DSA400

Configurable Four Output, Low Jitter Clock Generator for Automotive

Features

- AEC-Q100 Automotive Qualified
- Low RMS Phase Jitter: <1 ps (typ.)
- Complies with PCIe Gen1/2/3/4 Common Clock Spec
- High Stability: ±25 ppm, ±50 ppm
- Wide Temperature Range:
  - Automotive Grade 2: –40°C to +105°C
  - Automotive Grade 3: –40°C to +85°C
- High Supply Noise Rejection: –50 dBc
- Four Format-Configurable Outputs:
  - LVPECL, LVDS, HCSL, LVCMOS
- Available Pin-Selectable Frequency Table
  - 1 Pin per Bank for 2 Frequency Sets
- Wide Frequency Range:
  - 2.3 MHz – 460 MHz
- 20-Pin QFN Footprint (5.0 mm x 3.2 mm)
- Excellent Shock and Vibration Immunity
- High Reliability
  - 20x better MTF than quartz-based devices
- Wide Supply Range of 2.25V to 3.6V
- Lead Free and RoHS-Compliant

Applications

- Automotive Infotainment
- Automotive ADAS
- Autonomous Driving
- In-Vehicle Network

General Description

The DSA400 is a four output clock generator. It utilizes proven PureSilicon™ MEMS technology to provide excellent jitter and stability while incorporating additional device functionality.

The nominal frequencies of the outputs can be identical or independently derived from common PLLs.

The four output DSA400 MEMS oscillators are excellent choices for use as clock references in automotive applications in which small size, low power consumption, and long-term reliability are paramount. The DSA400 is AEC-Q100 qualified.

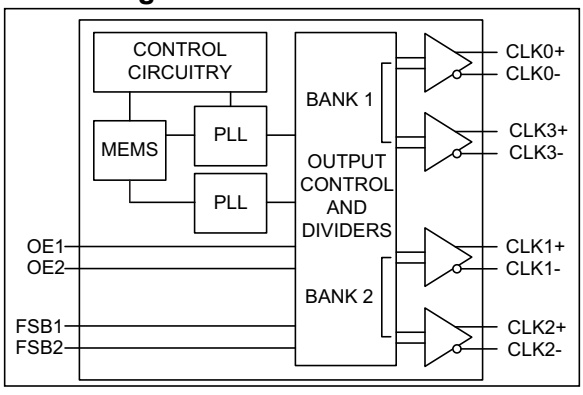

Each output may be configured independently to support a single-ended LVCMOS interface or a differential interface. Differential options include LVPECL, LVDS, or HCSL.

The DSA400 provides two independent select lines for choosing between two sets of pre-configured frequencies per bank. It also has two OE pins to allow for enabling and disabling outputs.

The DSA400 is packaged in a 20-pin QFN (5 mm x 3.2 mm) and is available in extended commercial and industrial temperature grades.

The DSA400 is a highly configurable device and is factory programmed to meet the customer's needs. Microchip's ClockWorks Configurator must be used to choose the necessary options, create the final part number, data sheet, and order samples.

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

Supply Voltage ..... –0.3V to +4.0V
Input Voltage ..... –0.3V to V_{DD}+0.3V
ESD Protection (HBM) ..... 4 kV
ESD Protection (MM) 400V
ESD Protection (CDM) ..... 1.5 kV

† Notice: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

TEMPERATURE SPECIFICATIONS (Note 1)

Parameters	Symbol	Min.	Typ.	Max.	Units	Conditions
Temperature Ranges						
Operating Temperature Range (T)	T_A	–40	—	+105	°C	Ordering Option L
	T_A	–40	—	+85	°C	Ordering Option I
Junction Temperature	T_J	—	—	+150	°C	—
Storage Temperature Range	T_S	–40	—	+150	°C	—
Soldering Temperature	—	—	—	+260	°C	40 sec. max.

Note 1: The maximum allowable power dissipation is a function of ambient temperature, the maximum allowable junction temperature, and the thermal resistance from junction to air (i.e., T_A, T_J, θ_{JA}). Exceeding the maximum allowable power dissipation will cause the device operating junction temperature to exceed the maximum +150°C rating. Sustained junction temperatures above +150°C can impact the device reliability.

3.0 OPERATIONAL DESCRIPTION

The DSA400 is a clock generator. Unlike older clock generators in the industry, it does not require an external crystal to operate; it relies on the integrated MEMS resonator that interfaces with internal PLLs. This technology enhances performance and reliability by allowing tighter frequency stability over a far wider temperature range. In addition, the higher resistance to shock and vibration decreases the aging rate to allow for much improved product life in the system.

3.1 Inputs

There are four input signals in the device. Each has an internal (40 kΩ) pull-up to default the selection to a high (1). Inputs can be controlled through hardware strapping method with a resistor to ground to assert the input low (0). Inputs may also be controlled by other components' GPIOs

In case more than one frequency set is desired, FSB1 and FSB2 are used to independently select one of two sets per bank. FSB1 selects the pre-configured set on Bank1 (CLK0 and CLK3) and FSB2 selects the pre-configured set on Bank2 (CLK1 and CLK2), as shown in Table 0-1 in the Product Identification System section.

If there is a requirement to disable outputs, the inputs OE1 and OE2 are used in conjunction to disable the banks of outputs. Outputs are disabled in tri-state (Hi-Z) mode. See Table 3-1 for more information.

TABLE 3-1: OUTPUT ENABLE SELECTION TABLE

OE1	OE2	Bank 1 (CLK0 & CLK3)	Bank 2 (CLK1 & CLK2)
0	0	Hi-Z	Hi-Z
0	1	Hi-Z	Running
1	0	Running	Hi-Z
1	1	Running	Running

3.2 Outputs

The four outputs are grouped into two banks. Each bank is supplied by an independent V_{DD} to allow for optimized noise isolation between the two banks. Each bank provides two synchronous outputs generated by a common PLL:

- Bank1 is composed of outputs CLK0 and CLK3.
- Bank2 is composed of outputs CLK1 and CLK2.

Each output may be pre-configured independently to be one of the following formats: LVCMOS, LVDS, LVPECL or HCSL. In case the output is configured to be single-ended LVCMOS, the frequency is generated on the true output (CLKx+) and the complement output (CLKx–) is shut off in a low state. Frequencies can be chosen from 2.3 MHz to 460 MHz for differential outputs and from 2.3 MHz to 170 MHz on LVCMOS outputs.

3.3 Power

V_{DD1} and V_{DD2} supply the power to banks 1 and 2 respectively. Each V_{DD} may have a different supply voltage from the other as long as it is within the 2.25V to 3.6V range. Each V_{DD} pin should have a 0.1 µF capacitor to filter high-frequency noise. V_{SS} is common to the entire device.

8.0 PACKAGING INFORMATION

8.1 Package Marking Information

20-Lead QFN*
(5.0 mm x 3.2 mm)

Example

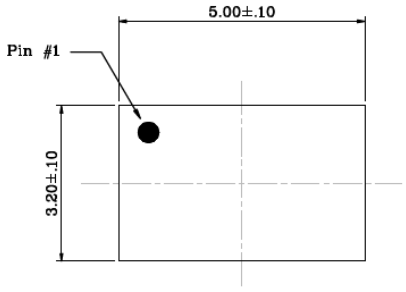

Legend:	XX...X	Product code or customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week ‘01’)
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC® designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package.
	●, ▲, ▼	Pin one index is identified by a dot, delta up, or delta down (triangle mark).
Note:	In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information. Package may or may not include the corporate logo.	
	Underbar (_) and/or Overbar (¯) symbol may not be to scale.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
