

UC1845A-SP QML Class V, Radiation Hardened Current-Mode PWM Controller

1 Features

- QML Class V (QMLV) Qualified, SMD 5962-86704
- 5962P8670411Vxx: ⁽¹⁾
 - Radiation Hardness Assurance (RHA) up to 30 kRAD (Si) Total Ionizing Dose (TID)
 - Passes Functional and Specified Post-Radiation Parametric Limits at 45 kRAD at LDR (10 mRAD/s) per 1.5× over Test as Defined in MIL-STD-883 Test Method 1019.9 Paragraph 3.13.3.b
 - Exhibits Low Dose Rate Sensitivity ⁽²⁾ But Remains Within the Pre-Radiation Electrical Limits at 30 krad Total Dose Level, as Allowed by MIL-STD-883, TM1019
- Optimized for DC-to-DC Converter Applications
- Low Start-Up Current (<0.5 mA)
- Trimmed Oscillator Discharge Current
- Automatic Feed Forward Compensation
- Pulse-by-Pulse Current Limiting
- Enhanced Load Response Characteristics
- Undervoltage Lockout (UVLO) With Hysteresis
- Double-Pulse Suppression
- High-Current Totem-Pole Output
- Internally-Trimmed Bandgap Reference
- 500-kHz Operation
- Low R_O Error Amplifier
- Qualified over the Military Temperature Range (–55°C to 125°C)

- (1) Improved TID radiation performance only applies to RHA device type 11.
- (2) The affected parameter Reference Output Voltage, V_{REF} Radiation Drift Curve (see [V_{REF} Radiation Drift Curve](#)).

2 Applications

- Radiation-Hardened DC-DC Converters
- Satellite Buses and Payloads
- Space Launch Vehicles
- Undersea Cabling
- Supports Various Topologies:
 - Flyback, Forward, Buck, Boost
 - Push-Pull, Half-Bridge, Full Bridge With External Interface Circuit

3 Description

The UC1845A-SP control IC is a radiation hardened pin-for pin compatible version of the UC184x family. It is primarily suited for Satellites and other harsh environment applications. Providing the necessary features to control current-mode switched-mode power supplies, this device has the following improved features. Start up current is specified to be less than 0.5 mA. Oscillator discharge is trimmed to 8.3 mA. During UVLO, the output stage can sink at least 10 mA at less than 1.2 V for V_{CC} over 5 V.

The *Device Comparison Table* shows the difference between members of this family. Reference the individual product data sheets for ordering the radiation-improved version if available.

OUTPUT						

(1) Adjust V_{CC} above the start threshold before setting at 15 V.

(2) See [Mechanical, Packaging, and Orderable Information](#) for radiation improved devices.

(3) Parameters ensured by design and/or characterization, if not production tested.

(4) Temperature stability, sometimes referred to as average temperature coefficient, is described by the equation:
 $\text{Temperature Stability} = (V_{REF}(\text{max}) - V_{REF}(\text{min})) / (T_J(\text{max}) - T_J(\text{min}))$. $V_{REF}(\text{max})$ and $V_{REF}(\text{min})$ are the maximum and minimum reference voltage measured over the appropriate temperature range. Note that the extremes in voltage do not necessarily occur at the extremes in temperature.

(5) Parameter applies only for 5962-8670408VxA

(6) Output frequency is one-half oscillator frequency for UC1845A.

(7) This parameter is measured with $R_T = 10\text{ k}\Omega$ to V_{REF} . This contributes approximately 300 μA of current to the measurement. The total current flowing into the R_T or C_T pin will be approximately 300 μA higher than the measured value.

(8) Parameter measured at trip point of latch with $V_{FB} = 0\text{ V}$.

(9) Gain defined as: $G = \Delta V_{\text{Comp}} / \Delta V_{\text{ISENSE}}$; $V_{\text{ISENSE}} = 0\text{ to }0.8\text{ V}$.

Electrical Characteristics (continued)

 $V_{CC} = 15\text{ V}^{(1)}$, $R_T = 10\text{ k}\Omega$, $C_T = 3.3\text{ nF}$, $T_A = T_J = -55^\circ\text{C}$ to 125°C (unless otherwise noted) ⁽²⁾

9 Detailed Description

9.1 Overview

The UC1845A-SP control IC is a pin-for-pin compatible improved version of the UC184x family. Providing the necessary features to control current-mode switched-mode power supplies, this device has the following improved features. Startup current is specified to be less than 0.5 mA. Oscillator discharge is trimmed to 8.3 mA. During UVLO, the output stage can sink at least 10 mA at less than 1.2 V for V_{CC} over 5 V.

9.2 Functional Block Diagram

9.3 Feature Description

UC1845A is a current mode controller, used to support various topologies such as forward, flyback, Buck, Boost and using an external interface circuit will also support half-bridge, full bridge, and push-pull configurations.

Figure 2 shows the two-loop current-mode control system in a typical buck regulator application. A clock signal initiates power pulses at a fixed frequency. The termination of each pulse occurs when an analog of the inductor current reaches a threshold established by the error signal. In this way, the error signal actually controls peak inductor current. This contrasts with conventional schemes in which the error signal directly controls pulse width without regard to inductor current.

Several performance advantages result from the use of current-mode control. First, an input voltage feed-forward characteristic is achieved; that is, the control circuit instantaneously corrects for input voltage variations without using up any of the error amplifier's dynamic range. Therefore, line regulation is excellent and the error amplifier can be dedicated to correcting for load variations exclusively.

Feature Description (continued)

0019-1

Figure 2. Two-Loop Current-Mode Control System

For converters in which inductor current is continuous, controlling peak current is nearly equivalent to controlling average current. Therefore, when such converters employ current-mode control, the inductor can be treated as an error-voltage-controlled-current-source for the purposes of small-signal analysis (see [Figure 3](#)). The two-pole control-to-output frequency response of these converters is reduced to a single-pole (filter capacitor in parallel with load) response. One result is that the error amplifier compensation can be designed to yield a stable closed-loop converter response with greater gain bandwidth than would be possible with pulse-width control, giving the supply improved small-signal dynamic response to changing loads. A second result is that the error amplifier compensation circuit becomes simpler, as shown in [Figure 4](#). Capacitor C_i and resistor R_i , in [Figure 4\(A\)](#), add a low-frequency zero, which cancels one of the two control-to-output poles of non-current-mode converters. For large signal load changes, in which converter response is limited by inductor slew rate, the error amplifier saturates while the inductor is catching up with the load. During this time, C_i charges to an abnormal level. When the inductor current reaches its required level, the voltage on C_i causes a corresponding error in supply output voltage. The recovery time is $R_{iz}C_i$, which may be long. However, the compensation network of [Figure 4\(B\)](#) can be used where current-mode control has eliminated the inductor pole. Large-signal dynamic response is then greatly improved due to the absence of C_i .

Current limiting is greatly simplified with current-mode control. Pulse-by-pulse limiting is, of course, inherent in the control scheme. Furthermore, an upper limit on the peak current can be established by simply clamping the error voltage. Accurate current limiting allows optimization of magnetic and power semiconductor elements while ensuring reliable supply operation.

Finally, current-mode controlled power stages can be operated in parallel with equal current sharing. This opens the possibility of a modular approach to power supply design.

9.3.1 UVLO

The UVLO circuit ensures that V_{CC} is adequate to make the UC1845A fully operational before enabling the output stage. Figure 5 shows that the UVLO turn-on and turn-off thresholds are fixed internally at 8.5 V and 7.9 V, respectively. The 0.6-V hysteresis prevents V_{CC} oscillations during power sequencing. Figure 6 shows supply current requirements. Start-up current is <1 mA for efficient bootstrapping from the rectified input of an off-line converter, as shown in Figure 7. During normal circuit operation, V_{CC} is developed from auxiliary winding, W_{Aux} , with D_1 and C_{IN} . However, at start-up, C_{IN} must be charged to 16 V through R_{IN} . With a start-up current of 1 mA, R_{IN} can be as large as 100 k Ω and still charge C_{IN} when $V_{Ac} = 90$ -V RMS (low line). Power dissipation in R_{IN} would then be less than 350 mW even under high line ($V_{Ac} = 130$ -V RMS) conditions.

During UVLO, the output driver is in a low state. While it does not exhibit the same saturation characteristics as normal operation, it can easily sink 1 mA, enough to ensure the MOSFET is held off.

Feature Description (continued)

Figure 5. UVLO Turn-On Turn-Off Threshold

During UVLO, the output driver is biased to sink minor amounts of current.

Figure 6. Supply Current Requirements

0019-8

Figure 7. Providing Power to the UC1845A

Feature Description (continued)

9.3.2 Reference

As highlighted in the [Functional Block Diagram](#), UC1845A-SP incorporates a 5-V internal reference regulator with $\pm 2\%$ set point variation over temperature.

9.3.3 Totem-Pole Output

The UC1845A PWM has a single totem-pole output which can be operated to ± 1 -A peak for driving MOSFET gates, and a +200 mA average current for bipolar power U-100A transistors. Cross conduction between the output transistors is minimal, the average added power with $V_{IN} = 30$ V is only 80 mW at 200 kHz.

Limiting the peak current through the IC is accomplished by placing a resistor between the totem-pole output and the gate of the MOSFET. The value is determined by dividing the totem-pole collector voltage V_C by the peak current rating of the IC's totem-pole. Without this resistor, the peak current is limited only by the dV/dT rate of the totem-pole switching and the FET gate capacitance.

The use of a Schottky diode from the PWM output to ground prevents the output voltage from going excessively below ground, causing instabilities within the IC. To be effective, the diode selected should have a forward drop of less than 0.3 V at 200 mA. Most 1- to 3-A Schottky diodes exhibit these traits above room temperature. Placing the diode as physically close to the PWM as possible enhances circuit performance. Implementation of the complete drive scheme is shown in [Figure 8](#) through [Figure 10](#). Transformer-driven circuits also require the use of the Schottky diodes to prevent a similar set of circumstances from occurring on the PWM output. The ringing below ground is greatly enhanced by the transformer leakage inductance and parasitic capacitance, in addition to the magnetizing inductance and FET gate capacitance. Circuit implementation is similar to the previous example.

[Figure 8](#) through [Figure 10](#) show suggested circuits for driving MOSFETs and bipolar transistors with the UC1845A output. The simple circuit of [Figure 8](#) can be used when the control IC is not electrically isolated from the MOSFET turn-on and turn-off to ± 1 A. It also provides damping for a parasitic tank circuit formed by the FET input capacitance and series wiring inductance. Schottky diode, D_1 , prevents the output of the IC from going far below ground during turn-off.

[Figure 9](#) shows an isolated MOSFET drive circuit which is appropriate when the drive signal must be level shifted or transmitted across an isolation boundary. Bipolar transistors can be driven efficiently with the circuit of [Figure 10](#). Resistors R_1 and R_2 fix the on-state base current while capacitor C_1 provides a negative base current pulse to remove stored charge at turn-off.

Because the UC1845A series has only a single output, an interface circuit is needed to control push-pull half-bridge or full-bridge topologies. The UC1706 dual output driver with internal toggle flip-flop performs this function. [Typical Application](#) shows a typical application for these two ICs. Increased drive capability for driving numerous FETs in parallel, or other loads can be accomplished using one of the UC1705/6/7 driver ICs.

Figure 10. Bipolar Drive With Negative Turn-Off Bias

9.4 Device Functional Modes

The UC1845A uses fixed frequency, peak current mode control. An internal oscillator initiates the turn on of the driver to high-side power switch. The external power switch current is sensed through an external resistor and is compared via internal comparator. The voltage generated at the COMP pin is stepped down via internal resistors (as shown in the functional block diagram). When the sensed current reaches the stepped down COMP voltage, the high side power switch is turned off.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

UC1845A can be used as a controller to design various topologies such as buck, boost, flyback, and forward. Using an external interphase circuit can also support push-pull, half bridge and full bridge topologies.

10.2 Typical Application

Figure 11. Typical Application Schematic

10.2.2.1 Oscillator

The UC1845A oscillator is programmed as shown in [Figure 13](#). Timing capacitor C_T is charged from V_{REF} (5 V) through the timing resistor R_T , and discharged by an internal current source. The first step in selecting the oscillator components is to determine the required circuit dead time. Once obtained, [Figure 14](#) is used to pinpoint the nearest standard value of C_T for a given dead time. Next, the appropriate R_T value is interpolated using the parameters for C_T and oscillator frequency. [Figure 15](#) shows the R_T/C_T combinations versus oscillator frequency. The timing resistor can be calculated from the following formula.

$$f_{osc} \text{ (kHz)} = \frac{1.72}{R_T \text{ (k}\Omega) \times C_T \text{ (pF)}} \quad (1)$$

Figure 12. E/A Compensation Circuit for Continuous Boost and Flyback Topologies

The UC1845A has an internal divide-by-two flip-flop driven by the oscillator for a 50% maximum duty cycle. Therefore, their oscillators must be set to run at twice the desired power supply switching frequency.

Figure 13. Oscillator Programming

Figure 14. Deadtime vs C_T ($R_T > 5 \text{ k}\Omega$)

Figure 15. Timing Resistance vs Frequency

10.2.2.2 Current Sensing and Limiting

The UC1845A current sense input is configured as shown in [Figure 16](#). Current-to-voltage conversion is done externally with ground-referenced resistor R_S . Under normal operation, the peak voltage across R_S is controlled by the E/A according to the following relation:

$$I_P = \frac{V_C - 1.4 \text{ V}}{3 R_S}$$

where

- V_C = Control voltage = E/A output voltage (2)

R_S can be connected to the power circuit directly or through a current transformer, as [Figure 16](#) shows. While a direct connection is simpler, a transformer can reduce power dissipation in R_S , reduce errors caused by the base current, and provide level shifting to eliminate the restraint of ground-referenced sensing. The relation between V_C and peak current in the power stage is given by:

$$I_{(pk)} = N \left(\frac{V_{R_S(pk)}}{R_S} \right) = \frac{N}{3 R_S} (V_C - 1.4 \text{ V})$$

where

- N = Current sense transformer turns ratio = 1 when transformer not used. (3)

For purposes of small-signal analysis, the control-to-sensed-current gain is:

$$\frac{I_{(pk)}}{V_C} = \frac{N}{3 R_S} \quad (4)$$

When sensing current in series with the power transistor, as shown in [Figure 16](#), the current waveform often has a large spike at its leading edge. This spike is due to rectifier recovery and/or inter-winding capacitance in the power transformer. If unattenuated, this transient can prematurely terminate the output pulse. As shown, a simple RC filter is usually adequate to suppress this spike. The RC time constant should be approximately equal to the current spike duration (usually a few hundred nanoseconds).

The inverting input to the UC1845A current-sense comparator is internally clamped to 1 V ([Figure 16](#)). Current limiting occurs if the voltage at pin 3 reaches this threshold value, that is, the current limit is defined by:

$$I_{max} = \frac{N \times 1 \text{ V}}{R_S} \quad (5)$$

0019-13

Figure 16. Transformer-Coupled Current Sensing

10.2.2.3 Error Amplifier

The error amplifier (E/A) configuration is shown in Figure 17. The non-inverting input is not brought out to a pin, but is internally biased to 5 V $\pm 2\%$. The E/A output is available at pin 1 for external compensation, allowing the user to control the converter's closed-loop frequency response.

Figure 18 shows an E/A compensation circuit suitable for stabilizing any current-mode controlled topology except for flyback and boost converters operating with inductor current. The feedback components add a pole to the loop transfer function at $f_p = \frac{1}{2} \pi R_F$. R_F and C_F are chosen so that this pole cancels the zero of the output filter capacitor ESR in the power circuit. R_I and R_F fix the low-frequency gain. They are chosen to provide as much gain as possible while still allowing the pole formed by the output filter capacitor and load to roll off the loop gain to unity (0 dB) at $f \approx f_{\text{SWITCHING}} / 4$. This technique ensures converter stability while providing good dynamic response.

Figure 17. E/A Configuration

0019–15

Figure 18. Compensation

The E/A output sources 0.5 mA and sinks 2 mA. A lower limit for RF is given by:

$$R_{F(MIN)} \approx \frac{V_{EA OUT (MAX)} - 2.5 V}{0.5 \text{ mA}} = \frac{6 V - 2.5 V}{0.5 \text{ mA}} = 7 \text{ k}\Omega \quad (6)$$

E/A input bias current (2-μA max) flows through Ri, resulting in a DC error in output voltage (VO) given by:

$$\Delta V_{O(MAX)} = (2 \text{ }\mu\text{A}) R_i \quad (7)$$

Therefore, the designer should keep the value of Ri, as low as possible.

Figure 19 shows the open-loop frequency response of the UC1845A E/A. The gain represents an upper limit on the gain of the compensated E/A. Phase lag increases rapidly as frequency exceeds 1 MHz due to second-order poles at about 10 MHz and above.

Continuous-inductor-current boost and flyback converters each have a right-half-plane zero in their transfer function. An additional compensation pole is needed to roll off loop gain at a frequency less than that of the RHP zero. Rp and Cp in the circuit of Figure 12 provide this pole.

Figure 22. Oscillation Schematic

11 Power Supply Recommendations

The devices are designed to operate from an input voltage supply range between 8 and 40 V. This input supply should be well regulated. If the input supply is located more than a few inches from the UC1845A converter, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. A tantalum capacitor with a value of 47 μF is a typical choice; however, this may vary depending upon the output power being delivered.

Power supply specifications:

1. Input voltage: 95 VAC to 130 VAC (50 Hz/60 Hz)
2. Line isolation: 3750 V
3. Switching frequency: 40 kHz
4. Efficiency full load: 70%
5. Output voltage:
 - (a) +5 V, $\pm 5\%$; 1- to 4-A load, Ripple voltage: 50 mVP-P Max
 - (b) +12 V, $\pm 3\%$; 0.1- to 0.3-A load, Ripple voltage: 100 mVP-P Max
 - (c) -12 V, $\pm 3\%$; 0.1- to 0.3-A load, Ripple voltage: 100 mVP-P Max

Figure 23. Offline Flyback Regulator

12 Layout

12.1 Layout Guidelines

Always try to use a low-EMI inductor with a ferrite-type closed core. Some examples would be toroid and encased E core inductors. Open core can be used if they have low-EMI characteristics and are located a bit more away from the low-power traces and components. Make the poles perpendicular to the PCB as well if using an open core. Stick cores usually emit the most unwanted noise.

12.1.1 Feedback Traces

Try to run the feedback trace as far as possible from the inductor and noisy power traces. The designer should also make the feedback trace as direct as possible and somewhat thick. These two guidelines sometimes involve a trade-off, but keeping the trace away from inductor EMI and other noise sources is the more critical guideline. Run the feedback trace on the side of the PCB opposite of the inductor with a ground plane separating the two.

Layout Guidelines (continued)

12.1.2 Input/Output Capacitors

When using a low-value ceramic input filter capacitor, locate it as close as possible to the VIN pin of the IC. This eliminates as much trace inductance effects as possible and gives the internal IC rail a cleaner voltage supply. Some designs require the use of a feed-forward capacitor connected from the output to the feedback pin as well, usually for stability reasons. In this case, it should also be positioned as close as possible to the IC. Using surface mount capacitors also reduces lead length and lessens the chance of noise coupling into the effective antenna created by through-hole components.

12.1.3 Compensation Components

External compensation components for stability should also be placed close to the IC. TI recommends to also use surface mount components for the same reasons discussed for the filter capacitors. These should not be located very close to the inductor either.

12.1.4 Traces and Ground Planes

Make all of the power (high-current) traces as short, direct, and thick as possible. It is good practice on a standard PCB to make the traces an absolute minimum of 15 mils (0.381 mm) per ampere. The inductor, output capacitors, and output diode should be as close as possible to each other. This helps reduce the EMI radiated by the power traces due to the high switching currents through them. This also reduces lead inductance and resistance, which in turn reduces noise spikes, ringing, and resistive losses that produce voltage errors. The grounds of the IC, input capacitors, output capacitors, and output diode (if applicable) should be connected close together directly to a ground plane. It would also be a good idea to have a ground plane on both sides of the PCB. This reduces noise by reducing ground loop errors and absorbing more of the EMI radiated by the inductor.

For multi-layer boards with more than two layers, a ground plane can be used to separate the power plane (where the power traces and components are) and the signal plane (where the feedback and compensation and components are) for improved performance. On multi-layer boards, vias are required to connect traces and different planes. It is a good practice to use one standard via per 200 mA of current if the trace needs to conduct a significant amount of current from one plane to the other. Arrange the components so that the switching current loops curl in the same direction. Due to the way switching regulators operate, there are two power states: one state when the switch is on and one when the switch is off. During each state there is a current loop made by the power components that are currently conducting. Place the power components so that during each of the two states the current loop is conducting in the same direction. This prevents magnetic field reversal caused by the traces between the two half-cycles and reduces radiated EMI.

12.2 Layout Example

High peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin 5 in a single point ground. The transistor and 5k potentiometer are used to sample the oscillator waveform and apply an adjustable ramp to pin 3.

13 Device and Documentation Support

13.1 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

13.2 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

13.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

13.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
