

Bulk Metal[®] Foil Technology Molded Resistor Networks

Product may not be to scale

Unitized Resistor Networks are comprised of Vishay S102C elements combined and molded into single units. This method of making networks yields some important advantages that should be considered where space is not a limitation and maximizing performance is important. To begin with, the leads that emerge from the package go directly to the resistance element (or an internal PC board), so the possibility of thermal EMFs is very low. Next, the value range of the elements is large (1 ohms to 150Kohms in a single foil element) and they can be combined for even higher values. Finally, these elements possess all the good features of discrete Bulk Metal[®] Foil resistors, plus the ability to be further sorted for TCR track and absolute match before encapsulation. These networks make excellent voltage dividers, bridges, and attenuators where performance and stability are important.

APPLICATIONS

- Differential amplifiers
- Gain defining resistors in digital voltmeters
- Ratio arms in bridge circuits
- Fuel metering systems
- Heads up displays
- Fire control systems
- Spacecraft instrumentation
- Naval weapons systems
- Binary Coded Decimal Ladder Networks
- Binary Ladders (A-D, D-A conversion, current and voltage summing)
- Ratio and Ratio-matching Networks
- Bridge Networks
- Synchro Input and Summing Networks
- Resolver Networks
- Linear and Linear-summing Networks
- Decoder Networks
- Quadrature Bridge Networks
- Resistive Summing Networks

FEATURES

- Resistance range each resistor: 1Ω to 150KΩ
- TCR Tracking: to ± 0.5ppm/°C
- Nominal TCR each resistor: See Figures 1 and 2 in data sheet "7 Technical Reasons to Specify Bulk Metal[®] Foil Resistor Networks."
- Nominal tolerance ratio matching between resistors: from ± 0.005 to ± 1%
- Absolute tolerance each resistor: ± 1.0%, ± 0.5%, ± 0.25%, ± 0.1%, ± 0.05%, ± 0.02%, ± 0.01%, ± 0.005%
- Power rating: 0.25 watts per resistor

- (1) Typical is a designer's reference that represents 85% of production. Most of the ΔR's shown are maximums. To ensure that all typical values are maximums a "burn-in" is required.
- (2) ΔR: absolute resistance change.
- (3) ΔRatio: change in ratio between resistors within the network package from before to after the specified test.
- (4) Depending on construction and ratio value.
- (5) Measured < 0.1ppm/V and within the measurement capability of the equipment. Voltage coefficient is "essentially zero".
- (6) 2 ppm when in hermetically sealed package.

ORDERING INFORMATION - MOLDED 2R, 3R AND 4R RESISTOR NETWORKS

Networks are built to your requirements. Send your schematic and electrical requirements to the Applications Engineering Department. (See data sheet "Network Worksheet.") A unique part number will be assigned which defines all aspects of your network.
