                                          |
|---------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| W1C                             | W<br>1C | Write<br>1 to clear                                                                                                                                                                                                                                                                  |
| W1S                             | W<br>1S | Write<br>1 to set                                                                                                                                                                                                                                                                    |
| <b>Reset or Default Value</b>   |         |                                                                                                                                                                                                                                                                                      |
| -n                              |         | Value after reset or the default value                                                                                                                                                                                                                                               |
| <b>Register Array Variables</b> |         |                                                                                                                                                                                                                                                                                      |
| i,j,k,l,m,n                     |         | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                               |         | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.                                                                                                                                                                  |

### 5.8.4.1 MVECT1 Register (Offset = 0h) [reset = 0h]

MVECT1 is shown in [Figure 5-10](#) and described in [Table 5-38](#).

Return to the [Summary Table](#).

Each CLA interrupt has its own interrupt vector (MVECT1 to MVECT8). This interrupt vector points to the first instruction of the associated task. When a task begins, the CLA will start fetching instructions at the location indicated by the appropriate MVECT register .

**Figure 5-10. MVECT1 Register**

| Bit  | Field | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------|-------|------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15-0 | MVECT | R/W  | 0h    | <p>MPC Start Address: These bits specify the start address for the given interrupt (task). The address range of the CLA with a 16-bit MVECT is 64Kx16 words or 32K CLA instructions.</p> <p>There is one MVECT register per interrupt (task). Interrupt 1 uses MVECT1, interrupt 2 uses MVECT2 and so forth.</p> <p>Note: While the CLA is running or executing a task, the CPU can change the MVECT values..</p> <p>Reset type: SYSRSn</p> |

#### 5.8.4.2 MVECT2 Register (Offset = 1h) [reset = 0h]

MVECT2 is shown in [Figure 5-11](#) and described in [Table 5-39](#).

Return to the [Summary Table](#).

Each CLA interrupt has its own interrupt vector (MVECT1 to MVECT8). This interrupt vector points to the first instruction of the associated task. When a task begins, the CLA will start fetching instructions at the location indicated by the appropriate MVECT register .

**Figure 5-11. MVECT2 Register**

| Bit  | Field | Type | Reset | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------|-------|------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15-0 | MVECT | R/W  | 0h    | <p>MPC Start Address: These bits specify the start address for the given interrupt (task). The address range of the CLA with a 16-bit MVECT is 64Kx16 words or 32K CLA instructions.</p> <p>There is one MVECT register per interrupt (task). Interrupt 1 uses MVECT1, interrupt 2 uses MVECT2 and so forth.</p> <p>Note: While the CLA is running or executing a task, the CPU can change the MVECT values..</p> <p>Reset type: SYSRSn</p> |

#### 5.8.4.7 MVECT7 Register (Offset = 6h) [reset = 0h]

MVECT7 is shown in [Figure 5-16](#) and described in [Table 5-44](#).

Return to the [Summary Table](#).

Each CLA interrupt has its own interrupt vector (MVECT1 to MVECT8). This interrupt vector points to the first instruction of the associated task. When a task begins, the CLA will start fetching instructions at the location indicated by the appropriate MVECT register .

**Figure 5-16. MVECT7 Register**

| 2    | IACKE     | R/W     | 0h    | <p>IACK Operation Enable Bit: Writing a "1" to this bit will enable the IACK operation for setting the MIFR bits in the same manner as the MIFRC register (write of "1" will set respective MIFR bit). At reset, this feature is disabled.</p> <p>This feature enables the C28 CPU to efficiently trigger a task.</p> <p>Note: IACK operation should ignore EALLOW status of C28 core when accessing the MIFRC register.</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = The CLA ignores the IACK instruction. (default)</p> <p>1h (R/W) = Enable the main CPU to use the IACK #16bit instruction to set MIFR bits in the same manner as writing to the MIFRC register. Each bit in the operand, #16bit, corresponds to a bit in the MIFRC register. Using IACK has the advantage of not having to first set the EALLOW bit. This allows the main CPU to efficiently trigger a CLA task through software.</p> <p>Examples IACK #0x0001 Write a 1 to MIFRC bit 0 to force task 1</p> <p>IACK #0x0003 Write a 1 to MIFRC bit 0 and 1 to force task 1 and task 2</p> |
| 1    | SOFTRESET | R-0/W1S | 0h    | <p>Soft Reset Bit: Writing a "1" to this bit will stop a current task, clear the RUN flag and also clear all bits in the MIER register. Writes of "0" are ignored and reads always return a "0".</p> <p>Note: After issuing SOFTRESET command, user should wait at least 1 clock cycle before attempting to write to MIER register.</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = This bit always reads back 0 and writes of 0 are ignored.</p> <p>1h (R/W) = Writing a 1 will cause a soft reset of the CLA. This will stop the current task, clear the MIRUN flag and clear all bits in the MIER register. After a soft reset you must wait at least 1 SYSCLKOUT cycle before reconfiguring the MIER bits. If these two operations are done back-to-back then the MIER bits will not get set.</p>                                                                                                                                                                                                                                                             |
| 0    | HARDRESET | R-0/W1S | 0h    | <p>Hard Reset Bit: Writing a "1" to this bit will cause a HARD reset on the CLA. The behavior of a HARD reset is the same as a system reset SYSRSn on the CLA. Writes of "0" are ignored and reads always return a "0".</p> <p>Reset type: SYSRSn</p> <p>0h (R/W) = This bit always reads back 0 and writes of 0 are ignored.</p> <p>1h (R/W) = Writing a 1 will cause a hard reset of the CLA. This will set all CLA registers to their default state.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

#### 5.8.4.10 \_MVECTBGRNDACTIVE Register (Offset = 1Bh) [reset = 0h]

\_MVECTBGRNDACTIVE is shown in [Figure 5-19](#) and described in [Table 5-47](#).

Return to the [Summary Table](#).

Gives the current interrupted MPC value of the background task, if the background task was running and interrupted, or reflects the MVECTBGRND value, if MCTLBGRND.BGSTART bit is 0.

**Figure 5-19. \_MVECTBGRNDACTIVE Register**

|      |    |    |    |    |    |   |   |

| 15-0 | i16   | R    | 0h    | Gives the current interrupted MPC value of the background task, if the background task was running and interrupted, or reflects the MVECTBGRND value, if MCTLBGRND.BGSTART bit is 0.<br>Reset type: SYSRSn |

#### 5.8.4.11 SOFTINTEN Register (Offset = 1Ch) [reset = 0h]

SOFTINTEN is shown in [Figure 5-20](#) and described in [Table 5-48](#).

Return to the [Summary Table](#).

Enables the ability to generate CLA task interrupt from within the task, by writing to SOFTINTFRC register. SOFTINTFRC register can only be written from CLA. Only reads are allowed from CPU. Writes are not allowed from CPU.

**Figure 5-20. SOFTINTEN Register**

|          |        |        |        |        |        |        |        |

#### 5.8.4.15 MIFR Register (Offset = 20h) [reset = 0h]

MIFR is shown in [Figure 5-24](#) and described in [Table 5-52](#).

Return to the [Summary Table](#).

Each bit in the interrupt flag register corresponds to a CLA task. The corresponding bit is automatically set when the task request is received from the peripheral interrupt. The bit can also be set by the main CPU writing to the MIFRC register or using the IACK instruction to start the task. To use the IACK instruction to begin a task first enable this feature in the MCTL register. If the bit is already set when a new peripheral interrupt is received, then the corresponding overflow bit will be set in the MIOVF register. The corresponding MIFR bit is automatically cleared when the task begins execution. This will occur if the interrupt is enabled in the MIER register and no other higher priority task is pending. The bits can also be cleared manually by writing to the MICLR register. Writes to the MIFR register are ignored.

**Figure 5-24. MIFR Register**

### 5.8.4.16 MIOVF Register (Offset = 21h) [reset = 0h]

MIOVF is shown in [Figure 5-25](#) and described in [Table 5-53](#).

Return to the [Summary Table](#).

Each bit in the overflow flag register corresponds to a CLA task. The bit is set when an interrupt overflow event has occurred for the specific task. An overflow event occurs when the MIFR register bit is already set when a new interrupt is received from a peripheral source. The MIOVF bits are only affected by peripheral interrupt events. They do not respond to a task request by the main CPU IACK instruction or by directly setting MIFR bits. The overflow flag will remain latched and can only be cleared by writing to the overflow flag clear (MICLROVF) register. Writes to the MIOVF register are ignored.

### 5.8.4.17 MIFRC Register (Offset = 22h) [reset = 0h]

MIFRC is shown in [Figure 5-26](#) and described in [Table 5-54](#).

Return to the [Summary Table](#).

The interrupt force register can be used by the main CPU to start tasks through software. Writing a 1 to a MIFRC bit will set the corresponding bit in the MIFR register. Writes of 0 are ignored and reads always return 0. The IACK #16bit operation can also be used to start tasks and has the same effect as the MIFRC register. To enable IACK to set MIFR bits you must first set the MCTL[IACKE] bit. Using IACK has the advantage of not having to first set the EALLOW bit. This allows the main CPU to efficiently trigger CLA tasks through software.

#### 5.8.4.18 MICLR Register (Offset = 23h) [reset = 0h]

MICLR is shown in [Figure 5-27](#) and described in [Table 5-55](#).

Return to the [Summary Table](#).

Normally bits in the MIFR register are automatically cleared when a task begins. The interrupt flag clear register can be used to instead manually clear bits in the interrupt flag (MIFR) register. Writing a 1 to a MICLR bit will clear the corresponding bit in the MIFR register. Writes of 0 are ignored and reads always return 0.

#### 5.8.4.19 MICLROVF Register (Offset = 24h) [reset = 0h]

MICLROVF is shown in [Figure 5-28](#) and described in [Table 5-56](#).

Return to the [Summary Table](#).

Overflow flag bits in the MIOVF register are latched until manually cleared using the MICLROVF register. Writing a 1 to a MICLROVF bit will clear the corresponding bit in the MIOVF register. Writes of 0 are ignored and reads always return 0.

#### 5.8.4.20 MIER Register (Offset = 25h) [reset = 0h]

MIER is shown in [Figure 5-29](#) and described in [Table 5-57](#).

Return to the [Summary Table](#).

Setting the bits in the interrupt enable register (MIER) allow an incoming interrupt or main CPU software to start the corresponding CLA task. Writing a 0 will block the task, but the interrupt request will still be latched in the flag register (MIFLG). Setting the MIER register bit to 0 while the corresponding task is executing will have no effect on the task. The task will continue to run until it hits the MSTOP instruction. When a soft reset is issued, the MIER bits are cleared. There should always be at least a 1 SYSCLKOUT delay between issuing the soft reset and reconfiguring the MIER bits.

### 5.8.4.21 MIRUN Register (Offset = 26h) [reset = 0h]

MIRUN is shown in [Figure 5-30](#) and described in [Table 5-58](#).

Return to the [Summary Table](#).

The interrupt run status register (MIRUN) indicates which task is currently executing. Only one MIRUN bit will ever be set to a 1 at any given time. The bit is automatically cleared when the task completes and the respective interrupt is fed to the peripheral interrupt expansion (PIE) block of the device. This lets the main CPU know when a task has completed. The main CPU can stop a currently running task by writing to the MCTL[SOFTRESET] bit. This will clear the MIRUN flag and stop the task. In this case no interrupt will be generated to the PIE.

### 5.8.4.25 \_MSTF Register (Offset = 2Eh) [reset = 0h]

\_MSTF is shown in [Figure 5-34](#) and described in [Table 5-62](#).

Return to the [Summary Table](#).

The CLA status register (MSTF) reflects the results of different operations. These are the basic rules for the flags:

- Zero and negative flags are cleared or set based on:
- floating-point moves to registers
- the result of compare, minimum, maximum, negative and absolute value operations
- the integer result of operations such as MMOV16, MAND32, MOR32, MXOR32, MCMP32, MASR32, MLRS32
- Overflow and underflow flags are set by floating-point math instructions such as multiply, add, subtract and 1/x. These flags may also be connected to the peripheral interrupt expansion (PIE) block on your device. This can be useful for debugging underflow and overflow conditions within an application.

## ***Dual-Clock Comparator (DCC)***

This chapter describes the Dual-Clock Comparator (DCC) module.

| <b>6.4 Interrupts.....</b>        | <b>849</b> |
| <b>6.5 DCC Registers.....</b>     | <b>850</b> |

## 6.1 Introduction

The dual-clock comparator module is used for evaluating and monitoring the clock input based on a second clock, which can be a more accurate and reliable version. This instrumentation is used to detect faults in clock source or clock structures, thereby enhancing the system's safety metrics.

## 6.2 Features

The main features of each of the DCC modules are:

- Allows the application to ensure that a fixed ratio is maintained between frequencies of two clock signals.
- Supports the definition of a programmable tolerance window in terms of the number of reference clock cycles.
- Supports a single-sequence mode for spot measurements.
- Allows the selection of a clock source for each of the counters, resulting in several specific use cases.

### 6.2.1 Block Diagram

The DCC block diagram illustrates the main concept of the DCC module.

**Figure 6-1. DCC Operation**

## 6.3 Module Operation

As shown in Figure 6-1, DCC contains three counters – Counter0, Valid0 and Counter1. Initially, all counters are loaded with their user-defined, pre-load value. Counter0 and Counter1 start decrementing once the DCC is enabled at rates determined by the frequencies of Clock0 and Clock1, respectively. When Counter0 equals 0 (expires), the Valid0 counter begins decrementing at a rate determined by Clock0. If Counter1 decrements to 0 in the valid window, then no error is generated and Clock1 is considered to be good within allowable tolerance as configured by the user.

### 6.3.1 Configuring DCC Counters

Counter0 and Counter1 are configured based on the ratio between the frequencies of Clock0 and Clock1 ( $F_{clk1} \times \text{Counter0} = F_{clk0} \times \text{Counter1}$ ). The Valid0 counter provides tolerance and is configured based on the error in DCC. Since Clock0 and Clock1 are asynchronous, the start and stop of the counters do not occur synchronously. Hence, while configuring the counters, two different sources of errors must be accounted for:

- Errors due to the asynchronous timing of Clock0 and Clock1 - This depends on the frequency of Clock0 and Clock1:
  - If  $F_{clk1} > F_{clk0}$ , then Async. Error (In Clock0 cycles) = 2

- If  $F_{clk1} < F_{clk0}$ , then Async. Error (In Clock0 cycles) =  $2 \times (F_{clk0}/F_{clk1})$
- Digitization error - 3 Clock0 cycles

**Total Error (in Clock0 Cycles) = Async. Error + Digitization Error**

Another consideration while configuring the counters is the amount of frequency tolerance that users can accept in the frequency of the clock under measurement. If the desired tolerance is low, then the counter values will be large and will increase the window of measurement. This means that counter values for a tolerance of 0.1% will be larger than that of 0.2%. So, based on the tolerance, users can define the window of measurement in terms of Clock0 cycles. To illustrate:

**Window (in Clock0 Cycles) = (Total Error) / (0.01×Tolerance)**

For example, if the total Error is 10 and the tolerance desired is +/-0.1%, then:

**Window (In Clock0 cycles) =  $10 / (0.01 \times 0.1) = 10000$**

The following equations should be used to configure counter values:

**Counter0 = Window - Total Error**

**Valid0 = 2 × Total Error**

**Counter1 = Window × (Fclk1/Fclk0)**

### 6.3.2 Single-Shot Measurement Mode

The DCC module can be programmed to count down one time by enabling the single-shot mode. In this mode, the DCC stops operating when the down counter0 and the valid counter0 reach 0.

At the end of one sequence of counting down in this single-shot mode, the DCC gets disabled automatically, which prevents further counting. This mode is typically used for spot checking the frequency of a signal.

#### Example-1: Validating PLLRAWCLK frequency

A practical example of the usage is to validate the PLL output clock frequency using the XTAL as the reference clock. Assume XTAL is 10Mhz, PLL output frequency is 100Mhz and tolerance required is 0.1%. The measurement sequence would proceed as follows:

- Set Clock0 source for Counter0 and Valid0 as XTAL, and Clock1 source for Counter1 as PLL output clock.
- Based on the equations defined in [Section 6.3.1](#), calculated seed values for Counters will be: Counter0 = 4995; Valid0 = 10; Counter1 = 50000
- Once the DCC is enabled, the counters Counter0 and Counter1 both start counting down from their seed values.
- When Counter0 reaches zero, it automatically triggers the Valid0 counter.
- When Valid0 reaches zero and Counter1 is not zero, an ERROR status flag is set and a "DCC error" is sent to the PIE. Counter1 is frozen so that it stops counting down any further. The application can enable an interrupt to be generated from the PIE whenever this DCC error is indicated. Refer to [Table 3-3](#) to know the channel mapping of DCC Interrupt.
- The application then needs to clear the ERROR status flag and restart the DCC module so that it is ready for the next spot measurement.

If there is no error generated at the end of the sequence, then the DONE status flag is set and a DONE interrupt is generated. The application must clear the DONE flag before restarting the DCC.

#### Error Conditions:

An error condition is generated by any one of the following:

1. Counter1 counts down to 0 before Counter0 reaches 0. This means that Clock1 is faster than expected, or Clock0 is slower than expected. It includes the case when Clock0 is stuck at 1 or 0.
2. Counter1 does not reach 0 even when Counter0 and Valid0 have both reached 0. This means that Clock1 is slower than expected. It includes the case when Clock1 is stuck at 1 or 0.

Any error freezes the counters from counting. An application may then read out the counter values to help determine what caused the error.

## 6.4 Interrupts

DCC generates interrupt on either of the two events:

- DCC finishes counting and all the counters expire within defined window indicating DONE operation, provided `DCCGCTRL.DONENA=1`.
- DCC finishes counting with error where counters do not expire in defined window. This indicates an ERROR event, and sets an interrupt provided `DCCGCTRL.ERRENA=1`.

Interrupt due to DONE or ERROR event is OR'd and is flagged as DCC, which goes to INT7.16 in PIE Interrupt table. Application ISR needs to check the status flag inside `DCCSTATUS` register to determine whether it is due to ERROR or DONE.

## 6.5 DCC Registers

This section describes the Dual Clock Comparator Registers.

### 6.5.1 DCC Base Addresses

**Table 6-1. DCC Base Address Table**

| Device Registers | Register Name | Start Address | End Address |
|------------------|---------------|---------------|-------------|
| DCC0Regs         | DCC_REGS      | 0x0005_E700   | 0x0005_E71C |

## 6.5.2 DCC\_REGS Registers

Table 6-2 lists the DCC\_REGS registers. All register offset addresses not listed in Table 6-2 should be considered as reserved locations and the register contents should not be modified.

**Table 6-2. DCC\_REGS Registers**

| Offset | Acronym       | Register Name           | Write Protection | Section            |
|--------|---------------|-------------------------|------------------|--------------------|
| 0h     | DCCGCTRL      | Global Control Register |                  | <a href="#">Go</a> |
| 4h     | DCCREV        | DCC Revision Register   |                  | <a href="#">Go</a> |
| 8h     | DCCCNTSEED0   | Counter 0 Seed Value    |                  | <a href="#">Go</a> |
| Ch     | DCCVALIDSEED0 | Valid 0 Seed Value      |                  | <a href="#">Go</a> |
| 10h    | DCCCNTSEED1   | Counter 1 Seed Value    |                  | <a href="#">Go</a> |
| 14h    | DCCSTATUS     | DCC Status              |                  | <a href="#">Go</a> |
| 18h    | DCCCNT0       | Counter 0 Value         |                  | <a href="#">Go</a> |
| 1Ch    | DCCVALID0     | Valid Value 0           |                  | <a href="#">Go</a> |
| 20h    | DCCCNT1       | Counter 1 Value         |                  | <a href="#">Go</a> |
| 24h    | DCCCLKSRC1    | Clock Source 1          |                  | <a href="#">Go</a> |
| 28h    | DCCCLKSRC0    | Clock Source 0          |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 6-3 shows the codes that are used for access types in this section.

**Table 6-3. DCC\_REGS Access Type Codes**

| Access Type                     | Code    | Description                                                                                                                                                                                                                                                                          |

| R-1                             | R<br>-1 | Read<br>Returns 1s                                                                                                                                                                                                                                                                   |
| <b>Write Type</b>               |         |                                                                                                                                                                                                                                                                                      |
| W                               | W       | Write                                                                                                                                                                                                                                                                                |
| <b>Reset or Default Value</b>   |         |                                                                                                                                                                                                                                                                                      |
| -n                              |         | Value after reset or the default value                                                                                                                                                                                                                                               |
| <b>Register Array Variables</b> |         |                                                                                                                                                                                                                                                                                      |
| i,j,k,l,m,n                     |         | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                               |         | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.                                                                                                                                                                  |

### 6.5.2.1 DCCGCTRL Register (Offset = 0h) [reset = 5555h]

DCCGCTRL is shown in [Figure 6-2](#) and described in [Table 6-4](#).

Return to the [Summary Table](#).

Starts / stops the counters. Clears the error signal.

**Figure 6-2. DCCGCTRL Register**

## ***CLA Program ROM CRC (CLAPROMCRC)***

---

---

The CLAPROMCRC is a feature which calculates a CRC-32 value of a configurable block of data in the Control Law Accelerator program ROM space.

| Topic                                   | Page       |
|-----------------------------------------|------------|
| <b>7.1 Overview .....</b>               | <b>865</b> |
| <b>7.2 Functional Description .....</b> | <b>865</b> |
| <b>7.3 CLAPROM Registers .....</b>      | <b>867</b> |

## 7.1 Overview

The CLAPROMCRC is a feature which calculates a CRC-32 on a configurable block of memory in the CLA program ROM space. Neither the C28x nor the CLA have the capability to compute a CRC on the CLA program ROM. The CLAPROMCRC solves this problem by calculating a CRC-32 in a non-intrusive manner. It is a hardware CRC-32 module which fetches the CLA program ROM during idle cycles (when the CLA is not accessing the ROM on the CLA program bus), and calculates the CRC-32 in order to perform a code integrity check. It then compares the result with a golden CRC-32 value and indicates a pass or fail condition.

## 7.2 Functional Description

The CLAPROMCRC module can be configured and initiated by either the C28x or the CLA. Once the CLAPROMCRC is initiated, the processing core can switch back to the application and service the CLAPROMCRC via interrupt. An interrupt can trigger the C28x and CLA and signal that the CRC-32 calculation and comparison has completed (CRCDONE). The CLAPROMCRC module waits for CLA program bus idle cycles in order to access the CLA program ROM. This ensures that the CRC-32 hardware calculation does not affect code execution and performance on the CLA.

Below is a functional diagram of the CLAPROMCRC module.

**Figure 7-1. CLAPROMCRC Functional Diagram**

Once the CLAPROMCRC is initiated by the C28x or CLA, the module will snoop for idle cycles to fetch program memory and calculate the CRC-32. It will begin fetching from the START\_ADDRESS and stop after the CRC-32 has been calculated for the required number of bytes specified by BLOCK\_SIZE. The CRC-32 can be calculated on as little as 1KB of data up to the size of the CLA program ROM in increments of 1KB.

The CLAPROMCRC module fetches 32 bits of program data on every fetch and takes four cycles to calculate the CRC-32 value for each fetch. For example, in order to calculate a CRC-32 on 1KB of program data, the module requires 256 idle cycles if each fetch access is spaced four cycles apart. Therefore, to calculate the CRC-32 on a 1KB block of program data requires a minimum of 1024 cycles. The CRC polynomial used in the hardware calculation is 0x04C11DB7.

### 7.2.1 Start Address

The start address must be aligned to a 1KB boundary (512 word boundary). If a non-aligned address is programmed, then the 9 least significant bits are ignored to align the address. The start address written to the CRC32\_STARTADDRESS register must be the memory address corresponding to the CLA memory map.

---

**NOTE:** If the start address is not within the CLA program ROM space of the CLA memory map, then the calculation will not be initiated.

---

### 7.2.2 Seed

The seed is the initial value used for the CRC-32 calculation. Therefore, the result will vary with the initial seed. The seed can be written into the CRC32\_SEED register.

### 7.2.3 Halt

Once the CRC calculation is triggered, it can be halted by setting the HALT bit in the configuration register (CRC32\_CONTROLREG). When this bit is cleared, the CRC calculation will resume from the current address.

### 7.2.4 Result and Comparison

To protect the contents of the CLA program ROM, which includes TI proprietary code, the result of the CRC-32 must be protected. To protect the result, the actual CRC-32 value as it is calculated cycle by cycle is not made visible. However, the final result of the block is populated in the CRC32\_CRCRESULT register. This is the reason for the block size requirements which must specifically be a minimum of 1KB and an increment of 1KB.

To check the correctness of the CRC-32 result, a golden CRC value should be written in the CRC32\_GOLDENCRC register. After the CRC-32 calculation is completed by the module for the configured block size, the golden CRC will be compared with the final result and the module will then set a pass or fail bit accordingly in the status register (CRC32\_STATUSREG).

## 7.3 CLAPROM Registers

### 7.3.1 CLAPROM Base Addresses

**Table 7-1. CLA PROM CRC Base Address Table**

| Device Registers | Register Name       | Start Address | End Address |
|------------------|---------------------|---------------|-------------|
| ClaPromCrc32Regs | CLA_PROM_CRC32_REGS | 0x000061C0    | 0x000061DF  |

### 7.3.2 CLA\_PROM\_CRC32\_REGS Registers

Table 7-2 lists the CLA\_PROM\_CRC32\_REGS registers. All register offset addresses not listed in Table 7-2 should be considered as reserved locations and the register contents should not be modified.

**Table 7-2. CLA\_PROM\_CRC32\_REGS Registers**

| Offset | Acronym            | Register Name                   | Write Protection | Section            |
|--------|--------------------|---------------------------------|------------------|--------------------|
| 0h     | CRC32_CONTROLREG   | CRC32-Control Register          | EALLOW           | <a href="#">Go</a> |
| 2h     | CRC32_STARTADDRESS | CRC32-Start address register    | EALLOW           | <a href="#">Go</a> |
| 4h     | CRC32_SEED         | CRC32-Seed Register             | EALLOW           | <a href="#">Go</a> |
| 6h     | CRC32_STATUSREG    | CRC32-Status Register           |                  | <a href="#">Go</a> |
| 8h     | CRC32_CRCRESULT    | CRC32-CRC result Register       |                  | <a href="#">Go</a> |
| Ah     | CRC32_GOLDENCRC    | CRC32-Golden CRC register       |                  | <a href="#">Go</a> |
| 18h    | CRC32_INTEN        | CRC32-Interrupt enable register | EALLOW           | <a href="#">Go</a> |
| 1Ah    | CRC32_FLG          | CRC32-Interrupt Flag Register   |                  | <a href="#">Go</a> |
| 1Ch    | CRC32_CLR          | CRC32-Interrupt Clear Register  |                  | <a href="#">Go</a> |
| 1Eh    | CRC32_FRC          | CRC32-Interrupt Force Register  |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 7-3 shows the codes that are used for access types in this section.

**Table 7-3. CLA\_PROM\_CRC32\_REGS Access Type Codes**

| Access Type                     | Code | Description                                                                                                                                                                                                                                                                          |

## General-Purpose Input/Output (GPIO)

The GPIO module controls the device's digital and analog I/O multiplexing, which uses shared pins to maximize application flexibility. The pins are named by their general-purpose I/O name (for example, GPIO0, GPIO25, GPIO58). These pins can be individually selected to operate as digital I/O (also called GPIO mode), or connected to one of several peripheral I/O signals. The input signals can be qualified to remove unwanted noise.

## 8.1 Introduction

Up to twelve independent peripheral signals are multiplexed on a single GPIO-enabled pin in addition to the CPU-controlled I/O capability. Each pin output can be controlled by either a peripheral or one of the two CPU masters (CPU1, CPU1.CLA). There are two I/O ports:

- Port A consists of GPIO0-GPIO31
- Port B consists of GPIO32-GPIO59

The analog signals on this device are multiplexed with digital inputs. These analog IO (AIO) pins do not have digital output capability. They are assigned to a single port:

- Port H consists of GPIO224-GPIO247

Figure 8-1 shows the GPIO logic for a single pin.

Figure 8-1. GPIO Logic for a Single Pin

**NOTE:** High-speed SPI and AUXCLKIN use a different signal path that does not support inversion or qualification. For more details on high-speed SPI pins, see .

The USB PHY pin muxing is not shown in this diagram. For more details on USB pins, see .

There are two key features to note in this diagram. The first is that the input and output paths are entirely separate, connecting only at the pin. The second is that peripheral muxing takes place far from the pin. As a result, it is always possible for both CPUs and CLAs to read the physical state of the pin independent of CPU mastering and peripheral muxing. Likewise, external interrupts can be generated from peripheral activity. All pin options such as input qualification and open-drain output are valid for all masters and peripherals. However, the peripheral muxing, CPU muxing, and pin options can only be configured by CPU1.

A separate configuration is required for the USB signals. See for details.

---

**NOTE:** JTAG uses a different signal path that does not support inversion or qualification.

---

---

**NOTE:** GPIO22 and GPIO23 are in a special analog mode at reset, and must be reconfigured for GPIO use by disabling DC-DC and clearing their bits in GPAAMSEL. GPIO23's maximum toggle frequency is limited. The exact limit is TBD, but estimated to be 12 MHz.

---

---

**NOTE:** GPIO18/X2 has different timings due to the load placed on it by the oscillator circuit. For information on using GPIO18/X2 as a GPIO, please see the device datasheet and the Clocking section of this document.

---

---

**NOTE:** If digital signals with sharp edges (high dv/dt) are connected to the AIOs, cross-talk can occur with adjacent analog signals. Therefore, the user should limit the edge rate of signals connected to AIOs if adjacent channels are being used for analog functions.

---

## 8.2 Configuration Overview

I/O pin configuration consists of several steps:

### 1. Plan the device pin-out

Make a list of all required peripherals for the application. Using the peripheral mux information in the device data manual, choose which GPIOs to use for the peripheral signals. Decide which of the remaining GPIOs to use as inputs and outputs for each CPU and CLA.

Once the peripheral muxing has been chosen, it should be implemented by writing the appropriate values to the GPyMUX1/2 and GPyGMUX1/2 registers. When changing the GPyGMUX value for a pin, always set the corresponding GPyMUX bits to zero first to avoid glitching in the muxes. By default, all pins are general-purpose I/Os, not peripheral signals.

### 2. (Optional) Enable internal pullup resistors

To enable or disable the pullup resistors, write to the appropriate bits in the GPIO pullup disable registers (GPyPUD). All pullups are disabled by default. pullups can be used to keep input pins in a known state when there is no external signal driving them.

### 3. Select input qualification

If the pin will be used as an input, specify the required input qualification, if any. The input qualification sampling period is selected in the GPyCTRL registers, while the type of qualification is selected in the GPyQSEL1 and GPyQSEL2 registers. By default, all qualification is synchronous with a sampling period equal to PLLSYSCLK. For an explanation of input qualification, see section [Section 8.4](#).

### 4. Select the direction of any general-purpose I/O pins

For each pin configured as a GPIO, specify the direction of the pin as either input or output using the GPyDIR registers. By default, all GPIO pins are inputs. Before changing a pin to an output, load the output latch with the value to be driven by writing that value to the GPySET, GPyCLEAR, or GPyDAT registers. Once the latch is loaded, write to GPyDIR to change the pin direction. By default, all output latches are zero.

### 5. Select low-power mode wake-up sources

GPIOs 0-59 can be used to wake the system up from Standby or Halt mode. To select one or more GPIOs for wake-up, write to the appropriate bits in the GPIOLPMSEL0 and GPIOLPMSEL1 registers. These registers are part of the CPU system register space. For more information on low-power modes

and GPIO wake-up, see the Low Power Modes section in the *System Control and Interrupts* chapter.

#### 6. Select external interrupt sources

Configuring external interrupts is a two-step process. First, the interrupts themselves must be enabled and their polarity must be configured via the XINTnCR registers. Second, the XINT1-5 GPIO pins must be set by selecting the sources for Input X-BAR signals 4, 5, 6, 13, and 14, respectively. For more information on the Input X-BAR architecture, see the *Crossbar(XBAR)* chapter of this manual.

### 8.3 Digital General-Purpose I/O Control

The values on the pins that are configured as GPIO can be changed by using these registers.

#### • GPyDAT Registers

Each I/O port has one data register. Each bit in the data register corresponds to one GPIO pin. No matter how the pin is configured (GPIO or peripheral function), the corresponding bit in the data register reflects the current state of the pin after qualification. Writing to the GPyDAT register clears or sets the corresponding output latch and if the pin is enabled as a general purpose output (GPIO output) the pin will also be driven either low or high. If the pin is not configured as a GPIO output then the value will be latched, but the pin will not be driven. Only if the pin is later configured as a GPIO output, will the latched value be driven onto the pin.

When using the GPyDAT register to change the level of an output pin, you should be cautious not to accidentally change the level of another pin. For example, if you mean to change the output latch level of GPIOA1 by writing to the GPADAT register bit 0 using a read-modify-write instruction, a problem can occur if another I/O port A signal changes level between the read and the write stage of the instruction. Following is an analysis of why this happens:

The GPyDAT registers reflect the state of the pin, not the latch. This means the register reflects the actual pin value. However, there is a lag between when the register is written to when the new pin value is reflected back in the register. This may pose a problem when this register is used in subsequent program statements to alter the state of GPIO pins. An example is shown below where two program statements attempt to drive two different GPIO pins that are currently low to a high state.

If Read-Modify-Write operations are used on the GPyDAT registers, because of the delay between the output and the input of the first instruction (I1), the second instruction (I2) will read the old value and write it back.

```
GpioDataRegs.GPADAT.bit.GPIO1 = 1; //I1 performs read-modify-  
write of GPADAT GpioDataRegs.GPADAT.bit.GPIO2 = 1; //I2 also a read-modify-  
write of GPADAT. //GPADAT gets the old value of GPIO1 due to the delay
```

The second instruction will wait for the first to finish its write due to the write-followed-by-read protection on this peripheral frame. There will be some lag, however, between the write of (I1) and the GPyDAT bit reflecting the new value (1) on the pin. During this lag, the second instruction will read the old value of GPIO1 (0) and write it back along with the new value of GPIO2 (1). Therefore, GPIO1 pin stays low.

One solution is to put some NOPs between instructions. A better solution is to use the GPySET/GPyCLEAR/GPyTOGGLE registers instead of the GPyDAT registers. These registers always read back a 0 and writes of 0 have no effect. Only bits that need to be changed can be specified without disturbing any other bit(s) that are currently in the process of changing.

#### • GPySET Registers

The set registers are used to drive specified GPIO pins high without disturbing other pins. Each I/O port has one set register and each bit corresponds to one GPIO pin. The set registers always read back 0. If the corresponding pin is configured as an output, then writing a 1 to that bit in the set register will set the output latch high and the corresponding pin will be driven high. If the pin is not configured as a GPIO output, then the value will be latched but the pin will not be driven. Only if the pin is later configured as a GPIO output will the latched value will be driven onto the pin. Writing a 0 to any bit in the set registers has no effect.

#### • GPyCLEAR Registers

The clear registers are used to drive specified GPIO pins low without disturbing other pins. Each I/O port has one clear register. The clear registers always read back 0. If the corresponding pin is configured as a general purpose output, then writing a 1 to the corresponding bit in the clear register will clear the output latch and the pin will be driven low. If the pin is not configured as a GPIO output,

then the value will be latched but the pin will not be driven. Only if the pin is later configured as a GPIO output will the latched value will be driven onto the pin. Writing a 0 to any bit in the clear registers has no effect.

- **GPyTOGGLE Registers**

The toggle registers are used to drive specified GPIO pins to the opposite level without disturbing other pins. Each I/O port has one toggle register. The toggle registers always read back 0. If the corresponding pin is configured as an output, then writing a 1 to that bit in the toggle register flips the output latch and pulls the corresponding pin in the opposite direction. That is, if the output pin is driven low, then writing a 1 to the corresponding bit in the toggle register will pull the pin high. Likewise, if the output pin is high, then writing a 1 to the corresponding bit in the toggle register will pull the pin low. If the pin is not configured as a GPIO output, then the value will be latched but the pin will not be driven. Only if the pin is later configured as a GPIO output will the latched value will be driven onto the pin. Writing a 0 to any bit in the toggle registers has no effect.

## 8.4 Input Qualification

The input qualification scheme has been designed to be very flexible. You can select the type of input qualification for each GPIO pin by configuring the GPyQSEL1 and GPyQSEL2 registers. In the case of a GPIO input pin, the qualification can be specified as only synchronize to SYSCLKOUT or qualification by a sampling window. For pins that are configured as peripheral inputs, the input can also be asynchronous in addition to synchronized to SYSCLKOUT or qualified by a sampling window. The remainder of this section describes the options available.

### 8.4.1 No Synchronization (Asynchronous Input)

This mode is used for peripherals where input synchronization is not required or the peripheral itself performs the synchronization. Examples include communication ports McBSP, SCI, SPI, and I<sup>2</sup>C. In addition, it may be desirable to have the ePWM trip zone ( $\overline{TZN}$ ) signals function independent of the presence of SYSCLKOUT.

The asynchronous option is not valid if the pin is used as a general purpose digital input pin (GPIO). If the pin is configured as a GPIO input and the asynchronous option is selected then the qualification defaults to synchronization to SYSCLKOUT as described in [Section 8.4.2](#).

---

**NOTE:** Using input synchronization when the peripheral itself performs the synchronization may cause unexpected results. The user should ensure that the GPIO pin is configured for asynchronous in this case.

---

### 8.4.2 Synchronization to SYSCLKOUT Only

This is the default qualification mode of all the pins at reset. In this mode, the input signal is only synchronized to the system clock (SYSCLKOUT). Because the incoming signal is asynchronous, it can take up to a SYSCLKOUT period of delay in order for the input to the MCU to be changed. No further qualification is performed on the signal.

### 8.4.3 Qualification Using a Sampling Window

In this mode, the signal is first synchronized to the system clock (SYSCLKOUT) and then qualified by a specified number of cycles before the input is allowed to change. [Figure 8-2](#) and [Figure 8-3](#) show how the input qualification is performed to eliminate unwanted noise. Two parameters are specified by the user for this type of qualification: 1) the sampling period, or how often the signal is sampled, and 2) the number of samples to be taken.

**Figure 8-2. Input Qualification Using a Sampling Window**

**Time between samples (sampling period):**

To qualify the signal, the input signal is sampled at a regular period. The sampling period is specified by the user and determines the time duration between samples, or how often the signal will be sampled, relative to the CPU clock (SYSCLKOUT).

The sampling period is specified by the qualification period (QUALPRDn) bits in the GPxCTRL register. The sampling period is configurable in groups of 8 input signals. For example, GPIO0 to GPIO7 use GPxCTRL[QUALPRD0] setting and GPIO8 to GPIO15 use GPxCTRL[QUALPRD1]. [Table 8-1](#) and [Table 8-2](#) show the relationship between the sampling period or sampling frequency and the GPxCTRL[QUALPRDn] setting.

**Table 8-1. Sampling Period**

|                          | Sampling Period                                                 |
|--------------------------|-----------------------------------------------------------------|
| If GPxCTRL[QUALPRDn] = 0 | $1 \times T_{\text{SYSCLKOUT}}$                                 |
| If GPxCTRL[QUALPRDn] ≠ 0 | $2 \times \text{GPxCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}}$ |
|                          | Where $T_{\text{SYSCLKOUT}}$ is the period in time of SYSCLKOUT |

**Table 8-2. Sampling Frequency**

|                          | Sampling Frequency                                                       |
|--------------------------|--------------------------------------------------------------------------|
| If GPxCTRL[QUALPRDn] = 0 | $f_{\text{SYSCLKOUT}}$                                                   |
| If GPxCTRL[QUALPRDn] ≠ 0 | $f_{\text{SYSCLKOUT}} \times 1 \div (2 \times \text{GPxCTRL[QUALPRDn]})$ |
|                          | Where $f_{\text{SYSCLKOUT}}$ is the frequency of SYSCLKOUT               |

From these equations, the minimum and maximum time between samples can be calculated for a given SYSCLKOUT frequency:

**Example: Maximum Sampling Frequency:**

If GPxCTRL[QUALPRDn] = 0  
then the sampling frequency is  $f_{\text{SYSCLKOUT}}$   
If, for example,  $f_{\text{SYSCLKOUT}} = 60 \text{ MHz}$   
then the signal will be sampled at 60 MHz or one sample every 16.67 ns.

**Example: Minimum Sampling Frequency:**

If GPXCTRL[QUALPRDn] = 0xFF (255)

then the sampling frequency is  $f_{\text{SYSCLKOUT}} \times 1 \div (2 \times \text{GPXCTRL[QUALPRDn]})$

If, for example,  $f_{\text{SYSCLKOUT}} = 60 \text{ MHz}$

then the signal will be sampled at  $60 \text{ MHz} \times 1 \div (2 \times 255)$  or one sample every 8.5  $\mu\text{s}$ .

**Number of samples:**

The number of times the signal is sampled is either three samples or six samples as specified in the qualification selection (GPAQSEL1, GPAQSEL2, GPBQSEL1, and GPBQSEL2) registers. When three or six consecutive cycles are the same, then the input change will be passed through to the MCU.

**Total Sampling Window Width:**

The sampling window is the time during which the input signal will be sampled as shown in [Figure 8-3](#). By using the equation for the sampling period along with the number of samples to be taken, the total width of the window can be determined.

For the input qualifier to detect a change in the input, the level of the signal must be stable for the duration of the sampling window width or longer.

The number of sampling periods within the window is always one less than the number of samples taken. For a three-sample window, the sampling window width is two sampling periods wide where the sampling period is defined in [Table 8-1](#). Likewise, for a six-sample window, the sampling window width is five sampling periods wide. [Table 8-3](#) and [Table 8-4](#) show the calculations that can be used to determine the total sampling window width based on GPXCTRL[QUALPRDn] and the number of samples taken.

**Table 8-3. Case 1: Three-Sample Sampling Window Width**

|                               | Total Sampling Window Width                                              |
|-------------------------------|--------------------------------------------------------------------------|
| If GPXCTRL[QUALPRDn] = 0      | $2 \times T_{\text{SYSCLKOUT}}$                                          |
| If GPXCTRL[QUALPRDn] $\neq$ 0 | $2 \times 2 \times \text{GPXCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}}$ |
|                               | Where $T_{\text{SYSCLKOUT}}$ is the period in time of SYSCLKOUT          |

**Table 8-4. Case 2: Six-Sample Sampling Window Width**

|                               | Total Sampling Window Width                                              |
|-------------------------------|--------------------------------------------------------------------------|
| If GPXCTRL[QUALPRDn] = 0      | $5 \times T_{\text{SYSCLKOUT}}$                                          |
| If GPXCTRL[QUALPRDn] $\neq$ 0 | $5 \times 2 \times \text{GPXCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}}$ |
|                               | Where $T_{\text{SYSCLKOUT}}$ is the period in time of SYSCLKOUT          |

**NOTE:** The external signal change is asynchronous with respect to both the sampling period and SYSCLKOUT. Due to the asynchronous nature of the external signal, the input should be held stable for a time greater than the sampling window width to make sure the logic detects a change in the signal. The extra time required can be up to an additional sampling period +  $T_{\text{SYSCLKOUT}}$ .

The required duration for an input signal to be stable for the qualification logic to detect a change is described in the device-specific data manual.

**Example Qualification Window:**

For the example shown in [Figure 8-3](#), the input qualification has been configured as follows:

- GPXQSEL1/2 = 1,0. This indicates a six-sample qualification.
- GPXCTRL[QUALPRDn] = 1. The sampling period is  $t_w(\text{SP}) = 2 \times \text{GPXCTRL[QUALPRDn]} \times T_{\text{SYSCLKOUT}} = 2 \times T_{\text{SYSCLKOUT}}$ .

This configuration results in the following:

- The width of the sampling window is: .  

$$t_w(\text{IQSW}) = 5 \times t_w(\text{SP}) = 5 \times 2 \times \text{GPxCTRL}[\text{QUALPRDn}] \times T_{\text{SYCLKOUT}} = 5 \times 2 \times T_{\text{SYCLKOUT}}$$
- If, for example,  $T_{\text{SYCLKOUT}} = 16.67 \text{ ns}$ , then the duration of the sampling window is:  
Sampling period,  $t_w(\text{SP}) = 2 \times T_{\text{SYCLKOUT}} = 2 \times 16.67 \text{ ns} = 33.3 \text{ ns}$   
Sampling window,  $t_w(\text{IQSW}) = 5 \times t_w(\text{SP}) = 5 \times 33.3 \text{ ns} = 166.7 \text{ ns}$ .
- To account for the asynchronous nature of the input relative to the sampling period and SYCLKOUT, up to an additional sampling period and SYCLK period may be required to detect a change in the input signal. For this example:  

$$t_w(\text{IQSW}) + t_w(\text{SP}) + T_{\text{SYCLKOUT}} = 166.7 \text{ ns} + 33.3 \text{ ns} + 16.67 \text{ ns} = 216.7 \text{ ns}$$
- In [Figure 8-3](#), the glitch (A) is shorter than the qualification window and will be ignored by the input qualifier.

**Figure 8-3. Input Qualifier Clock Cycles**

- This glitch will be ignored by the input qualifier. The QUALPRD bit field specifies the qualification sampling period. It can vary from 00 to 0xFF. If QUALPRD = 00, then the sampling period is 1 SYCLKOUT cycle. For any other value "n", the qualification sampling period is 2n SYCLKOUT cycles (i.e., at every 2n SYCLKOUT cycles, the GPIO pin will be sampled).
- The qualification period selected via the GPxCTRL register applies to groups of 8 GPIO pins.
- The qualification block can take either three or six samples. The GPxQSELn Register selects which sample mode is used.
- In the example shown, for the qualifier to detect the change, the input should be stable for 10 SYCLKOUT cycles or greater. In other words, the inputs should be stable for  $(5 \times \text{QUALPRD} \times 2)$  SYCLKOUT cycles. That would ensure 5 sampling periods for detection to occur. Since external signals are driven asynchronously, a 13-SYCLKOUT-wide pulse ensures reliable recognition.

## 8.5 GPIO and Peripheral Muxing

Up to twelve different peripheral functions are multiplexed to each pin along with a general-purpose input/output (GPIO) function. This allows you to choose the peripheral mix and pinout that will work best for your particular application. Refer to the table below for muxing combinations and definitions.

**Table 8-5. GPIO Muxed Pins**

| 0, 4, 8, 12  | 1             | 2             | 3           | 5             | 6             | 7             | 9             | 10            | 11       | 13       | 14 | 15  |
|--------------|---------------|---------------|-------------|---------------|---------------|---------------|---------------|---------------|----------|----------|----|-----|
| GPIO0        | EPWM1_A       |               |             |               | I2CA_SDA      |               |               |               |          |          |    |     |
| GPIO1        | EPWM1_B       |               |             |               | I2CA_SCL      |               |               |               |          |          |    |     |

| GPIO59      |             |   |          | OUTPUTXBAR2      | SPIB_STE   | SD1_C4     | LINA_RX   | CANB_RX          | EQEP1_INDEX      |    |    |     |

For example, the multiplexing for the GPIO 6 pin is controlled by writing to GPAGMUX[13:12] and GPAMUX[13:12]. By writing to these bits, GPIO 6 can be configured as either a general-purpose digital I/O or one of four different peripheral functions. The options are shown in [Table 8-6](#).

**Table 8-6. GPIO and Peripheral Muxing**

| GPAGMUX1[13:12] | GPAMUX1[13:12] | Pin functionality |
|-----------------|----------------|-------------------|
| 00              | 00             | GPIO6             |
| 00              | 01             | EPWM4A            |
| 00              | 10             | OUTPUTXBAR4       |
| 00              | 11             | EXTSYNCOUT        |
| 01              | 00             | GPIO6             |
| 01              | 01             | EQEP1A            |
| 01              | 10             | CANB_TX           |
| 01              | 11             | SPIBSOMI          |
| 10              | 00             | GPIO6             |
| 10              | 01             | FSITXAD0          |
| 10              | 10             |                   |
| 10              | 11             |                   |
| 11              | 00             |                   |
| 11              | 01             |                   |
| 11              | 10             |                   |
| 11              | 11             |                   |

The devices have different multiplexing schemes. If a peripheral is not available on a particular device, that mux selection is reserved on that device and should not be used.

---

**NOTE:** If you select a reserved GPIO mux configuration that is not mapped to either a peripheral or GPIO mode, the state of the pin will be undefined and the pin may be driven. Unimplemented configurations are for future expansion and must not be selected. In the device mux table (see datasheet), these options are indicated as Reserved or left blank.

---

Some peripherals can be assigned to more than one pin via the mux registers. For example, OUTPUTXBAR1 can be assigned to GPIOs 2, 24, 34, or 58, depending on individual system requirements. An example of this is shown in [Table 8-7](#).

**Table 8-7. Peripheral Muxing (multiple pins assigned)**

| GMUX Configuration | MUX Configuration  |                   |
|--------------------|--------------------|-------------------|
| Choice 1 GPIO2     | GPAGMUX1[5:4]=01   | GPAMUX1[5:4]=01   |
| or Choice 2 GPIO24 | GPAGMUX2[17:16]=00 | GPAMUX2[17:16]=01 |
| or Choice 3 GPIO34 | GPBGMUX1[5:4]=00   | GPBMUX1[5:4]=01   |
| or Choice 4 GPIO58 | GPBGMUX2[21:20]=01 | GPBMUX2[21:20]=01 |

If none, or more than one, of the GPIO pins are configured as peripheral input pins, then that GPIO will be set to a hard-wired default value.

## 8.6 Internal Pullup Configuration Requirements

On reset, GPIOs are in input mode and have the internal pullups disabled. An un-driven input can float to a mid-rail voltage and cause wasted shoot-through current on the input buffer. The user should always put each GPIO in one of these configurations:

- Input mode and driven on the board by another component to a level above  $V_{ih}$  or below  $V_{il}$
- Input mode with GPIO internal pullup enabled
- Output mode

On devices with lesser pin count packages, pull-ups on unbonded GPIOs are by default enabled to prevent floating inputs. The user should take care to avoid disabling these pullups in their application code.

On devices in the 176 PTP packages, the pullups for any internally unbonded GPIO must be enabled to prevent floating inputs. TI has provided functions in controlSUITE which users can call to enable the pullup on any unbonded GPIO for the package they are using. This function, `GPIO_EnabledUnbondedIOPullups()`, resides in the `(Device)_Sysctrl.c` file and is called by default from `InitSysCtrl()`. The user should take care to avoid disabling these pullups in their application code.

## 8.7 GPIO Registers

This section describes the General Purpose Input/Output Registers.

### 8.7.1 GPIO Base Addresses

**Table 8-8. GPIO Base Address Table**

| Device Registers | Register Name  | Start Address | End Address |
|------------------|----------------|---------------|-------------|
| GpioCtrlRegs     | GPIO_CTRL_REGS | 0x0000_7C00   | 0x0000_7EFF |
| GpioDataRegs     | GPIO_DATA_REGS | 0x0000_7F00   | 0x0000_7FFF |

## 8.7.2 GPIO\_CTRL\_REGS Registers

Table 8-9 lists the GPIO\_CTRL\_REGS registers. All register offset addresses not listed in Table 8-9 should be considered as reserved locations and the register contents should not be modified.

**Table 8-9. GPIO\_CTRL\_REGS Registers**

| Offset | Acronym  | Register Name                                           | Write Protection | Section            |
|--------|----------|---------------------------------------------------------|------------------|--------------------|
| 0h     | GPACTRL  | GPIO A Qualification Sampling Period (GPIO0 to GPIO31)  | EALLOW           | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. [Table 8-10](#) shows the codes that are used for access types in this section.

**Table 8-10. GPIO\_CTRL\_REGS Access Type Codes**

| Access Type                     | Code       | Description                                                                                                                                                                                                                                                                          |
|---------------------------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| -n                              |            | Value after reset or the default value                                                                                                                                                                                                                                               |
| <b>Register Array Variables</b> |            |                                                                                                                                                                                                                                                                                      |
| i,j,k,l,m,n                     |            | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                               |            | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.                                                                                                                                                                  |

### 8.7.2.1 GPACTRL Register (Offset = 0h) [reset = 0h]

GPACTRL is shown in [Figure 8-4](#) and described in [Table 8-11](#).

Return to the [Summary Table](#).

GPIO A Qualification Sampling Period (GPIO0 to GPIO31)

Each field in this register selects the qualification sampling period in SYSCLK cycles for eight GPIOs. The period is equal to 2 times the register field value.

0x00: Period = 0 SYSCLK cycles

0x01: Period = 2 SYSCLK cycles

0x02: Period = 4 SYSCLK cycles

...

0xFF: Period = 510 SYSCLK cycles

### 8.7.2.4 GPAMUX1 Register (Offset = 6h) [reset = 0h]

GPAMUX1 is shown in [Figure 8-7](#) and described in [Table 8-14](#).

Return to the [Summary Table](#).

GPIO A Peripheral Mux (GPIO0 to GPIO15)

Each field in this register determines part of the GPIO mux configuration for one IO pin. A value of 0x0, 0x4, 0x8, or 0xC configures the pin as a general-purpose IO. All other values select a peripheral to control the pin. See the device datasheet for a table of peripheral mux options. Pins must be set to GPIO mode using this register before changing the corresponding field in the GPAGMUX1 register.

**Figure 8-7. GPAMUX1 Register**

|        |        |        |        |        |        |        |        |    |    |    |    |    |    |    |    |

### 8.7.2.5 GPAMUX2 Register (Offset = 8h) [reset = 0h]

GPAMUX2 is shown in [Figure 8-8](#) and described in [Table 8-15](#).

Return to the [Summary Table](#).

GPIO A Peripheral Mux (GPIO16 to GPIO31)

Each field in this register determines part of the GPIO mux configuration for one IO pin. A value of 0x0, 0x4, 0x8, or 0xC configures the pin as a general-purpose IO. All other values select a peripheral to control the pin. See the device datasheet for a table of peripheral mux options. Pins must be set to GPIO mode using this register before changing the corresponding field in the GPAGMUX2 register.

**Figure 8-8. GPAMUX2 Register**

|        |        |        |        |        |        |        |        |    |    |    |    |    |    |    |    |

### 8.7.2.6 GPADIR Register (Offset = Ah) [reset = 0h]

GPADIR is shown in [Figure 8-9](#) and described in [Table 8-16](#).

Return to the [Summary Table](#).

GPIO A Direction (GPIO0 to GPIO31)

Each field in this register selects the direction of one IO pin in GPIO mode. If the pin is not configured as a general-purpose IO, this register has no effect.

0: The pin is an input

1: The pin is an output

**Figure 8-9. GPADIR Register**

### 8.7.2.8 GPAINV Register (Offset = 10h) [reset = 0h]

GPAINV is shown in [Figure 8-11](#) and described in [Table 8-18](#).

Return to the [Summary Table](#).

GPIO A Input Inversion (GPIO0 to GPIO31)

Each field in this register selects whether the input value of one IO pin passes through an inverter.

0: The input is not inverted

1: The input is inverted

**Figure 8-11. GPAINV Register**

### 8.7.2.9 GPAODR Register (Offset = 12h) [reset = 0h]

GPAODR is shown in [Figure 8-12](#) and described in [Table 8-19](#).

Return to the [Summary Table](#).

GPIO A Open Drain Output Mode (GPIO0 to GPIO31)

Each field in this register selects between push-pull mode and open-drain mode for one general-purpose output pin. In both modes, writing a 0 to the output data latch drives the pin low. In push-pull mode, writing a 1 to the output data latch drives the pin high. In open-drain mode, it tri-states the output buffer.

0: Push-pull output

1: Open-drain output

### 8.7.2.12 GPAGMUX2 Register (Offset = 22h) [reset = 0h]

GPAGMUX2 is shown in [Figure 8-15](#) and described in [Table 8-22](#).

Return to the [Summary Table](#).

GPIO A Peripheral Group Mux (GPIO16 to GPIO31)

Each field in this register determines part of the GPIO mux configuration for a single IO pin. See the device datasheet for a table of peripheral mux options. Pins must be set to GPIO mode using the GPAGMUX2 register before changing their configuration in this register.

**Figure 8-15. GPAGMUX2 Register**

|        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |        |

### 8.7.2.17 GPALOCK Register (Offset = 3Ch) [reset = 0h]

GPALOCK is shown in [Figure 8-20](#) and described in [Table 8-27](#).

Return to the [Summary Table](#).

GPIO A Lock Register (GPIO0 to GPIO31)

Each field in this register locks one IO pin's configuration. This blocks writes to the corresponding bits in the GPAMUXn, GPAIDR, GPAINV, GPAODR, GPAGMUXn, and GPACSELn registers.

0: Pin configuration is unlocked

1: Pin configuration is locked

**Figure 8-20. GPALOCK Register**

| 31     | 30     | 29     | 28     | 27     | 26     | 25     | 24     |

### 8.7.2.18 GPACR Register (Offset = 3Eh) [reset = 0h]

GPACR is shown in [Figure 8-21](#) and described in [Table 8-28](#).

Return to the [Summary Table](#).

GPIO A Lock Commit Register (GPIO0 to GPIO31)

Each field in this register blocks writes to one IO pin's GPALOCK bit. Once set, a lock commit can only be cleared by a reset.

0: Pin configuration lock is unlocked

1: Pin configuration lock is locked

**Figure 8-21. GPACR Register**

### 8.7.2.19 GPBCTRL Register (Offset = 40h) [reset = 0h]

GPBCTRL is shown in [Figure 8-22](#) and described in [Table 8-29](#).

Return to the [Summary Table](#).

GPIO B Qualification Sampling Period (GPIO32 to GPIO63)

Each field in this register selects the qualification sampling period in SYSCLK cycles for eight GPIOs. The period is equal to 2 times the register field value.

0x00: Period = 0 SYSCLK cycles

0x01: Period = 2 SYSCLK cycles

0x02: Period = 4 SYSCLK cycles

...

0xFF: Period = 510 SYSCLK cycles

### 8.7.2.22 GPBMUX1 Register (Offset = 46h) [reset = CC0h]

GPBMUX1 is shown in [Figure 8-25](#) and described in [Table 8-32](#).

Return to the [Summary Table](#).

GPIO B Peripheral Mux (GPIO32 to GPIO47)

Each field in this register determines part of the GPIO mux configuration for one IO pin. A value of 0x0, 0x4, 0x8, or 0xC configures the pin as a general-purpose IO. All other values select a peripheral to control the pin. See the device datasheet for a table of peripheral mux options. Pins must be set to GPIO mode using this register before changing the corresponding field in the GPBGMUX1 register.

### 8.7.2.24 GPBDIR Register (Offset = 4Ah) [reset = 0h]

GPBDIR is shown in [Figure 8-27](#) and described in [Table 8-34](#).

Return to the [Summary Table](#).

GPIO B Direction (GPIO32 to GPIO63)

Each field in this register selects the direction of one IO pin in GPIO mode. If the pin is not configured as a general-purpose IO, this register has no effect.

0: The pin is an input

1: The pin is an output

**Figure 8-27. GPBDIR Register**

### 8.7.2.26 GPBINV Register (Offset = 50h) [reset = 0h]

GPBINV is shown in [Figure 8-29](#) and described in [Table 8-36](#).

Return to the [Summary Table](#).

GPIO B Input Inversion (GPIO32 to GPIO63)

Each field in this register selects whether the input value of one IO pin passes through an inverter.

0: The input is not inverted

1: The input is inverted

### 8.7.2.27 GPBODR Register (Offset = 52h) [reset = 0h]

GPBODR is shown in [Figure 8-30](#) and described in [Table 8-37](#).

Return to the [Summary Table](#).

GPIO B Open Drain Output Mode (GPIO32 to GPIO63)

Each field in this register selects between push-pull mode and open-drain mode for one general-purpose output pin. In both modes, writing a 0 to the output data latch drives the pin low. In push-pull mode, writing a 1 to the output data latch drives the pin high. In open-drain mode, it tri-states the output buffer.

0: Push-pull output

1: Open-drain output

### 8.7.2.29 GPBGMUX2 Register (Offset = 62h) [reset = 0h]

GPBGMUX2 is shown in [Figure 8-32](#) and described in [Table 8-39](#).

Return to the [Summary Table](#).

GPIO B Peripheral Group Mux (GPIO48 to GPIO63)

Each field in this register determines part of the GPIO mux configuration for a single IO pin. See the device datasheet for a table of peripheral mux options. Pins must be set to GPIO mode using the GPBMUX2 register before changing their configuration in this register.

**Figure 8-32. GPBGMUX2 Register**

### 8.7.2.34 GPBLOCK Register (Offset = 7Ch) [reset = 0h]

GPBLOCK is shown in [Figure 8-37](#) and described in [Table 8-44](#).

Return to the [Summary Table](#).

GPIO B Lock Register (GPIO32 to GPIO63)

Each field in this register locks one IO pin's configuration. This blocks writes to the corresponding bits in the GPBMUXn, GPBIDR, GPBINV, GPBODR, GPBGMUXn, and GPBCSELn registers.

0: Pin configuration is unlocked

1: Pin configuration is locked

### 8.7.2.35 GPBCR Register (Offset = 7Eh) [reset = 0h]

GPBCR is shown in [Figure 8-38](#) and described in [Table 8-45](#).

Return to the [Summary Table](#).

GPIO B Lock Commit Register (GPIO32 to GPIO63)

Each field in this register blocks writes to one IO pin's GPBLOCK bit. Once set, a lock commit can only be cleared by a reset.

0: Pin configuration lock is unlocked

1: Pin configuration lock is locked

**Figure 8-38. GPBCR Register**

### 8.7.2.36 GPHCTRL Register (Offset = 1C0h) [reset = 0h]

GPHCTRL is shown in [Figure 8-39](#) and described in [Table 8-46](#).

Return to the [Summary Table](#).

GPIO H Qualification Sampling Period (GPIO224 to GPIO255)

Each field in this register selects the qualification sampling period in SYSCLK cycles for eight GPIOs. The period is equal to 2 times the register field value.

0x00: Period = 0 SYSCLK cycles

0x01: Period = 2 SYSCLK cycles

0x02: Period = 4 SYSCLK cycles

...

0xFF: Period = 510 SYSCLK cycles

### 8.7.2.42 GPHLOCK Register (Offset = 1FCh) [reset = 0h]

GPHLOCK is shown in [Figure 8-45](#) and described in [Table 8-52](#).

Return to the [Summary Table](#).

GPIO H Lock Register (GPIO224 to GPIO255)

Each field in this register locks one IO pin's configuration. This blocks writes to the corresponding bits in the GPHINV register.

0: Pin configuration is unlocked

1: Pin configuration is locked

### 8.7.2.43 GPHCR Register (Offset = 1FEh) [reset = 0h]

GPHCR is shown in [Figure 8-46](#) and described in [Table 8-53](#).

Return to the [Summary Table](#).

GPIO H Lock Commit Register (GPIO224 to GPIO255)

Each field in this register blocks writes to one IO pin's GPHLOCK bit. Once set, a lock commit can only be cleared by a reset.

0: Pin configuration lock is unlocked

1: Pin configuration lock is locked

**Figure 8-46. GPHCR Register**

### 8.7.3 GPIO\_DATA\_REGS Registers

Table 8-54 lists the GPIO\_DATA\_REGS registers. All register offset addresses not listed in Table 8-54 should be considered as reserved locations and the register contents should not be modified.

**Table 8-54. GPIO\_DATA\_REGS Registers**

| Offset | Acronym   | Register Name                           | Write Protection | Section            |
|--------|-----------|-----------------------------------------|------------------|--------------------|
| 0h     | GPADAT    | GPIO A Data Register (GPIO0 to GPIO31)  |                  | <a href="#">Go</a> |
| 2h     | GPASET    | GPIO A Output Set (GPIO0 to GPIO31)     |                  | <a href="#">Go</a> |
| 4h     | GPACLEAR  | GPIO A Output Clear (GPIO0 to GPIO31)   |                  | <a href="#">Go</a> |
| 6h     | GPATOGGLE | GPIO A Output Toggle (GPIO0 to GPIO31)  |                  | <a href="#">Go</a> |
| 8h     | GPBDAT    | GPIO B Data Register (GPIO32 to GPIO64) |                  | <a href="#">Go</a> |
| Ah     | GPBSET    | GPIO B Output Set (GPIO32 to GPIO64)    |                  | <a href="#">Go</a> |
| Ch     | GPBCLEAR  | GPIO B Output Clear (GPIO32 to GPIO64)  |                  | <a href="#">Go</a> |
| Eh     | GPBTOGGLE | GPIO B Output Toggle (GPIO32 to GPIO64) |                  | <a href="#">Go</a> |
| 38h    | GPHDAT    | GPIO H Data Register (GPIO0 to GPIO255) |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 8-55 shows the codes that are used for access types in this section.

**Table 8-55. GPIO\_DATA\_REGS Access Type Codes**

| Access Type                     | Code | Description                                                                                                                                                                                                                                                                          |
|---------------------------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Read Type</b>                |      |                                                                                                                                                                                                                                                                                      |
| R                               | R    | Read                                                                                                                                                                                                                                                                                 |
| <b>Write Type</b>               |      |                                                                                                                                                                                                                                                                                      |
| W                               | W    | Write                                                                                                                                                                                                                                                                                |
| <b>Reset or Default Value</b>   |      |                                                                                                                                                                                                                                                                                      |
| -n                              |      | Value after reset or the default value                                                                                                                                                                                                                                               |
| <b>Register Array Variables</b> |      |                                                                                                                                                                                                                                                                                      |
| i,j,k,l,m,n                     |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                               |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.                                                                                                                                                                  |

### 8.7.3.1 GPADAT Register (Offset = 0h) [reset = 0h]

GPADAT is shown in [Figure 8-47](#) and described in [Table 8-56](#).

Return to the [Summary Table](#).

GPIO A Data (GPIO0 to GPIO31)

Reading a field in this register returns the input level of the corresponding IO pin after qualification and (optionally) inversion. The input value is always readable even when the pin is configured as a GPIO output or peripheral signal.

Writing to a field in this register selects the value of the output data latch for the corresponding IO pin. If the pin is configured as a GPIO output, this value will be driven onto the pin. Otherwise, the value will be latched and ignored unless the pin is reconfigured to be an output. A system reset will clear all output latches.

Due to the difference between the read and write values, sequential read-modify-write operations on this register may corrupt the state of the output latches. The GPASET, GPACLEAR, and GPATOGGLE registers should be used to safely control the output latches.

**Figure 8-47. GPADAT Register**

### 8.7.3.2 GPASET Register (Offset = 2h) [reset = 0h]

GPASET is shown in [Figure 8-48](#) and described in [Table 8-57](#).

Return to the [Summary Table](#).

GPIO Output Set (GPIO0 to GPIO31)

Writing a 1 to a field in this register sets the output data latch for the corresponding IO pin. Writes of 0 are ignored. Reads of this register always return 0.

**Figure 8-48. GPASET Register**

### 8.7.3.3 GPACLEAR Register (Offset = 4h) [reset = 0h]

GPACLEAR is shown in [Figure 8-49](#) and described in [Table 8-58](#).

Return to the [Summary Table](#).

GPIO Output Clear (GPIO0 to GPIO31)

Writing a 1 to a field in this register clears the output data latch for the corresponding IO pin. Writes of 0 are ignored. Reads of this register always return 0.

### 8.7.3.4 GPATOGGLE Register (Offset = 6h) [reset = 0h]

GPATOGGLE is shown in [Figure 8-50](#) and described in [Table 8-59](#).

Return to the [Summary Table](#).

GPIO Output Toggle (GPIO0 to GPIO31)

Writing a 1 to a field in this register inverts the value of the output data latch for the corresponding IO pin. Writes of 0 are ignored. Reads of this register always return 0.

### 8.7.3.5 GPBDAT Register (Offset = 8h) [reset = 0h]

GPBDAT is shown in [Figure 8-51](#) and described in [Table 8-60](#).

Return to the [Summary Table](#).

GPIO B Data (GPIO32 to GPIO64)

Reading a field in this register returns the input level of the corresponding IO pin after qualification and (optionally) inversion. The input value is always readable even when the pin is configured as a GPIO output or peripheral signal.

Writing to a field in this register selects the value of the output data latch for the corresponding IO pin. If the pin is configured as a GPIO output, this value will be driven onto the pin. Otherwise, the value will be latched and ignored unless the pin is reconfigured to be an output. A system reset will clear all output latches.

Due to the difference between the read and write values, sequential read-modify-write operations on this register may corrupt the state of the output latches. The GPBSET, GPBCLEAR, and GPBTOGGLE registers should be used to safely control the output latches.

**Figure 8-51. GPBDAT Register**

### 8.7.3.7 GPBCLEAR Register (Offset = Ch) [reset = 0h]

GPBCLEAR is shown in [Figure 8-53](#) and described in [Table 8-62](#).

Return to the [Summary Table](#).

GPIO Output Clear (GPIO32 to GPIO64)

Writing a 1 to a field in this register clears the output data latch for the corresponding IO pin. Writes of 0 are ignored. Reads of this register always return 0.

### 8.7.3.9 GPHDAT Register (Offset = 38h) [reset = 0h]

GPHDAT is shown in [Figure 8-55](#) and described in [Table 8-64](#).

Return to the [Summary Table](#).

GPIO H Data (GPIO224 to GPIO255)

Reading a field in this register returns the input level of the corresponding IO pin after qualification and (optionally) inversion. In digital mode, these pins only support input functionality.

**Figure 8-55. GPHDAT Register**

## Crossbar (X-BAR)

The crossbars (referred to as X-BAR throughout this document) provide flexibility to connect device inputs, outputs, and internal resources in a variety of configurations. The device contains a total of three X-BARS: the Input X-BAR, the Output X-BAR, and the ePWM X-BAR. Each of the X-BARS is named according to where they take signals. For example, the Input X-BAR brings external signals “in” to the device. The Output X-BAR takes internal signals “out” of the device to a GPIO. The ePWM X-BAR takes signals and brings them to the ePWM modules. You can read more about each of these X-BARS in the following sections.

| Topic                                             | Page       |
|---------------------------------------------------|------------|
| <b>9.1 Introduction .....</b>                     | <b>990</b> |
| <b>9.2 ePWM, CLB, and GPIO Output X-BAR .....</b> | <b>991</b> |
| <b>9.3 XBAR Registers.....</b>                    | <b>999</b> |

## 9.1 Introduction

On this device, the Input X-BAR is used to route signals from a GPIO to many different IP blocks such as the ADC(s), eCAP(s), ePWM(s), and external interrupts. The Input X-BAR has access to every GPIO and can route each signal to any (or multiple) of the IP blocks previously mentioned. The digital input of AIOs are also available on the Input X-BAR. This flexibility relieves some of the constraints on peripheral muxing by just requiring any GPIO pin to be available. It is important to note that the function selected on the GPIO mux does not affect the Input X-BAR. The Input X-BAR simply connects the signal on the input buffer to the selected destination. Therefore, you can do things such as route the output of one peripheral to another (that is, measure the output of an ePWM with an eCAP for a frequency test).

The Input X-BAR is configured via the INPUTxSELECT registers. The available IP destination(s) for each INPUTx is shown in [Figure 9-1](#). For more information on configuration, see the INPUT\_XBAR\_REGS register definitions at the end of this chapter.

**Figure 9-1. Input X-BAR**

**Table 9-1. Input X-BAR Destinations**

| INPUT   | DESTINATIONS                                                    |
|---------|-----------------------------------------------------------------|
| INPUT1  | eCAPx, ePWM X-BAR, ePWM[TZ1,TRIP1], Output X-BAR                |
| INPUT2  | eCAPx, ePWM X-BAR, ePWM[TZ2,TRIP2], Output X-BAR                |

| INPUT15 | eCAPx                                                           |
| INPUT16 | eCAPx                                                           |

## 9.2 ePWM, CLB, and GPIO Output X-BAR

This section describes the ePWM , CLB, and GPIO Output X-BAR

### 9.2.1 ePWM X-BAR

The ePWM X-BAR brings signals to the ePWM modules. Specifically, the ePWM X-BAR is connected to the Digital Compare (DC) submodule of each ePWM module for actions such as tripzones and syncing. Please refer to the *ePWM* chapter for more information on additional ways the DC submodule can be used. [Figure 9-5](#) shows the architecture of the ePWM X-BAR. It is worth noting that the architecture of the ePWM X-BAR is identical to the architecture of the Output X-BAR (with the exception of the output latch).

#### 9.2.1.1 ePWM X-BAR Architecture

The ePWM X-BAR has eight outputs which are routed to each ePWM module. [Figure 18-58](#) represents the architecture of a single output but it is identical to the architecture of all of the other outputs.

**Figure 9-2. ePWM X-BAR Architecture - Single Output**

First, determine the signal(s) which should be passed to the ePWM by referencing [Table 9-2](#). You may select up to one signal per mux (32 total muxes) for each TRIPx output. Select the inputs to each mux via the TRIPxMUX0TO15CFG and TRIPxMUX16TO31CFG registers. In order to pass any signal through to the ePWM, you must also enable the mux in the TRIPxMUXENABLE register. All muxes which are enabled will be logically OR'd before being passed on to the respective TRIPx signal on the ePWM. You may also optionally invert the signal via the TRIPxOUTINV register.

**Table 9-2. ePWM X-BAR Mux Configuration Table**

| Mux | 0             | 1                       | 2         | 3          |

## 9.2.2 CLB X-BAR

The CLB X-BAR brings signals to the CLB modules. [Figure 9-5](#) shows the architecture of the CLB X-BAR. It is worth noting that the architecture of the CLB X-BAR is identical to the architecture of the Output X-BAR (with the exception of the output latch).

### 9.2.2.1 CLB X-BAR Architecture

The CLB X-BAR has eight outputs which are routed to each CLB module. [Figure 9-3](#) represents the architecture of a single output but it is identical to the architecture of all of the other outputs.

**Figure 9-3. CLB X-BAR Architecture - Single Output**

First, determine the signal(s) which should be passed to the CLB by referencing [Table 9-3](#). You may select up to one signal per mux (31 total muxes) for each AUXSIGx output. Select the inputs to each mux via the AUXSIGxMUX0TO15CFG and AUXSIGxMUX16TO31CFG registers. In order to pass any signal through to the CLB, you must also enable the mux in the AUXSIGxMUXENABLE register. All muxes which are enabled will be logically OR'd before being passed on to the respective AUXSIGx signal on the CLB. You may also optionally invert the signal via the AUXSIGOUTINV register.

**Table 9-3. CLB X-BAR Mux Configuration Table**

| Mux | 0                | 1                             | 2         | 3          |

### 9.2.3 GPIO Output X-BAR

The GPIO Output X-BAR takes signals from inside the device and brings them out to a GPIO. [Figure 9-5](#) shows the architecture of the GPIO Output X-BAR. The signals which are available to bring to the GPIO are listed in [Table 9-4](#). The X-BAR contains eight outputs and each will contain at least one position on the GPIO mux, denoted as OUTPUTXBARx. The X-BAR allows the selection of a single signal or a logical OR of up to 32 signals.

#### 9.2.3.1 GPIO Output X-BAR Architecture

The Output X-BAR has eight outputs which are routed to the GPIO module. [Figure 9-4](#) represents the architecture of a single output, but it is identical to the architecture of all of the other outputs. It is worth noting that the architecture of the Output X-BAR (with the exception of the output latch) is identical to the architecture of the ePWM X-BAR.

**Figure 9-4. GPIO Output X-BAR Architecture**

First, determine the signal(s) which should be passed to the GPIO by referencing [Table 9-4](#). You may select up to one signal per mux (32 total muxes) for each OUTPUTXBARx output. Select the inputs to each mux via the OUTPUTxMUX0TO15CFG and OUTPUTxMUX16TO31CFG registers.

In order to pass any signal through to the GPIO, you must also enable the mux in the OUTPUTxMUXENABLE register. All muxes which are enabled will be logically OR'd before being passed on to the respective OUTPUTx signal on the GPIO module. You may also optionally invert the signal via the OUTPUTINV register. The signal will only be seen on the GPIO if the proper OUTPUTx muxing options are selected via the GpioCtrlRegs.GPxMUX and GpioCtrlRegs.GPxGMUX registers.

**Table 9-4. Output X-BAR Mux Configuration Table**

| Mux | 0                | 1                             | 2         | 3         |

**NOTE:** Please do not use "Reserved" signals in your application.

### 9.2.4 X-BAR Flags

With the exception of the CMPSS signals, the ePWM X-BAR and the Output X-BAR have all of the same input signals. Due to the inputs being similar, the ePWM X-BAR and Output X-BAR leverage a single set of input flags to indicate which input signals have been triggered. This allows software to check the input flags when an event occurs. See [Figure 9-5](#) for more information. There is a bit allocated for each input signal in one of the XBARFLGx registers. The flag will remain set until cleared through the appropriate XBARCLR register.

**Figure 9-5. ePWM and Output X-BARs Sources**

## 9.3 XBAR Registers

This section describes the Crossbar registers.

### 9.3.1 XBAR Base Addresses

**Table 9-5. System Control Base Address Table**

| Device Registers | Register Name    | Start Address | End Address |
|------------------|------------------|---------------|-------------|
| InputXbarRegs    | INPUT_XBAR_REGS  | 0x0000_7900   | 0x0000_791F |
| XbarRegs         | XBAR_REGS        | 0x0000_7920   | 0x0000_793F |
| EpwmXbarRegs     | EPWM_XBAR_REGS   | 0x0000_7A00   | 0x0000_7A3F |
| OutputXbarRegs   | OUTPUT_XBAR_REGS | 0x0000_7A80   | 0x0000_7ABF |
| ClbXbarRegs      | CLB_XBAR_REGS    | 0x0000_7A40   | 0x0000_7A7F |

### 9.3.2 XBAR\_REGS Registers

Table 9-6 lists the XBAR\_REGS registers. All register offset addresses not listed in Table 9-6 should be considered as reserved locations and the register contents should not be modified.

**Table 9-6. XBAR\_REGS Registers**

| Offset | Acronym  | Register Name                     | Write Protection | Section            |
|--------|----------|-----------------------------------|------------------|--------------------|
| 0h     | XBARFLG1 | X-Bar Input Flag Register 1       |                  | <a href="#">Go</a> |
| 2h     | XBARFLG2 | X-Bar Input Flag Register 2       |                  | <a href="#">Go</a> |
| 4h     | XBARFLG3 | X-Bar Input Flag Register 3       |                  | <a href="#">Go</a> |
| 6h     | XBARFLG4 | X-Bar Input Flag Register 4       |                  | <a href="#">Go</a> |
| 8h     | XBARCLR1 | X-Bar Input Flag Clear Register 1 |                  | <a href="#">Go</a> |
| Ah     | XBARCLR2 | X-Bar Input Flag Clear Register 2 |                  | <a href="#">Go</a> |
| Ch     | XBARCLR3 | X-Bar Input Flag Clear Register 3 |                  | <a href="#">Go</a> |
| Eh     | XBARCLR4 | X-Bar Input Flag Clear Register 4 |                  | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 9-7 shows the codes that are used for access types in this section.

**Table 9-7. XBAR\_REGS Access Type Codes**

| Access Type                     | Code | Description                                                                                                                                                                                                                                                                          |

| -n                              |      | Value after reset or the default value                                                                                                                                                                                                                                               |
| <b>Register Array Variables</b> |      |                                                                                                                                                                                                                                                                                      |
| i,j,k,l,m,n                     |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                               |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.                                                                                                                                                                  |

### 9.3.2.1 XBARFLG1 Register (Offset = 0h) [reset = 0h]

XBARFLG1 is shown in [Figure 9-6](#) and described in [Table 9-8](#).

Return to the [Summary Table](#).

This register is used to flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered.

- 1: Corresponding Input was triggered
- 0: Corresponding Input was not triggered

**Figure 9-6. XBARFLG1 Register**

### 9.3.2.2 XBARFLG2 Register (Offset = 2h) [reset = 0h]

XBARFLG2 is shown in [Figure 9-7](#) and described in [Table 9-9](#).

Return to the [Summary Table](#).

This register is used to flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered.

- 1: Corresponding Input was triggered
- 0: Corresponding Input was not triggered

**Figure 9-7. XBARFLG2 Register**

### 9.3.2.3 XBARFLG3 Register (Offset = 4h) [reset = 0h]

XBARFLG3 is shown in [Figure 9-8](#) and described in [Table 9-10](#).

Return to the [Summary Table](#).

This register is used to flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered.

- 1: Corresponding Input was triggered
- 0: Corresponding Input was not triggered

### 9.3.2.4 XBARFLG4 Register (Offset = 6h) [reset = 0h]

XBARFLG4 is shown in [Figure 9-9](#) and described in [Table 9-11](#).

Return to the [Summary Table](#).

This register is used to flag the inputs of the X-Bars to provide software knowledge of the input sources which got triggered.

- 1: Corresponding Input was triggered
- 0: Corresponding Input was not triggered

**Figure 9-9. XBARFLG4 Register**

### 9.3.2.5 XBARCLR1 Register (Offset = 8h) [reset = 0h]

XBARCLR1 is shown in [Figure 9-10](#) and described in [Table 9-12](#).

Return to the [Summary Table](#).

This register is used to clear the flag(s) in the XBARFLG1 register.

1: Clears the corresponding bit in the XBARFLG1 register.

0: Writing 0 has no effect

**Figure 9-10. XBARCLR1 Register**

### 9.3.2.6 XBARCLR2 Register (Offset = Ah) [reset = 0h]

XBARCLR2 is shown in [Figure 9-11](#) and described in [Table 9-13](#).

Return to the [Summary Table](#).

This register is used to clear the flag(s) in the XBARFLG2 register.

1: Clears the corresponding bit in the XBARFLG2 register.

0: Writing 0 has no effect

### 9.3.2.7 XBARCLR3 Register (Offset = Ch) [reset = 0h]

XBARCLR3 is shown in [Figure 9-12](#) and described in [Table 9-14](#).

Return to the [Summary Table](#).

This register is used to clear the flag(s) in the XBARFLG3 register.

1: Clears the corresponding bit in the XBARFLG3 register.

0: Writing 0 has no effect

**Figure 9-12. XBARCLR3 Register**

### 9.3.2.8 XBARCLR4 Register (Offset = Eh) [reset = 0h]

XBARCLR4 is shown in [Figure 9-13](#) and described in [Table 9-15](#).

Return to the [Summary Table](#).

This register is used to clear the flag(s) in the XBARFLG4 register.

1: Clears the corresponding bit in the XBARFLG4 register.

0: Writing 0 has no effect

**Figure 9-13. XBARCLR4 Register**

Complex bit access types are encoded to fit into small table cells. Table 9-17 shows the codes that are used for access types in this section.

**Table 9-17. INPUT\_XBAR\_REGS Access Type Codes**

| Access Type                     | Code      | Description                                                                                                                                                                                                                                                                          |

### 9.3.3.17 INPUTSELECTLOCK Register (Offset = 1Eh) [reset = 0h]

INPUTSELECTLOCK is shown in [Figure 9-30](#) and described in [Table 9-34](#).

Return to the [Summary Table](#).

Input Select Lock Register.

Any bit in this register, once set can only be cleared through SYSRSn. Write of 0 to any bit of this register has no effect. Reads to the registers which have LOCK protection are always allowed.

**Figure 9-30. INPUTSELECTLOCK Register**

### 9.3.4 OUTPUT\_XBAR\_REGS Registers

Table 9-35 lists the OUTPUT\_XBAR\_REGS registers. All register offset addresses not listed in Table 9-35 should be considered as reserved locations and the register contents should not be modified.

**Table 9-35. OUTPUT\_XBAR\_REGS Registers**

| Offset | Acronym             | Register Name                               | Write Protection | Section            |
|--------|---------------------|---------------------------------------------|------------------|--------------------|
| 0h     | OUTPUT1MUX0TO15CFG  | Output X-BAR Mux Configuration for Output 1 | EALLOW           | <a href="#">Go</a> |
| 2h     | OUTPUT1MUX16TO31CFG | Output X-BAR Mux Configuration for Output 1 | EALLOW           | <a href="#">Go</a> |
| 4h     | OUTPUT2MUX0TO15CFG  | Output X-BAR Mux Configuration for Output 2 | EALLOW           | <a href="#">Go</a> |
| 6h     | OUTPUT2MUX16TO31CFG | Output X-BAR Mux Configuration for Output 2 | EALLOW           | <a href="#">Go</a> |
| 8h     | OUTPUT3MUX0TO15CFG  | Output X-BAR Mux Configuration for Output 3 | EALLOW           | <a href="#">Go</a> |
| Ah     | OUTPUT3MUX16TO31CFG | Output X-BAR Mux Configuration for Output 3 | EALLOW           | <a href="#">Go</a> |
| Ch     | OUTPUT4MUX0TO15CFG  | Output X-BAR Mux Configuration for Output 4 | EALLOW           | <a href="#">Go</a> |
| Eh     | OUTPUT4MUX16TO31CFG | Output X-BAR Mux Configuration for Output 4 | EALLOW           | <a href="#">Go</a> |
| 10h    | OUTPUT5MUX0TO15CFG  | Output X-BAR Mux Configuration for Output 5 | EALLOW           | <a href="#">Go</a> |
| 12h    | OUTPUT5MUX16TO31CFG | Output X-BAR Mux Configuration for Output 5 | EALLOW           | <a href="#">Go</a> |
| 14h    | OUTPUT6MUX0TO15CFG  | Output X-BAR Mux Configuration for Output 6 | EALLOW           | <a href="#">Go</a> |
| 16h    | OUTPUT6MUX16TO31CFG | Output X-BAR Mux Configuration for Output 6 | EALLOW           | <a href="#">Go</a> |
| 18h    | OUTPUT7MUX0TO15CFG  | Output X-BAR Mux Configuration for Output 7 | EALLOW           | <a href="#">Go</a> |
| 1Ah    | OUTPUT7MUX16TO31CFG | Output X-BAR Mux Configuration for Output 7 | EALLOW           | <a href="#">Go</a> |
| 1Ch    | OUTPUT8MUX0TO15CFG  | Output X-BAR Mux Configuration for Output 8 | EALLOW           | <a href="#">Go</a> |
| 1Eh    | OUTPUT8MUX16TO31CFG | Output X-BAR Mux Configuration for Output 8 | EALLOW           | <a href="#">Go</a> |
| 20h    | OUTPUT1MUXENABLE    | Output X-BAR Mux Enable for Output 1        | EALLOW           | <a href="#">Go</a> |
| 22h    | OUTPUT2MUXENABLE    | Output X-BAR Mux Enable for Output 2        | EALLOW           | <a href="#">Go</a> |
| 24h    | OUTPUT3MUXENABLE    | Output X-BAR Mux Enable for Output 3        | EALLOW           | <a href="#">Go</a> |
| 26h    | OUTPUT4MUXENABLE    | Output X-BAR Mux Enable for Output 4        | EALLOW           | <a href="#">Go</a> |
| 28h    | OUTPUT5MUXENABLE    | Output X-BAR Mux Enable for Output 5        | EALLOW           | <a href="#">Go</a> |
| 2Ah    | OUTPUT6MUXENABLE    | Output X-BAR Mux Enable for Output 6        | EALLOW           | <a href="#">Go</a> |
| 2Ch    | OUTPUT7MUXENABLE    | Output X-BAR Mux Enable for Output 7        | EALLOW           | <a href="#">Go</a> |
| 2Eh    | OUTPUT8MUXENABLE    | Output X-BAR Mux Enable for Output 8        | EALLOW           | <a href="#">Go</a> |
| 30h    | OUTPUTLATCH         | Output X-BAR Output Latch                   |                  | <a href="#">Go</a> |
| 32h    | OUTPUTLATCHCLR      | Output X-BAR Output Latch Clear             |                  | <a href="#">Go</a> |
| 34h    | OUTPUTLATCHFRC      | Output X-BAR Output Latch Clear             |                  | <a href="#">Go</a> |
| 36h    | OUTPUTLATCHENABLE   | Output X-BAR Output Latch Enable            | EALLOW           | <a href="#">Go</a> |
| 38h    | OUTPUTINV           | Output X-BAR Output Inversion               | EALLOW           | <a href="#">Go</a> |
| 3Eh    | OUTPUTLOCK          | Output X-BAR Configuration Lock register    | EALLOW           | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 9-36 shows the codes that are used for access types in this section.

**Table 9-36. OUTPUT\_XBAR\_REGS Access Type Codes**

| Access Type       | Code | Description     |
|-------------------|------|-----------------|
| <b>Read Type</b>  |      |                 |
| R                 | R    | Read            |
| R-0               | R-0  | Read Returns 0s |
| <b>Write Type</b> |      |                 |
| W                 | W    | Write           |
| W1S               | W1S  | Write 1 to set  |

**Table 9-36. OUTPUT\_XBAR\_REGS Access Type Codes (continued)**

| Access Type                     | Code       | Description                                                                                                                                                                                                                                                                          |
|---------------------------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WOnce                           | W<br>Sonce | Write<br>Set once                                                                                                                                                                                                                                                                    |
| <b>Reset or Default Value</b>   |            |                                                                                                                                                                                                                                                                                      |
| -n                              |            | Value after reset or the default value                                                                                                                                                                                                                                               |
| <b>Register Array Variables</b> |            |                                                                                                                                                                                                                                                                                      |
| i,j,k,l,m,n                     |            | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                               |            | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.                                                                                                                                                                  |

### 9.3.4.1 OUTPUT1MUX0TO15CFG Register (Offset = 0h) [reset = 0h]

OUTPUT1MUX0TO15CFG is shown in [Figure 9-31](#) and described in [Table 9-37](#).

Return to the [Summary Table](#).

Output X-BAR Mux Configuration for Output 1

### 9.3.4.18 OUTPUT2MUXENABLE Register (Offset = 22h) [reset = 0h]

OUTPUT2MUXENABLE is shown in [Figure 9-48](#) and described in [Table 9-54](#).

Return to the [Summary Table](#).

Output X-BAR Mux Enable for Output 2

### 9.3.4.19 OUTPUT3MUXENABLE Register (Offset = 24h) [reset = 0h]

OUTPUT3MUXENABLE is shown in [Figure 9-49](#) and described in [Table 9-55](#).

Return to the [Summary Table](#).

Output X-BAR Mux Enable for Output 3

### 9.3.4.20 OUTPUT4MUXENABLE Register (Offset = 26h) [reset = 0h]

OUTPUT4MUXENABLE is shown in [Figure 9-50](#) and described in [Table 9-56](#).

Return to the [Summary Table](#).

Output X-BAR Mux Enable for Output 4

### 9.3.4.21 OUTPUT5MUXENABLE Register (Offset = 28h) [reset = 0h]

OUTPUT5MUXENABLE is shown in [Figure 9-51](#) and described in [Table 9-57](#).

Return to the [Summary Table](#).

Output X-BAR Mux Enable for Output 5

### 9.3.4.22 OUTPUT6MUXENABLE Register (Offset = 2Ah) [reset = 0h]

OUTPUT6MUXENABLE is shown in [Figure 9-52](#) and described in [Table 9-58](#).

Return to the [Summary Table](#).

Output X-BAR Mux Enable for Output 6

### 9.3.4.23 OUTPUT7MUXENABLE Register (Offset = 2Ch) [reset = 0h]

OUTPUT7MUXENABLE is shown in [Figure 9-53](#) and described in [Table 9-59](#).

Return to the [Summary Table](#).

Output X-BAR Mux Enable for Output 7

### 9.3.4.24 OUTPUT8MUXENABLE Register (Offset = 2Eh) [reset = 0h]

OUTPUT8MUXENABLE is shown in [Figure 9-54](#) and described in [Table 9-60](#).

Return to the [Summary Table](#).

Output X-BAR Mux Enable for Output 8

**Table 9-68. EPWM\_XBAR\_REGS Access Type Codes (continued)**

| Access Type | Code | Description                                                                                                                                                                                                                                                                          |
|-------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| i,j,k,l,m,n |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y           |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.                                                                                                                                                                  |

### 9.3.5.1 TRIP4MUX0TO15CFG Register (Offset = 0h) [reset = 0h]

TRIP4MUX0TO15CFG is shown in [Figure 9-61](#) and described in [Table 9-69](#).

Return to the [Summary Table](#).

### 9.3.5.18 TRIP5MUXENABLE Register (Offset = 22h) [reset = 0h]

TRIP5MUXENABLE is shown in [Figure 9-78](#) and described in [Table 9-86](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP5

**Figure 9-78. TRIP5MUXENABLE Register**

### 9.3.5.19 TRIP7MUXENABLE Register (Offset = 24h) [reset = 0h]

TRIP7MUXENABLE is shown in [Figure 9-79](#) and described in [Table 9-87](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP7

### 9.3.5.20 TRIP8MUXENABLE Register (Offset = 26h) [reset = 0h]

TRIP8MUXENABLE is shown in [Figure 9-80](#) and described in [Table 9-88](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP8

**Figure 9-80. TRIP8MUXENABLE Register**

### 9.3.5.21 TRIP9MUXENABLE Register (Offset = 28h) [reset = 0h]

TRIP9MUXENABLE is shown in [Figure 9-81](#) and described in [Table 9-89](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP9

### 9.3.5.22 TRIP10MUXENABLE Register (Offset = 2Ah) [reset = 0h]

TRIP10MUXENABLE is shown in [Figure 9-82](#) and described in [Table 9-90](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP10

### 9.3.5.23 TRIP11MUXENABLE Register (Offset = 2Ch) [reset = 0h]

TRIP11MUXENABLE is shown in [Figure 9-83](#) and described in [Table 9-91](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP11

### 9.3.5.24 TRIP12MUXENABLE Register (Offset = 2Eh) [reset = 0h]

TRIP12MUXENABLE is shown in [Figure 9-84](#) and described in [Table 9-92](#).

Return to the [Summary Table](#).

ePWM XBAR Mux Enable for TRIP12

### 9.3.6 CLB\_XBAR\_REGS Registers

Table 9-95 lists the CLB\_XBAR\_REGS registers. All register offset addresses not listed in Table 9-95 should be considered as reserved locations and the register contents should not be modified.

**Table 9-95. CLB\_XBAR\_REGS Registers**

| Offset | Acronym             | Register Name                             | Write Protection | Section            |
|--------|---------------------|-------------------------------------------|------------------|--------------------|
| 0h     | AUXSIG0MUX0TO15CFG  | CLB XBAR Mux Configuration for Output-0   | EALLOW           | <a href="#">Go</a> |
| 2h     | AUXSIG0MUX16TO31CFG | CLB XBAR Mux Configuration for Output-0   | EALLOW           | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 9-96 shows the codes that are used for access types in this section.

**Table 9-96. CLB\_XBAR\_REGS Access Type Codes**

| Access Type                     | Code      | Description                               |
|---------------------------------|-----------|-------------------------------------------|
| <b>Read Type</b>                |           |                                           |
| R                               | R         | Read                                      |
| R-0                             | R<br>-0   | Read<br>Returns 0s                        |
| <b>Write Type</b>               |           |                                           |
| W                               | W         | Write                                     |
| WOnce                           | W<br>Once | Write<br>Set once                         |
| <b>Reset or Default Value</b>   |           |                                           |
| -n                              |           | Value after reset or the default<br>value |
| <b>Register Array Variables</b> |           |                                           |

**Table 9-96. CLB\_XBAR\_REGS Access Type Codes (continued)**

| Access Type | Code | Description                                                                                                                                                                                                                                                                          |
|-------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| i,j,k,l,m,n |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y           |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.                                                                                                                                                                  |

### 9.3.6.1 AUXSIG0MUX0TO15CFG Register (Offset = 0h) [reset = 0h]

AUXSIG0MUX0TO15CFG is shown in [Figure 9-87](#) and described in [Table 9-97](#).

Return to the [Summary Table](#).

CLB XBAR Mux Configuration for Output-0

### 9.3.6.17 AUXSIG0MUXENABLE Register (Offset = 20h) [reset = 0h]

AUXSIG0MUXENABLE is shown in [Figure 9-103](#) and described in [Table 9-113](#).

Return to the [Summary Table](#).

CLB XBAR Mux Enable Register for Output-0

### 9.3.6.18 AUXSIG1MUXENABLE Register (Offset = 22h) [reset = 0h]

AUXSIG1MUXENABLE is shown in [Figure 9-104](#) and described in [Table 9-114](#).

Return to the [Summary Table](#).

CLB XBAR Mux Enable Register for Output-1

### 9.3.6.19 AUXSIG2MUXENABLE Register (Offset = 24h) [reset = 0h]

AUXSIG2MUXENABLE is shown in [Figure 9-105](#) and described in [Table 9-115](#).

Return to the [Summary Table](#).

CLB XBAR Mux Enable Register for Output-2

### 9.3.6.20 AUXSIG3MUXENABLE Register (Offset = 26h) [reset = 0h]

AUXSIG3MUXENABLE is shown in [Figure 9-106](#) and described in [Table 9-116](#).

Return to the [Summary Table](#).

CLB XBAR Mux Enable Register for Output-3

### 9.3.6.21 AUXSIG4MUXENABLE Register (Offset = 28h) [reset = 0h]

AUXSIG4MUXENABLE is shown in [Figure 9-107](#) and described in [Table 9-117](#).

Return to the [Summary Table](#).

CLB XBAR Mux Enable Register for Output-4

### 9.3.6.22 AUXSIG5MUXENABLE Register (Offset = 2Ah) [reset = 0h]

AUXSIG5MUXENABLE is shown in [Figure 9-108](#) and described in [Table 9-118](#).

Return to the [Summary Table](#).

CLB XBAR Mux Enable Register for Output-5

### 9.3.6.23 AUXSIG6MUXENABLE Register (Offset = 2Ch) [reset = 0h]

AUXSIG6MUXENABLE is shown in [Figure 9-109](#) and described in [Table 9-119](#).

Return to the [Summary Table](#).

CLB XBAR Mux Enable Register for Output-6

### 9.3.6.24 AUXSIG7MUXENABLE Register (Offset = 2Eh) [reset = 0h]

AUXSIG7MUXENABLE is shown in [Figure 9-110](#) and described in [Table 9-120](#).

Return to the [Summary Table](#).

CLB XBAR Mux Enable Register for Output-7

## ***Direct Memory Access (DMA)***

The direct memory access (DMA) module provides a hardware method of transferring data between peripherals and/or memory without intervention from the CPU, thereby freeing up bandwidth for other system functions. Additionally, the DMA has the capability to orthogonally rearrange the data as it is transferred as well as “ping-pong” data between buffers. These features are useful for structuring data into blocks for optimal CPU processing.

## 10.1 Introduction

The strength of a controller is not measured purely in processor speed, but in total system capabilities. As a part of the equation, any time the CPU bandwidth for a given function can be reduced, the greater the system capabilities. Many times applications spend a significant amount of their bandwidth moving data, whether it is from off-chip memory to on-chip memory, or from a peripheral such as an analog-to-digital converter (ADC) to RAM, or even from one peripheral to another. Furthermore, many times this data comes in a format that is not conducive to the optimum processing powers of the CPU. The DMA module described in this reference guide has the ability to free up CPU bandwidth and rearrange the data into a pattern for more streamlined processing.

The DMA module is an event-based machine, meaning it requires a peripheral or software trigger to start a DMA transfer. Although it can be made into a periodic time-driven machine by configuring a timer as the DMA trigger source, there is no mechanism within the module itself to start memory transfers periodically. The DMA module has six independent DMA channels which can be configured separately and each channel contains its own independent PIE interrupt to let the CPU know when a DMA transfer has either started or completed. Five of the six channels are exactly the same, while Channel 1 has the ability to be configured at a higher priority than the others. At the heart of the DMA is a state machine and tightly coupled address control logic. It is this address control logic that allows for rearrangement of the block of data during the transfer as well as the process of ping-ponging data between buffers. Each of these features, along with others, will be discussed in detail in this document.

## 10.2 Features

DMA features include:

- Six channels with independent PIE interrupts
- Each DMA channel can be triggered from multiple peripheral trigger sources independently
- Word Size: 16-bit or 32-bit (SPI limited to 16-bit)
- Throughput: 3 cycles/word without arbitration

Figure 10-2. DMA Trigger Architecture

**NOTE:** To use the system level DMA Trigger source selection, the DMA internal trigger source selection configuration for each channel should be done using the DMACHSRCSELx register, and the CHx.MODE.PERINTSEL register as shown here. See [Table 10-1](#) or the DMACHSRCSELx register definition for a complete list of DMA trigger sources.

Regardless of the value of the MODE.CHx[PERINTSEL] bit field, software can always force a trigger by using the CONTROL.CHx[PERINTFRC] bit. Likewise, software can always clear a pending DMA trigger using the CONTROL.CHx[PERINTCLR] bit.

Once a particular peripheral trigger event sets a channel's PERINTFLG bit, the bit remains pending until the priority logic of the state machine starts the burst transfer for that channel. Once the burst transfer starts, the flag is cleared. If a new peripheral trigger event is generated while a burst is in progress, the burst will complete before responding to the new peripheral trigger event (after proper prioritization). If a third peripheral trigger event occurs before the pending event is serviced, an error flag is set in the CONTROL.CHx[OVRFLG] bit. If a peripheral trigger event occurs at the same time as the latched flag is being cleared, the trigger event has priority and the PERINTFLG will remain set.

Figure 10-3 shows a diagram of the trigger select circuit. See the DMACHSRCSELx register description for the complete list of peripheral trigger event sources.

**Figure 10-3. Peripheral Interrupt Trigger Input Diagram**

A See Figure 10-2.

Table 10-1 shows the peripheral trigger source options that are available for each channel.

**Table 10-1. DMA Trigger Source Options**

| Select Value (8-bit) | DMA ChTrigger Source |
|----------------------|----------------------|
| 0                    | No Peripheral        |
| 1                    | ADCA.1               |
| 2                    | ADCA.2               |
| 3                    | ADCA.3               |
| 4                    | ADCA.4               |
| 5                    | ADCAEVT              |
| 6                    | ADCB.1               |
| 7                    | ADCB.2               |
| 8                    | ADCB.3               |
| 9                    | ADCB.4               |
| 10                   | ADCB EVT             |
| 11                   | ADCC.1               |
| 12                   | ADCC.2               |
| 13                   | ADCC.3               |
| 14                   | ADCC.4               |
| 15                   | ADCCEVT              |
| 16 - 28              | No Peripheral        |
| 29                   | XINT1                |

| Select Value (8-bit) | DMA ChTrigger Source |
|----------------------|----------------------|
| 30                   | XINT2                |
| 31                   | XINT3                |
| 32                   | XINT4                |
| 33                   | XINT5                |
| 34 - 35              | No Peripheral        |
| 36                   | EPWM1.SOCA           |
| 37                   | EPWM1.SOCB           |
| 38                   | EPWM2.SOCA           |
| 39                   | EPWM2.SOCB           |
| 40                   | EPWM3.SOCA           |
| 41                   | EPWM3.SOCB           |
| 42                   | EPWM4.SOCA           |
| 43                   | EPWM4.SOCB           |
| 44                   | EPWM5.SOCA           |
| 45                   | EPWM5.SOCB           |
| 46                   | EPWM6.SOCA           |
| 47                   | EPWM6.SOCB           |
| 48                   | EPWM7.SOCA           |
| 49                   | EPWM7.SOCB           |
| 50                   | EPWM8.SOCA           |
| 51                   | EPWM8.SOCB           |
| 52 - 67              | No Peripheral        |
| 68                   | TINT0                |
| 69                   | TINT1                |
| 70                   | TINT2                |
| 71 - 74              | No Peripheral        |
| 75                   | ECAP1DMA             |
| 76                   | ECAP2DMA             |
| 77                   | ECAP3DMA             |
| 78                   | ECAP4DMA             |
| 79                   | ECAP5DMA             |
| 80                   | ECAP6DMA             |
| 81                   | ECAP7DMA             |
| 82 - 95              | No Peripheral        |
| 96                   | SD1FLT1              |
| 97                   | SD1FLT2              |
| 98                   | SD1FLT3              |
| 99                   | SD1FLT4              |
| 100 - 108            | No Peripheral        |

| 131 - 166            | No Peripheral        |
| 167                  | CANAIF1              |
| 168                  | CANAIF2              |
| 169                  | CANAIF3              |
| 170                  | CANBIF1              |
| 171                  | CANBIF2              |
| 172                  | CANBIF3              |
| 173 - 255            | No Peripheral        |

### 10.3.3 DMA Bus

The DMA bus architecture consists of a 32-bit address bus, a 32-bit data read bus, and a 32-bit data write bus. Memories and register locations connected to the DMA bus are via interfaces that sometimes share resources with the CPU memory or peripheral bus. Arbitration rules are defined in [Section 10.6](#).

## 10.4 Address Pointer and Transfer Control

The DMA state machine is, at its most basic level, two nested loops.

### Burst (Inner) Loop:-

The burst (inner) loop transfers programmable number of words set by (BURST\_SIZE + 1) register when a DMA channel trigger (Peripheral / Software trigger) is received. The BURST\_SIZE register allows a maximum of 32 sixteen-bit words to be transferred in one burst. Each DMA channel supports both 16-bit (or) 32-bit word burst which can be controlled by MODE.DATASIZE bit field. Each DMA channel contains a shadowed address pointer for the source (SRC\_ADDR\_SHADOW) and the destination (DST\_ADDR\_SHADOW) address. At the beginning of each transfer, the shadowed version of each pointer is copied into its respective active (SRC\_ADDR\_ACTIVE / DST\_ADDR\_ACTIVE) register. During the burst loop, after each word is transferred, the signed value contained in the appropriate source or destination BURST\_STEP register is added to the active register as shown below

$$\text{SRC\_ADDR\_ACTIVE} = \text{SRC\_ADDR\_ACTIVE} + \text{SRC\_BURST\_STEP}$$

$$\text{DST\_ADDR\_ACTIVE} = \text{DST\_ADDR\_ACTIVE} + \text{DST\_BURST\_STEP}$$

The burst (inner) loop transfers a burst of data when a DMA Channel Trigger (Peripheral / Software trigger) is received.

### Transfer (Outer) Loop:-

The Transfer (outer) loop transfers programmable number of bursts set by (TRANSFER\_SIZE + 1) register for each channel. Since TRANSFER\_SIZE is a 16-bit register, the total size of a transfer allowed is well beyond any practical requirement. During the transfer loop, after each burst is complete, there are two methods that can be used to modify the active address pointer.

**Method 1** (Default): When address wrapping is disabled (SRC\_WRAP\_SIZE / DST\_WRAP\_SIZE is greater than TRANSFER\_SIZE), active address pointer is updated as shown below

$$\text{SRC\_ADDR\_ACTIVE} = \text{SRC\_ADDR\_ACTIVE} + \text{SRC\_TRANSFER\_STEP}$$

$$\text{DST\_ADDR\_ACTIVE} = \text{DST\_ADDR\_ACTIVE} + \text{DST\_TRANSFER\_STEP}$$

**Method 2:** Address wrapping gets enabled when SRC\_WRAP\_SIZE / DST\_WRAP\_SIZE is less than TRANSFER\_SIZE. This allows the channel to wrap multiple times within a single transfer. When the number of bursts is equal to (SRC/DST\_WRAP\_SIZE + 1) register, state machine modifies the active address pointers as shown below.

$$\text{SRC\_BEG\_ADDR\_ACTIVE} = \text{SRC\_BEG\_ADDR\_ACTIVE} + \text{SRC\_WRAP\_STEP}$$

$$\text{DST\_BEG\_ADDR\_ACTIVE} = \text{DST\_BEG\_ADDR\_ACTIVE} + \text{DST\_WRAP\_STEP}$$

$$\text{SRC\_ADDR\_ACTIVE} = \text{SRC\_BEG\_ADDR\_ACTIVE}$$

$$\text{DST\_ADDR\_ACTIVE} = \text{DST\_BEG\_ADDR\_ACTIVE}$$

At the end of DMA transfer, DMA would have transferred (BURST\_SIZE + 1) x (TRANSFER\_SIZE + 1) words.

### OneShot Mode:-

OneShot mode is disabled by default.

When OneShot mode is disabled (MODE.CHx[ONESHOT] = 0), DMA transfers one burst [(BURST\_SIZE + 1) words] of data each time a DMA Channel Trigger is received. After the burst is completed, the state machine moves on to the next pending channel in the priority scheme, even if another trigger for the channel just completed is pending. This feature keeps any single channel from monopolizing the DMA bus.

When OneShot mode is enabled (MODE.CHx[ONESHOT] = 1), DMA transfers all the bursts [(BURST\_SIZE + 1) x (TRANSFER\_SIZE + 1) words] on a single DMA channel trigger. Be careful when using this mode, since this can create a condition where one trigger uses up the majority of the DMA bandwidth.

### Continuos Mode:-

Continuos mode is disabled by default.

When Continuos mode is disabled (MODE.CHx[CONTINUOUS] = 0), DMA state machine disables channel after all bursts in a transfer loop (TRANSFER\_COUNT = 0) are complete. The channel must be re-enabled by setting the RUN bit in the CONTROL register before another transfer can be started on that channel.

When Continuos mode is enabled (MODE.CHx[CONTINUOUS] = 1), DMA state machine keep channel active even after all bursts in a transfer loop (TRANSFER\_COUNT = 0) are complete.

Each DMA channel can trigger its own EPIE interrupt for each DMA transfer either at start of DMA transfer (or) end of DMA transfer using MODE.CHx[CHINTMODE] bit.

**Source/Destination Address Pointers (SRC/DST\_ADDR)**— The value written into the shadow register is the start address of the first location where data is read or written to.

At the beginning of a transfer the shadow register (SRC/DST\_ADDR\_SHADOW) is copied into the active register (SRC/DST\_ADDR\_ACTIVE). The active register performs as the current address pointer.

**Source/Destination Begin Address Pointers (SRC/DST\_BEG\_ADDR)**— This is the wrap pointer.

The value written into the shadow register (SRC/DST\_BEG\_ADDR\_SHADOW) will be loaded into the active register (SRC/DST\_BEG\_ADDR\_ACTIVE) at the start of a transfer. On a wrap condition, the active register (SRC/DST\_BEG\_ADDR\_ACTIVE) will be incremented by the signed value in the appropriate SRC/DST\_WRAP\_STEP register prior to being loaded into the active register ((SRC/DST\_ADDR\_ACTIVE)).

For each channel, the transfer process can be controlled with the following size values:

**Source and Destination Burst Size (BURST\_SIZE):** — This specifies the number of words to be transferred in a burst.

This value is loaded into the BURST\_COUNT register at the beginning of each burst. The BURST\_COUNT decrements each word that is transferred and when it reaches a zero value, the burst is complete, indicating that the next channel can be serviced. The behavior of the current channel is defined by the ONE\_SHOT bit in the MODE register. The maximum size of the burst is dictated by the type of peripheral. For the ADC, the burst size could be all 16 registers (if all 16 registers are used). For RAM the burst size can be up to the maximum allowed by the BURST\_SIZE register, which is 32. See [Table 10-2](#) to understand how BURST\_SIZE register affects the number of 16-bit words transferred with respect to DATASIZE.

**Table 10-2. BURSTSIZE vs DATASIZE Behavior**

| BURSTSIZE | Number of 16-bit words transferred in |                        |
|-----------|---------------------------------------|------------------------|
|           | DataSize = 16-bit data                | DataSize = 32-bit data |
| 0         | 1                                     | 2                      |
| 1         | 2                                     | 2                      |
| 2         | 3                                     | 4                      |
| 3         | 4                                     | 4                      |
| 4         | 5                                     | 6                      |
| 5         | 6                                     | 6                      |
| 6         | 7                                     | 8                      |
| 7         | 8                                     | 8                      |
| 8         | 9                                     | 10                     |
| 9         | 10                                    | 10                     |
| 10        | 11                                    | 12                     |
| 11        | 12                                    | 12                     |
| *         | *                                     | *                      |
| *         | *                                     | *                      |
| *         | *                                     | *                      |
| 30        | 31                                    | 32                     |
| 31        | 32                                    | 32                     |

**Source and Destination Transfer Size (TRANSFER\_SIZE):** — This specifies the number of bursts to be transferred per CPU interrupt (if enabled).

Whether this interrupt is generated at the beginning or the end of the transfer is defined in the CHINTMODE bit in the MODE register. Whether the channel remains enabled or not after the transfer is completed is defined by the CONTINUOUS bit in the MODE register. The TRANSFER\_SIZE register is loaded into the TRANSFER\_COUNT register at the beginning of each transfer. The TRANSFER\_COUNT register keeps track of how many bursts of data the channel has transferred and when it reaches zero, the DMA transfer is complete.

**Source/Destination Wrap Size (SRC/DST\_WRAP\_SIZE)**— This specifies the number of bursts to be transferred before the current address pointer wraps around to the beginning.

This feature is used to implement a circular addressing type function. This value is loaded into the appropriate SRC/DST\_WRAP\_COUNT register at the beginning of each transfer. The SRC/DST\_WRAP\_COUNT registers keep track of how many bursts of data the channel has transferred and when they reach zero, the wrap procedure is performed on the appropriate source or destination address pointer. A separate size and count register is allocated for source and destination pointers. To *disable* the wrap function, assign the value of these registers to be larger than the TRANSFER\_SIZE.

**NOTE:** The value written to the SIZE registers is one less than the intended size. So, to transfer three 16-bit words, the value 2 should be placed in the SIZE register.

Regardless of the state of the DATASIZE bit, the value specified in the SIZE registers are for 16-bit addresses. So, to transfer three 32-bit words, the value 5 should be placed in the SIZE register.

For each source/destination pointer, the address changes can be controlled with the following step values:

**Source/Destination Burst Step (SRC/DST\_BURST\_STEP)**— Within each burst transfer, the address source and destination step sizes are specified by these registers.

This value is a signed 2's compliment number so that the address pointer can be incremented or decremented as required. If no increment is desired, such as when accessing the data receive or transmit registers in a communication peripheral, the value of these registers should be set to zero.

**Source/Destination Transfer Step (SRC/DST\_TRANSFER\_STEP)**— This specifies the address offset to start the next burst transfer after completing the current burst transfer.

This is used in cases where registers or data memory locations are spaced at constant intervals. This value is a signed 2's compliment number so that the address pointer can be incremented or decremented as required.

**Source/Destination Wrap Step (SRC/DST\_WRAP\_STEP):** — When the wrap counter reaches zero, this value specifies the number of words to add/subtract from the SRC/DST\_BEG\_ADDR pointer and hence sets the new start address.

This implements a circular type of addressing mode, useful in many applications. This value is a signed 2's compliment number so that the address pointer can be incremented or decremented as required.

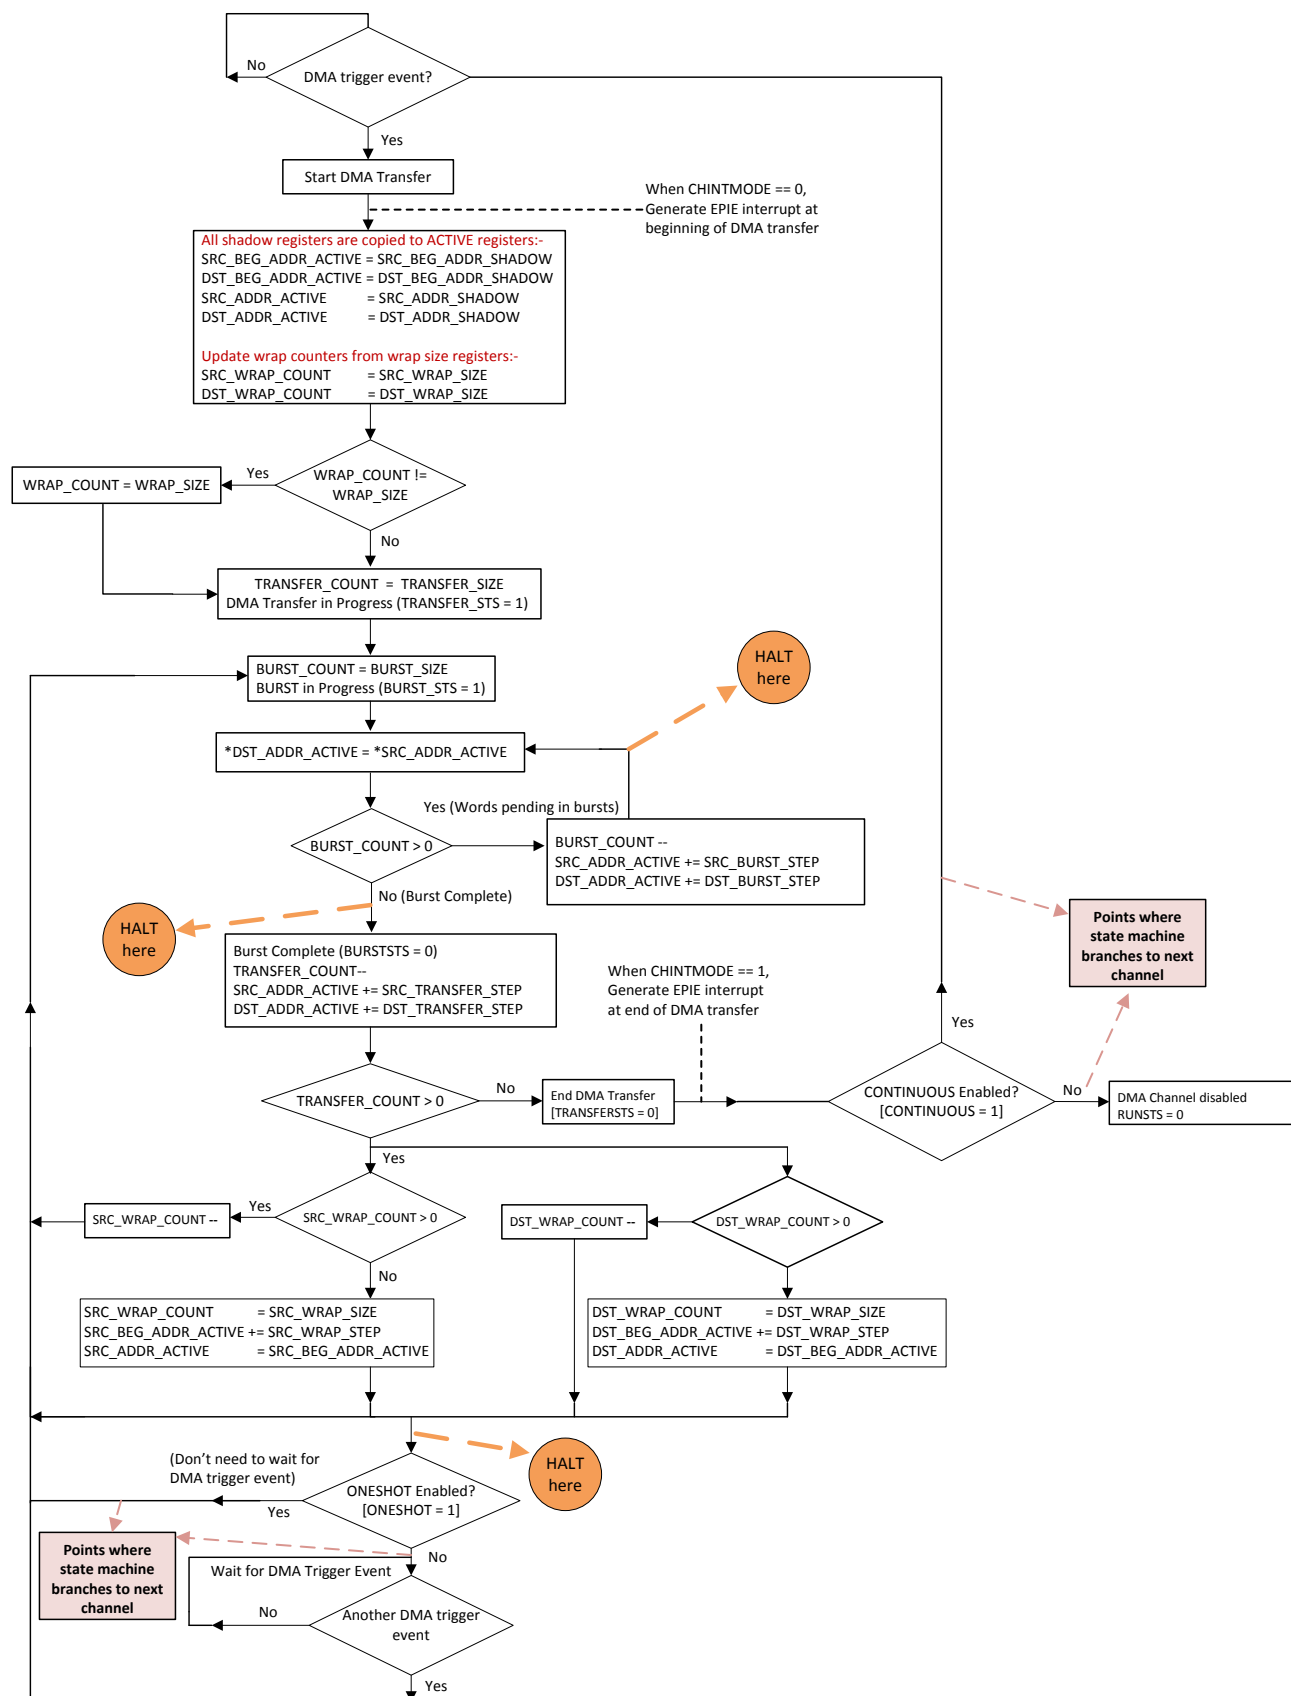

**NOTE:** Regardless of the state of the DATASIZE bit, the value specified in the STEP registers are for 16-bit addresses. So, to increment one 32-bit address, a value of 2 should be placed in these registers.

**Channel Interrupt Mode (CHINTMODE)**— This mode bit selects whether the DMA interrupt from the respective channel is generated at the beginning of a new transfer or at the end of the transfer.

If implementing a ping-pong buffer scheme with continuous mode of operation, then the interrupt would be generated at the beginning, just after the working registers are copied to the shadow set. If the DMA does not operate in continuous mode, then the interrupt is typically generated at the end when the transfer is complete.

All of the above features and modes are shown in [Figure 10-4](#).

### Figure 10-4. DMA State Diagram

The following items are in reference to [Figure 10-4](#).

- The *HALT* points represent where the channel halts operation when interrupted by a high priority channel 1 trigger, or when the HALT command is set, or when an emulation halt is issued and the FREE bit is cleared to 0.
- The SRC/DST\_ADDR\_ACTIVE registers are not affected by SRC/DST\_BEG\_ADDR\_ACTIVE at the start of a transfer. SRC/DST\_BEG\_ADDR\_ACTIVE only affects the SRC/DST\_ADDR\_ACTIVE registers on a wrap. Following is what happens when a transfer first starts:
  - SRC/DST\_BEG\_ADDR\_SHADOW remains unchanged.
  - SRC/DST\_ADDR\_SHADOW remains unchanged.
  - SRC/DST\_BEG\_ADDR\_ACTIVE = SRC/DST\_BEG\_ADDR\_SHADOW
  - SRC/DST\_ADDR\_ACTIVE = SRC/DST\_ADDR\_SHADOW
- The active registers get updated when a wrap occurs. The shadow registers remain unchanged. Specifically:
  - SRC/DST\_BEG\_ADDR\_SHADOW remains unchanged.
  - SRC/DST\_ADDR\_SHADOW remains unchanged.
  - SRC/DST\_BEG\_ADDR\_ACTIVE += SRC/DST\_WRAP\_STEP
  - SRC/DST\_ADDR\_ACTIVE = SRC/DST\_BEG\_ADDR\_ACTIVE
- The best way to remember this is:
  - The shadow registers never change except by software.
  - The active registers never change except by hardware, and a shadow register is only copied into its own active register, never an active register by another name.

## 10.5 Pipeline Timing and Throughput

In addition to the pipeline there are a few other behaviors of the DMA that affect its total throughput:

- A 1-cycle delay is added at the beginning of each burst
- A 1-cycle delay is added when returning from a CH1 high priority interrupt
- Collisions with the CPU may add delay slots (see [Section 10.6](#))
- 32-bit transfers run at double the speed of a 16-bit transfer (it takes the same amount of time to transfer a 32-bit word as it does a 16-bit word)

For example, to transfer 128 16-bit words from GS0 RAM to GS3 RAM, a channel can be configured to transfer 8 bursts of 16 words/burst. This will give:

$$8 \text{ bursts} * [(3 \text{ cycles/word} * 16 \text{ words/burst}) + 1] = 392 \text{ cycles}$$

If instead the channel were configured to transfer the same amount of data 32 bits at a time (the word size is configured to 32 bits) the transfer would take:

$$8 \text{ bursts} * [(3 \text{ cycles/word} * 8 \text{ words/burst}) + 1] = 200 \text{ cycles}$$

The DMA module consists of a 3-stage pipeline as shown in [Figure 10-5](#) and [Figure 10-6](#).

**Figure 10-5. 3-Stage Pipeline DMA Transfer**

**Figure 10-6. 3-stage Pipeline With One Read Stall**

## 10.6 CPU and CLA Arbitration

Typically, DMA activity is independent of CPU and CLA activity. However, when the DMA and CPU (or CLA) try to access the same peripheral at the same time, an arbitration procedure is required to resolve the conflict. All instances of the same peripheral type conflict with each other. For instance, CAN-A and CAN-B conflict, as do the GS0 and GS2 RAMs. Different peripheral types can share a bus interface, which creates further opportunities for conflicts. These bus interfaces are:

- Peripheral frame 1: ePWM, eCAP, eQEP, SDFM, CMPSS, DAC
- Peripheral frame 2: PMBus and SPI

**Conflict Example:** The CLA is accessing DAC-A while the DMA is simultaneously accessing DAC-B.

**Conflict Example:** The CPU is accessing an SPI FIFO while the DMA is simultaneously accessing a PMBus register.

**Non-conflict Example:** The CPU is accessing a shared ePWM while the DMA is accessing an SPI.

The exception to all this is the ADC result registers, which are duplicated for each bus master. The CPU, DMA, and CLA can all simultaneously read these registers with no stalls for any master.

A DMA transfer consists of four phases: send source address, read source data, send destination address, and write destination data (see [Section 10.5](#)). Suppose CPU accesses a peripheral / memory causing conflict in middle of a DMA transfer, CPU is stalled till the current DMA access is complete and not until the completion of whole DMA transfer.

The following priority schemes are implemented for the various interfaces on the device.

- The fixed priority scheme for the peripheral frames is:
  - CLA/DMA Write
  - CLA/DMA Read

- CPU Write
- CPU Read
- The priority scheme for GSx RAM accesses is round-robin.
- All masters can access the ADC result registers simultaneously without delay.

---

**NOTE:** If the CPU is performing a read-modify-write operation and the DMA performs a write to the same location, the DMA write may be lost if the operation occurs in between the CPU read and the CPU write. Avoid mixing CPU writes with DMA writes to the same locations.

---

Arbitration within DMA channels is based on a round robin priority (or) Channel 1 high priority scheme described in [Section 10.7](#).

## 10.7 Channel Priority

Two priority schemes exist when determining channel priority: Round-robin mode and Channel 1 high-priority mode.

### 10.7.1 Round-Robin Mode

In this mode, all channels have *equal* priority and each enabled channel is serviced in round-robin fashion as follows:

$$\text{CH1} \rightarrow \text{CH2} \rightarrow \text{CH3} \rightarrow \text{CH4} \rightarrow \text{CH5} \rightarrow \text{CH6} \rightarrow \text{CH1} \rightarrow \text{CH2} \rightarrow \dots$$

In the case above, after each channel has transferred a burst of words, the next channel is serviced. You can specify the size of the burst for each channel. Once CH6 (or the last enabled channel) has been serviced, and no other channels are pending, the round-robin state machine enters an idle state.

From the idle state, channel 1 (if enabled) is always serviced first. However, if the DMA is currently processing another channel x, all other pending channels between x and the end of the round are serviced before CH1. It is in this sense that all the channels are of *equal* priority. For instance, take an example where CH1, CH4, and CH5 are enabled in round-robin mode and CH4 is currently being processed. Then CH1 and CH5 both receive an interrupt trigger from their respective peripherals before CH4 completes. CH1 and CH5 are now both pending. When CH4 completes its burst, CH5 will be serviced next. Only after CH5 completes will CH1 be serviced. Upon completion of CH1, if there are no more channels pending, the round-robin state machine will enter an idle state.

A more complicated example is shown below:

- Assume all channels are enabled, and the DMA is in an idle state,
- Initially a trigger occurs on CH1, CH3, and CH5 on the same cycle,
- When the CH1 burst transfer starts, requests from CH3 and CH5 are pending,
- Before completion of the CH1 burst, the DMA receives a request from CH2. Now the pending requests are from CH2, CH3, and CH5,
- After completing the CH1 burst, CH2 will be serviced since it is next in the round-robin scheme after CH1.
- After the burst from CH2 is finished, the CH3 burst will be serviced, followed by CH5 burst.
- Now while the CH5 burst is being serviced, the DMA receives a request from CH1, CH3, and CH6.
- The burst from CH6 will start after the completion of the CH5 burst since it is the next channel after CH5 in the round-robin scheme.
- This will be followed by the CH1 burst and then the CH3 burst
- After the CH3 burst finishes, assuming no more triggers have occurred, the round-robin state machine will enter an idle state.

The round-robin state machine may be reset to the idle state via the DMACTRL[PRIORITYRESET] bit.

### 10.7.2 Channel 1 High Priority Mode

In this mode, Channel 1 has high priority over all the other channels. Channel 2 – 6 have equal priority and each enabled channel is serviced in round-robin fashion.

Higher Priority: CH1

Lower priority: CH2 → CH3 → CH4 → CH5 → CH6 → CH2 → ...

Given an example where CH1, CH4 and CH5 are enabled in Channel 1 High Priority Mode and CH4 is currently being processed. Then CH1 and CH5 both receive an interrupt trigger from their respective peripherals before CH4 completes. CH1 and CH5 are now both pending. When the current CH4 word transfer is completed, regardless of whether the DMA has completed the entire CH4 burst, CH4 execution will be suspended and CH1 will be serviced. After the CH1 burst completes, CH4 will resume execution.

Upon completion of CH4, CH5 will be serviced. After CH5 completes, if there are no more channels pending, the round-robin state machine will enter an idle state.

Typically Channel 1 would be used in this mode for the ADC, since its data rate is so high. However, Channel 1 High Priority Mode may be used in conjunction with any peripheral.

**NOTE:** High-priority mode and ONESHOT mode may not be used at the same time on channel 1. Other channels may use ONESHOT mode when channel 1 is in high-priority mode.

## 10.8 Overrun Detection Feature

The DMA contains overrun detection logic. When a peripheral event trigger is received by the DMA, the PERINTFLG bit in the CONTROL register is set, pending the channel to the DMA state machine. When the burst for that channel is started, the PERINTFLG is cleared. If however, between the time that the PERINTFLG bit is set by an event trigger and cleared by the start of the burst, an additional event trigger arrives, the second trigger will be lost. This condition will set the OVRFLG bit in the CONTROL register as in Figure 10-7. If the overrun interrupt is enabled, the channel interrupt will be generated to the PIE module.

Figure 10-7. Overrun Detection Logic

## 10.9 DMA Registers

This section describes the C28x Direct Memory Access Registers.

### 10.9.1 DMA Base Addresses

**Table 10-3. DMA Base Address Table**

| Device Registers | Register Name | Start Address | End Address |
|------------------|---------------|---------------|-------------|
| DmaRegs          | DMA_REGS      | 0x0000_1000   | 0x0000_11FF |

## 10.9.2 DMA\_REGS Registers

Table 10-4 lists the DMA\_REGS registers. All register offset addresses not listed in Table 10-4 should be considered as reserved locations and the register contents should not be modified.

**Table 10-4. DMA\_REGS Registers**

| Offset | Acronym       | Register Name               | Write Protection | Section            |
|--------|---------------|-----------------------------|------------------|--------------------|
| 0h     | DMACTRL       | DMA Control Register        | EALLOW           | <a href="#">Go</a> |
| 1h     | DEBUGCTRL     | Debug Control Register      | EALLOW           | <a href="#">Go</a> |
| 4h     | PRIORITYCTRL1 | Priority Control 1 Register | EALLOW           | <a href="#">Go</a> |
| 6h     | PRIORITYSTAT  | Priority Status Register    | EALLOW           | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 10-5 shows the codes that are used for access types in this section.

**Table 10-5. DMA\_REGS Access Type Codes**

| Access Type                     | Code    | Description                                                                                                                                                                                                                                                                          |
|---------------------------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Read Type</b>                |         |                                                                                                                                                                                                                                                                                      |
| R                               | R       | Read                                                                                                                                                                                                                                                                                 |
| R-0                             | R<br>-0 | Read<br>Returns 0s                                                                                                                                                                                                                                                                   |
| <b>Write Type</b>               |         |                                                                                                                                                                                                                                                                                      |
| W                               | W       | Write                                                                                                                                                                                                                                                                                |
| W1S                             | W<br>1S | Write<br>1 to set                                                                                                                                                                                                                                                                    |
| <b>Reset or Default Value</b>   |         |                                                                                                                                                                                                                                                                                      |
| -n                              |         | Value after reset or the default value                                                                                                                                                                                                                                               |
| <b>Register Array Variables</b> |         |                                                                                                                                                                                                                                                                                      |
| i,j,k,l,m,n                     |         | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                               |         | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.                                                                                                                                                                  |

### 10.9.2.1 DMACTRL Register (Offset = 0h) [reset = 0h]

DMACTRL is shown in [Figure 10-8](#) and described in [Table 10-6](#).

Return to the [Summary Table](#).

DMA Control Register

| 1    | PRIORITYRESET | R-0/W1S | 0h    | <p>The priority reset bit resets the round-robin state machine when a 1 is written. Service starts from the first enabled channel. Writes of 0 are ignored and this bit always reads back a 0.</p> <p>When a 1 is written to this bit, any pending burst transfer completes before resetting the channel priority machine. If CH1 is configured as a high-priority channel, and this bit is written to while CH1 is servicing a burst, both the CH1 burst and the next pending low-priority burst are completed before the state machine is reset.</p> <p>If CH1 is high-priority, the state machine restarts from CH2 (or the next highest enabled channel).</p> <p>Reset type: SYSRSn</p> |
| 0    | HARDRESET     | R-0/W1S | 0h    | <p>Writing a 1 to the hard reset bit resets the whole DMA and aborts any current access (similar to applying a device reset). Writes of 0 are ignored and this bit always reads back a 0.</p> <p>For a soft reset, a bit is provided for each channel to perform a gentler reset. Refer to the channel control registers.</p> <p>When writing to this bit, there is a one cycle delay before it takes effect. Hence, a one-cycle delay (such as a NOP instruction) is required in software before attempting to access any other DMA register.</p> <p>Reset type: SYSRSn</p>                                                                                                                |

### 10.9.2.2 DEBUGCTRL Register (Offset = 1h) [reset = 0h]

DEBUGCTRL is shown in [Figure 10-9](#) and described in [Table 10-7](#).

Return to the [Summary Table](#).

Complex bit access types are encoded to fit into small table cells. Table 10-11 shows the codes that are used for access types in this section.

**Table 10-11. DMA\_CH\_REGS Access Type Codes**

| Access Type                     | Code    | Description                            |
|---------------------------------|---------|----------------------------------------|
| <b>Read Type</b>                |         |                                        |
| R                               | R       | Read                                   |
| R-0                             | R<br>-0 | Read<br>Returns 0s                     |
| <b>Write Type</b>               |         |                                        |
| W                               | W       | Write                                  |
| W1S                             | W<br>1S | Write<br>1 to set                      |
| <b>Reset or Default Value</b>   |         |                                        |
| -n                              |         | Value after reset or the default value |
| <b>Register Array Variables</b> |         |                                        |

**Table 10-11. DMA\_CH\_REGS Access Type Codes (continued)**

| Access Type | Code | Description                                                                                                                                                                                                                                                                          |
|-------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| i,j,k,l,m,n |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y           |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.                                                                                                                                                                  |

### 10.9.3.1 MODE Register (Offset = 0h) [reset = 0h]

MODE is shown in [Figure 10-12](#) and described in [Table 10-12](#).

Return to the [Summary Table](#).

## ***Embedded Real-time Analysis and Diagnostic (ERAD)***

This chapter describes the features and operation of the embedded real-time analysis and diagnostic (ERAD) module. The ERAD module enhances the debug and system analysis capabilities of the device. The debug and system analysis enhancements provided by the ERAD module are implemented external to the CPU. The ERAD module consists of the enhanced bus comparator (EBC) units and the system event counter (SEC) units. The EBC units are used to generate hardware breakpoints, hardware watch points, and other output events. The SEC units are used to analyze and profile the system. The ERAD module is accessible both by the debugger and the application software, which significantly increases the debug capabilities of many real-time systems, especially in situations where the debugger is not connected.

## 11.1 Introduction

The ERAD module is shown in [Figure 11-1](#).

**Figure 11-1. ERAD Overview**

ERAD enhances the debug and system analysis capabilities of the device external to the CPU. The C28x CPU alone has two analysis resources; Analysis Unit 1 (AU1) and Analysis Unit 2 (AU2). The first analysis unit counts events or monitors address buses. The second analysis unit monitors address and data buses. The two analysis units can be configured for hardware breakpoints or hardware watch points, and additionally the first analysis unit can be configured as a benchmark counter or event counter. The ERAD module further expands this capability to provide additional hardware breakpoints, hardware watch points, and counters for profiling, as well as other advanced features. The ERAD module can be utilized by the debugger, and also by the application software. For many real-time systems, it is not always possible to connect a debugger and perform an intrusive debug. Under these situations, the user's code has the ability to set up and control the ERAD module in order to debug and profile the system without disturbing the end application.

The ERAD module consists of eight enhanced bus comparator (EBC) units and four system event counter (SEC) units. The EBC units monitor buses and generate output events. The SEC units can be used with EBC units to profile and analyze the system. These units are described in detail in the following sections.

## 11.2 Enhanced Bus Comparator Unit

The EBC units connect to the CPU similar to any standard direct memory interface connection. The program space buses, data space buses, debug qualifiers for memory access, and debug-related strobes necessary for breakpoints, watch points and trace points, are connected between the CPU and these units. The EBC units are usually controlled by the debug software. However, a CPU application code can also configure and use these units for interrupt and event generation. The ERAD module can be configured and used by either the application software or debug software. It is not possible for an EBC unit to be used by both the application software and the debug software simultaneously. The ERAD module will be owned by either the debugger or the application software through the memory-mapped registers.

The EBC unit has the following capabilities:

- Generate hardware breakpoints
- Generate hardware watch points
- Generate trace tags for instruction fetch matches and generate RTOSINT
- Monitor data read address buses, data write address buses, data write data bus, and generate RTOSINT
- Generate an event output which can be used by other modules. This is done through monitoring any of the program address buses, Virtual Program Counter (VPC), or the Program Counter of the CPU

The following features are not supported by the EBC units:

- Chain breakpoints
- Ability to monitor DMA transfers
- Ability to monitor CLA buses

The EBC units have the capability to monitor a range of addresses by defining masks and generating outputs based on greater than, less than, or equal events.

The EBC units can be used with the SEC units for profiling and analysis purposes.

### 11.2.1 Enhanced Bus Comparator Unit Operations

The following operations are supported by the EBC unit:

- Operation of a hardware breakpoint: The EBC unit will generate the appropriate tags for an access made to a particular address. When the instruction is going to enter the DECODE 2 (D2) phase of the pipeline, the CPU is halted.
- Operation of a watch point: Unlike breakpoints which halt the CPU before a designated address is executed, watch points will detect the occurrence of a data memory read or write, and will halt the CPU. There is no precise definition as to when the CPU will halt, since it is entirely dependant on the current state of the CPU pipeline. The CPU will halt at the next interruptible boundary.
- Operation of program trace: This operation is very similar to the hardware breakpoint operation. The difference between the CPU behavior is that it will internally generate an RTOSINT when the tagged instruction reaches the DECODE 2 (D2) phase of the pipeline. If this instruction is discarded in the fetch buffer due to discontinuity, then no RTOSINT will be generated.
- Operation of RTOSINTn: This is an alternative to a watch point where an interrupt can be generated to the CPU on detecting the designated read and write access.

It is important to note that a hardware breakpoint will only halt the CPU if a debugger is connected.

## 11.3 System Event Counter Unit

The SEC units provide better system profiling, analysis, and debug capability. The SEC units contain counters which can enhance the debug and profiling process in various types of system scenarios such as:

- Profiling code segments
- Counting duration between specified memory reads and writes
- Counting system events (such as interrupts)
- Counting duration between system events
- System timer
- Measuring the number of wait states in code segments
- Measuring the maximum amount of time spent in between a pair of events, measured over multiple iterations
- Chaining counters in order to link events or create larger counters

Furthermore, the SEC unit has the capability to:

- Function as a counter capable of counting:
  - Any of the match events generated by the EBC units
  - Events generated by the EBC units. These events can be used to start and stop the counting.
  - System events including the PIE interrupts, timer interrupts, and CLA task interrupts. These system events can be used to start and stop the counting.
  - More information on the sources of the SEC units can be found at the Event Selector Mux Signals Table.
- Generate an interrupt or a watch point if the count reaches a reference value.
- Operate in counting mode in one of the following two modes:
  - Duration mode: The counter will count the CPU cycles as long as the event is active.

- Event mode: The counter will count only the positive edge of the event signal. This is effectively counting the number of times the event transitions from inactive to active.

### 11.3.1 System Event Counter Modes

The following are the key features of the SEC unit. The counters are initialized to zero and will always count up.

- Continuous Count: In this mode the counter continues to count as specified by the input selector. If the counter reaches the maximum value, it resets to zero and will continue to count up. A sticky overflow bit will be set to indicate that this counter had overflowed. The counter can count the CPU cycles without any events selected. In this mode the module can be used as a software controlled SYSCLK counter.
- Timer Mode Count: In this mode, the counter counts up to a set reference value and after reaching the reference value, it resets to zero. The counter will generate an event which can send an interrupt to the CPU or generate a watch point. The counter can be set up to either continue incrementing or reset when a match event occurs.
- Start-Stop Count: In this mode, two events are allowed to act as start and stop indicators to the counter. The counter will commence counting only when the defined start event occurs. The counter will then continue to count up until the stop event occurs. Once the first start event has occurred, further start events will be ignored till the stop event occurs.

#### 11.3.1.1 Counting Active Levels vs. Edges

The SEC units can be configured to either count active levels or edges of the selected inputs.

Each SEC unit has eight inputs from the EBC units and many inputs from other events in the device. Each SEC unit can be configured to count any of the input events or just count up on every cycle. For example if an input event occurs and is active for 25 cycles, the SEC unit's counter will increment only by 1 in event mode, whereas in the duration mode, it will increment by 25.

#### 11.3.1.2 Max mode

Max mode is also supported by the SEC units. This mode allows the user to detect the maximum count that has occurred during various count iterations in start-stop mode. For example, a user can set up the counter in the start-stop count mode to count the duration of a critical code loop. Every time the stop event occurs and the counter stops, the counter value is checked against the current MAX\_COUNT present in the register. If the new value is greater, then the MAX\_COUNT register is updated. The counter will always reset to zero at the stop event and will be ready to start counting on the next start event. Therefore the MAX\_COUNT will contain the maximum number of cycles that occurred between the start and stop condition over many iterations.

#### 11.3.1.3 Input Signal Selection

The SEC inputs can be selected from various signals from in the system to enable debug and system analysis. [Figure 11-2](#) shows the SEC inputs.

**Figure 11-2. System Event Counter Inputs**

Each event selector MUX can select from various signals on in the system. These signals are show in [Table 11-1](#) .

**Table 11-1. Event Selector Mux Signals**

| CTM_INP_SEL, STA_INP_SEL, STO_INP_SEL, RST_INP_SEL | EVENT_INPUT_SELECTED |
|----------------------------------------------------|----------------------|
| INP_SEL[0]                                         | HWBP1                |

| INP_SEL[12]                                        | PIE_INT1             |
| INP_SEL[13]                                        | PIE_INT2             |
| INP_SEL[14]                                        | PIE_INT3             |
| INP_SEL[15]                                        | PIE_INT4             |
| INP_SEL[16]                                        | PIE_INT5             |
| INP_SEL[17]                                        | PIE_INT6             |
| INP_SEL[18]                                        | PIE_INT7             |
| INP_SEL[19]                                        | PIE_INT8             |
| INP_SEL[20]                                        | PIE_INT9             |
| INP_SEL[21]                                        | PIE_INT10            |
| INP_SEL[22]                                        | PIE_INT11            |
| INP_SEL[23]                                        | PIE_INT12            |

**Table 11-1. Event Selector Mux Signals (continued)**

| CTM_INP_SEL, STA_INP_SEL, STO_INP_SEL, RST_INP_SEL | EVENT_INPUT_SELECTED |
|----------------------------------------------------|----------------------|
| INP_SEL[24]                                        | TIMER1_TINT1         |
| INP_SEL[25]                                        | TIMER2_TINT2         |
| INP_SEL[26]                                        | CLA_INTERRUPT1       |
| INP_SEL[27]                                        | CLA_INTERRUPT2       |
| INP_SEL[28]                                        | CLA_INTERRUPT3       |
| INP_SEL[29]                                        | CLA_INTERRUPT4       |
| INP_SEL[30]                                        | CLA_INTERRUPT5       |
| INP_SEL[31]                                        | CLA_INTERRUPT8       |

### 11.3.2 Reset on Event

It is also possible to reset the counters on external events. Additionally all the counter event outputs are fed back to each of the counter's input MUX which will select the event that can be used as a reset input. When enabled, an active high on the reset input will cause the counter to reset. This gives a powerful feature which allows the user to set up threshold monitors. This can be used to flag an interrupt or a watch point if the distance between two events crosses a certain threshold.

### 11.3.3 Operation Conditions

The SEC units will count accurately only when the CPU is operating in normal conditions. If the counters are running and capturing the CPU cycles while the CPU is controlled through the debugger in order to single-step through the code, then the result may differ from when the CPU was executing the code in normal conditions.

It is also important to note that if the counters are set up to use the value of the raw program counter register (VPC) as the source for the start and stop events, the value of the CPU cycles measured may be off by a few cycles when the CALL instruction is executed.

## 11.4 ERAD Ownership, Initialization and Reset

Even though the features of this module are meant for the debugger to use, the user application may also need to take advantage of the capabilities to monitor the buses and generate interrupts and events. It is an option to completely hand over the ownership of the ERAD module to the application software or the debugger. Another option is for both the application code and the debugger to use the ERAD module. Only the owner of the module (application code or debugger) is allowed to use the module at that time. The responsibility of resolving any ownership conflict, is on the software. The last option is to have no owner. In this mode, both the application code and the debugger have the capability to access the module at the same time. It is critical for the software, both on the application side and the debugger side, to resolve any conflicts. In this mode, it is possible for the debugger to use some of the EBC units and the SEC units, while the application software uses the remaining units.

The ERAD module will initialize its internal states and all the registers to their initialized states under the following conditions:

- At power-on-reset (POR)
- With DCON and SYSRSN
  - Debug logic disconnected when the debugger owns the module
  - Functional reset when application owns the module

## 11.5 ERAD Programming Sequence

The ERAD module can be used to set hardware breakpoints and hardware watch points. The programming sequence to set hardware breakpoints, hardware watch points, or to use the timers to profile and analyze the system are described in this section. The same sequence can be used through the debugger software or the application code.

Please refer to the Driverlib example projects in C2000Ware for JavaScript files to configure the ERAD module. Example projects are also available to showcase the usage of these script files. These examples are included in the latest Driverlib install.

<C2000Ware installation>\driverlib\28004x\examples\erad

### 11.5.1 Hardware Breakpoint and Hardware Watch Point Programming Sequence

The programming sequence is identical when using the EBC units, regardless of whether it is a debug software or the application programming the units. A typical programming sequence for a unit is described below.

- Read and make sure the ownership is set as expected; if not, acquire the ownership before proceeding further if required.
- Ensure the unit is in IDLE mode.
- Set up the address reference, mask, bus select and stop bits.
- Enable the corresponding module bit in the global enable register.
- Once the usage is completed, write '1' to Clear EVENT\_FIRED sticky bit; This will take the module back to the enabled state.

The example programming sequences for hardware breakpoints and hardware watch points are shown below.

Set a hardware breakpoint on address 0x201000:

- Read GLBL\_OWNER to confirm ownership.
- Read HWBP\_STATUS to confirm the module is in IDLE state.
- Write 0x0 to HWBP\_MASK.
- Write 0x201000 to HWBP\_REF.
- Write 0x20 to HWBP\_CNTL (STOP = 1, BUS\_SEL = 000/PAB). If a trace is to be generated instead of a breakpoint, then set HWBP\_CNTL to 0x40 instead of (STOP = 0).
- Enable the corresponding module bit in the global enable register.

Set a hardware watch point on read of addresses from 0x121010 to 0x12101f:

- Read GLBL\_OWNER to confirm ownership.
- Read HWBP\_STATUS to confirm the module is in IDLE state.
- Write 0xf to HWBP\_MASK.
- Write 0x121010 to HWBP\_REF.
- Write 0x2C to HWBP\_CNTL (STOP = 1, BUS\_SEL = 011/DRAB). If an RTOSINTn is to be generated instead of a watch point, then set HWBP\_CNTL to 0x4C instead (STOP = 0).
- Enable the corresponding module bit in the global enable register.

Set a hardware watch point on write to address 0xff10101a:

- Read GLBL\_OWNER to confirm ownership
- Read HWBP\_STATUS to confirm the module is in IDLE state
- Write 0x0 to HWBP\_MASK
- Write 0xff10101a to HWBP\_REF
- Write 0x28 to HWBP\_CNTL (STOP = 1, BUS\_SEL = 010/DWAB). If an RTOSINTn is to be generated instead of a watch point, then set HWBP\_CNTL to 0x48 instead (STOP = 0)
- Enable the corresponding module bit in the global enable register.

### 11.5.2 Timer and Counter Programming Sequence

The programming sequence is identical when using the SEC units, regardless of whether it is a debug software, or the application, programming the units. Typical programming sequence for a unit is described below.

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding

further if required.

- Ensure the unit is in IDLE mode.
- Set up the counter reference, counter registers (clear/reset if a clean start is required) and CTM\_CNTL.
- Enable the corresponding module bit in the global enable register.
- Once the usage is completed, write '1' to Clear EVENT\_FIRED sticky bit. This will take the module back to the enabled state.

Set up a free running counter:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM\_STATUS to confirm that the module is in IDLE state.
- Write 0x0 to CTM\_INPUT\_SEL.
- Write 0x0 to CTM\_CNTL.
- Enable the module in the GLBL\_ENABLE register.

Set up the counter to count the duration spent between addresses 0x1000 and 0x1210:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM\_STATUS to confirm that the module is in IDLE state.
- Set up the EBC unit 1 to generate an event for VPC = 0x1000.
- Set up the EBC unit 2 to generate an event for VPC = 0x1210.
- Set up the start and stop input selects to use comparator event 1 and 2, respectively. This is achieved by writing the value 0x0800 to CTM\_INPUT\_SEL register (bits 15:11 = 0b00001 and bits 10:6 = 0b00000 and all other bits are set to 0).
- Enable the counter in the START\_STOP\_MODE of operation. This is achieved by writing 0x4 to CTM\_CNTL.
- Enable the module in the GLBL\_ENABLE register.

Set up the counter to count the number of times a function at address 0x2010 is called and fire an RTOSINT if this count reaches 0x300:

- Read and make sure the ownership is set as expected. If not, acquire the ownership before proceeding further, if required.
- Read CTM\_STATUS to confirm that the module is in IDLE state.
- Set up the EBC unit 1 to generate an event for VPC = 0x2010.
- Setup the counter to select comparator event 1 as the event to count. This is achieved by writing the value 0x0001 to CTM\_INPUT\_SEL register (Register bits 5:1 = 0b00000 and bit 0 = 1).
- Write 0x300 CTM\_REF.
- Enable the counter in the EVENT\_MODE, and also allow it to generate an RTOSINT when the count matches the reference. This is achieved by writing 0x88 to CTM\_CNTL (bit 3 = 1 and bit 7 = 1).
- Enable the module in the GLBL\_ENABLE register.

## 11.6 ERAD Registers

This section describes the Embedded Real-Time Analysis and Diagnostic Registers.

### 11.6.1 ERAD Base Addresses

**Table 11-2. ERAD Base Address Table**

| Device Registers | Register Name     | Start Address | End Address |
|------------------|-------------------|---------------|-------------|
| EradGlobalRegs   | ERAD_GLOBAL_REGS  | 0x0005_E800   | 0x0005_E812 |
| EradHWBP1Regs    | ERAD_HWBP_REGS    | 0x0005_E900   | 0x0005_E907 |
| EradHWBP2Regs    | ERAD_HWBP_REGS    | 0x0005_E908   | 0x0005_E90F |
| EradHWBP3Regs    | ERAD_HWBP_REGS    | 0x0005_E910   | 0x0005_E917 |
| EradHWBP4Regs    | ERAD_HWBP_REGS    | 0x0005_E918   | 0x0005_E91F |
| EradHWBP5Regs    | ERAD_HWBP_REGS    | 0x0005_E920   | 0x0005_E927 |
| EradHWBP6Regs    | ERAD_HWBP_REGS    | 0x0005_E928   | 0x0005_E92F |
| EradHWBP7Regs    | ERAD_HWBP_REGS    | 0x0005_E930   | 0x0005_E937 |
| EradHWBP8Regs    | ERAD_HWBP_REGS    | 0x0005_E938   | 0x0005_E93F |
| EradCounter1Regs | ERAD_COUNTER_REGS | 0x0005_E980   | 0x0005_E98F |
| EradCounter2Regs | ERAD_COUNTER_REGS | 0x0005_E990   | 0x0005_E99F |
| EradCounter3Regs | ERAD_COUNTER_REGS | 0x0005_E9A0   | 0x0005_E9AF |
| EradCounter4Regs | ERAD_COUNTER_REGS | 0x0005_E9B0   | 0x0005_E9BF |

### 11.6.2 ERAD\_GLOBAL\_REGS Registers

Table 11-3 lists the ERAD\_GLOBAL\_REGS registers. All register offset addresses not listed in Table 11-3 should be considered as reserved locations and the register contents should not be modified.

**Table 11-3. ERAD\_GLOBAL\_REGS Registers**

| Offset | Acronym         | Register Name                | Write Protection | Section            |
|--------|-----------------|------------------------------|------------------|--------------------|
| 0h     | GLBL_EVENT_STAT | Global Event Status Register |                  | <a href="#">Go</a> |
| 2h     | GLBL_HALT_STAT  | Global Halt Status Register  |                  | <a href="#">Go</a> |
| 4h     | GLBL_ENABLE     | Global Enable Register       | EALLOW           | <a href="#">Go</a> |
| 6h     | GLBL_CTM_RESET  | Global Counter Reset         | EALLOW           | <a href="#">Go</a> |
| Ah     | GLBL_OWNER      | Global Ownership             | EALLOW           | <a href="#">Go</a> |

Complex bit access types are encoded to fit into small table cells. Table 11-4 shows the codes that are used for access types in this section.

**Table 11-4. ERAD\_GLOBAL\_REGS Access Type Codes**

| Access Type                     | Code | Description                                                                                                                                                                                                                                                                          |
|---------------------------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Read Type</b>                |      |                                                                                                                                                                                                                                                                                      |
| R                               | R    | Read                                                                                                                                                                                                                                                                                 |
| R-0                             | R-0  | Read Returns 0s                                                                                                                                                                                                                                                                      |
| <b>Write Type</b>               |      |                                                                                                                                                                                                                                                                                      |
| W                               | W    | Write                                                                                                                                                                                                                                                                                |
| <b>Reset or Default Value</b>   |      |                                                                                                                                                                                                                                                                                      |
| -n                              |      | Value after reset or the default value                                                                                                                                                                                                                                               |
| <b>Register Array Variables</b> |      |                                                                                                                                                                                                                                                                                      |
| i,j,k,l,m,n                     |      | When these variables are used in a register name, an offset, or an address, they refer to the value of a register array where the register is part of a group of repeating registers. The register groups form a hierarchical structure and the array is represented with a formula. |
| y                               |      | When this variable is used in a register name, an offset, or an address it refers to the value of a register array.                                                                                                                                                                  |

### 11.6.2.1 GLBL\_EVENT\_STAT Register (Offset = 0h) [reset = 0h]

GLBL\_EVENT\_STAT is shown in [Figure 11-3](#) and described in [Table 11-5](#).

Return to the [Summary Table](#).

This register contains one bit for each of the bus comparator modules and the counter modules that are present in a device. Each bit directly reflects the state of the EVENT\_FIRED bit of the corresponding module. This facilitates software to just read one register and find out if any of the debug modules had fired.

**Figure 11-3. GLBL\_EVENT\_STAT Register**

### 11.6.2.2 GLBL\_HALT\_STAT Register (Offset = 2h) [reset = 0h]

GLBL\_HALT\_STAT is shown in [Figure 11-4](#) and described in [Table 11-6](#).

Return to the [Summary Table](#).

This register contains one bit for each of the bus comparator modules and the counter modules that are present in a device. Each bit directly reflects the state of the Completed status bit. This facilitates software to just read one register and find out if any of the debug modules have fired.
