

LC87F1K64A

CMOS IC

8-bit Microcontroller with USB-host Controller

64K-byte Flash ROM / 8K-byte RAM / 48-pin

ON Semiconductor®

<http://onsemi.com>

Overview

The LC87F1K64A is an 8-bit microcontroller that, integrates on a single chip a number of hardware features such as 64K-byte flash ROM, 8192-byte RAM, an on-chip debugger, a sophisticated 16-bit timer/counter (may be divided into 8-bit timers), a 16-bit timer (may be divided into 8-bit timers or PWMs), four 8-bit timers with a prescaler, a base timer serving as a time-of-day clock, two channels of synchronous SIO interface with automatic data transfer capabilities, an asynchronous/synchronous SIO interface, a single-master I²C/synchronous SIO interface, a UART interface (full duplex), a full/low-speed USB interface (host control function) × 2 ports, a 12-bit 12-channel AD converter, two channels of 12-bit PWM, a system clock frequency divider, an infrared remote control receiver circuit, an internal reset circuit, and a 44-source 10-vector interrupt feature.

Features

■Flash ROM

- 65536×8 bits
- Capable of on-board programming with a wide range of supply voltage from 3.0 to 5.5V
- Block-erasable in 128-byte units
- Data written in 2-byte units

■RAM

- 8192×9 bits

■Package Form

- SQFP48 (7×7): Lead-/halogen-free product

■Bus Cycle Time

- 83.3ns (when CF=12MHz)

Note: The bus cycle time here refers to the ROM read speed.

■Minimum Instruction Cycle Time (tCYC)

- 250ns (when CF=12MHz)

SQFP48(7X7)

SQFP48(7X7)

ORDERING INFORMATION

See detailed ordering and shipping information on page 35 of this data sheet.

LC87F1K64A

■ Ports

- I/O ports
Ports whose input/output can be specified in 1-bit units: 34 (P00 to P07, P10 to P17, P20 to P25, P30 to P34, P70 to P73, PWM0, PWM1, XT2)
- USB ports 4 (UHAD+, UHAD-, UHBD+, UHBD-)
- Dedicated oscillator ports 2 (CF1, CF2)
- Input-only port (also used for the oscillator) 1 (XT1)
- Reset pin 1 ($\overline{\text{RES}}$)
- Power supply pins 6 (V_{SS1} to 3, V_{DD1} to 3)

■ Timers

- Timer 0: 16-bit timer/counter with 2 capture registers
 - Mode 0: 8-bit timer with an 8-bit programmable prescaler (with two 8-bit capture registers) \times 2 channels
 - Mode 1: 8-bit timer with an 8-bit programmable prescaler (with two 8-bit capture registers) + 8-bit counter (with two 8-bit capture registers)
 - Mode 2: 16-bit timer with an 8-bit programmable prescaler (with two 16-bit capture registers)
 - Mode 3: 16-bit counter (with two 16-bit capture registers)
- Timer 1: 16-bit timer/counter that supports PWM/toggle output
 - Mode 0: 8-bit timer with an 8-bit prescaler (with toggle output) + 8-bit timer/counter with an 8-bit prescaler (with toggle output)
 - Mode 1: 8-bit PWM with an 8-bit prescaler \times 2 channels
 - Mode 2: 16-bit timer/counter with an 8-bit prescaler (with toggle output) (Toggle output also possible from low-order 8 bits.)
 - Mode 3: 16-bit timer with an 8-bit prescaler (with toggle output) (Low-order 8 bits can be used as a PWM output.)
- Timer 4: 8-bit timer with a 6-bit prescaler
- Timer 5: 8-bit timer with a 6-bit prescaler
- Timer 6: 8-bit timer with a 6-bit prescaler (with toggle output)
- Timer 7: 8-bit timer with a 6-bit prescaler (with toggle output)
- Base timer
 - 1) The clock can be selected from among a subclock (32.768kHz crystal oscillator), low-speed RC oscillator clock, system clock, and timer 0 prescaler output.
 - 2) Interrupts programmable in 5 different time schemes.

■ Serial Interfaces

- SIO0: Synchronous serial interface
 - 1) LSB first/MSB first selectable
 - 2) Transfer clock cycle: 4/3 to 512/3 tCYC
 - 3) Continuous automatic data transmission (1 to 256 bits can be specified in 1-bit units) (Suspension and resumption of data transfer possible in 1-byte units)
- SIO1: 8-bit asynchronous/synchronous serial interface
 - Mode 0: Synchronous 8-bit serial I/O (2- or 3-wire configuration, 2 to 512 tCYC transfer clock)
 - Mode 1: Asynchronous serial I/O (half-duplex, 8 data bits, 1 stop bit, 8 to 2048 tCYC baudrate)
 - Mode 2: Bus mode 1 (start bit, 8 data bits, 2 to 512 tCYC transfer clock)
 - Mode 3: Bus mode 2 (start detection, 8 data bits, stop detection)
- SIO4: Synchronous serial interface
 - 1) LSB first/MSB first selectable
 - 2) Transfer clock cycle: 4/3 to 1020/3 tCYC
 - 3) Continuous automatic data transmission (1 to 8192 bytes can be specified in 1-byte units) (Suspension and resumption of data transmission possible in 1-byte units or in word units)
 - 4) Clock polarity can be selected.
 - 5) CRC16 calculator circuit built-in
- SMIIC0: Single-master I²C/8-bit synchronous SIO
 - Mode 0: Communication in single-master mode.
 - Mode 1: 8-bit synchronous serial I/O (data MSB first)

■ Full Duplex UART

- 1) Data length: 7/8/9 bits selectable
- 2) Stop bits: 1 bit (2 bits in continuous transmission mode)
- 3) Parity bits: None/even/odd selectable (for 8-bit data only)
- 4) Baudrate: 16/3 to 8192/3 tCYC

■ AD Converter: 12 bits × 12 channels

■ PWM: Variable frequency 12-bit PWM × 2 channels

■ Infrared Remote Control Receiver Circuit

- 1) Noise rejection function (noise filter time constant: Approx. 120μs when the 32.768kHz crystal oscillator is selected as the reference clock)
- 2) Supports data encoding systems such as PPM (Pulse Position Modulation) and Manchester encoding.
- 3) X'tal HOLD mode release function

■ USB Interface (host control function) × 2 ports

- 1) Supports full-speed (12Mbps) and low-speed (1.5Mbps) specifications.
- 2) Supports four transfer types (control transfer, bulk transfer, interrupt transfer, and isochronous transfer).

■ Audio Interface

- 1) Sampling frequencies (fs): 8kHz/11.025kHz/12kHz/16kHz/22.05kHz/24kHz/32kHz/44.1kHz/48kHz
- 2) Master clock: 256fs/384fs
- 3) Bit clock: 48fs/64fs
- 4) Data bit length: 16bits/18bits/20bits/24bits
- 5) LSB first/MSB first selectable.
- 6) Left justified/right justified/I2S format selectable

■ Watchdog Timer

- External RC time constant type
 - 1) Interrupt generation/reset generation selectable
 - 2) Operation in HALT/HOLD mode can be selected from “continue operation” and “suspend operation.”
- Internal timer type
 - 1) Capable of generating a internal reset signal on an overflow of the timer running on the low-speed RC oscillator clock, or subclock.
 - 2) Operation in HALT/HOLD mode can be selected from among “continue count operation,” “suspend operation,” and “retain the count value.”

■ Clock Output Function

- 1) Can output a clock with a clock rate of 1/1, 1/2, 1/4, 1/8, 1/16, 1/32, or 1/64 of the source oscillator clock selected as the system clock.
- 2) Can output the source oscillator clock for the subclock.

■ Interrupts

- 44 sources, 10 vectors
 - 1) Provides three levels (low (L), high (H), and highest (X)) of multiplex interrupt control. Any interrupt request of the level equal to or lower than the current interrupt level is not accepted.
 - 2) When interrupt requests to two or more vector addresses occur at the same time, the interrupt of the highest level takes precedence over the other interrupts. For interrupts of the same level, the interrupt into the lowest vector address is given priority.

No.	Vector	Level	Interrupt Source
1	00003H	X or L	INT0
2	0000BH	X or L	INT1
3	00013H	H or L	INT2/T0L/INT4/UHC-A bus active/UHC-B bus active/remote control receive
4	0001BH	H or L	INT3/INT5/base timer
5	00023H	H or L	T0H/INT6/UHC-A device connected, disconnected, resumed
6	0002BH	H or L	T1L/T1H/INT7/AIF start/SMIIC0/UHC-B device connected, disconnected, resumed
7	00033H	H or L	SIO0/UART1 reception completed
8	0003BH	H or L	SIO1/SIO4/UART1 buffer empty/UART1 transmission completed/AIF end
9	00043H	H or L	ADC/T6/T7/UHC-ACK/UHC-NAK/UHC error/UHC-STALL
10	0004BH	H or L	Port 0/PWM0/PWM1/T4/T5/UHC-SOF

- Priority levels $X > H > L$
- When interrupts of the same level occur at the same time, the interrupt with the lowest vector address is given priority.

■ Subroutine Stack Levels: Up to 4096 levels (The stack is allocated in RAM.)

■ High-speed Multiplication/Division Instructions

- 16 bits \times 8 bits (5 tCYC execution time)
- 24 bits \times 16 bits (12 tCYC execution time)
- 16 bits \div 8 bits (8 tCYC execution time)
- 24 bits \div 16 bits (12 tCYC execution time)

■ Oscillator Circuit and PLL

- Medium-speed RC oscillator circuit (internal): For system clock (approx. 1MHz)
- Low-speed RC oscillator circuit (internal): For system clock, timer, and watchdog timer (approx. 30kHz)
- CF oscillator circuit: For system clock
- Crystal oscillator circuit: For system clock and time-of-day clock
- PLL circuit (internal): For USB interface (see Fig. 5) and audio interface (see Fig. 6)

■ Internal Reset Functions

- Power-on reset (POR) function
 - 1) POR is activated at power-on.
 - 2) POR release voltage can be selected from 8 levels (1.67V, 1.97V, 2.07V, 2.37V, 2.57V, 2.87V, 3.86V, and 4.35V) by setting options.
- Low voltage detection reset (LVD) function
 - 1) LVD and POR functions are combined to generate resets when power is turned on and when power voltage falls below a threshold level.
 - 2) The use/disuse of the LVD function and the low voltage threshold level (7 levels: 1.91V, 2.01V, 2.31V, 2.51V, 2.81V, 3.79V, and 4.28V) can be selected by setting options.

LC87F1K64A

■ Standby Function

- HALT mode: Halts instruction execution while allowing the peripheral circuits to continue operation.
 - 1) Oscillators do not stop automatically.
 - 2) There are three ways of releasing HOLD mode.
 - (1) Setting the reset pin to a low level.
 - (2) Generating a reset signal by watchdog timer or low-voltage detection
 - (3) Occurrence of an interrupt
- HOLD mode: Suspends instruction execution and operation of the peripheral circuits.
 - 1) The PLL, CF, RC and crystal oscillators automatically stop operation.

Note: Low-speed RC oscillator is controlled directly by the watchdog timer and its oscillation in standby mode is also controlled.
 - 2) There are five ways of releasing HOLD mode.
 - (1) Setting the reset pin to a low level
 - (2) Generating a reset signal by the watchdog timer or low-voltage detection
 - (3) Establishing an interrupt source at one of INT0, INT1, INT2, INT4, and INT5 pins
* INT0 and INT1 HOLD mode release is available only when level detection is configured.
 - (4) Establishing an interrupt source at port 0
 - (5) Establishing an bus active interrupt source in the USB host control circuit
- X'tal HOLD mode: Suspends instruction execution and the operation of the peripheral circuits except the base timer and infrared remote control receiver circuit.
 - 1) The PLL, CF and RC oscillators automatically stop operation.

Note: Low-speed RC oscillator is controlled directly by the watchdog timer and its oscillation in standby mode is also controlled.

Note: The low-speed RC oscillator retains the state that is established on entry into X'tal HOLD mode if the base timer is running with the low-speed RC oscillator selected as the base timer input clock source.
 - 2) The state of crystal oscillator established when the X'tal HOLD mode is entered is retained.
 - 3) There are seven ways of releasing X'tal HOLD mode.
 - (1) Setting the reset pin to a low level
 - (2) Generating a reset signal by the watchdog timer or low-voltage detection
 - (3) Establishing an interrupt source at one of INT0, INT1, INT2, INT4, and INT5 pins
* INT0 and INT1 X'tal HOLD mode release is available only when level detection is configured.
 - (4) Establishing an interrupt source at port 0
 - (5) Establishing an interrupt source in the base timer circuit
 - (6) Establishing an interrupt source in the infrared remote control receiver circuit
 - (7) Establishing an bus active interrupt source in the USB host control circuit

■ Development Tools

- On-chip debugger: TCB87–Type B + LC87F1K64A or
TCB87–Type C (3-wire communication cable) + LC87F1K64A

On-chip Debugger Pin Treatment

For the treatment of the on-chip debugger pins, refer to the separately available documents entitled "RD87 On-chip Debugger Installation Manual."

Recommended Unused Pin Treatment

Pin Name	Recommended Unused Pin Treatment	
	Board	Software
P00 to P03, P05 to P07	Open	Set output low.
P04	Pull-down with a 100kΩ resistor.	-
P10 to P17	Open	Set output low.
P20 to P25	Open	Set output low.
P30 to P34	Open	Set output low.
P70 to P73	Open	Set output low.
PWM0, PWM1	Open	Set output low.
UHAD+, UHAD-	Open	Set output low.
UHBD+, UHBD-	Open	Set output low.
XT1	Pull-down with a resistor of 100kΩ or lower.	-
XT2	Open	Set output low.

Note: Since P34 is multiplexed with UFILT, it must be configured for input when the USB function is to be used.

Since P33 is multiplexed with AFILT, it must be configured for input when the audio interface PLL circuit is to be used.

Port Output Types

The table below lists the type of port output and the presence/absence of a pull-up resistor.

Data can be read into any input port even if it is in output mode.

Port Name	Option Selected in Units of	Option Type	Output Type	Pull-up Resistor
P00 to P07	1 bit	1	CMOS	Programmable
P10 to P17 P20 to P25 P30 to P34		2	N-channel open drain	Programmable
P70	-	No	N-channel open drain	Programmable
P71 to P73	-	No	CMOS	Programmable
PWM0, PWM1	-	No	CMOS	No
UHAD+, UHAD- UHBD+, UHBD-	-	No	CMOS	No
XT1	-	No	Input only	No
XT2	-	No	32.768kHz crystal resonator output (N-channel open drain when in general-purpose output mode)	No

LC87F1K64A

User Option Table

Option Name	Option to be Applied on	Flash-ROM Version	Option Selected in Units of	Option Selection
Port output type	P00 to P07	○	1 bit	CMOS
				N-channel open drain
	P10 to P17	○	1 bit	CMOS
				N-channel open drain
	P20 to P25	○	1 bit	CMOS
				N-channel open drain
	P30 to P34	○	1 bit	CMOS

Power-on reset function	Power-on reset level	○	-	8 levels

LC87F1K64A

USB Reference Power Option

When a voltage 4.5 to 5.5V is supplied to V_{DD1} and the internal USB reference voltage circuit is activated, the reference voltage for USB port output is generated. The active/inactive state of the reference voltage circuit can be switched by selecting an option. The procedure for making the option selection is described below.

Option settings		(1)	(2)	(3)	(4)
	USB regulator	Use	Use	Use	Non-use
	USB regulator at HOLD mode	Use	Non-use	Non-use	Non-use
USB regulator at HALT mode	Use	Non-use	Use	Non-use	
Reference voltage circuit state	Normal mode	Active	Active	Active	Inactive
	HOLD mode	Active	Inactive	Inactive	Inactive
	HALT mode	Active	Inactive	Active	Inactive

- When the USB reference voltage circuit is made inactive, the level of the reference voltage for the USB port output is equal to V_{DD1}.
- Selection (2) or (3) can be used to set the reference voltage circuit inactive in HOLD or HALT mode.
- When the reference voltage circuit is activated, the current drain increases by approximately 100μA compared with when the reference voltage circuit is inactive.

Example 1: V_{DD1}=V_{DD2}=3.3V

- Inactivating the reference voltage circuit (selection (4)).
- Connecting V_{DD3} to V_{DD1} and V_{DD2}.

Example 2: V_{DD1}=V_{DD2}=5.0V

- Activating the reference voltage circuit (selection (1)).
- Isolating V_{DD3} from V_{DD1} and V_{DD2}, and connecting capacitor between V_{DD3} and V_{SS}.

(Note: Do not apply the voltage of more than 3.6V to UHAD+, UHAD-, UHBD+ and UHBD- when the reference voltage circuit is active.)

LC87F1K64A

Absolute Maximum Ratings at Ta = 25°C, VSS1 = VSS2 = VSS3 = 0V

Parameter	Symbol	Pin/Remarks	Conditions	Specification				unit
				VDD[V]	min	typ	max

	Output	tSU; DATx				Must be specified as the time up to the beginning of output state change.	1tSCL-1.5T _{filt}				

Note 4-5-1: These specifications are theoretical values. Margins must be allowed according to the actual operating conditions.

Note 4-5-2: The value of T_{filt} is determined by bits 7 and 6 (BRP1 and BRP0) of the SMIC0BRG register and the system clock frequency.

BRP1	BRP0	T _{filt}
0	0	(1/3) tCYC×1
0	1	(1/3) tCYC×2
1	0	(1/3) tCYC×3
1	1	(1/3) tCYC×4

Set the value of the BRP1 and BRP0 bits so that the value of T_{filt} falls within the following value range:
250ns ≥ T_{filt} > 140ns

Note 4-5-3: For standard clock mode operation, set up the SMIC0BRG register so that the following conditions are satisfied:

- 250ns ≥ T_{filt} > 140ns
- BRDQ (bit5) = 1
- SCL frequency value ≤ 100kHz

For high-speed clock mode operation, set up the SMIC0BRG register so that the following conditions are satisfied:

- 250ns ≥ T_{filt} > 140ns
- BRDQ (bit5) = 1
- SCL frequency value ≤ 400kHz

LC87F1K64A

Pulse Input Conditions at Ta = -40°C to +85°C, VSS1 = VSS2 = VSS3 = 0V

Parameter	Symbol	Pin/Remarks	Conditions	Specification				
				VDD[V]	min	typ	max	unit
High/low level pulse width	tPIH(1) tPIL(1)	INT0(P70), INT1(P71), INT2(P72), INT4(P20 to P23), INT5(P24 to P25), INT6(P20), INT7(P24)	<ul style="list-style-type: none"> Interrupt source flag can be set. Event inputs for timer 0/1 are enabled. 	2.7 to 5.5	1			tCYC
	tPIH(2) tPIL(2)	INT3(P73) when noisefilter time constant is 1/1.	<ul style="list-style-type: none"> Interrupt source flag can be set. Event inputs for timer 0 are enabled. 	2.7 to 5.5	2			
	tPIH(3) tPIL(3)	INT3(P73) when noisefilter time constant is 1/32.	<ul style="list-style-type: none"> Interrupt source flag can be set. Event inputs for timer 0 are enabled. 	2.7 to 5.5	64			
	tPIH(4) tPIL(4)	INT3(P73) when noisefilter time constant is 1/128.	<ul style="list-style-type: none"> Interrupt source flag can be set. Event inputs for timer 0 are enabled. 	2.7 to 5.5	256			
	tPIL(5)	RMIN(P73)	Recognized as a signal by infrared remote control receiver circuit	2.7 to 5.5	4			RMCK (Note 5-1)
	tPIL(6)	$\overline{\text{RES}}$	Resetting is enabled.	2.7 to 5.5	200			μs

Note 5-1: Denotes the reference frequency of the infrared remote control receiver circuit (1tCYC to 128tCYC or source oscillation frequency of the subclock)

LC87F1K64A

AD Converter Characteristics at Ta = -40°C to +85°C, VSS1 = VSS2 = VSS3 = 0V

<12-bit AD Converter Mode>

Parameter	Symbol	Pin/Remarks	Conditions	Specification				
				V _{DD} [V]	min	typ	max	unit
Resolution	N	AN0(P00) to AN7(P07) AN8(P70) AN9(P71) AN10(XT1) AN11(XT2)		3.0 to 5.5		12		bit
Absolute accuracy	ET		(Note 6-1)	3.0 to 5.5			±16	LSB
Conversion time	TCAD		See conversion time calculation formulas. (Note 6-2)	4.0 to 5.5	32		115	μs
				3.0 to 5.5	64		115	
Analog input voltage range	VAIN			3.0 to 5.5	V _{SS}		V _{DD}	V
Analog port input current	I _{AINH}	VAIN=V _{DD}	3.0 to 5.5			1	μA	
	I _{AINL}	VAIN=V _{SS}	3.0 to 5.5	-1				

<8-bit AD Converter Mode>

Parameter	Symbol	Pin/Remarks	Conditions	Specification				
				V _{DD} [V]	min	typ	max	unit
Resolution	N	AN0(P00) to AN7(P07) AN8(P70) AN9(P71) AN10(XT1) AN11(XT2)		3.0 to 5.5		8		bit
Absolute accuracy	ET		(Note 6-1)	3.0 to 5.5			±1.5	LSB
Conversion time	TCAD		See conversion time calculation formulas. (Note 6-2)	4.0 to 5.5	20		90	μs
				3.0 to 5.5	40		90	
Analog input voltage range	VAIN			3.0 to 5.5	V _{SS}		V _{DD}	V
A Analog port input current	I _{AINH}	VAIN=V _{DD}	3.0 to 5.5			1	μA	
	I _{AINL}	VAIN=V _{SS}	3.0 to 5.5	-1				

Conversion time calculation formulas :

12-bits AD Converter Mode : TCAD (Conversion time) = ((52/(AD division ratio))+2) × (1/3) × tCYC

8-bits AD Converter Mode : TCAD (Conversion time) = ((32/(AD division ratio))+2) × (1/3) × tCYC

<Recommended Operating Conditions>

External Oscillator FmCF[MHz]	Supply Voltage Range V _{DD} [V]	System Clock Division (SYSDIV)	Cycle Time tCYC [ns]	AD Frequency Division Ratio (ADDIV)	Conversion Time (TCAD)[μs]	
					12-bit AD	8-bit AD
12	4.0 to 5.5	1/1	250	1/8	34.8	21.5
	3.0 to 5.5	1/1	250	1/16	69.5	42.8

Note 6-1: The quantization error (±1/2LSB) must be excluded from the absolute accuracy. The absolute accuracy must be measured in the microcontroller's state in which no I/O operations occur at the pins adjacent to the analog input channel.

Note 6-2: The conversion time refers to the period from the time an instruction for starting a conversion process until the time the conversion result register is loaded with a complete digital conversion value corresponding to the analog input value.

The conversion time is doubled in the following cases:

- The AD conversion is carried out in the 12-bit AD conversion mode for the first time after a system reset.
- The AD conversion is carried out for the first time after the AD conversion mode is switched from 8-bit to 12-bit AD conversion mode.

LC87F1K64A

Power-on Reset (POR) Characteristics at Ta = -40°C to +85°C, VSS1 = VSS2 = VSS3 = 0V

Parameter	Symbol	Conditions	Option selected voltage	Specification			unit
				min	typ	max	
POR release voltage	PORRL	Select from option (Note 7-1)	1.67V	1.55	1.67	1.79	V
			1.97V	1.85	1.97	2.09	
			2.07V	1.95	2.07	2.19	
			2.37V	2.25	2.37	2.49	
			2.57V	2.45	2.57	2.69	
			2.87V	2.75	2.87	2.99	
			3.86V	3.73	3.86	3.99	
			4.35V	4.21	4.35	4.49	
Detection voltage unknown state	POUKS	See Fig. 13 (Note 7-2)			0.7	0.95	
Power supply rise time	PORIS	Power supply rise time from VDD=0V to 1.6V				100	ms

Note 7-1: The POR release level can be selected out of 8 levels only when LDV reset function is disabled.

Note 7-2: POR is in unknown state before transistors start operation.

Low Voltage Detection (LVD) Characteristics at Ta = -40°C to +85°C, VSS1 = VSS2 = VSS3 = 0V

Parameter	Symbol	Conditions	Option selected voltage	Specification			unit
				min	typ	max	
LVD reset voltage (Note 8-2)	LVDET	Select from option. See Fig. 14. (Note 8-1) (Note 8-3)	1.91V	1.81	1.91	2.01	V
			2.01V	1.91	2.01	2.11	
			2.31V	2.21	2.31	2.41	
			2.51V	2.41	2.51	2.61	
			2.81V	2.71	2.81	2.91	
			3.79V	3.69	3.79	3.89	
			4.28V	4.18	4.28	4.38	
LVD hysteresis width	LVHYS		1.91V		55		mV
			2.01V		55		
			2.31V		55		
			2.51V		55		
			2.81V		55		
			3.79V		60		
			4.28V		65		
Detection voltage unknown state	LVUKS	See Fig. 14. (Note 8-4)			0.7	0.95	V
Low voltage detection minimum width (Reply sensitivity)	TLVDW	LVDET-0.5V See Fig. 15.		0.2			ms

Note 8-1: The LVD reset level can be selected out of 7 levels only when the LVD reset function is enabled.

Note 8-2: LVD reset voltage specification values do not include hysteresis voltage.

Note 8-3: LVD reset voltage may exceed its specification values when port output state changes and/or when a large current flows through port.

Note 8-4: LVD is in an unknown state before transistors start operation.

Main System Clock Oscillation

The characteristics of a sample main system clock oscillator circuit shown in Table 1 are measured using a Our specification oscillation characteristics evaluation board and external components with circuit constant values with which the resonator vendor confirmed normal and stable oscillation.

Table 1 shows the characteristics of a oscillator circuit when USB host function is not used. If USB host function is to be used, it is absolutely recommended to use a resonator that satisfies the precision and stability according to the USB standards ($\pm 500\text{ppm}$)

Table 1 Characteristics of a Sample Main System Clock Oscillator Circuit with a Ceramic Resonator

Nominal Frequency	Vendor Name	Resonator Name	Circuit Constant			Operating Voltage Range [V]	Oscillation Stabilization Time		Remarks
			C1 [pF]	C2 [pF]	Rd1 [Ω]		typ [ms]	max [ms]	
12MHz	MURATA	CSTCE12M0GH5L**-R0	(33)	(33)	470	3.0 to 5.5	0.1	0.5	C1 and C2 integrated SMD type

The oscillation stabilization time is required for the oscillator to get stabilized in the following cases (see Figure 4):

- Until oscillation is stabilized after V_{DD} goes above the operating voltage lower limit
- Until oscillation is stabilized after the instruction for starting the main clock oscillator circuit is executed
- Until oscillation is stabilized after HOLD mode is released.
- Until oscillation is stabilized after X'tal HOLD mode is released with CFSTOP (OCR register, bit 0) set to 0 and oscillation is started.

Subsystem Clock Oscillation

Table 2 shows the characteristics of a sample subsystem clock oscillator circuit that are measured using a Our specification oscillation characteristics evaluation board and external components with circuit constant values with which the resonator vendor confirmed normal and stable oscillation.

Table 2 Characteristics of a Sample Subsystem Clock Oscillator Circuit with a Crystal Resonator

Nominal Frequency	Vendor Name	Resonator Name	Circuit Constant				Operating Voltage Range [V]	Oscillation Stabilization Time		Remarks
			C3 [pF]	C4 [pF]	Rf [Ω]	Rd2 [Ω]		typ [s]	max [s]	
32.768kHz	EPSON TOYOCOM	MC-306	18	18	Open	680k	2.7 to 5.5	1.1	3.0	Applicable CL value=12.5pF SMD type

The oscillation stabilization time is required for the oscillator to get stabilized in the following cases (see Figure 4):

- Until oscillation is stabilized after the instruction for starting the subclock oscillator circuit is executed
- Until oscillation is stabilized after HOLD mode is released with EXTOSC (OCR register, bit 6) set to 1 and oscillation is started.

Note: The components that are involved in oscillation should be placed as close to the IC and to one another as possible because they are vulnerable to the influences of the circuit pattern.

Figure 1 CF Oscillator Circuit

Figure 2 Crystal Oscillator Circuit

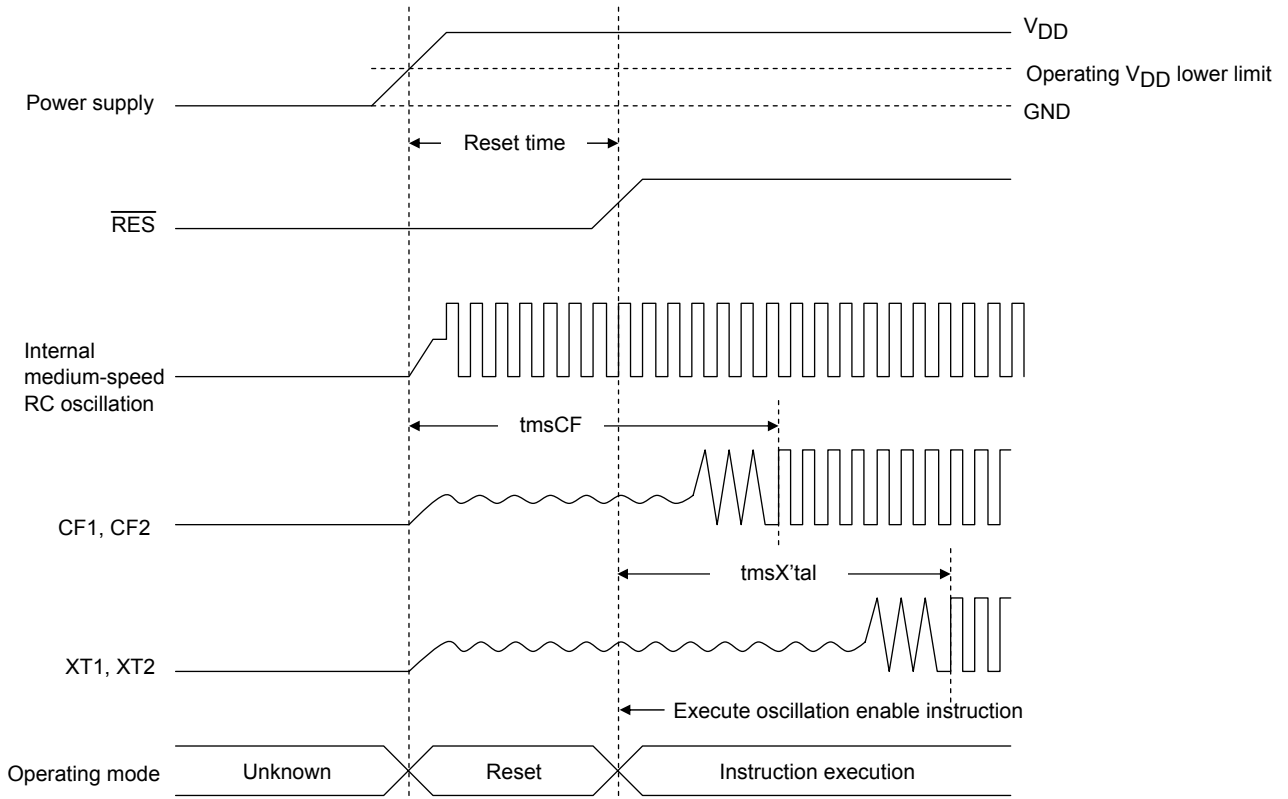

Figure 3 AC Timing Measurement Point

Reset Time and Oscillation Stabilization Time

HOLD Release Signal and Oscillation Stabilization Time

Figure 4 Oscillation Stabilization Time

When using the internal PLL circuit to generate the 48MHz clock for USB, it is necessary to connect a filter circuit as shown in the left figure to the P34/UFILT pin. After PLL is set, stabilization time of 20ms or longer must be secured.

Figure 5 External Filter Circuit for the Internal USB-dedicated PLL Circuit

To generate the master clock for the audio interface using the internal PLL circuit, it is necessary to connect a filter circuit as shown in the left figure to the P33 pin.

Figure 6 External Filter Circuit for Audio Interface (Used with Internal PLL Circuit)

It is necessary to adjust the circuit constant of the USB port peripheral circuit for each mounting board.

Figure 7 USB Port Peripheral Circuit

Note:
The external circuit differs depending on which of the power-on reset and low-voltage reset functions is to be used. Refer to the section on the reset functions in the user's manual.

Figure 8 Sample Reset Circuit

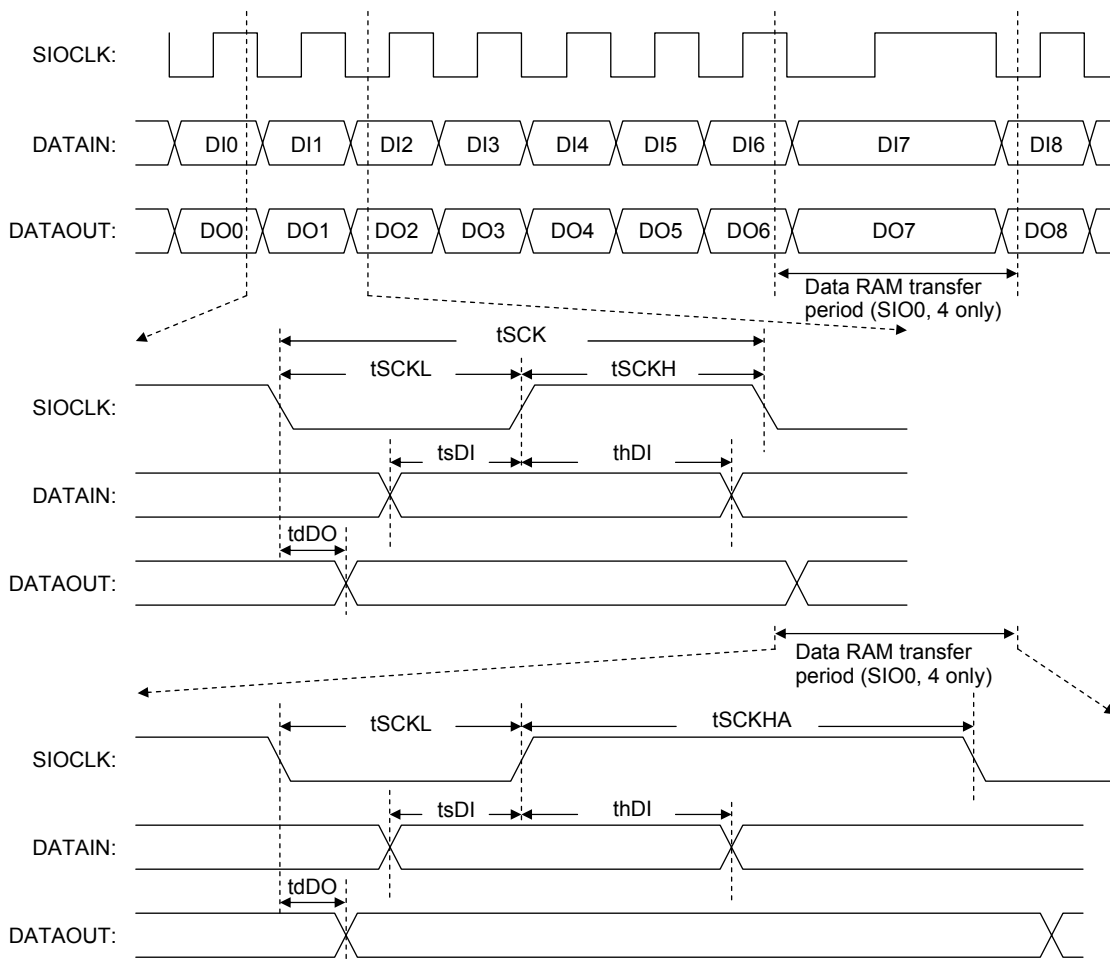

Figure 9 Serial I/O Waveform

Figure 10 Pulse Input Timing Waveform

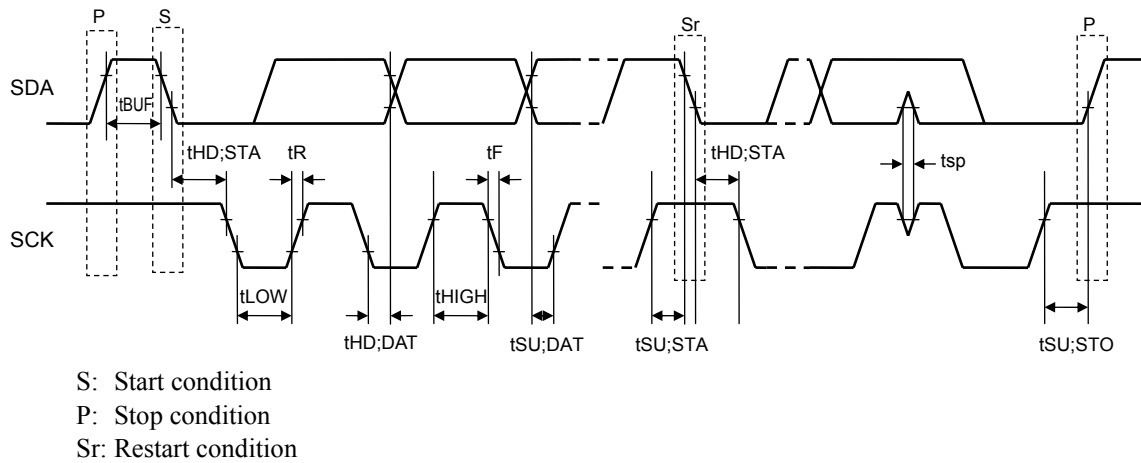

Figure 11 I²C Timing

Figure 12 USB Data Signal Timing and Voltage Levels

Figure 13 Sample Waveforms for POR-only (LVD deselected) Operation (Reset pin: Pull-up resistor PRES only)

- The POR function generates a reset only when the power is turned on starting at the V_{SS} level.
- No stable reset will be generated if power is turned on again if the power level does not go down to the V_{SS} level as shown in (a). If such a case is anticipated, use the LVD function together with the POR function as explained below or implement an external reset circuit.
- A reset is generated only when power level goes down to the V_{SS} level as shown in (b) and power is turned on again after this condition continues for 100μs or longer.

LC87F1K64A

Figure 14 Sample Waveforms for POR+LVD Operation (Reset pin: Pull-up Resistor PRES Only)

- A reset is generated both when power is turned on and when the power level lowers.
- A hysteresis width (LVHYS) is provided to prevent repetitions of reset release and entry cycles near the detection level.

Figure 15 Minimum Low Voltage Detection Width (Sample Temporary Power Interruption/Fluctuation Waveform)
