

### FEATURES

- Configurable high-side, low-side and push-pull operation
- Current limited output (< 450 mA)
- Reverse polarity protection
- 150 mA output current
- 5  $\mu$ s input filter for spike suppression
- Wide supply voltage range from 8 to 30 V
- Driver shut-down with over temperature
- Integrated free-wheeling diode for inductive loads
- Sensor supply voltage output of 5 V, 10 mA

### APPLICATIONS

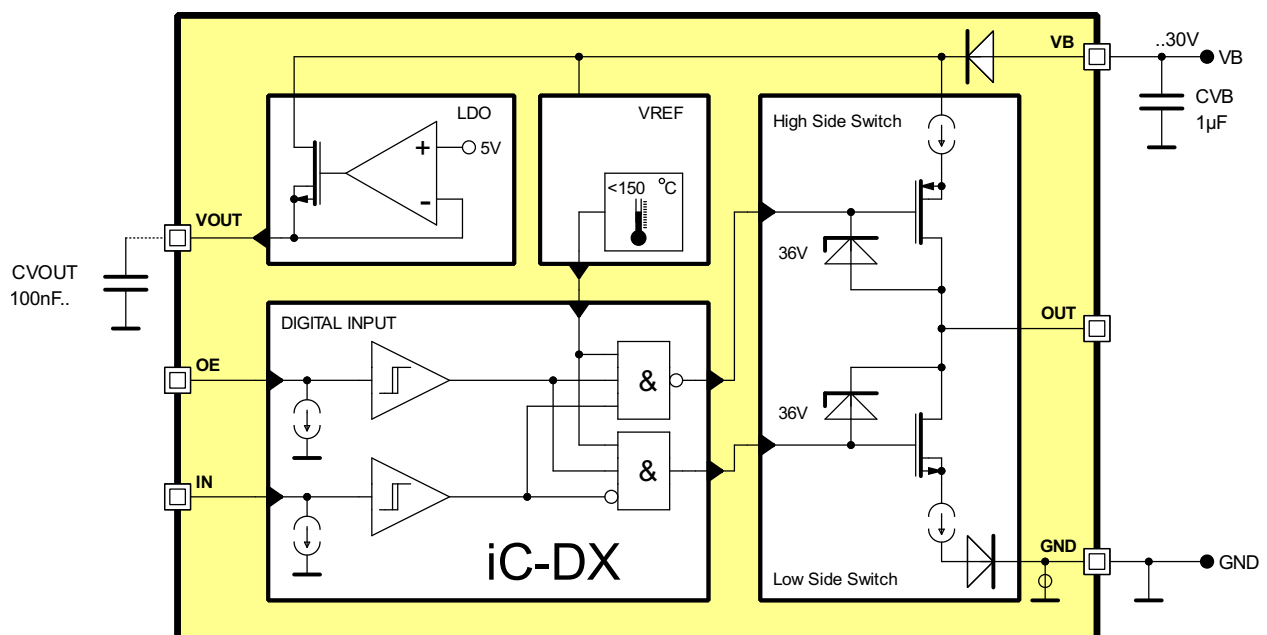

- Digital sensors
- Light barriers
- Proximity switches

### PACKAGES

DFN6 2x2mm

### BLOCK DIAGRAM

### DESCRIPTION

The iC-DX is a monolithic switch capable of driving ohmic, inductive and capacitive loads and features integrated reverse polarity protection. The supply voltage  $V_B$  of the device can range from 8 to 30 V.

Output source/sink-current is at least 150 mA, with saturation voltages of typically 2 V.

With input OE on high level state, the output works as a push-pull stage under control of pin IN. If pin IN is set either to high or low level, the output acts as

a high-side (PNP) or low-side (NPN) driver which is activated by a high logic level on input OE.

Output transitions are slew-rate limited to minimize interference on lines. The output is current limited to 450 mA maximum and short circuit protected by shutting down the device with excessive temperature.

A regulated 5 V supply which can be loaded up to 10 mA is available at pin VOUT.

### PACKAGES DFN6 2x2

#### PIN CONFIGURATION

#### PIN FUNCTIONS

##### No. Name Function

- |   |      |                        |
|---|------|------------------------|
| 1 | VOUT | Regulated +5 V Voltage |
| 2 | GND  | Ground                 |
| 3 | IN   | Input                  |
| 4 | OE   | Output Enabled         |
| 5 | OUT  | Driver Output          |
| 6 | VB   | Supply Voltage         |

The *Thermal Pad* is to be connected to a Ground Plane (GND) on the PCB.

**Only pin 1 marking on top or bottom defines the package orientation (top label and coding is subject to change).**

### PACKAGE DIMENSIONS DFN6 2x2

dra\_dfn6-1\_pack\_5, 20:1

**ABSOLUTE MAXIMUM RATINGS**

Beyond these values damage may occur; device operation is not guaranteed.

Item No.	Symbol	Parameter	Conditions			Unit
				Min.	Max.	
G001	VB	Supply Voltage	Referenced to lowest voltage of GND, OUT	-36	36	V
G002	OUT	OUT Voltage	Referenced to lowest voltage of VB, GND	-36	36	V
G003	GND	GND Voltage	Referenced to lowest voltage of VB, OUT	-36	36	V

### DESCRIPTION OF FUNCTIONS

iC-DX is a current limited switching channel which enables digital sensors to drive peripheral elements. They are designed to cope with high driver currents. The switches are reverse-polarity protected, feature a free-wheeling circuit for inductive loads, and a current limited output.

#### Reverse polarity protection

The pins VB, OUT and GND on the *line side* of the chip are reverse polarity protected. As far as the maximum voltage ratings are not exceeded, no possible supply combination at the *line side* pins can damage the chip.

Figure 1: OUT characteristic when Low side active

Figure 2: OUT characteristic when high side active

#### Output characteristics of OUT

The switching channel is current limited to a value between 150mA and 450mA. (cf. Electrical Characteristics Nos. 103, 104). The current limitation works only for voltages higher than 3V at OUT resp. lower than  $V_{BO} - 3V$ . For smaller output voltages the current limitation is reduced in order to minimise the saturation voltages without increasing the power dissipation. Figures 1 and 2 show the characteristic of the switching channels when activated. Region "A" is the saturation range, where the current limitation is not fully active yet and region "B" is the current limited range. Region "C" corresponds to the free-wheeling circuit activated. The switching channel is designed so that the low side can only sink current and high side can only source current (no reverse current).

#### Free-wheeling circuit for inductive loads

The free-wheeling circuit is always present and does not depend on the current output status. It is activated by voltages higher than 36V at OUT referenced to GND or lower than -36V at OUT referenced to VB. In that case the correspondent channel will switch on without current limitation (see Figure 3).

Figure 3: Free-wheeling characteristic

### OPERATION MODES

The iC-DX can be operated in High-Side (PNP-Switch), Low-Side (NPN-Switch) and Push-Pull switch mode. Figure 4 shows the high-side operation where IN pin must be kept high and the OE pin controls the switch. Figure 5 shows the low-side operation where IN pin must be kept low and the OE pin controls the switch. Figure 6 shows the push-pull operation where OE pin must be kept high and the IN pin controls the switch.

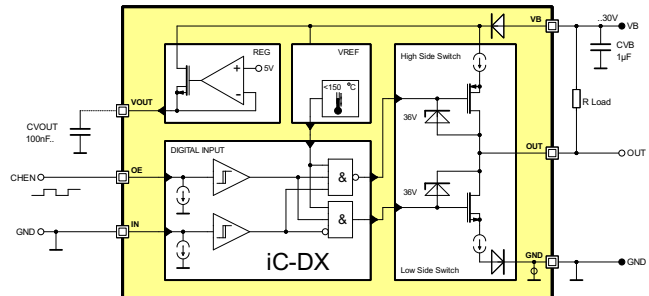

Figure 5: Configuration as Low-Side (NPN-Switch)

Output Table. Low-side mode (NPN-Switch)			
OE	IN	OUT	Mode
L	L	Z (H)	Low-Side, passive pull up
H	L	L	Low-Side, active pull down

OE	IN	OUT	Mode
H	L	L	Push-Pull, active pull down
H	H	H	Push-Pull, active pull up

Table 6: Output Function table Fig. 6. Push-Pull mode

### TIMING DESCRIPTION

The iC-DX has a built-in spurious pulse suppression that prevents short (undesired) pulses at the input pins from reaching the output. Every pulse at OE or IN pins shorter than 1.6µs (cf. Electrical Characteristics No. 306) will be ignored and the output will not react. The minimum required pulse length to be sure that the output reacts is 4µs (cf. Electrical Characteristics No. 307). That means that every pulse longer than

4µs will be propagated to the output but with an additional propagation delay of 1.2µs maximum. The resulting maximum propagation delay is 5.2µs (cf. Electrical Characteristics No. 305).

Figure 7: Timing diagram in push-pull operation mode

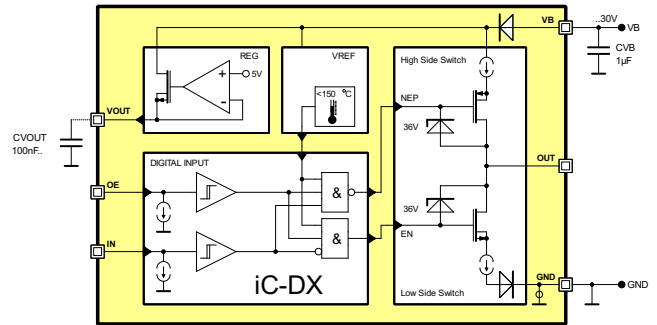

Figure 8: Block diagram with EN and NEP internal signals

### CIRCUIT PROTECTION

The iC-DX is reverse polarity protected via internal circuitry. As far as the maximum voltage ratings are not exceeded, no possible supply combination at the line side pins (VB, GND and OUT) can damage the chip.

Since the chip current consumption is relatively low, discharging of the backup capacitor C1 can be very slow, and injected charge through disturbances may in general result in capacitor voltage exceeding maximum ratings, leading to malfunction or destruction of circuitry and associated parts. Thus EMC requirements will afford more external circuitry. Figure 9 shows the iC-DX with the additional protective device D1, D2 and D3.

For over-voltage protection, the suppressor diodes D1, D2 and D3 absorb transients on supply line injected externally on the cable. Clamp voltage of the diodes should be rated slightly above maximum specified supply voltage.

These currents can be passed to ground or to VB by the internal ESD diodes of the iC-DX. Whereas negative current injection will simply be drained off to ground, positive current injection will charge capacitor C1 further to higher voltages. If not suppressor diodes nor any other over-voltage protection is implemented, the backup capacitor C1 should be kept small. A typical 100nF value is normally OK.

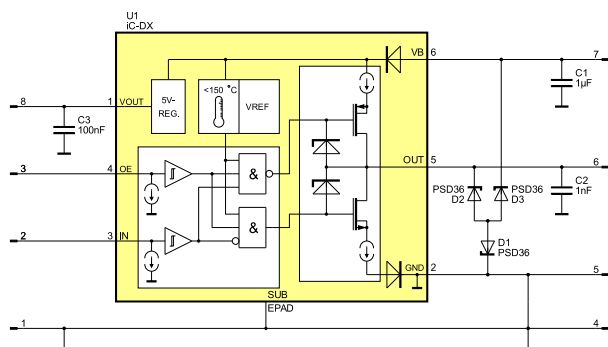

Figure 9: Circuit schematic showing protective devices

### Suggested protective devices

At  $V_{B_{max}}$  of 36V, suppressor diodes with a breakdown voltage from 36V has to be chosen in order to minimize the energy in iC-DX for higher voltages. For example Diode type like Vishay GSOT36C or PJS36W from Pan Jit should be enough as protection.

iC-Haus does not warrant the accuracy, completeness or timeliness of the specification and does not assume liability for any errors or omissions in these materials.

The data specified is intended solely for the purpose of product description. No representations or warranties, either express or implied, of merchantability, fitness for a particular purpose or of any other nature are made hereunder with respect to information/specification or the products to which information refers and no guarantee with respect to compliance to the intended use is given. In particular, this also applies to the stated possible applications or areas of applications of the product.

iC-Haus conveys no patent, copyright, mask work right or other trade mark right to this product. iC-Haus assumes no liability for any patent and/or other trade mark rights of a third party resulting from processing or handling of the product and/or any other use of the product.

As a general rule our developments, IPs, principle circuitry and range of Integrated Circuits are suitable and specifically designed for appropriate use in technical applications, such as in devices, systems and any kind of technical equipment, in so far as they do not infringe existing patent rights. In principle the range of use is limitless in a technical sense and refers to the products listed in the inventory of goods compiled for the 2008 and following export trade statistics issued annually by the Bureau of Statistics in Wiesbaden, for example, or to any product in the product catalogue published for the 2007 and following exhibitions in Hanover (Hannover-Messe).

We understand suitable application of our published designs to be state-of-the-art technology which can no longer be classed as inventive under the stipulations of patent law. Our explicit application notes are to be treated only as mere examples of the many possible and extremely advantageous uses our products can be put to.
