Switching characteristics include transceiver specifications, core, and periphery performance. This chapter also describes I/O timing, including programmable I/O element (IOE) delay and programmable output buffer delay.

For information regarding the densities and packages of devices in the Stratix IV family, refer to the *Stratix IV Device Family Overview* chapter.

Operating Conditions

When you use Stratix IV devices, they are rated according to a set of defined parameters. To maintain the highest possible performance and reliability of the Stratix IV devices, you must consider the operating requirements described in this chapter.

Stratix IV devices are offered in commercial, industrial, and military grades. Commercial devices are offered in –2 (fastest), –2×, –3, and –4 speed grades. Industrial devices are offered in –1, –2, –3, and –4 speed grades. Military devices are offered in –3 speed grade.

For the Stratix IV GT –1 and –2 speed grade specifications, refer to the –2/–2× speed grade column. For the Stratix IV GT –3 speed grade specification, refer to the –3 speed grade column, unless otherwise specified.

Absolute Maximum Ratings

Absolute maximum ratings define the maximum operating conditions for Stratix IV devices. The values are based on experiments conducted with the devices and theoretical modeling of breakdown and damage mechanisms. The functional operation of the device is not implied for these conditions.

Maximum Allowed Overshoot and Undershoot Voltage

During transitions, input signals may overshoot to the voltage shown in Table 1–4 and undershoot to –2.0 V for input currents less than 100 mA and periods shorter than 20 ns.

Table 1–4 lists the maximum allowed input overshoot voltage and the duration of the overshoot voltage as a percentage of device lifetime. The maximum allowed overshoot duration is specified as a percentage of high time over the lifetime of the device. A DC signal is equivalent to 100% duty cycle. For example, a signal that overshoots to 4.3 V can only be at 4.3 V for ~5% over the lifetime of the device; for a device lifetime of 10 years, this amounts to half of a year.

Temperature Overshoot Above Maximum Allowed Temperature

The maximum allowed operating temperature for Stratix IV industrial grade devices is 100 °C. It is recommended that the operating temperature of the device is maintained below 100 °C at all times. The temperature excursions over 100 °C due to internal heating of the device should not exceed the number of cycles as specified in the Table 1–5. Exceeding the recommended number of cycles may cause solder interconnect failures. Altera® recommends using the Stratix IV military grade devices if the application requires operating temperatures over 100 °C.

DC Characteristics

This section lists the supply current, I/O pin leakage current, bus hold, on-chip termination (OCT) tolerance, input pin capacitance, and hot socketing specifications.

Supply Current

Standby current is the current drawn from the respective power rails used for power budgeting. Use the Excel-based Early Power Estimator (EPE) to get supply current estimates for your design because these currents vary greatly with the resources you use.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter in the *Quartus II Handbook*.

OCT calibration is automatically performed at power-up for OCT-enabled I/Os. Table 1–13 lists OCT variation with temperature and voltage after power-up calibration. Use Table 1–13 to determine the OCT variation after power-up calibration and Equation 1–1 to determine the OCT variation without re-calibration.

Equation 1–1. OCT Variation Without Re-Calibration (1), (2), (3), (4), (5), (6)

$$R_{OCT} = R_{SCAL}\left(1 + \langle\frac{dR}{dT} \times \Delta T\rangle \pm \langle\frac{dR}{dV} \times \Delta V\rangle\right)$$

Notes to Equation 1–1:

(1) The R_{OCT} value calculated from Equation 1–1 shows the range of OCT resistance with the variation of temperature and V_{CCIO}.
(2) R_{SCAL} is the OCT resistance value at power-up.
(3) ΔT is the variation of temperature with respect to the temperature at power-up.
(4) ΔV is the variation of voltage with respect to the V_{CCIO} at power-up.
(5) dR/dT is the percentage change of R_{SCAL} with temperature.
(6) dR/dV is the percentage change of R_{SCAL} with voltage.

Table 1–13 lists the OCT variation after the power-up calibration.

Table 1–13. OCT Variation after Power-Up Calibration (1)

Hot Socketing

Table 1–15 lists the hot socketing specifications for Stratix IV devices.

Table 1–15. Hot Socketing Specifications for Stratix IV Devices

Symbol	Description	Maximum
$I_{IOPIN\ (DC)}$	DC current per I/O pin	300 µA
$I_{IOPIN\ (AC)}$	AC current per I/O pin	8 mA (1)
$I_{XCVR\text{-}TX\ (DC)}$	DC current per transceiver TX pin	100 mA
$I_{XCVR\text{-}RX\ (DC)}$	DC current per transceiver RX pin	50 mA

Note to Table 1–15:

(1) The I/O ramp rate is 10 ns or more. For ramp rates faster than 10 ns, $|I_{IOPIN}| = C\ dv/dt$, in which C is the I/O pin capacitance and dv/dt is the slew rate.

Internal Weak Pull-Up Resistor

Table 1–16 lists the weak pull-up resistor values for Stratix IV devices.

Table 1–16. Internal Weak Pull-Up Resistor for Stratix IV Devices (1), (3)

Symbol	Description	Conditions (V)	Value (4)	Unit
R_{PU}	Value of the I/O pin pull-up resistor before and during configuration, as well as user mode if the programmable pull-up resistor option is enabled.	V_{CCIO} = 3.0 ±5% (2)	25	kΩ
		V_{CCIO} = 2.5 ±5% (2)	25	kΩ
		V_{CCIO} = 1.8 ±5% (2)	25	kΩ
		V_{CCIO} = 1.5 ±5% (2)	25	kΩ
		V_{CCIO} = 1.2 ±5% (2)	25	kΩ

Notes to Table 1–16:

(1) All I/O pins have an option to enable weak pull-up except configuration, test, and JTAG pins.

(2) Pin pull-up resistance values may be lower if an external source drives the pin higher than V_{CCIO}.

(3) The internal weak pull-down feature is only available for the JTAG TCK pin. The typical value for this internal weak pull-down resistor is approximately 25 kΩ .

(4) These specifications are valid with ±10% tolerances to cover changes over PVT.

These tables also show the Stratix IV device family I/O standard specifications. V_{OL} and V_{OH} values are valid at the corresponding I_{OH} and I_{OL}, respectively.

(5) The receiver voltage input range for the data rate when $D_{MAX} > 700$ Mbps is $1.0\ V \leq V_{IN} \leq 1.6$ V.
The receiver voltage input range for the data rate when $D_{MAX} \leq 700$ Mbps is zero $V \leq V_{IN} \leq 1.85$ V.

(6) The receiver voltage input range for the data rate when $D_{MAX} > 700$ Mbps is $0.85\ V \leq V_{IN} \leq 1.75$ V.
The receiver voltage input range for the data rate when $D_{MAX} \leq 700$ Mbps is $0.45\ V \leq V_{IN} \leq 1.95$ V.

Power Consumption

Altera offers two ways to estimate power consumption for a design the Excel-based Early Power Estimator and the Quartus® II PowerPlay Power Analyzer feature.

You typically use the interactive Excel-based Early Power Estimator before designing the FPGA to get a magnitude estimate of the device power. The Quartus II PowerPlay Power Analyzer provides better quality estimates based on the specifics of the design after you complete place-and-route. The PowerPlay Power Analyzer can apply a combination of user-entered, simulation-derived, and estimated signal activities that, when combined with detailed circuit models, yields very accurate power estimates.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter in the *Quartus II Handbook*.

Switching Characteristics

This section provides performance characteristics of Stratix IV core and periphery blocks for commercial, industrial, and military grade devices.

The final numbers are based on actual silicon characterization and testing. The numbers reflect the actual performance of the device under worst-case silicon process, voltage, and junction temperature conditions. There are no designations on finalized tables.

Notes to Table 1–23:

(1) The –2× speed grade is the fastest speed grade offered in the following Stratix IV GX devices: EP4SGX70DF29, EP4SGX110DF29, EP4SGX110FF35, EP4SGX230DF29, EP4SGX110FF35, EP4SGX180DF29, EP4SGX230FF35, EP4SGX290FF35, EP4SGX180FF35, EP4SGX290FH29, EP4SGX360FF35, and EPSGX360FH29.

(2) Stratix IV GX devices in military speed grade only support selected transceiver configuration up to 3125 Mbps. For more information, contact Altera sales representative.

(3) To calculate the REFCLK rms phase jitter requirement at reference clock frequencies other than 100 MHz, use the following formula: REFCLK rms phase jitter at f (MHz) = REFCLK rms phase jitter at 100 MHz * 100/f.

(4) Differential LVPECL signal levels must comply to the minimum and maximum peak-to-peak differential input voltage specified in this table.

(5) The minimum `reconfig_clk` frequency is 2.5 MHz if the transceiver channel is configured in **Transmitter only** mode. The minimum `reconfig_clk` frequency is 37.5 MHz if the transceiver channel is configured in **Receiver only** or **Receiver and Transmitter** mode. For more information, refer to the *Dynamic Reconfiguration in Stratix IV Devices* chapter.

(6) The device cannot tolerate prolonged operation at this absolute maximum.

(7) You must use the 1.1-V RX V_{ICM} setting if the input serial data standard is LVDS.

(8) The rate matcher supports only up to ± 300 parts per million (ppm).

(9) Time taken to `rx_pll_locked` goes high from `rx_analogreset` de-assertion. Refer to Figure 1–2 on page 1–33.

(10) Time for which the CDR must be kept in lock-to-reference (LTR) mode after `rx_pll_locked` goes high and before `rx_locktodata` is asserted in manual mode. Refer to Figure 1–2 on page 1–33.

(11) Time taken to recover valid data after the `rx_locktodata` signal is asserted in manual mode. Refer to Figure 1–2 on page 1–33.

(12) Time taken to recover valid data after the `rx_freqlocked` signal goes high in automatic mode. Refer to Figure 1–3 on page 1–33.

(13) A GPLL may be required to meet the PMA-FPGA fabric interface timing above certain data rates. For more information, refer to the "Left/Right PLL Requirements in Basic (PMA Direct) Mode" section in the *Transceiver Clocking in Stratix IV Devices* chapter.

(14) The Quartus II software automatically selects the appropriate slew rate depending on the configured data rate or functional mode.

(15) For applications that require low transmit lane-to-lane skew, use Basic (PMA Direct) xN to achieve PMA-Only bonding across all channels in the link. You can bond all channels on one side of the device by configuring them in Basic (PMA Direct) xN mode. For more information about clocking requirements in this mode, refer to the "Basic (PMA Direct) Mode Clocking" section in the *Transceiver Clocking in Stratix IV Devices* chapter.

(16) The Quartus II software automatically selects the appropriate /L divider depending on the configured data.

(17) The maximum transceiver-FPGA fabric interface speed of 265.625 MHz is allowed only in Basic low-latency PCS mode with a 32-bit interface width. For more information, refer to the "Basic Double-Width Mode Configurations" section in the *Transceiver Architecture in Stratix IV Devices* chapter.

(18) Figure 1–1 shows the AC gain curves for each of the 16 available equalization settings.

(19) If your design uses more than one dynamic reconfiguration controller (`altgx_reconfig`) instances to control the transceiver (`altgx`) channels physically located on the same side of the device AND if you use different `reconfig_clk` sources for these `altgx_reconfig` instances, the delta time between any two of these `reconfig_clk` sources becoming stable must not exceed the maximum specification listed.

(20) The differential eye opening specification at the receiver input pins assumes that **Receiver Equalization** is disabled. If you enable **Receiver Equalization**, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level. Use H-Spice simulation to derive the minimum eye opening requirement with **Receiver Equalization** enabled.

(21) The rise and fall time transition is specified from 20% to 80%.

(22) Stratix IV GX devices in -4 speed grade support Basic mode and deterministic latency mode transceiver configurations up to 6375 Mbps. These configurations are shown in the figures 1-90, 1-92, 1-94, 1-96, and 1-101 in the *Transceiver Architecture in Stratix IV Devices* chapter.

Figure 1–1 shows the top-to-bottom AC gain curve for equalization settings 0 to 15.

Figure 1–1. AC Gain Curves for Equalization Settings 0 to 15 (Bottom to Top)

		Min	Typ	Max	Min	Typ	Max	Min	Typ	Max	
Digital reset pulse width	—	Minimum is two parallel clock cycles									—

Notes to Table 1–24:

(1) The minimum `reconfig_clk` frequency is 2.5 MHz if the transceiver channel is configured in **Transmitter Only** mode. The minimum `reconfig_clk` frequency is 37.5 MHz if the transceiver channel is configured in **Receiver only** or **Receiver and Transmitter** mode. For more information, refer to the *Dynamic Reconfiguration in Stratix IV Devices* chapter.

(2) To calculate the REFCLK rms phase jitter requirement at reference clock frequencies other than 100 MHz, use the following formula: REFCLK rms phase jitter at f (MHz) = REFCLK rms phase jitter at 100 MHz * 100/f.

(3) Differential LVPECL signal levels must comply to the minimum and maximum peak-to-peak differential input voltage specified in this table.

(4) The device cannot tolerate prolonged operation at this absolute maximum.

(5) You must use the 1.2-V RXV_{ICM} setting if the input serial data standard is LVDS.

(6) The differential eye opening specification at the receiver input pins assumes that **Receiver Equalization** is disabled. If you enable **Receiver Equalization**, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level. Use H-Spice simulation to derive the minimum eye opening requirement with **Receiver Equalization** enabled.

(7) The rate matcher supports only up to ± 300 ppm.

(8) Time taken to `rx_pll_locked` goes high from `rx_analogreset` de-assertion. Refer to Figure 1–2 on page 1–33.

(9) Time for which the CDR must be kept in lock-to-reference mode after `rx_pll_locked` goes high and before `rx_locktodata` is asserted in manual mode. Refer to Figure 1–2 on page 1–33.

(10) Time taken to recover valid data after the `rx_locktodata` signal is asserted in manual mode. Refer to Figure 1–2 on page 1–33.

(11) Time taken to recover valid data after the `rx_freqlocked` signal goes high in automatic mode. Refer to Figure 1–3 on page 1–33.

(12) A GPLL may be required to meet the PMA-FPGA fabric interface timing above certain data rates. For more information, refer to the "Left/Right PLL Requirements in Basic (PMA Direct) Mode" section in the *Transceiver Clocking in Stratix IV Devices* chapter.

(13) The Quartus II software automatically selects the appropriate slew rate depending on the configured data rate or functional mode.

(14) For applications that require low transmit lane-to-lane skew, use Basic (PMA Direct) xN to achieve PMA-Only bonding across all channels in the link. You can bond all channels on one side of the device by configuring them in Basic (PMA Direct) xN mode. For more information about clocking requirements in this mode, refer to the "Basic (PMA Direct) Mode Clocking" section in the *Transceiver Clocking in Stratix IV Devices* chapter.

(15) If your design uses more than one dynamic reconfiguration controller (`altgx_reconfig`) instances to control the transceiver (`altgx`) channels physically located on the same side of the device AND if you use different `reconfig_clk` sources for these `altgx_reconfig` instances, the delta time between any two of these `reconfig_clk` sources becoming stable must not exceed the maximum specification listed.

The levels listed in Table 1–29 are a representation of possible pre-emphasis levels under the specified conditions only and that the pre-emphasis levels may change with data pattern and data rate.

To predict the pre-emphasis level for your specific data rate and pattern, run simulations using the Stratix IV HSSI HSPICE models.

Notes to Table 1–34:

(1) This specification is limited in the Quartus II software by the I/O maximum frequency. The maximum I/O frequency is different for each I/O standard.

(2) The VCO frequency reported by the Quartus II software in the PLL summary section of the compilation report takes into consideration the VCO post-scale counter K value. Therefore, if the counter K has a value of 2, the frequency reported can be lower than the f_{VCO} specification.

(3) This specification is limited by the lower of the two: I/O F_{MAX} or F_{OUT} of the PLL.

(4) A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source that is less than 120 ps.

(5) F_{REF} is fIN/N when N = 1.

(6) Peak-to-peak jitter with a probability level of 10^{-12} (14 sigma, 99.99999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in Table 1–51 on page 1–62.

(7) The cascaded PLL specification is only applicable with the following condition:
A. Upstream PLL: 0.59Mhz ≤ Upstream PLL BW < 1 MHz
B. Downstream PLL: Downstream PLL BW > 2 MHz

(8) High bandwidth PLL settings are not supported in external feedback mode.

(9) External memory interface clock output jitter specifications use a different measurement method, which is available in Table 1–49 on page 1–61.

(2) This is only applicable to the Stratix IV E and GX devices.

(3) When you use the error detection CRC feature, there is no degradation in F_{MAX}.

Periphery Performance

This section describes periphery performance, including high-speed I/O and external memory interface.

I/O performance supports several system interfaces, such as the LVDS high-speed I/O interface, external memory interface, and the PCI/PCI-X bus interface. General-purpose I/O standards such as 3.3-, 2.5-, 1.8-, and 1.5-LVTTL/LVCMOS are capable of typical 167 MHz and 1.2 LVCMOS at 100 MHz interfacing frequency with 10 pF load.

For the Stratix IV GT –1 and –2 speed grade specifications, refer to the –2/–2× speed grade column. For the Stratix IV GT –3 speed grade specification, refer to the –3 speed grade column, unless otherwise specified.

Actual achievable frequency depends on design- and system-specific factors. You must perform HSPICE/IBIS simulations based on your specific design and system setup to determine the maximum achievable frequency in your system.

Notes to Table 1–42:

(1) When J = 3 to 10, use the serializer/deserializer (SERDES) block.

(2) When J = 1 or 2, bypass the SERDES block.

(3) Clock Boost Factor (W) is the ratio between input data rate to the input clock rate.

(4) The minimum specification depends on the clock source (for example, the PLL and clock pin) and the clock routing resource (global, regional, or local) that you use. The I/O differential buffer and input register do not have a minimum toggle rate.

(5) The maximum ideal frequency is the SERDES factor (J) x the PLL maximum output frequency (f_{OUT}) provided you can close the design timing and the signal integrity simulation is clean.

(6) You must calculate the leftover timing margin in the receiver by performing link timing closure analysis. You must consider the board skew margin, transmitter channel-to-channel skew, and receiver sampling margin to determine leftover timing margin.

(7) You can estimate the achievable maximum data rate for non-DPA mode by performing link timing closure analysis. You must consider the board skew margin, transmitter delay margin, and the receiver sampling margin to determine the maximum data rate supported.

(8) This is achieved by using the LVDS and DPA clock network.

(9) If the receiver with DPA enabled and transmitter are using shared PLLs, the minimum data rate is 150 Mbps.

(10) This only applies to DPA and soft-CDR modes.

(11) This only applies to LVDS source synchronous mode.

I/O Timing

Altera offers two ways to determine I/O timing—the Excel-based I/O Timing and the Quartus II Timing Analyzer.

Excel-based I/O Timing provides pin timing performance for each device density and speed grade. The data is typically used prior to designing the FPGA to get an estimate of the timing budget as part of the link timing analysis. The Quartus II Timing Analyzer provides a more accurate and precise I/O timing data based on the specifics of the design after you complete place-and-route.

The Excel-based I/O Timing spreadsheet is downloadable from the Literature: Stratix IV Devices webpage.

Letter	Subject	Definitions
S	**SW (sampling window)**	Timing Diagram—the period of time during which the data must be valid in order to capture it correctly. The setup and hold times determine the ideal strobe position within the sampling window, as shown: 
	Single-ended voltage referenced I/O standard	The JEDEC standard for SSTI and HSTL I/O defines both the AC and DC input signal values. The AC values indicate the voltage levels at which the receiver must meet its timing specifications. The DC values indicate the voltage levels at which the final logic state of the receiver is unambiguously defined. After the receiver input has crossed the AC value, the receiver changes to the new logic state. The new logic state is then maintained as long as the input stays beyond the AC threshold. This approach is intended to provide predictable receiver timing in the presence of input waveform ringing, as shown: *Single-Ended Voltage Referenced I/O Standard* 
T	t_C	High-speed receiver/transmitter input and output clock period.
	TCCS (channel-to-channel-skew)	The timing difference between the fastest and slowest output edges, including t_{CO} variation and clock skew, across channels driven by the same PLL. The clock is included in the TCCS measurement (refer to the *Timing Diagram* figure under **SW** in this table).
	t_{DUTY}	High-speed I/O block: Duty cycle on high-speed transmitter output clock.
		Timing Unit Interval (TUI) The timing budget allowed for skew, propagation delays, and data sampling window. (TUI = 1/(Receiver Input Clock Frequency Multiplication Factor) = t_C/w)
	t_{FALL}	Signal high-to-low transition time (80-20%)
	t_{INCCJ}	Cycle-to-cycle jitter tolerance on the PLL clock input
	t_{OUTPJ_IO}	Period jitter on the general purpose I/O driven by a PLL
	t_{OUTPJ_DC}	Period jitter on the dedicated clock output driven by a PLL
	t_{RISE}	Signal low-to-high transition time (20-80%)
