Low-Power Audio Codec With Embedded miniDSP and Stereo Class-D Speaker Amplifier

Check for Samples: TLV320AIC3111

1 INTRODUCTION

1.1 Features

- **Stereo Audio DAC With 95-dB SNR**
- **Mono Audio ADC With 91-dB SNR**
- **Supports 8-kHz to 192-kHz SepArate DAC and ADC Sample Rates**
- **Instruction-Programmable Embedded miniDSP**
- **Stereo 1.29-W Class-D BTL 8-Ω Speaker Driver With Direct Battery Connection**
- **One Differential and Three Single-Ended Inputs With Mixing and Level Control**
- **Microphone With Bias, Preamp PGA, and AGC**
- **Built-in Digital Audio Processing Blocks With User-Programmable Biquad and FIR Filters**
- **Digital Mixing Capability**
- **Programmable Digital Audio Processor for Bass Boost/Treble/EQ With up to Five Biquads for Record and up to Six Biquads for Playback**
- **Pin Control or Register Control for Digital-Playback Volume-Control Settings**
- **Sine-Wave Generator for Beep**
- **Integrated PLL Used for Programmable Digital Audio Processor**
- **I^2S, Left-Justified, Right-Justified, DSP, and TDM Audio Interfaces**
- **I^2C Control With Register Auto-Increment**
- **Full Power-Down Control**
- **Power Supplies:**
  - **Analog: 2.7 V–3.6 V**
  - **Digital Core: 1.65 V–1.95 V**
  - **Digital I/O: 1.1 V–3.6 V**
  - **Class-D: 2.7 V–5.5V (SPLVDD and SPRVDD ≥ AVDD)**
- **5-mm × 5-mm 32-QFN Package**

1.2 Applications

- **Portable Audio Devices**
- **Mobile Internet Devices**
- **Adaptive Filtering Applications**

1.3 Description

The TLV320AIC3111 is a low-power, highly integrated, high-performance codec which provides a stereo audio DAC and mono audio ADC.

The TLV320AIC3111 features a high-performance audio codec with 16-bit stereo playback and monaural record functionality. The device integrates several analog features, such as a microphone interface, headphone drivers, and speaker drivers.

The TLV320AIC3111 has a fully programmable miniDSP for digital audio processing. The digital audio data format is programmable to work with popular audio standard protocols (I^2S, left/right-justified) in master, slave, DSP, and TDM modes. Bass boost, treble, or EQ can be supported by the programmable digital signal-processing block.

An on-chip PLL provides the high-speed clock needed by the digital signal processing block. The volume level can be controlled by either pin control or by register control. The audio functions are controlled using the I^2C serial bus.

The TLV320AIC3111 has a programmable beep generator and is available in a 32-pin QFN package.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

NOTE

This data manual is designed using PDF document-viewing features that allow quick access to information. For example, performing a global search on "page 0 / register 27" produces all references to this page and register in a list. This makes it easy to traverse the list and find all information related to a page and register. Note that the search string must be of the indicated format. Also, this document includes document hyperlinks to allow the user to find a document reference quickly. To come back to the original page, click the green left arrow near the PDF page number at the bottom of the file. The hot-key for this function is alt-left arrow on the keyboard. Another way to find information quickly is to use the PDF bookmarks.

Table 2-1. TERMINAL FUNCTIONS

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
AVDD	17	–	Analog power supply
AVSS	16	–	Analog ground
BCLK	7	I/O	Audio serial bit clock
DIN	5	I	Audio serial data input
DOUT	4	O	Audio serial data output
DVDD	3	–	Digital power – digital core
DVSS	18	–	Digital ground
GPIO1	32	I/O	General-purpose input/output and multifunction pin
HPL	27	O	Left-channel headphone/line driver output
HPR	30	O	Right-channel headphone/line driver output
HPVDD	28	–	Headphone/line driver and PLL power
HPVSS	29	–	Headphone/line driver and PLL ground
IOVDD	2	–	Interface power
IOVSS	1	–	Interface ground
MCLK	8	I	Exterrnal master clock
MICBIAS	12	O	Micophone bias voltage
MIC1LM	15	I	Microphone/line input routed to M or P input mixer
MIC1LP	13	I	Microphone/line input routed to P input mixer and left output mixer
MIC1RP	14	I	Microphone/line input routed to P input mixer and left/right output mixer

TERMINAL FUNCTIONS (continued)

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
$\overline{\text{RESET}}$	31	I	Device reset
SCL	10	I/O	I^2C control bus clock input
SDA	9	I/O	I^2C control bus data input
SPLM	19	O	Left-channel class-D speaker driver inverting output
SPLP	22	O	Left-channel class-D speaker driver noninverting output
SPLVDD	21	–	Left-channel class-D speaker driver power supply
SPLVSS	20	–	Left-channel class-D speaker driver power supply ground
SPRM	23	O	Right-channel class-D speaker driver inverting output
SPRP	26	O	Right-channel class-D speaker driver noninverting output
SPRVDD	24	–	Right-channel class-D speaker driver power supply
SPRVSS	25	–	Right-channel class-D speaker driver power supply ground
VOL/MICDET	11	I	Volume control or microphone detection
WCLK	6	I/O	Audio serial word clock

3 ELECTRICAL SPECIFICATIONS

3.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (1)

		VALUE	UNIT
AVDD to AVSS		–0.3 to 3.9	V
DVDD to DVSS		–0.3 to 2.5	V
HPVDD to HPVSS		–0.3 to 3.9	V
SPLVDD to SPLVSS		–0.3 to 6	V
SPRVDD to SPRVSS		–0.3 to 6	V
IOVDD to IOVSS		–0.3 to 3.9	V
Digital input voltage		IOVSS – 0.3 to IOVDD + 0.3	V
Analog input voltage		AVSS – 0.3 to AVDD + 0.3	V
Operating temperature range		–40 to 85	°C
Storage temperature range		–55 to 150	°C
Junction temperature (T_J Max)		105	°C
QFN package	Power dissipation	$(T_J \text{ Max} – T_A)/R_{\theta JA}$	W
	$R_{\theta JA}$ thermal impedance (with thermal pad soldered to board)	35	°C/W

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

3.2 THERMAL CHARACTERISTICS

This data was taken using 2-oz. (0.071-mm thick) trace and copper pad that is soldered to a JEDEC high-K, standard 4-layer 3-in. × 3-in. (7.62-cm × 7.62-cm) PCB.

Power Rating at 25°C	Derating Factor	Power Rating at 70°C	Power Rating at 85°C
2.3 W	28.57 mW/°C	1 W	0.6 W

Copyright © 2009, Texas Instruments Incorporated

3.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
AVDD[1]	Power-supply voltage range	Referenced to AVSS[2]	2.7	3.3	3.6	V
DVDD		Referenced to DVSS[2]	1.65	1.8	1.95	
HPVDD		Referenced to HPVSS[2]	2.7	3.3	3.6	
SPLVDD[1]		Referenced to SPLVSS[2]	2.7		5.5	
SPRVDD[1]		Referenced to SPRVSS[2]	2.7		5.5	
IOVDD		Referenced to IOVSS[2]	1.1	3.3	3.6	
	Speaker impedance	Resistance applied across class-D output pins (BTL)	8			Ω
	Headphone impedance	AC-coupled to R_L	16			Ω
V_I	Analog audio full-scale input voltage	AVDD = 3.3 V, single-ended		0.707		V_{RMS}
	Stereo line output load impedance	AC coupled to R_L		10		kΩ
MCLK[3]	Master clock frequency	IOVDD = 3.3 V			50	MHz
f_{SCL}	SCL clock frequency				400	kHz
T_A	Operating free-air temperature		–40		85	°C

(1) To minimize battery-current leakage, the SPLVDD and SPRVDD voltage levels should not be below the AVDD voltage level.
(2) All grounds on board are tied together, so they should not differ in voltage by more than 0.2 V maximum for any combination of ground signals. By use of a wide trace or ground plane, ensure a low-impedance connection between HPVSS and DVSS.
(3) The maximum input frequency should be 50 MHz for any digital pin used as a general-purpose clock.

3.4 Electrical Characteristics

At 25°C; AVDD, HPVDD, IOVDD = 3.3V; SPLVDD, SPRVDD = 3.6 V; DVDD = 1.8 V; f_S (audio) = 48 kHz; CODEC_CLKIN = 256 × f_S; PLL = Off; VOL/MICDET pin disabled (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
INTERNAL OSCILLATOR—RC_CLK					
Oscillator frequency			8.2		MHz
VOLUME CONTROL PIN (ADC); VOL/MICDET PIN ENABLED					
Input voltage range	VOL/MICDET pin configured as volume control (page 0 / register 116, bit D7 = 1 and page 0 / register 67, bit D7 = 0)	0		0.5 × AVDD	V
Input capacitance			2		pF
Volume control steps			128		Steps

Electrical Characteristics *(continued)*

At 25°C; AVDD, HPVDD, IOVDD = 3.3V; SPLVDD, SPRVDD = 3.6 V; DVDD = 1.8 V; f_S (audio) = 48 kHz; CODEC_CLKIN = 256 × f_S; PLL = Off; VOL/MICDET pin disabled (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
AUDIO ADC						
Microphone Input to ADC, 984-Hz Sine-Wave Input, f_S = 48 kHz, AGC = OFF						
	Input signal level (0-dB)	MIC with R1 = 20 kΩ (page 1 / register 48 and page 1 / register 49, bits D7–D6)		0.707		V_{RMS}
SNR	Signal-to-noise ratio	f_S = 48 kHz, 0-dB PGA gain, MIC input ac-shorted to ground; measured as idle-channel noise, A-weighted(1) (2)	80	91		dB
	Dynamic range	f_S = 48 kHz, 0-dB PGA gain, MIC input 1 kHz at –60-dBFS input applied, referenced to 0.707-Vrms input, A-weighted (1) (2)		91		dB
THD+N	Total harmonic distortion + noise	f_S = 48 kHz, 0-dB PGA gain, MIC input 1 kHz at –2 dBFS input applied, referenced to 0.707 Vrms input		–85	–70	dB
THD	Total harmonic distortion	f_S = 48 kHz, 0-dB PGA gain, MIC input 1 kHz at –2 dBFS input applied, referenced to 0.707 Vrms input		–91		dB
	Input capacitance	MIC input		2		pF
Microphone Bias						
	Voltage output	Page 1 / register 46, bits D1–D0 = 10	2.25	2.5	2.75	V
		Page 1 / register 46, bits D1–D0 = 01		2		
	Voltage regulation	At 4-mA load current, page 1 / register 46, bits D1–D0 = 10 (MICBIAS = 2.5 V)		5		mV
		At 4-mA load current, page 1 / register 46, bits D1–D0 = 01 (MICBIAS = 2 V)		7		
Audio ADC Digital Decimation Filter Characteristics						
See Section 5.5.4.4 for audio ADC decimation filter characteristics.						
AUDIO DAC						
DAC Headphone Output, AC-coupled load = 16 Ω (single-ended), driver gain = 0 dB, parasitic capacitance = 30 pF						
	Full-scale output voltage (0 dB)	Output common-mode setting = 1.65 V		0.707		Vrms
SNR	Signal-to-noise ratio	Measured as idle-channel noise, A-weighted(1) (2)	80	95		dB
THD	Total harmonic distortion	0-dBFS input		–85	–65	dB
THD+N	Total harmonic distortion + noise	0-dBFS input		–82	–60	dB
	Mute attenuation			87		dB
PSRR	Power-supply rejection ratio(3)	Ripple on HPVDD (3.3 V) = 200 mVp-p at 1 kHz		–62		dB
P_O	Maximum output power	R_L = 32 Ω, THD+N ≤ –60 dB		20		mW
		R_L = 16 Ω, THD+N ≤ –60 dB		60		
DAC Lineout (HP Driver in Lineout Mode)						
SNR	Signal-to-noise ratio	Measured as idle-channel noise, A-weighted		95		dB
THD	Total harmonic distortion	0-dBFS input, 0-dB gain		–86		dB
THD+N	Total harmonic distortion + noise	0-dBFS input, 0-dB gain		–83		dB

(1) Ratio of output level with 1-kHz full-scale sine-wave input, to the output level with the inputs short-circuited, measured A-weighted over a 20-Hz to 20-kHz bandwidth using an audio analyzer.
(2) All performance measurements done with 20-kHz low-pass filter and, where noted, A-weighted filter. Failure to use such a filter may result in higher THD+N and lower SNR and dynamic range readings than shown in the Electrical Characteristics. The low-pass filter removes out-of-band noise, which, although not audible, may affect dynamic specification values.
(3) DAC to headphone-out PSRR measurement is calculated as PSRR = 20 × log(ΔV_{HPL} / ΔV_{HPVDD}).

5 APPLICATION INFORMATION

5.1 Typical Circuit Configuration

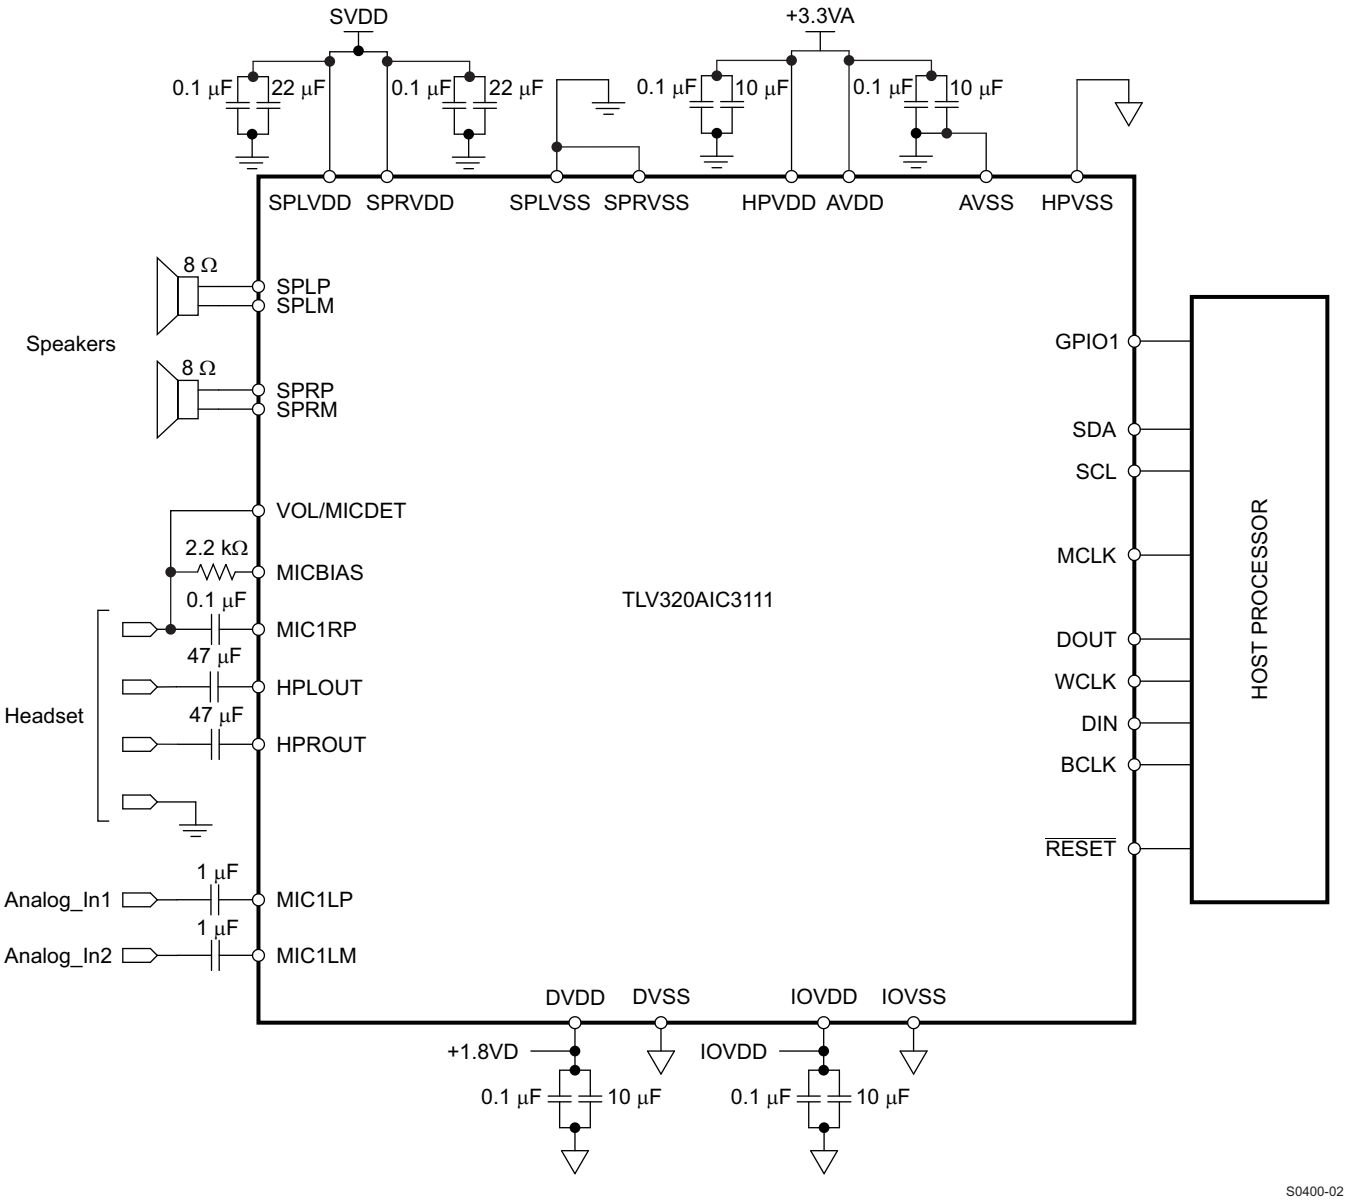

Figure 5-1. Typical Circuit Configuration

5.2 Overview

The TLV320AIC3111 is a highly integrated stereo audio DAC and monaural ADC for portable computing, communication, and entertainment applications. A register-based architecture eases integration with microprocessor-based systems through standard serial-interface buses. This device supports the 2-wire I^2C bus interface which provides full register access. All peripheral functions are controlled through these registers and the onboard state machines.

The TLV320AIC3111 consists of the following blocks:

- Microphone interfaces (analog and digital)
- Audio codec (mono ADC and stereo DAC)

Copyright © 2009, Texas Instruments Incorporated

- AGC and DRC
- Two miniDSP digital signal-processing blocks (record and playback paths)
- Beep generator
- Stereo headphone/lineout amplifier
- Class-D stereo amplifier for 8-Ω speakers
- Pin-controlled or register-controlled volume level
- Power-down de-pop and power-up soft start
- Analog inputs
- I^2C control interface
- Power-down control block

Following a toggle of the $\overline{\text{RESET}}$ pin or a software reset, the device operates in the default mode. The I^2C interface is used to write to the control registers to configure the device.

The I^2C address assigned to the TLV320AIC3111 is 001 1000. This device always operates in an I^2C slave mode. All registers are 8-bit, and all writable registers have read-back capability. The device auto-increments to support sequential addressing and can be used with I^2C fast mode. Once the device is reset, all appropriate registers are updated by the host processor to configure the device as needed by the user.

5.2.1 Device Initialization

5.2.1.1 Reset

The TLV320AIC3111 internal logic must be initialized to a known condition for proper device function. To initialize the device to its default operating condition, the hardware reset pin ($\overline{\text{RESET}}$) must be pulled low for at least 10 ns. For this initialization to work, both the IOVDD and DVDD supplies must be powered up. It is recommended that while the DVDD supply is being powered up, the $\overline{\text{RESET}}$ pin be pulled low.

The device can also be reset via software reset. Writing a 1 into page 0 / register 1, bit D0 resets the device.

5.2.1.2 Device Start-Up Lockout Times

After the TLV320AIC3111 is initialized through hardware reset at power up or software reset, the internal memories are initialized to default values. This initialization takes place within 1 ms after pulling the $\overline{\text{RESET}}$ signal high. During this initialization phase, no register-read or register-write operation should be performed on ADC or DAC coefficient buffers. Also, no block within the codec should be powered up during the initialization phase.

5.2.1.3 PLL Start-Up

Whenever the PLL is powered up, a start-up delay of approximately of 10 ms occurs after the power-up command of the PLL and before the clocks are available to the codec. This delay is to ensure stable operation of the PLL and clock-divider logic.

5.2.1.4 Power-Stage Reset

The power-stage-only reset is used to reset the device after an overcurrent latching shutdown has occurred. Using this reset re-enables the output stage without resetting all of the registers in the device. Each of the four power stages has its own dedicated reset bit. The headphone power-stage reset is performed by setting page 1 / register 31, bit D7 for HPL and by setting page 1 / register 31, bit D6 for HPR. The speaker power-stage reset is performed by setting page 1 / register 32, bit D7 for SPLP and SPLM, and by setting page 1 / register 32, bit D6 for SPRP and SPRM.

5.2.1.5 Software Power Down

By default, all circuit blocks are powered down following a reset condition. Hardware power up of each circuit block can be controlled by writing to the appropriate control register. This approach allows the lowest power-supply current for the functionality required. However, when a block is powered down, all of the register settings are maintained as long as power is still being applied to the device.

5.2.2 Audio Analog I/O

The TLV320AIC3111 has a stereo audio DAC and a monaural ADC. It supports a wide range of analog interfaces to support different headsets and analog outputs. The TLV320AIC3111 has features to interface output drivers (8-Ω, 16-Ω, 32-Ω) and a microphone PGA with AGC control. A special circuit has also been included in the TLV320AIC3111 to insert a short key-click sound into the stereo audio output. The key-click sound is used to provide feedback to the user when a particular button is pressed or item is selected. The specific sound of the keyclick can be adjusted by varying several register bits that control its frequency, duration, and amplitude. See *Key-Click Functionality With Beep Generator*, Section 5.6.7.

5.3 miniDSP

The TLV320AIC3111 features two miniDSP cores. The first miniDSP core is tightly coupled to the ADC; the second miniDSP core is tightly coupled to the DAC. The fully programmable algorithms for the miniDSP must be loaded into the device after power up. The miniDSPs have direct access to the digital stereo audio stream on the ADC and on the DAC side, offering the possibility for advanced, very low-group-delay DSP algorithms.

The ADC miniDSP has 384 programmable instructions, 256 data memory locations, and 128 programmable coefficients. The DAC miniDSP has 1024 programmable instructions, 896 data memory locations, and 512 programmable coefficients (in the adaptive mode, each bank has 256 programmable coefficients).

5.3.1 Software

Software development for the TLV320AIC3111 is supported through TI's comprehensive PurePath™ Studio software development environment, a powerful, easy-to-use tool designed specifically to simplify software development on Texas Instruments miniDSP audio platforms. The graphical development environment consists of a library of common audio functions that can be dragged and dropped into an audio signal flow and graphically connected together. The DSP code can then be assembled from the graphical signal flow with the click of a mouse.

See the TLV320AIC3111 product folder on www.ti.com to learn more about PurePath Studio software and the latest status on available, ready-to-use DSP algorithms.

5.4 Digital Processing Low-Power Modes

The TLV320AIC3111 device can be tuned to minimize power dissipation, to maximize performance, or to an operating point between the two extremes to best fit the application. The choice of processing blocks, PRB_P1 to PRB_P25 for stereo playback and PRB_R4 to PRB_R18 for mono recording, also influences the power consumption. In fact, the numerous processing blocks have been implemented to offer a choice among configurations having a different balance of power optimization and signal-processing capabilities.

5.5 Audio ADC and Analog Inputs

5.5.1 MICBIAS and Microphone Preamplifier

The TLV320AIC3111 includes a microphone bias circuit which can source up to 4 mA of current and is programmable to a 2-V, 2.5-V, or AVDD level. The level can be controlled by writing to page 1 / register 46, bits D1–D0. This functionality is shown in Table 5-14.

Table 5-14. MICBIAS Settings

D1	D0	FUNCTIONALITY
0	0	MICBIAS output is powered down.
0	1	MICBIAS output is powered to 2 V.
1	0	MICBIAS output is powered to 2.5 V.
1	1	MICBIAS output is powered to AVDD.

During normal operation, MICBIAS can be set to 2.5 V for better performance. However, depending on the model of microphone that is selected, optimal performance might be obtained at another setting, so the performance at a given setting should be verified.

The lowest current consumption occurs when MICBIAS is powered down. The next-lowest current consumption occurs when MICBIAS is set at AVDD.

Because of the oversampling nature of the audio ADC and the integrated digital decimation filtering, requirements for analog anti-aliasing filtering are very relaxed. The TLV320AIC3111 integrates a second-order analog anti-aliasing filter with 20-dB attenuation at 1 MHz. This filter, combined with the digital decimal filter, provides sufficient anti-aliasing filtering without requiring any external components.

The MIC PGA supports analog gain control from from 0 dB to 59.5 dB in steps of 0.5 dB. These gain levels can be controlled by writing to page 1 / register 47, bits D6–D0. The PGA gain changes are implemented with internal soft-stepping. This soft-stepping ensures that volume-control changes occur smoothly with no audible artifacts. On reset, the MIC PGA gain defaults to a mute condition, with soft-stepping enabled. The ADC soft-stepping control can be enabled or disabled by writing to page 0 / register 81, bits D1–D0. ADC soft-stepping timing is provided by the internal oscillator and internal divider logic block.

The input feed-forward resistance for the MIC1LP input of the microphone PGA stage has three settings, 10 kΩ, 20 kΩ, and 40 kΩ, which are controlled by writing to page 1 / register 48, bits D7 and D6. The input feed-forward resistance value selected affects the gain of the microphone PGA. The ADC PGA gain for the MIC1LP input depends on the setting of page1 / register 48 and page 1 / register 49, bits D7–D6. If D7–D6 are set to 01, then the ADC PGA has 6 dB more gain with respect to the value programmed using page 1 / register 47. If D7–D6 are set to 10, then the ADC PGA has the same gain as programmed using page 1 / register 47. If D7–D6 are set to 11, then the ADC PGA has 6 dB less gain with respect to the value programmed using page 1 / register 47. The same gain scaling is also valid for the MIC1RP and MIC1LM input, based on the feed-forward resistance selected using page 1 / register 48, bits D5–D2.

The MIC PGA gain can be controlled either by an AGC loop or as a fixed gain. See Figure 1-1 for the various analog input routings to the MIC PGA that are supported in the single-ended and differential configurations. The AGC can be enabled by writing to page 0 / register 86, bit D7. If the AGC is not enabled, then setting a fixed gain is done by writing to page 1 / register 47, bits D6–D0. Because the TLV320AIC3111 supports soft-stepping gain changes, a read-only flag on page 0 / register 36, bit D7 is set whenever the gain applied by PGA equals the desired value set by the gain register. The MIC PGA can be enabled by writing to page 1 / register 47, bit D7. ADC muting can be done by writing to page 0 /

Copyright © 2009, Texas Instruments Incorporated

register 82, bit D7 and page 1 / register 47, bit D7. Disabling the MIC PGA sets the gain to 0 dB. Muting the ADC causes the digital output to mute so that the output value remains fixed. When soft-stepping is enabled, the CODEC_CLKIN signal must stay active until after the ADC power-down register is written, in order to ensure that soft-stepping to mute has had time to complete. When the ADC POWER UP flag is no longer set, the CODEC_CLKIN signal can be shut down.

5.5.2 Automatic Gain Control (AGC)

The TLV320AIC3111 includes automatic gain control (AGC) for the microphone inputs. AGC can be used to maintain nominally constant output-signal amplitude when recording speech signals. This circuitry automatically adjusts the MIC PGA gain as the input signal becomes overly loud or very weak, such as when a person speaking into a microphone moves closer to or farther from the microphone. The AGC algorithm has several programmable settings, including target gain, attack and decay time constants, noise threshold, and maximum PGA applicable, that allow the algorithm to be fine-tuned for any particular application. The algorithm uses the absolute average of the signal (which is the average of the absolute value of the signal) as a measure of the nominal amplitude of the output signal. Because the gain can be changed at the sample interval time, the AGC algorithm operates at the ADC_f_S clock rate.

Target level represents the nominal output level at which the AGC attempts to hold the ADC output signal. The TLV320AIC3111 allows programming of eight different target levels, which can be programmed from –5.5 dB to –24 dB relative to a full-scale signal. Because the TLV320AIC3111 reacts to the signal absolute average and not to peak levels, it is recommended that the target level be set with enough margin to avoid clipping at the occurrence of loud sounds.

An AGC low-pass filter is used to help determine the average level of the input signal. This average level is compared to the programmed detection levels in the AGC to provide the correct functionality. This low-pass filter is in the form of a first-order IIR filter. Programming this filter is done by writing to page 4 / register 2 through page 4 / register 7. Two 8-bit registers are used to form the 16-bit digital coefficient as shown on the register map. In this way, a total of six registers are programmed to form the three IIR coefficients.

Attack time determines how quickly the AGC circuitry reduces the PGA gain when the input signal is too loud. Programming the attack time is done by writing to page 0 / register 89, bits D7–D0.

Decay time determines how quickly the PGA gain is increased when the input signal is too low. Programming the decay time is done by writing to page 0 / register 90, bits D7–D0.

Noise threshold is a reference level. If the input speech average value falls below the noise threshold, the AGC considers it as a silence and hence brings down the gain to 0 dB in steps of 0.5 dB every sample period and sets the noise-threshold flag. The gain stays at 0 dB unless the input speech signal average rises above the noise-threshold setting. This ensures that noise is not amplified in the absence of speech. The noise-threshold level in the AGC algorithm is programmable from –30 dB to –90 dB for the microphone input. When the AGC noise threshold is set to –70 dB, –80 db, or –90 dB, the microphone input maximum PGA applicable setting must be greater than or equal to 11.5 dB, 21.5 dB, or 31.5 dB, respectively. This operation includes debounce and hysteresis to prevent the AGC gain from cycling between high gain and 0 dB when signals are near the noise threshold level. When the noise-threshold flag is set, the status of the gain applied by the AGC and the saturation flag should be ignored. Programming the noise debounce is done by writing to page 0 / register 91, bits D4–D0. Programming the signal debounce is done by writing to page 0 / register 92, bits D3–D0.

Max PGA applicable allows the user to restrict the maximum gain applied by the AGC. This can be used for limiting PGA gain in situations where environmental noise is greater than the programmed noise threshold. Microphone input maximum PGA can be programmed from 0 dB to 59.5 dB in steps of 0.5 dB. Programming the maximum PGA gain allowed by the AGC is done by writing to page 0 / register 88, bits D6–D0.

See Table 5-15 for various AGC programming options. AGC can be used only if the microphone input is routed to the ADC channel.

5.5.3 Delta-Sigma ADC

The analog-to-digital converter has a delta-sigma modulator with an oversampling ratio (AOSR) up to 128. The ADC can support a maximum output rate of 192 kHz.

ADC power up is controlled by writing to page 0 / register 81, bit D7. An ADC power-up condition can be verified by reading page 0 / register 36, bit D6.

5.5.4 ADC Decimation Filtering and Signal Processing

The TLV320AIC3111 ADC channel includes built-in digital decimation filters to process the oversampled data from the delta-sigma modulator to generate digital data at the Nyquist sampling rate with high dynamic range. The decimation filter can be chosen from three different types, depending on the required frequency response, group delay, and sampling rate.

5.5.4.1 ADC Processing Blocks

The TLV320AIC3111 offers a range of processing blocks which implement various signal processing capabilities along with decimation filtering. These processing blocks give users the choice of how much and what type of signal processing they may use and which decimation filter is applied.

The choices among these processing blocks allow the system designer to balance power conservation and signal-processing flexibility. Less signal-processing capability reduces the power consumed by the device. Table 5-16 gives an overview of the available processing blocks of the ADC channel and their properties. The Resource Class (RC) column gives a relative indication of power consumption.

The signal processing blocks available are:

- First-order IIR
- Scalable number of biquad filters
- Variable-tap FIR filter
- AGC

The processing blocks are tuned for common cases and can achieve high anti-alias filtering or low group delay in combination with various signal-processing effects such as audio effects and frequency shaping. The available first-order IIR, biquad, and FIR filters have fully user-programmable coefficients.

Table 5-16. ADC Processing Blocks

Processing Blocks	Channel	Decimation Filter	1st-Order IIR Available	Number Biquads	FIR	Required AOSR Value	Resource Class
PRB_R4	Mono	A	Yes	0	No	128, 64	3

5.5.4.3 User-Programmable Filters

Depending on the selected processing block, different types and orders of digital filtering are available. A first-order IIR filter is always available, and is useful to filter out possible dc components of the signal efficiently. Up to five biquad sections or, alternatively, FIR filters of up to 25 taps are available for specific processing blocks. The coefficients of the available filters are arranged as sequentially indexed coefficients.

Copyright © 2009, Texas Instruments Incorporated

The coefficients of these filters are each 16 bits wide, in 2s-complement format, and occupy two consecutive 8-bit registers in the register space. Specifically, the filter coefficients are in 1.15 (one dot 15) format with a range from –1.0 (0x8000) to 0.999969482421875 (0x7FFF), as shown in Figure 5-12.

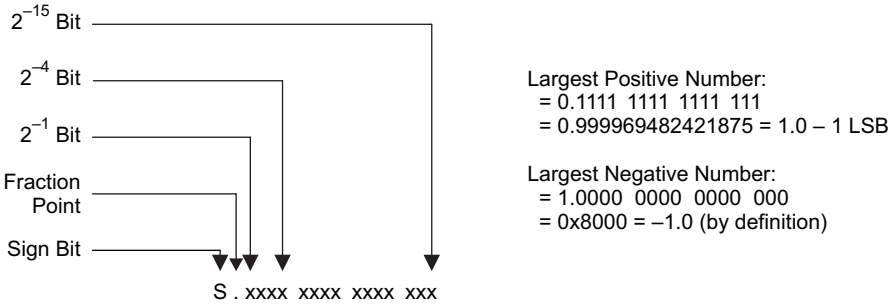

Figure 5-12. 1.15 2s-Complement Coefficient Format

5.5.4.3.1 First-Order IIR Section

The transfer function for the first-order IIR filter is given by

$$H(z) = \frac{N_0 + N_1 z^{-1}}{2^{15} - D_1 z^{-1}} \quad (1)$$

The frequency response for the first-order IIR section with default coefficients is flat at a gain of 0 dB.

Table 5-17. ADC First-Order IIR Filter Coefficients

Filter	Filter Coefficient	ADC Coefficient	Default (Reset) Values
First-order IIR	N0	Page 4 / register 8 and page 4 / register 9	0x7FFF (decimal 1.0 – LSB value)
	N1	Page 4 / register 10 and page 4 / register 11	0x0000
	D1	Page 4 / register 12 and page 4 / register 13	0x0000

5.5.4.3.2 Biquad Section

The transfer function of each of the biquad filters is given by

$$H(z) = \frac{N_0 + 2 \times N_1 z^{-1} + N_2 z^{-2}}{2^{15} - 2 \times D_1 z^{-1} - D_2 z^{-2}} \quad (2)$$

The default values for each biquad section yield an all-pass (flat) frequency response at a gain of 0 dB.

5.5.4.3.3 FIR Section

Three of the available ADC processing blocks offer FIR filters for signal processing. Processing block PRB_R12 features a 20-tap FIR filter, whereas the processing blocks PRB_R6 and PRB_R18 each feature a 25-tap FIR filter.

Copyright © 2009, Texas Instruments Incorporated

$$H(z) = \sum_{n=0}^{M} FIR_n z^{-n}$$
$$M = 24 \text{ for } PRB_R6, PRB_R18$$
$$M = 19 \text{ for } PRB_R12 \quad (3)$$

The coefficients of the FIR filters are 16-bit 2s-complement format (2 bytes each) and correspond to the ADC coefficient space as listed in Table 5-19. Note that the default (reset) coefficients are not vaild for the FIR filter. When the FIR filter is used, all applicable coefficients must be reprogrammed by the user. To reprogram the FIR filter coefficients as an all-pass filter, write value 0x00 to page 4 / registers 24, 25, 34, 35, 44, 45, 54, and 55.

Table 5-19. ADC FIR Filter Coefficients

Filter Coefficient	FIlter Coefficient RAM Location	Default (Reset) Values – Not Valid for the FIR Filter – Must Be Reprogrammed by User

5.5.4.4 ADC Digital Decimation Filter Characteristics

The TLV320AIC3111 offers three different types of decimation filters. The integrated digital decimation filter removes high-frequency content and downsamples the audio data from an initial sampling rate of AOSR × f_S to the final output sampling rate of f_S. The decimation filtering is achieved using a higher-order CIC filter followed by linear-phase FIR filters. The decimation filter cannot be chosen by itself; it is implicitly set through the chosen processing block.

The following subsections describe the properties of the available filters A, B, and C.

Copyright © 2009, Texas Instruments Incorporated

5.5.4.4.1 Decimation Filter A

This filter is intended for use at sampling rates up to 48 kHz. When configuring this filter, the oversampling ratio of the ADC can either be 128 or 64. For highest performance, the oversampling ratio must be set to 128.

Filter A can also be used for 96 kHz at an AOSR of 64.

Table 5-20. ADC Decimation-Filter-A Specifications

Parameter	Condition	Value (Typical)	Unit
AOSR = 128			
Filter gain pass band	0…0.39 f_S	0.062	dB
Filter gain stop band	0.55…64 f_S	–73	dB
Filter group delay		17/f_S	s
Pass-band ripple, 8 ksps	0…0.39 f_S	0.062	dB
Pass-band ripple, 44.1 ksps	0…0.39 f_S	0.05	dB
Pass-band ripple, 48 ksps	0…0.39 f_S	0.05	dB
AOSR = 64			
Filter gain pass band	0…0.39 f_S	0.062	dB
Filter gain stop band	0.55…32 f_S	–73	dB
Filter group delay		17/f_S	s
Pass-band ripple, 8 ksps	0…0.39 f_S	0.062	dB
Pass-band ripple, 44.1 ksps	0…0.39 f_S	0.05	dB
Pass-band ripple, 48 ksps	0…0.39 f_S	0.05	dB
Pass-band ripple, 96 ksps	0…20 kHz	0.1	dB

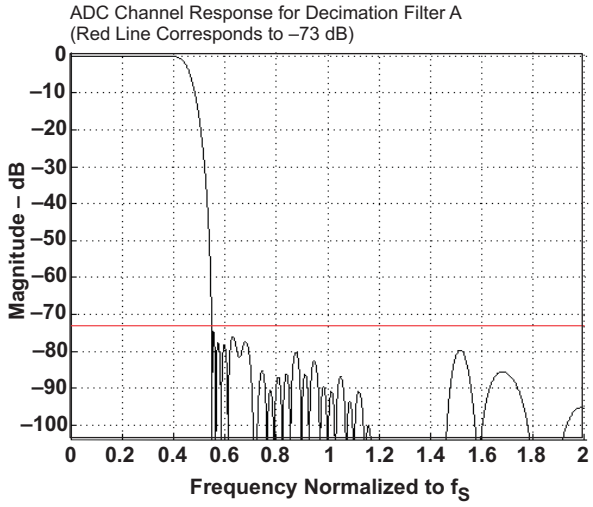

Figure 5-13. ADC Decimation-Filter-A Frequency Response

Copyright © 2009, Texas Instruments Incorporated

5.5.4.4.2 Decimation Filter B

Filter B is intended to support sampling rates up to 96 kHz at an oversampling ratio of 64.

Table 5-21. ADC Decimation-Filter-B Specifications

Parameter	Condition	Value (Typical)	Unit
AOSR = 64			
Filter gain pass band	0…0.39 f_S	±0.077	dB
Filter gain stop band	0.60 f_S…32 f_S	–46	dB
Filter group delay		11/f_S	s
Pass-band ripple, 8 ksps	0…0.39 f_S	0.076	dB
Pass-band ripple, 44.1 ksps	0…0.39 f_S	0.06	dB
Pass-band ripple, 48 ksps	0…0.39 f_S	0.06	dB
Pass-band ripple, 96 ksps	0…20 kHz	0.11	dB

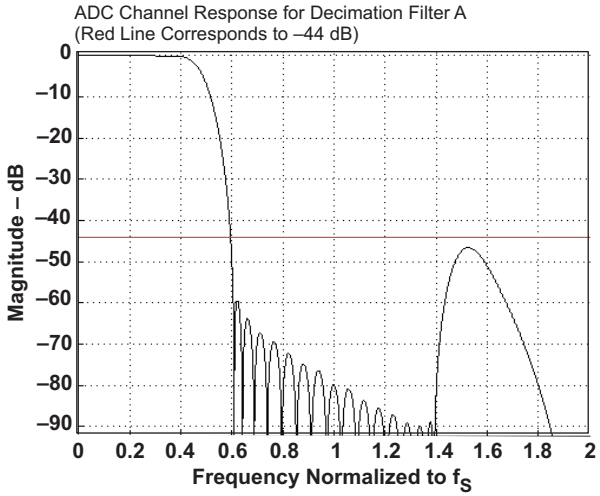

Figure 5-14. ADC Decimation-Filter-B Frequency Response

5.5.4.4.3 Decimation Filter C

Filter C along with an AOSR of 32 is specially designed for 192-ksps operation for the ADC. The pass band, which extends up to 0.11 × f_S (corresponding to 21 kHz), is suited for audio applications.

Table 5-22. ADC Decimation-Filter-C Specifications

Parameter	Condition	Value (Typical)	Unit
Filter gain from 0 to 0.11 f_S	0…0.11 f_S	±0.033	dB
Filter gain from 0.28 f_S to 16 f_S	0.28 f_S…16 f_S	–60	dB
Filter group delay		11/f_S	s
Pass-band ripple, 8 ksps	0…0.11 f_S	0.033	dB
Pass-band ripple, 44.1 ksps	0…0.11 f_S	0.033	dB
Pass-band ripple, 48 ksps	0…0.11 f_S	0.032	dB
Pass-band ripple, 96 ksps	0…0.11 f_S	0.032	dB
Pass-band ripple, 192 ksps	0…20 kHz	0.086	dB

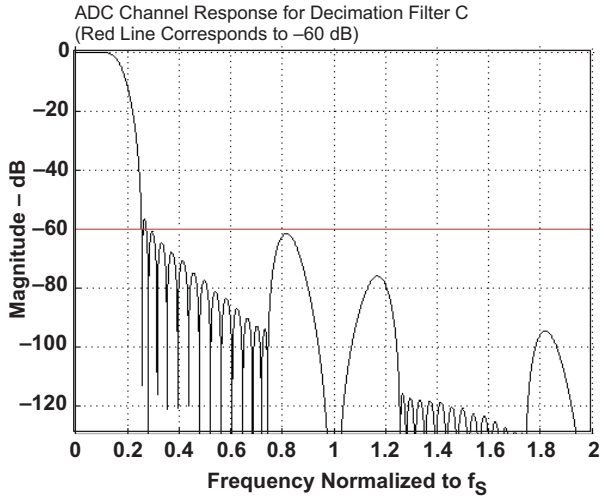

Figure 5-15. ADC Decimation-Filter-C Frequency Response

5.5.4.5 ADC Data Interface

The decimation filter and signal processing block in the ADC channel pass 32-bit data words to the audio serial interface once every cycle of ADC_f_S. During each cycle of ADC_f_S, a pair of data words (for left and right channel) is passed. The audio serial interface rounds the data to the required word length of the interface before converting to serial data. Because the TLV320AIC3111 has only a mono ADC, it passes the same data to both the left and right channels of the audio serial interface.

5.5.5 Updating ADC Digital Filter Coefficients During Record

When it is required to update the ADC digital filter coefficients during record, care must be taken to avoid click and pop noise or even a possible oscillation noise. These artifacts can occur if the ADC coefficients are updated without following the proper update sequence. The correct sequence is shown in Figure 5-16. The values for the times listed are conservative and should be used for software purposes.

Copyright © 2009, Texas Instruments Incorporated

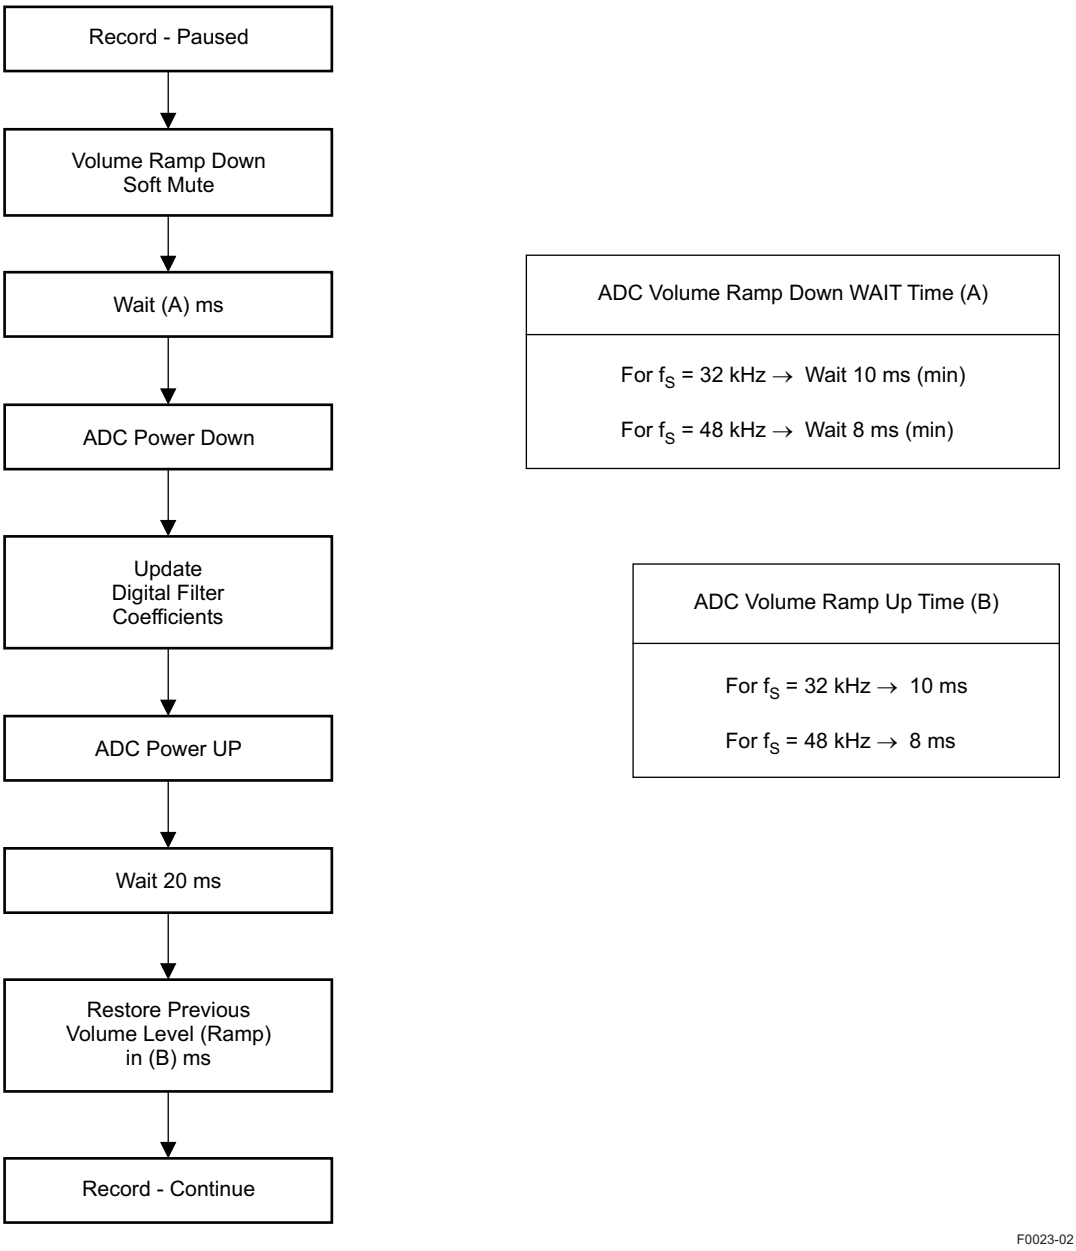

Figure 5-16. Updating ADC Digital Filter Coefficients During Record

5.5.6 *Digital Microphone Function*

In addition to supporting analog microphones, the TLV320AIC3111 can also interface to one digital microphone using using the mono ADC channel. Figure 5-17 shows the digial microphone interface block diagram and Figure 5-18 shows the timing diagram for the digital microphone interface.

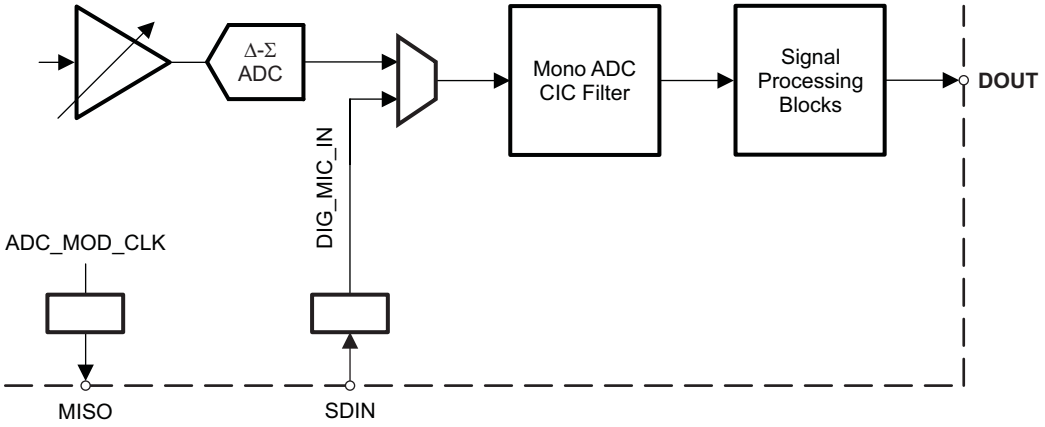

Figure 5-17. Digital Microphone in the TLV320AIC3111

The TLV320AIC3111 outputs internal clock ADC_MOD_CLK on the GPIO1 pin (page 0 / register 51, bits D5–D2 = 1010). This clock can be connected to the external digital microphone device. The single-bit output of the external digital microphone device can be connected to the DIN pin. Internally, the TLV320AIC3111 latches the steady value of the mono ADC data on the rising edge of ADC_MOD_CLK.

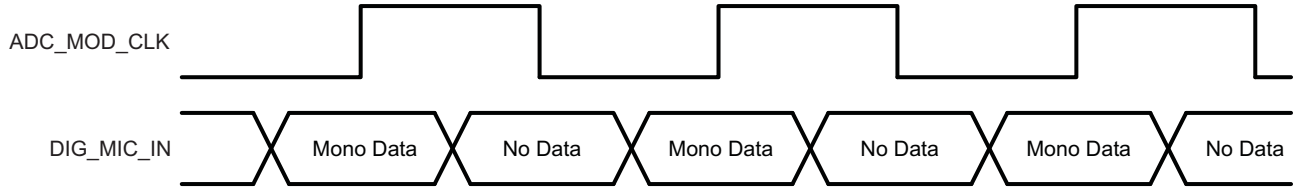

Figure 5-18. Timing Diagram for Digital Microphone Interface

When the digital microphone mode is enabled, the analog section of the ADC can be powered down and bypassed for power efficiency. The AOSR value for the ADC channel must be configured to select the desired decimation ratio to be achieved, based on the external digital microphone properties.

5.5.7 DC Measurement

The TLV320AIC3111 supports a highly flexible dc-measurement mode using the high-resolution oversampling and noise-shaping ADC. This mode can be used when the ADC channel is not used for the voice/audio record function. This mode can be enabled by programming page 0 / register 102, bit D7. The converted data is 24 bits, using the 2.22 numbering format. The value of the converted data for the ADC channel can be read back from page 0 / register 104 through page 1 / register 106. Before reading back the converted data, page 0 / register 103, bit D6 must be programmed to 1 in order to latch the converted data into the read-back registers. After the converted data is read back, page 0 / register 103, bit D6 must be immediately reset to 0. In dc-measurement mode, two measurement modes are supported.

Mode A

In dc-measurement mode A, a variable-length averaging filter is used. The length of averaging filter D can be programmed from 1 to 20 by programming page 0 / register 102, bits D4–D0. To choose mode A, page 0 / register 102, bit D5 must be programmed to 0.

Copyright © 2009, Texas Instruments Incorporated

Mode B

To choose mode B, page 0 / register 102, bit D5 must be programmed to 1. In dc-measurement mode B, a first-order IIR filter is used. The coefficients of this filter are determined by D, page 0 / register 102, bits D4–D0. The nature of the filter is given in Table 5-23.

Table 5-23. DC Measurement Bandwidth Settings

D: Page 0 / register 102, Bits D4–D0	–3 dB BW (Hz)	–0.5 dB BW (Hz)
1	688,440	236,500
2	275,970	96,334
3	127,400	44,579
4	61,505	21,532
5	30,248	10,590
6	15,004	5,253
7	7,472	2,616
8	3,729	1,305
9	1,862	652
10	931	326
11	465	163
12	232.6	81.5
13	116.3	40.7
14	58.1	20.3
15	29.1	10.2
16	14.54	5.09
17	7.25	2.54
18	3.63	1.27
19	1.8	0.635
20	0.908	0.3165

By programming page 0 / register 103, bit D5 to 1, the averaging filter is periodically reset after 2^R number of ADC_MOD_CLK periods, where R is programmed in page 0 / register 103, bits D4–D0. When page 0 / register 103, bit D5 is set to 1, then the value of D should be less than the value of R. When page 0 / register 103, bit D5 is programmed to 0, the averaging filter is never reset.

5.6 Audio DAC and Audio Analog Outputs

Each channel of the stereo audio DAC consists of a digital audio processing block, a digital interpolation filter, a digital delta-sigma modulator, and an analog reconstruction filter. This high oversampling ratio (normally DOSR is between 32 and 128) exhibits good dynamic range by ensuring that the quantization noise generated within the delta-sigma modulator stays outside of the audio frequency band. Audio analog outputs include stereo headphone/lineouts and stereo class-D speaker outputs.

5.6.1 DAC

The TLV320AIC3111 stereo audio DAC supports data rates from 8 kHz to 192 kHz. Each channel of the stereo audio DAC consists of a signal-processing engine with fixed processing blocks, a programmable miniDSP, a digital interpolation filter, multibit digital delta-sigma modulator, and an analog reconstruction filter. The DAC is designed to provide enhanced performance at low sampling rates through increased oversampling and image filtering, thereby keeping quantization noise generated within the delta-sigma

Copyright © 2009, Texas Instruments Incorporated

modulator and signal images strongly suppressed within the audio band to beyond 20 kHz. To handle multiple input rates and optimize power dissipation and performance, the TLV320AIC3111 allows the system designer to program the oversampling rates over a wide range from 1 to 1024 by configuring page 0 / register 13 and page 0 / register 14. The system designer can choose higher oversampling ratios for lower input data rates and lower oversampling ratios for higher input data rates.

The TLV320AIC3111 DAC channel includes a built-in digital interpolation filter to generate oversampled data for the delta-sigma modulator. The interpolation filter can be chosen from three different types, depending on required frequency response, group delay, and sampling rate.

DAC power up is controlled by writing to page 0 / register 63, bit D7 for the left channel and bit D6 for the right channel. The left-channel DAC clipping flag is provided as a read-only bit on page 0 / register 39, bit D7. The right-channel DAC clipping flag is provided as a read-only bit on page 0 / register 39, bit D6.

5.6.1.1 DAC Processing Blocks

The TLV320AIC3111 implements signal-processing capabilities and interpolation filtering via processing blocks. These fixed processing blocks give users the choice of how much and what type of signal processing they use and which interpolation filter is applied.

The choices among these processing blocks allow the system designer to balance power conservation and signal-processing flexibility. Table 5-24 gives an overview of all available processing blocks of the DAC channel and their properties. The resource-class column gives an approximate indication of power consumption for the digital (DVDD) supply; however, based on the out-of-band noise spectrum, the analog power consumption of the drivers (HPVDD) may differ.

The signal processing blocks available are:

- First-order IIR
- Scalable number of biquad filters
- 3D effect
- Beep generator

The processing blocks are tuned for common cases and can achieve high image rejection or low group delay in combination with various signal-processing effects such as audio effects and frequency shaping. The available first-order IIR and biquad filters have fully user-programmable coefficients.

5.6.1.3 DAC User-Programmable Filters

Depending on the selected processing block, different types and orders of digital filtering are available. Up to six biquad sections are available for specific processing blocks.

The coefficients of the available filters are arranged as sequentially-indexed coefficients in two banks. If adaptive filtering is chosen, the coefficient banks can be switched on-the-fly.

When the DAC is running, the user-programmable filter coefficients are locked and cannot be accessed for either read or write.

However, the TLV320AIC3111 offers an adaptive filter mode as well. Setting page 8 / register 1, bit D2 = 1 turns on double buffering of the coefficients. In this mode, filter coefficients can be updated through the host and activated without stopping and restarting the DAC. This enables advanced adaptive filtering applications.

In the double-buffering scheme, all coefficients are stored in two buffers (buffers A and B). When the DAC is running and the adaptive filtering mode is turned on, setting page 8 / register 1, bit D0 = 1 switches the coefficient buffers at the next start of a sampling period. This bit is set back to 0 after the switch occurs. At the same time, page 8 / register 1, bit D1 toggles.

The flag in page 8 / register 1, bit D1 indicates which of the two buffers is actually in use.

Page 8 / register 1, bit D1 = 0: buffer A is in use by the DAC engine; bit D1 = 1: buffer B is in use.

While the device is running, coefficient updates are always made to the buffer not in use by the DAC, regardless of the buffer to which the coefficients have been written.

Table 5-25. Adaptive-Mode Filter-Coefficient Buffer Switching

DAC Running?	Page 8, Reg 1, Bit D1	Coefficient Buffer in Use	Writing to	Updates
No	0	None	C1, buffer A	C1, buffer A
No	0	None	C1, buffer B	C1, buffer B
Yes	0	Buffer A	C1, buffer A	C1, buffer B
Yes	0	Buffer A	C1, buffer B	C1, buffer B
Yes	1	Buffer B	C1, buffer A	C1, buffer A
Yes	1	Buffer B	C1, buffer B	C1, buffer A

The user-programmable coefficients C1 to C70 are defined on pages 8, 9, 10, and 11 for buffer A and pages 12, 13, 14, and 15 for buffer B.

The coefficients of these filters are each 16-bit, 2s-complement format, occupying two consecutive 8-bit registers in the register space. Specifically, the filter coefficients are in 1.15 (one dot 15) format with a range from –1.0 (0x8000) to 0.999969482421875 (0x7FFF) as shown in Figure 5-12.

5.6.1.3.1 First-Order IIR Section

The IIR is of first order and its transfer function is given by

$$H(z) = \frac{N_0 + N_1 z^{-1}}{2^{15} - D_1 z^{-1}} \quad (4)$$

The frequency response for the first-order IIR section with default coefficients is flat.

Table 5-26. DAC IIR Filter Coefficients

5.6.1.3.2 Biquad Section

The transfer function of each of the biquad filters is given by

$$H(z) = \frac{N_0 + 2 \times N_1 z^{-1} + N_2 z^{-2}}{2^{15} - 2 \times D_1 z^{-1} - D_2 z^{-2}} \quad (5)$$

Table 5-27. DAC Biquad Filter Coefficients

5.6.1.4 DAC Interpolation Filter Characteristics

5.6.1.4.1 Interpolation Filter A

Filter A is designed for an f_S up to 48 ksps with a flat pass band of 0 kHz–20 kHz.

Table 5-28. Specification for DAC Interpolation Filter A

Parameter	Condition	Value (Typical)	Unit
Filter-gain pass band	0 … 0.45 f_S	±0.015	dB
Filter-gain stop band	0.55 f_S… 7.455 f_S	–65	dB
Filter group delay		21/f_S	s

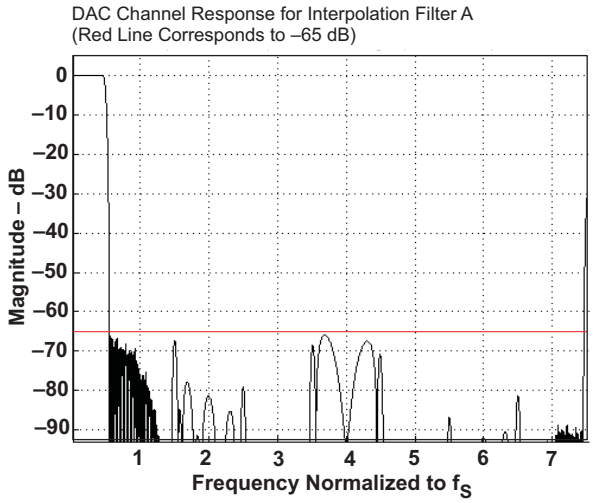

Figure 5-30. Frequency Response of DAC Interpolation Filter A

5.6.1.4.2 Interpolation Filter B

Filter B is specifically designed for an f_S up to 96 ksps. Thus, the flat pass-band region easily covers the required audio band of 0 kHz–20 kHz.

Table 5-29. Specification for DAC Interpolation Filter B

Parameter	Condition	Value (Typical)	Unit
Filter-gain pass band	0 … 0.45 f_S	±0.015	dB
Filter-gain stop band	0.55 f_S … 3.45 f_S	–58	dB
Filter group delay		18/f_S	s

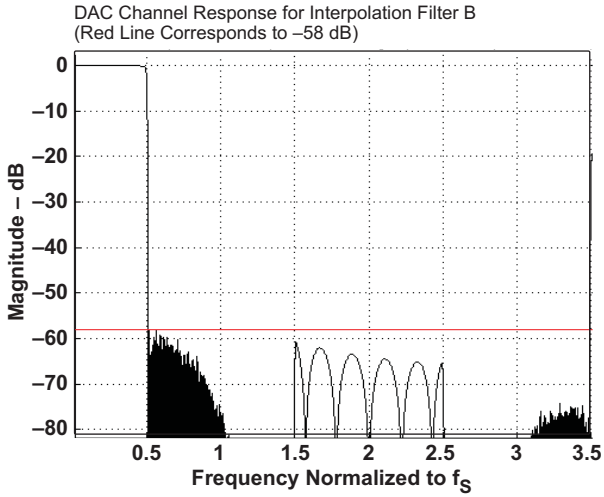

Figure 5-31. Frequency Response of Channel Interpolation Filter B

5.6.1.4.3 Interpolation Filter C

Filter C is specifically designed for the 192-ksps mode. The pass band extends up to 0.4 × f_S (corresponds to 80 kHz), more than sufficient for audio applications.

Copyright © 2009, Texas Instruments Incorporated

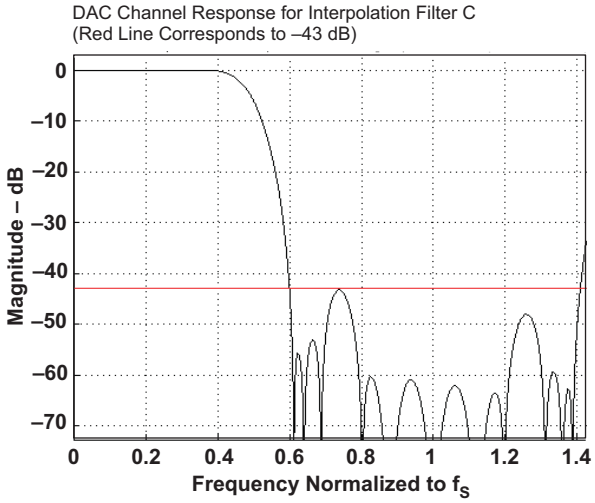

Figure 5-32. Frequency Response of DAC Interpolation Filter C

Table 5-30. Specification for DAC Interpolation Filter C

Parameter	Condition	Value (Typical)	Unit
Filter-gain pass band	0 … 0.35 f_S	±0.03	dB
Filter-gain stop band	0.6 f_S … 1.4 f_S	–43	dB
Filter group delay		13/f_S	s

5.6.2 DAC Digital-Volume Control

The DAC has a digital-volume control block which implements programmable gain. Each channel has an independent volume control that can be varied from 24 dB to –63.5 dB in 0.5-dB steps. The left-channel DAC volume can be controlled by writing to page 0 / register 65, bits D7–D0. The right-channel DAC volume can be controlled by writing to page 0 / register 66, bits D7–D0. DAC muting and setting up a master gain control to control both channels is done by writing to page 0 / register 64, bits D3–D0. The gain is implemented with a soft-stepping algorithm, which only changes the actual volume by 0.125 dB per input sample, either up or down, until the desired volume is reached. The rate of soft-stepping can be slowed to one step per two input samples by writing to page 0 / register 63, bits D1–D0. Note that the default source for volume-control level settings is control by register writes (page 0 / register 65 and page 0 / register 66 to control volume). Use of the VOL/MICDET pin to control the DAC volume is ignored until the volume control source selected has been changed to pin control (page 0 / register 116, bit D7 = 1). This functionality is shown in Figure 1-1.

During soft-stepping, the host does not receive a signal when the DAC has been completely muted. This may be important if the host must mute the DAC before making a significant change, such as changing sample rates. In order to help with this situation, the device provides a flag back to the host via a read-only register, page 0 / register 38, bit D4 for the left channel and bit D0 for the right channel. This information alerts the host when the part has completed the soft-stepping and the actual volume has reached the desired volume level. The soft-stepping feature can be disabled by writing to page 0 / register 63, bits D1–D0.

If soft-stepping is enabled, the CODEC_CLKIN signal should be kept active until the DAC power-up flag is cleared. When this flag is cleared, the internal DAC soft-stepping process is complete, and CODEC_CLKIN can be stopped if desired. (The analog volume control can be ramped down using an internal oscillator.)

Copyright © 2009, Texas Instruments Incorporated

5.6.3 Volume-Control Pin

The volume-control pin is not enabled by default but it can be enabled by writing 1 to page 0 / register 116, bit D7. The default DAC volume control uses software control of the volume, which occurs if page 0 / register 116, bit D7 = 0. Soft-stepping the volume level is set up by writing to page 0 / register 63, bits D1–D0.

When the volume-pin function is used, a 7-bit Vol ADC reads the voltage on the VOL/MICDET pin and updates the digital volume control. (It overwrites the current value of the volume control.) The new volume setting which has been applied due to a change of voltage on the volume control pin can be read on page 0 / register 117, bits D6–D0. The 7-bit Vol ADC clock source can be selected on page 0 / register 116, bit D6. The update rate can be programmed on page 0 / register 116, bits D2–D0 for this 7-bit SAR ADC.

The VOL/MICDET pin gainmapping is shown in Table 5-31.

Table 5-31. VOL/MICDET Pin Gain Mapping

VOL/MICDET PIN SAR OUTPUT	DIGITAL GAIN APPLIED
0	18 dB
1	17.5 dB
2	17 dB
:	:
35	0.5 dB
36	0.0 dB
37	–0.5 dB
:	:
89	–26.5 dB
90	–27 dB
91	–28 dB
:	:
125	–62 dB
126	–63 dB
127	Mute

Copyright © 2009, Texas Instruments Incorporated

The VOL/MICDET pin connection and functionality are shown in Figure 5-33.

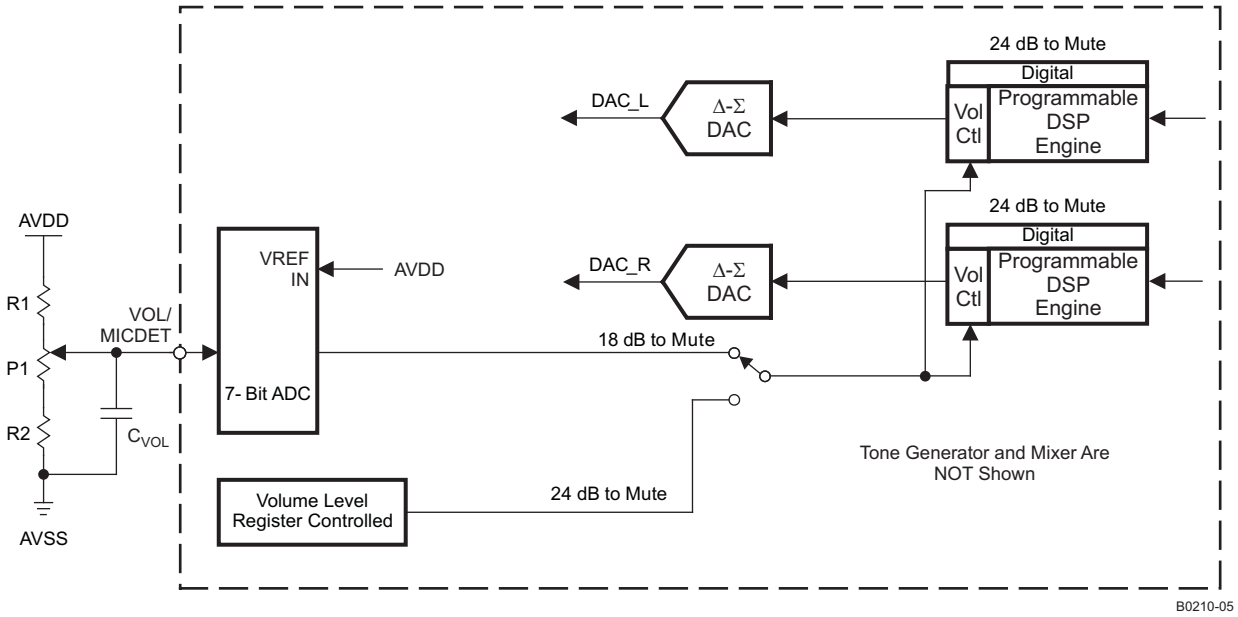

Figure 5-33. Digital Volume Controls for Beep Generator and DAC Play Data

As shown in Table 5-31, the VOL/MICDET pin has a range of volume control from 18 dB down to –63 dB, and mute. However, if less maximum gain is required, then a smaller range of voltage should be applied to the VOL/MICDET pin. This can be done by increasing the value of R2 relative to the value of (P1 + R1), so that more voltage is available at the bottom of P1. The circuit should also be designed such that for the values of R1, R2, and P1 chosen, the maximum voltage (top of the potentiometer) does not exceed AVDD/2 (see Figure 5-33). The recommended values for R1, R2, and P1 for several maximum gains are shown in Table 5-32. Note that in typical applications, R1 should not be 0 Ω, as the VOL/MICDET pin should not exceed AVDD/2 for proper ADC operation.

Table 5-32. VOL/MICDET Pin Gain Scaling

R1 (kΩ)	P1 (kΩ)	R2 (kΩ)	ADC VOLTAGE for AVDD = 3.3 V (V)	DIGITAL GAIN RANGE (dB)
25	25	0	0 V to 1.65 V	18 dB to –63 dB
33	25	7.68	0.386 V to 1.642 V	3 dB to –63 dB
34.8	25	9.76	0.463 V to 1.649 V	0 dB to –63 dB

5.6.4 Dynamic Range Compression

Typical music signals are characterized by crest factors, the ratio of peak signal power to average signal power, of 12 dB or more. To avoid audible distortions due to clipping of peak signals, the gain of the DAC channel must be adjusted so as not to cause hard clipping of peak signals. As a result, during nominal periods, the applied gain is low, causing the perception that the signal is not loud enough. To overcome this problem, dynamic range conpression (DRC) in the TLV320AIC3111 continuously monitors the output of the DAC digital volume control to detect its power level relative to 0 dBFS. When the power level is low, DRC increases the input signal gain to make it sound louder. At the same time, if a peaking signal is detected, it autonomously reduces the applied gain to avoid hard clipping. This results in sounds more pleasing to the ear as well as sounding louder during nominal periods.

The DRC functionality in the TLV320AIC3111 is implemented by a combination of processing blocks in the DAC channel as described in Section 5.6.1.2.

Copyright © 2009, Texas Instruments Incorporated

DRC can be disabled by writing to page 0 / register 68, bits D6–D5.

DRC typically works on the filtered version of the input signal. The input signals have no audio information at dc and extremely low frequencies; however, they can significantly influence the energy estimation function in the dynamic range compressor (*the DRC*). Also, most of the information about signal energy is concentrated in the low-frequency region of the input signal.

To estimate the energy of the input signal, the signal is first fed to *the DRC* high-pass filter and then to *the DRC* low-pass filter. These filters are implemented as first-order IIR filters given by

$$H_{HPF}(z) = \frac{N_0 + N_1 z^{-1}}{2^{15} - D_1 z^{-1}} \quad (6)$$

$$H_{LPF}(z) = \frac{N_0 + N_1 z^{-1}}{2^{15} - D_1 z^{-1}} \quad (7)$$

The coefficients for these filters are 16 bits wide in 2s-complement format and are user-programmable through register write as given in Table 5-33.

Table 5-33. *The DRC* HPF and LPF Coefficients

Coefficient	Location
HPF N0	C71 page 9 / register 14 and page 9 / register 15
HPF N1	C72 page 9 / registers 16 and page 9 / register 17
HPF D1	C73 page 9 / registers 18 and page 9 / register 19
LPF N0	C74 page 9 / registers 20 and page 9 / register 21
LPF N1	C75 page 9 / registers 22 and page 9 / register 23
LPF D1	C76 page 9 / registers 24 and page 9 / register 25

The default values of these coefficients implement a high-pass filter with a cutoff at 0.00166 × DAC_f_S, and a low-pass filter with a cutoff at 0.00033 × DAC_f_S.

The output of *the DRC* high-pass filter is fed to the processing block selected for the DAC channel. The absolute value of *the DRC* LPF filter is used for energy estimation within *the DRC*.

The gain in the DAC digital volume control is controlled by page 0 / register 65 and page 0 / register 66. When *the DRC* is enabled, the applied gain is a function of the digital volume control register setting and the output of *the DRC*.

The DRC parameters are described in sections that follow.

5.6.4.1 DRC Threshold

DRC threshold represents the level of the DAC playback signal at which the gain compression becomes active. The output of the digital volume control in the DAC is compared with the set threshold. The threshold value is programmable by writing to page 0 / register 68, bits D4–D2. The threshold value can be adjusted between –3 dBFS and –24 dBFS in steps of 3 dB. Keeping the DRC threshold value too high may not leave enough time for *the DRC* block to detect peaking signals, and can cause excessive distortion at the outputs. Keeping the DRC threshold value too low can limit the perceived loudness of the output signal.

The recommended DRC threshold value is –24 dB.

When the output signal exceeds the set DRC threshold, the interrupt flag bits at page 0 / register 44, bits D3–D2 are updated. These flag bits are *sticky* in nature, and are reset only after they are read back by the user. The non-sticky versions of the interrupt flags are also available at page 0 / register 46, bits D3–D2.

Copyright © 2009, Texas Instruments Incorporated

5.6.4.2 DRC Hysteresis

DRC hysteresis is programmable by writing to page 0 / register 68, bits D1–D0. These bits can be programmed to represent values between 0 dB and 3 dB in steps of 1dB. It is a programmable window around the programmed DRC threshold that must be exceeded for *the* disabled *DRC* to become enabled, or *the* enabled *DRC* to become disabled. For example, if the DRC threshold is set to –12 dBFS and the DRC hysteresis is set to 3 dB, then if the gain compression in *the DRC* is inactive, the output of the DAC digital volume control must exceed –9 dBFS before gain compression due to *the DRC* is activated. Similarly, when the gain compression in *the DRC* is active, the output of the DAC digital volume control must fall below –15 dBFS for gain compression in *the DRC* to be deactivated. The DRC hysteresis feature prevents the rapid activation and de-activation of gain compression in *the DRC* in cases when the output of the DAC digital volume control rapidly fluctuates in a narrow region around the programmed DRC threshold. By programming the DRC hysteresis as 0 dB, the hysteresis action is disabled.

The recommended value of DRC hysteresis is 3 dB.

5.6.4.3 DRC Hold

DRC hold is intended to slow the start of decay for a specified period of time in response to a decrease in energy level. To minimize audible artifacts, it is recommended to set the DRC hold time to 0 through programming page 0 / register 69, bits D6–D3 = 0000.

5.6.4.4 DRC Attack Rate

When the output of the DAC digital volume control exceeds the programmed DRC threshold, the gain applied in the DAC digital volume control is progressively reduced to avoid the signal from saturating the channel. This process of reducing the applied gain is called *attack*. To avoid audible artifacts, the gain is reduced slowly with a rate equaling the attack rate, programmable via page 0 / register 70, bits D7–D4. Attack rates can be programmed from 4-dB gain change per 1/DAC_f_S to 1.2207e–5-dB gain change per 1/DAC_f_S.

Attack rates should be programmed such that before the output of the DAC digital volume control can clip, the input signal should be sufficiently attenuated. High attack rates can cause audible artifacts, and too-slow attack rates may not be able to prevent the input signal from clipping.

The recommended DRC attack rate value is 1.9531e–4 dB per 1/DAC_f_S.

5.6.4.5 DRC Decay Rate

When *the DRC* detects a reduction in output signal swing beyond the programmed DRC threshold, *the DRC* enters a decay state, where the applied gain in the digital-volume control is gradually increased to programmed values. To avoid audible artifacts, the gain is slowly increased with a rate equal to the decay rate programmed through page 0 / register 70, bits D3–D0. The decay rates can be programmed from 1.5625e–3 dB per 1/DAC_f_S to 4.7683e–7 dB per 1/DAC_f_S. If the decay rates are programmed too high, then sudden gain changes can cause audible artifacts. However, if it is programmed too slow, then the output may be perceived as too low for a long time after the peak signal has passed.

The recommended value of DRC decay rate is 2.4414e–5 dB per 1/DAC_f_S.

5.6.5 Headset Detection

The TLV320AIC3111 includes extensive capability to monitor a headphone, microphone, or headset jack, to determine if a plug has been inserted into the jack, and then determine what type of headset/headphone is wired to the plug. The device also includes the capability to detect a button press, even, for example, when starting calls on mobile phones with headsets. Figure 5-34 shows the circuit configuration to enable this feature.

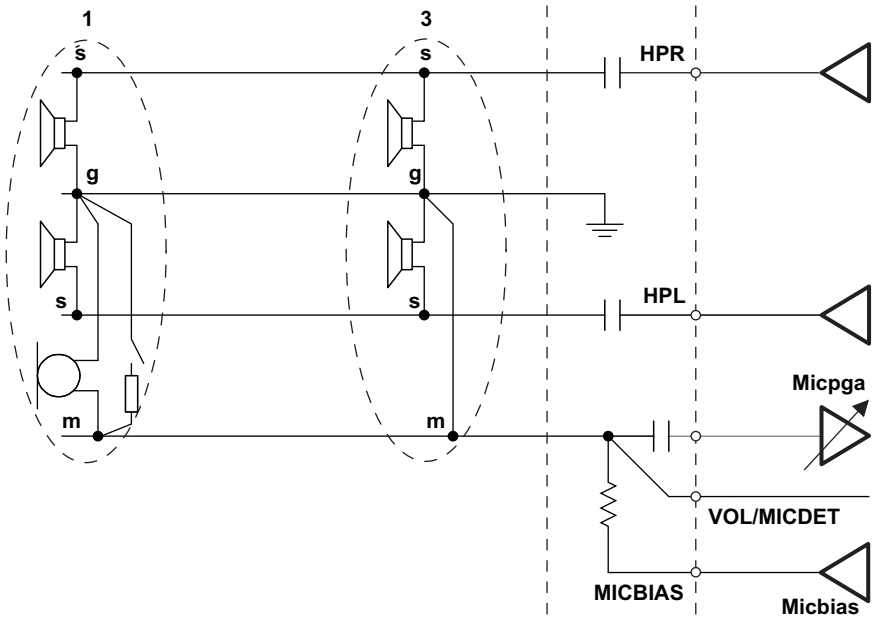

Figure 5-34. Jack Connections for Headset Detection

Copyright © 2009, Texas Instruments Incorporated

This feature is enabled by programming page 0 / register 67, bit D1. In order to avoid false detections due to mechanical vibrations in headset jacks or microphone buttons, a debounce function is provided for glitch rejection. For the case of headset insertion, a debounce function with a range of 32 ms to 512 ms is provided. This can be programmed via page 0 / register 67, bits D4–D2. For improved button-press detection, the debounce function has a range of 8 ms to 32 ms by programming page 0 / register 67, bits D1–D0.

The TLV320AIC3111 also provides feedback to the user through register-readable flags as well as an interrupt on the I/O pins when a button press or a headset insertion/removal event is detected. The value in page 0 / register 46, bits D5–D4 provides the instantaneous state of button press and headset insertion. Page 0 / register 44, bit D5 is a sticky (latched) flag that is set when the button-press event is detected. Page 0 / register 44, bit D4 is a sticky flag which is set when the headset insertion or removal event is detected. These sticky flags are set by the event occurrence, and are reset only when read. This requires polling page 0 / register 44. To avoid polling and the associated overhead, the TLV320AIC3111 also provides an interrupt feature, whereby events can trigger the INT1 and/or INT2 interrupts. These interrupt events can be routed to one of the digital output pins. See Section 5.6.6 for details.

The TLV320AIC3111 not only detects a headset insertion event, but also is able to distinguish between the different headsets inserted, such as stereo headphones or cellular headphones. After the headset-detection event, the user can read page 0 / register 67, bits D6–D5 to determine the type of headset inserted.

Table 5-34. Headset-Detection Block Registers

Register	Description
Page 0 / register 67, bit D1	Headset-detection enable/disable
Page 0 / register 67, bits D4–D2	Debounce programmability for headset detection
Page 0 / register 67, bits D1–D0	Debounce programmability for button press
Page 0 / register 44, bit D5	Sticky flag for button-press event
Page 0 / register 44, bit D4	Sticky flag for headset-insertion or -removal event
Page 0/ register 46, bit D5	Status flag for button-press event
Page 0 / register 46, bit D4	Status flag for headset insertion and removal
Page 0 / register 67, bits D6–D5	Flags for type of headset detected

The headset detection block requires AVDD to be powered. The headset detection feature in the TLV320AIC3111 is achieved with very low power overhead, requiring less than 20 µA of additional current from the AVDD supply.

5.6.6 Interrupts

Some specific events in the TLV320AIC3111 which may require host processor intervention, can be used to trigger interrupts to the host processor. This avoids polling the status-flag registers continuously. The TLV320AIC3111 has two defined interrupts, INT1 and INT2, that can be configured by programming page 0 / register 48 and page 0 / register 49. A user can configure interrupts INT1 and INT2 to be triggered by one or many events, such as:

- Headset detection
- Button press
- DAC DRC signal exceeding threshold
- Noise detected by AGC
- Overcurrent condition in headphone drivers/speaker drivers
- Data overflow in ADC and DAC processing blocks and filters
- DC measurement data available

Copyright © 2009, Texas Instruments Incorporated

Each of these INT1 and INT2 interrupts can be routed to output pins GPIO1 or DOUT. These interrupt signals can either be configured as a single pulse or a series of pulses by programming page 0 / register 48, bit D0 and page 0 / register 49, bit D0. If the user configures the interrupts as a series of pulses, the events trigger the start of pulses that stop when the flag registers in page 0 / registers 44, 45, and 50 are read by the user to determine the cause of the interrupt.

5.6.7 Key-Click Functionality With Beep Generator (PRB_P25)

A special algorithm has been included in the digital signal processing block PRB_P25 for generating a digital sine-wave signal that is sent to the DAC. This functionality is intended for generating key-click sounds for user feedback. The sine-wave generator is very flexible (see Table 5-35) and is completely register programmable. Programming page 0 / register 71 through page 0 / register 79 (8 bits each) completely controls the functionality of this generator and allows for differentiating sounds.

The two registers used for programming the 16-bit sine-wave coefficient are page 0 / register 76 and page 0 / register 77. The two registers used for programming the 16-bit cosine-wave coefficient are page 0 / register 78 and page 0 / register 79. This coefficient resolution allows virtually any frequency of sine wave in the audio band to be generated, up to $f_S/2$.

The three registers used to control the length of the sine-burst waveform are page 0 / register 73 through page 0 / register 75. The resolution (bit) in the registers of the sine-burst length is one sample time, so this allows great control on the overall time of the sine-burst waveform. This 24-bit length timer supports 16,777,215 sample times. (For example, if f_S is set at 48 kHz, and the register value equals 96,000d (01 7700h), then the sine burst lasts exactly 2 seconds.) The default settings for the tone generator, based on using a sample rate of 48 kHz, are 1-kHz (approximately) sine wave, with a sine-burst length of five cycles (5 ms).

Table 5-35. Beep Generator Register Locations (Page 00h)

	LEFT BEEP CONTROL	RIGHT BEEP CONTROL	BEEP LENGTH			SINE		COSINE	
			MSB	MID	LSB	MSB	LSB	MSB	LSB
REGISTER	71	72	73	74	75	76	77	78	79

Table 5-36. Example Beep-Generator Settings for a 1000-Hz Tone

BEEP FREQUENCY	BEEP LENGTH			SINE		COSINE		SAMPLE RATE
Hz	MSB (hex)	MID (hex)	LSB (hex)	MSB (hex)	LSB (hex)	MSB (hex)	LSB (hex)	Hz
1000 (1)	0	0	EE	10	D8	7E	E3	48,000

(1) These are the default settings.

Two registers are used to control the left sine-wave volume and the right sine-wave volume independently. The 6-bit digital volume control used allows level control of 2 dB to –61 dB in 1-dB steps. The left-channel volume is controlled by writing to page 0 / register 71, bits D5–D0. The right-channel volume is controlled by writing to page 0, register 72, bits D5–D0. A master volume control that controls the left and right channels of the beep generator can be set up by writing to page 0 / register 72, bits D7–D6. The default volume control setting is 2 dB, which provides the maximum tone-generator output level.

For generating other tones, the three tone-generator coefficients can be found by running the following script using MATLAB™ :

```
Sine = dec2hex(round(sin(2*pi*Fin/Fs)*2^15)) Cosine =
dec2hex(round(cos(2*pi*Fin/Fs)*2^15)) Beep Length =
dec2hex(floor(Fs*Cycle/Fin))
```

where,

f_{in} = Beep frequency desired
f_S = Sample rate
Cycle = Number of beep (sine wave) cycles that are needed

Copyright © 2009, Texas Instruments Incorporated

dec2hex = Decimal to hexadecimal conversion function

NOTES:

1. f_{in} should be less than $f_S/4$.
2. For the sine and cosine values, if the number of bits is less than the full 16-bit value, then the unused MSBs must be written as 0s.
3. For the beep-length values, if number of bits is less than the full 24-bit value, then the unused MSBs must be written as 0s.

Following the beep-volume control is a digital mixer that mixes in a playback data stream whose level has already been set by the DAC volume control. Therefore, once the key-click volume level is set, the key-click volume is not affected by the DAC volume control, which is the main control available to the end user. This functionality is shown in Figure 1-1.

Following the DAC, the signal can be further scaled by the analog output volume control and power-amplifier level control.

The beep generator is used for the key-click function. A single beep is generated by writing to page 0 / register 71, bit D7. After the programmed beep length has finished, register 71, bit D7 is reset back to zero.

5.6.8 Programming DAC Digital Filter Coefficients

The digital filter coefficients must be programmed through the I^2C interface. All digital filtering for the DAC signal path must be loaded into the RAM before the DAC is powered on. (Note that default ALLPASS filter coefficients for programmable biquads are located in boot ROM. The boot ROM automatically loads the default values into the RAM following a hardware reset (toggling the $\overline{\text{RESET}}$ pin) or after a software reset. After resetting the device, loading boot ROM coefficients into the digital filters requires 100 µs of programming time. During this time, reading or writing to page 8 through page 15 for updating DAC filter coefficient values is not permitted. (The DAC should not be powered up until after all of the DAC configurations have been done by the system microprocessor.)

5.6.9 Updating DAC Digital Filter Coefficients During PLAY

When it is required to update the DAC digital filter coefficients or beep generator during play, care must be taken to avoid click and pop noise or even a possible oscillation noise. These artifacts can occur if the DAC coefficients are updated without following the proper update sequence. The correct sequence is shown in Figure 5-35. The values for times listed in Figure 5-35 are conservative and should be used for software purposes.

There is also an adaptive mode, in which DAC coefficients can be updated while the DAC is on. For details, see Section 5.6.1.3.

Copyright © 2009, Texas Instruments Incorporated

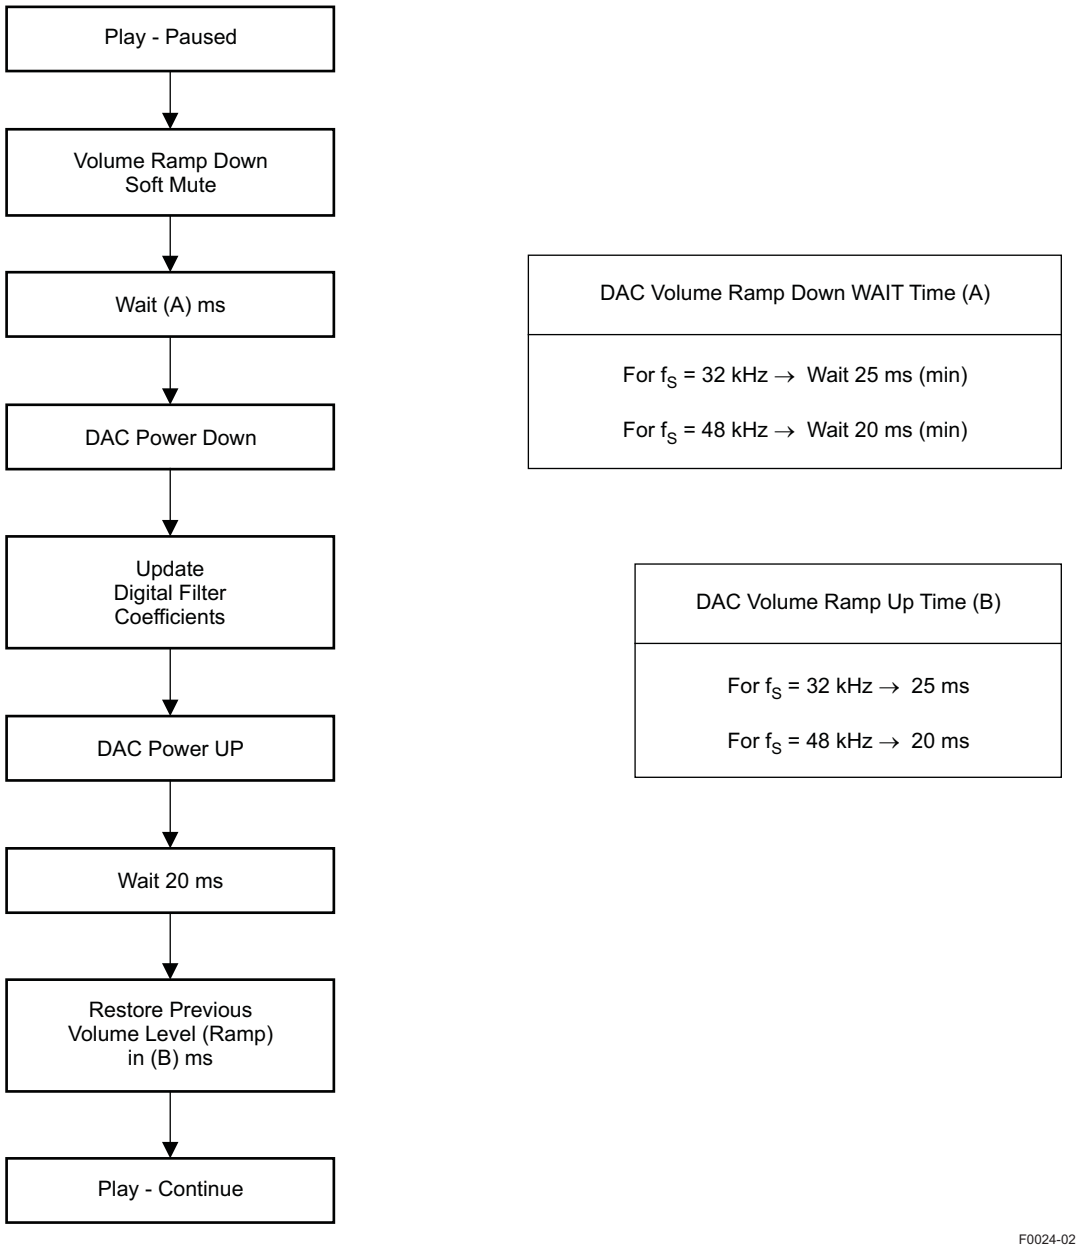

Figure 5-35. Example Flow For Updating DAC Digital Filter Coefficients During Play

5.6.10 Digital Mixing and Routing

The TLV320AIC3111 has four digital mixing blocks. Each mixer can provide either mixing or multiplexing of the digital audio data. This arrangement of digital mixers allows independent volume control for both the playback data and the key-click sound. The first set of mixers can be used to make monaural signals from left and right audio data, or they can even be used to swap channels to the DAC. This function is accomplished by selecting left audio data for the right DAC input, and right data for the left DAC input. The second set of mixers provides mixing of the audio data stream and the key-click sound. The digital routing can be configured by writing to page 0 / register 63, bits D5–D4 for the left channel and bits D3–D2 for the right channel.

Because the key-click function uses the digital signal processing block, the CODEC_CLKIN, DAC, analog volume control, and output driver must be powered on for the key-click sound to occur.

Copyright © 2009, Texas Instruments Incorporated

5.6.11 Analog Audio Routing

The TLV320AIC3111 has the capability to route the DAC output to either the headphone or the speaker output. If desirable, both output drivers can be operated at the same time while playing at different volume levels. The TLV320AIC3111 provides various digital routing capabilities, allowing digital mixing or even channel swapping in the digital domain. All analog outputs other than the selected ones can be powered down for optimal power consumption.

5.6.11.1 Analog Output Volume Control

The output volume control can be used to fine-tune the level of the mixer amplifier signal supplied to the headphone driver or the speaker driver. This architecture supports separate and concurrent volume levels for each of the four output drivers. This volume control can also be used as part of the output pop-noise reduction scheme. This feature is available even if the ADC and DAC are powered down.

5.6.11.2 Headphone Analog Output Volume Control

For the headphone outputs, the analog volume control has a range from 0 dB to –78 dB in 0.5-dB steps for most of the useful range plus mute, which is shown in Table 5-37 and Table 5-38. This volume control includes soft-stepping logic. Routing the left-channel DAC output signal to the left-channel analog volume control is done by writing to page 1 / register 35, bit D6. Routing the right-channel DAC output signal to the right-channel analog volume control is done by writing to page 1 / register 35, bit D2.

Changing the left-channel analog volume for the headphone is controlled by writing to page 1 / register 36, bits D6–D0. Changing the right-channel analog volume for the headphone is controlled by writing to page 1 / register 37, bits D6–D0. Routing the signal from the output of the left-channel analog volume control to the input of the left-channel headphone power amplifier is done by writing to page 1 / register 36, bit D7. Routing the signal from the output of the right-channel analog volume control to the input of the right-channel headphone power amplifier is done by writing to page 1 / register 37, bit D7.

The analog volume-control soft-stepping time is based on the setting in page 0 / register 63, bits D1–D0.

5.6.11.3 Class-D Speaker Analog Output Volume Control

For the speaker outputs, the analog volume control has a range from 0 dB to –78 dB in 0.5-dB steps for most of the useful range plus mute, as seen in Table 5-37 and Table 5-38. The implementation includes soft-stepping logic.

Routing the left-channel DAC output signal to the left-channel analog volume control is done by writing to page 1 / register 35, bit D6. Routing the right-channel DAC output signal to the right-channel analog volume control is done by writing to page 1 / register 35, bit D2. Changing the left-channel analog volume for the speaker is controlled by writing to page 1 / register 38, bits D6–D0. Changing the right-channel analog volume for the speaker is controlled by writing to page 1 / register 39, bits D6–D0.

Routing the signal from the output of the left-channel analog volume control to the input of the left-channel speaker amplifier is done by writing to page 1 / register 38, bit D7. Routing the signal from the output of the right-channel analog volume control to the input of the right-channel speaker amplifier is done by writing to page 1 / register 39, bit D7.

The analog volume-control soft-stepping time is based on the setting in page 0 / register 63, bits D1–D0.

Copyright © 2009, Texas Instruments Incorporated

5.6.12 Analog Outputs

Various analog routings are supported for playback. All the options can be conveniently viewed on the functional block diagram, Figure 1-1.

5.6.12.1 Headphone Drivers

The TLV320AIC3111 features a stereo headphone driver (HPL and HPR) that can deliver up to 30 mW per channel, at 3.3-V supply voltage, into a 16-Ω load. The headphones are used in a single-ended configuration where an ac-coupling capacitor (dc-blocking) is connected between the device output pins and the headphones. The headphone driver also supports 32-Ω and 10-kΩ loads without changing any control register settings.

The headphone drivers can be configured to optimize the power consumption in the lineout-drive mode by writing 11 to page 0 / register 44, bits D2–D1.

The output common mode of the headphone/lineout drivers can be programmed to 1.35 V, 1.5 V, 1.65 V, or 1.8 V by setting page 1 / register 31, bits D4–D3. The common-mode voltage should be set ≤ AVDD/2.

The left headphone driver can be powered on by writing to page 1 / register 31, bit D7. The right headphone driver can be powered on by writing to page 1 / register 31, bit D6. The left-output driver gain can be controlled by writing to page 1 / register 40, bits D6–D3, and it can be muted by writing to page 1 / register 40, bit D2. The right-output driver gain can be controlled by writing to page 1 / register 41, bits D6–D3, and it can be muted by writing to page 1 / register 41, bit D2.

The TLV320AIC3111 has a short-circuit protection feature for the headphone drivers, which is always enabled to provide protection. The output condition of the headphone driver during short circuit can be programmed by writing to page 1 / register 31, bit D1. If D1 = 0 when a short circuit is detected, the device limits the maximum current to the load. If D1 = 1 when a short circuit is detected, the device powers down the output driver. The default condition for headphones is the current-limiting mode. In case of a short circuit on either channel, the output is disabled and a status flag is provided as read-only bits on page 1 / register 31, bit D0. If shutdown mode is enabled, then as soon as the short circuit is detected, page 1 / register 31, bit D7 (for HPL) and/or page 1 / register 31, bit D6 (for HPR) clears automatically. Next, the device requires a reset to re-enable the output stage. Resetting can be done in two ways. First, the device master reset can be used, which requires either toggling the $\overline{\text{RESET}}$ pin or using the software reset. If master reset is used, it resets all of the registers. Second, a dedicated headphone power-stage reset can also be used to re-enable the output stage, and that keeps all of the other device settings. The headphone power stage reset is done by setting page 1 / register 31, bit D7 for HPL and by setting page 1 / register 31, bit D6 for HPR. If the fault condition has been removed, then the device returns to normal operation. If the fault is still present, then another shutdown occurs. Repeated resetting (more than three times) is not recommended, as this could lead to overheating.

5.6.12.2 Speaker Drivers

The TLV320AIC3111 has an integrated class-D stereo speaker driver (SPLP/SPLM and SPRP/SPRM) capable of driving an 8-Ω differential load. The speaker driver can be powered directly from the battery supply (2.7 V to 5.5 V) on the SPLVDD and SPRVDD pins; however, the voltage (including spike voltage) must be limited below the absolute-maximum voltage of 6 V.

The speaker driver is capable of supplying 400 mW per channel with a 3.6-V power supply. Through the use of digital mixing, the device can connect one or both digital audio playback data channels to either speaker driver; this also allows digital channel swapping if needed.

The left class-D speaker driver can be powered on by writing to page 1 / register 32, bit D7. The right class-D speaker driver can be powered on by writing to page 1 / register 32, bit D6. The left-output driver gain can be controlled by writing to page 1 / register 42, bits D4–D3, and it can be muted by writing to page 1 / register 42, bit D2. The right-output driver gain can be controlled by writing to page 1 / register 43, bits D4–D3, and it can be muted by writing to page 1 / register 43, bit D2.

Copyright © 2009, Texas Instruments Incorporated

The TLV320AIC3111 has a short-circuit protection feature for the speaker drivers that is always enabled to provide protection. If the output is shorted, the output stage shuts down on the overcurrent condition. (Current limiting is not an available option for the higher-current speaker driver output stage.) In case of a short circuit on either channel, the output is disabled and a status flag is provided as a read-only bit on page 1 / register 32, bit D0.

If shutdown occurs due to an overcurrent condition, then the device requires a reset to re-enable the output stage. Resetting can be done in two ways. First, the device master reset can be used, which requires either toggling the $\overline{\text{RESET}}$ pin or using the software reset. If master reset is used, it resets all of the registers. Second, a dedicated speaker power-stage reset can be used that keeps all of the other device settings. The speaker power-stage reset is done by setting page 1 / register 32, bit D7 for SPLP and SPLM and by setting page 1 / register 32, bit D6 for SPRP and SPRM. If the fault condition has been removed, then the device returns to normal operation. If the fault is still present, then another shutdown occurs. Repeated resetting (more than three times) is not recommended, as this could lead to overheating.

To minimize battery current leakage, the SPLVDD and SPRVDD voltage levels should not be less than the AVDD voltage level.

The TLV320AIC3111 has a thermal protection (OTP) feature for the speaker drivers which is always enabled to provide protection. If the device is overheated, then the output stops switching. When the device cools down, the device resumes switching. An overtemperature status flag is provided as a read-only bit on page 0 / register 3, bit D1. The OTP feature is for self-protection of the device. If die temperature can be controlled at the system/board level, then overtemperature does not occur.

5.6.13 Audio Output-Stage Power Configurations

After the device has been configured (following a $\overline{\text{RESET}}$) and the circuitry has been powered up, the audio output stage can be powered up and powered down by register control.

These functions soft-start automatically. By using these register controls, it is possible to turn all four stages on at the same time without turning two of them off.

See Table 5-39 for register control of audio output stage power configurations.

Table 5-39. Audio-Output Stage-Power Configurations

Audio Output Pins	Desired Function	Page 1 / Register, Bit Values
HPL	Power down HPL driver	Page 1 / register 31, bit D7 = 0
	Power up HPL driver	Page 1 / register 31, bit D7 = 1
HPR	Power down HPR driver	Page 1 / register 31, bit D6 = 0
	Power up HPR driver	Page 1 / register 31, bit D6 = 1
SPLP / SPLM	Power down left class-D drivers	Page 1 / register 32, bit D7 = 0
	Power up left class-D drivers	Page 1 / register 32, bit D7 = 1
SPRP / SPRM	Power down right class-D drivers	Page 1 / register 32, bit D6 = 0
	Power up right class-D drivers	Page 1 / register 32, bit D6 = 1

5.7 CLOCK Generation and PLL

The TLV320AIC3111 supports a wide range of options for generating clocks for the ADC and DAC sections as well as interface and other control blocks as shown in Figure 5-36. The clocks for the ADC and DAC require a source reference clock. This clock can be provided on variety of device pins, such as the MCLK, BCLK, or GPIO1 pins. The source reference clock for the codec can be chosen by programming the CODEC_CLKIN value on page 0 / register 4, bits D1–D0. CODEC_CLKIN can then be routed through highly-flexible clock dividers shown in Figure 5-36 to generate the various clocks required

Copyright © 2009, Texas Instruments Incorporated

for the ADC, DAC, and miniDSP sections. In the event that the desired audio or miniDSP clocks cannot be generated from the reference clocks on MCLK, BCLK, or GPIO1, the TLV320AIC3111 also provides the option of using the on-chip PLL which supports a wide range of fractional multiplication values to generate the required clocks. Starting from CODEC_CLKIN, the TLV320AIC3111 provides several programmable clock dividers to help achieve a variety of sampling rates for the ADC, DAC, and clocks for the miniDSP.

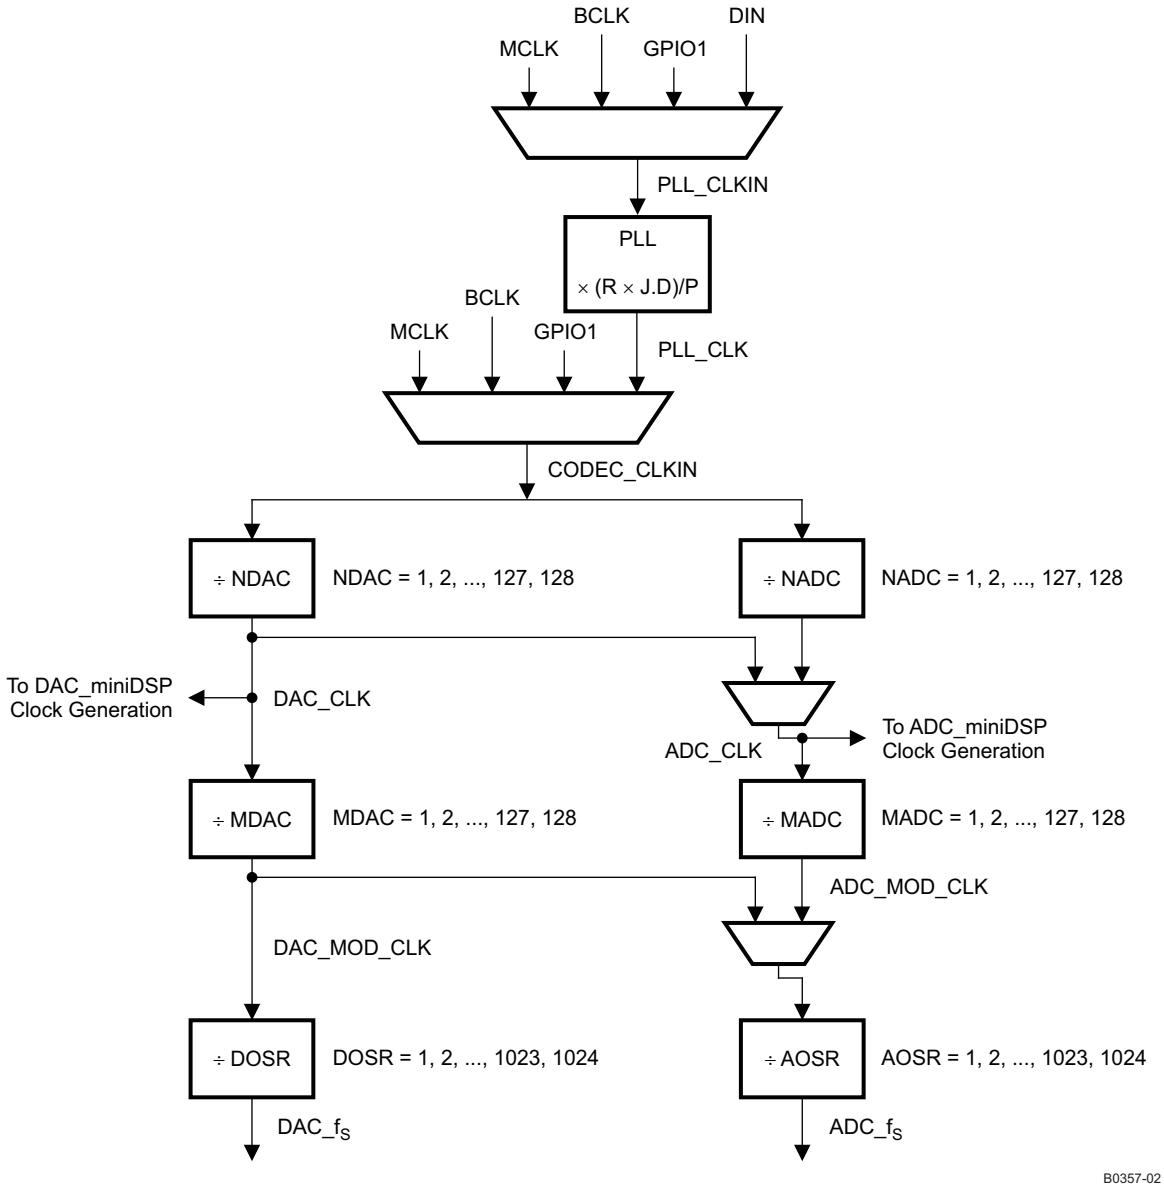

Figure 5-36. Clock Distribution Tree

$$DAC_MOD_CLK = \frac{CODEC_CLKIN}{NDAC \times MDAC} \qquad ADC_MOD_CLK = \frac{CODEC_CLKIN}{NADC \times MADC}$$

$$DAC_f_S = \frac{CODEC_CLKIN}{NDAC \times MDAC \times DOSR} \qquad ADC_f_S = \frac{CODEC_CLKIN}{NADC \times MADC \times AOSR} \quad (8)$$

Copyright © 2009, Texas Instruments Incorporated

Table 5-40. CODEC CLKIN Clock Dividers

Divider	Bits
NDAC	Page 0 / register 11, bits D6–D0
MDAC	Page 0 / register 12, bits D6–D0
DOSR	Page 0 / register 13, bits D1–D0 and page 0 / register 14, bits D7–D0
NADC	Page 0 / register 18, bits D6–D0
MADC	Page 0 / register 19, bits D6–D0
AOSR	Page 0 / register 20, bits D7–D0

The DAC modulator is clocked by DAC_MOD_CLK. For proper power-up operation of the DAC channel, DAC_MOD_CLK must be enabled by configuring the NDAC and MDAC clock dividers (page 0 / register 11, bit D7 = 1 and page 0 / register 12, bit D7 = 1). When the DAC channel is powered down, the device internally initiates a power-down sequence for proper shutdown. During this shutdown sequence, the NDAC and MDAC dividers must not be powered down, or else a proper low-power shutdown may not take place. The user can read back the power-status flag at page 0 / register 37, bit D7 and page 0 / register 37, bit D3. When both the flags indicate power-down, the MDAC divider may be powered down, followed by the NDAC divider. Note that when the ADC clock dividers are powered down, the ADC clock is derived from the DAC clocks.

The ADC modulator is clocked by ADC_MOD_CLK. For proper power-up of the ADC channel, these clocks are enabled by the NADC and MADC clock dividers (page 0 / register 18, bit D7 = 1 and page 0 / register 19, bit D7 = 1). When the ADC channel is powered down, the device internally initiates a power-down sequence for proper shutdown. During this shutdown sequence, the NADC and MADC dividers must not be powered down, or else a proper low-power shutdown may not take place. The user can read back the power-status flag from page 0 / register 36, bit D6. When this flag indicates power down, the MADC divider may be powered down, followed by NADC divider.

When ADC_CLK (ADC DSP clock) is derived from the NDAC divider output, the NDAC must be kept powered up until the power-down status flags for ADC do not indicate power down. When the input to the AOSR clock divider is derived from DAC_MOD_CLK, then MDAC must be powered up when ADC_f_S is needed (i.e., when WCLK is generated by the TLV320AIC3111 or AGC is enabled) and can be powered down only after the ADC power-down flags indicate power-down status.

In general, for proper operation, all the root clock dividers should be powered down only after the child clock dividers have been powered down.

The TLV320AIC3111 also has options for routing some of the internal clocks to the output pins of the device to be used as general-purpose clocks in the system. The feature is shown in Figure 5-38.

Copyright © 2009, Texas Instruments Incorporated

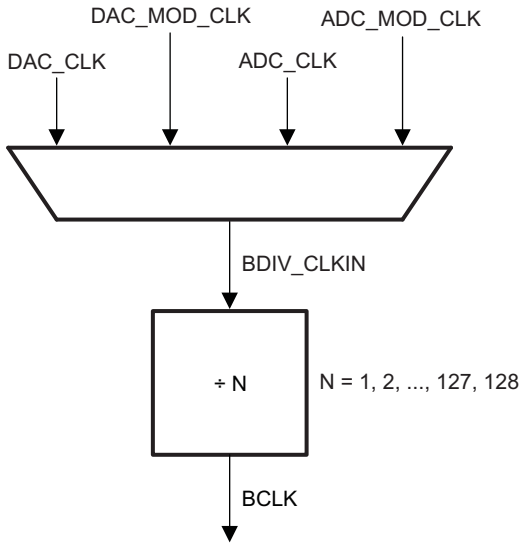

Figure 5-37. BCLK Output Options

In the mode when the TLV320AIC3111 is configured to drive the BCLK pin (page 0 / register 27, bit D3 = 1), it can be driven as the divided value of BDIV_CLKIN. The division value can be programmed in page 0 / register 30, bits D6–D0 from 1 to 128. BDIV_CLKIN can itself be configured to be one of DAC_CLK (DAC DSP clock), DAC_MOD_CLK, ADC_CLK (ADC DSP clock) or ADC_MOD_CLK by configuring the BDIV_CLKIN multiplexer in page 0 / register 29, bits D1–D0. Additionally, a general-purpose clock can be driven out on either GPIO1 or DOUT.

This clock can be a divided-down version of CDIV_CLKIN. The value of this clock divider can be programmed from 1 to 128 by writing to page 0 / register 26, bits D6–D0. CDIV_CLKIN can itself be programmed as one of the clocks among the list shown in Figure 5-38. This can be controlled by programming the multiplexer in page 0 / register 25, bits D2–D0.

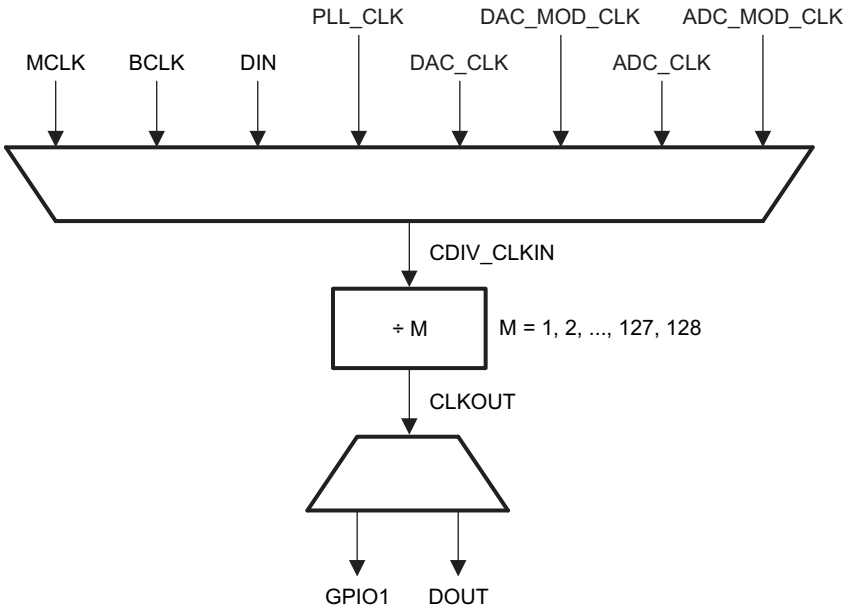

Figure 5-38. General-Purpose Clock Output Options

CDIV_CLKIN	100 MHz when M is odd 110 MHz when M is even

5.7.1 PLL

For lower power consumption, it is best to derive the internal audio processing clocks using the simple dividers. When the input MCLK or other source clock is not an integer multiple of the audio processing clocks then it is necessary to use the on-board PLL. The TLV320AIC3111 fractional PLL can be used to generate an internal *master clock* used to produce the processing clocks needed by the ADC, DAC, and miniDSP. The programmability of this PLL allows operation from a wide variety of clocks that may be available in the system.

The PLL input supports clocks varying from 512 kHz to 20 MHz and is register-programmable to enable generation of the required sampling rates with fine resolution. The PLL can be turned on by writing to page 0 / register 5, bit D7. When the PLL is enabled, the PLL output clock, PLL_CLK, is given by the following equation:

$$PLL_CLK = \frac{PLL_CLKIN \times R \times J.D}{P} \quad (9)$$

where

R = 1, 2, 3, ..., 16 (page 0 / register 5, default value = 1)

J = 1, 2,3, … , 63, (page 0 / register 6, default value = 4)

D = 0, 1, 2, …, 9999 (page 0 / register 7 and page 0 / register 8, default value = 0)

P = 1, 2, 3, …, 8 (page 0 / register 5, default value = 1)

The PLL can be turned on via page 0 / register 5, bit D7. The variable P can be programmed via page 0 / register 5, bits D6–D4. The variable R can be programmed via page 0 / register 5, bits D3–D0. The variable J can be programmed via page 0 / register 6, bits D5–D0. The variable D is 14 bits and is programmed into two registers. The MSB portion can be programmed via page 0 / register 7, bits D5–D0, and the LSB portion is programmed via page 0 / register 8, bits D7–D0. For proper update of the D divider value, page 0 / register 7 must be programmed first, followed immediately by page 0 / register 8. Unless the write to page 0 / register 8 is completed, the new value of D does not take effect.

When the PLL is enabled, the following conditions must be satisfied:

- When the PLL is enabled and D = 0, the following conditions must be satisfied for PLL_CLKIN:

$$512\ kHz \le \frac{PLL_CLKIN}{P} \le 20\ MHz \quad (10)$$

- When the PLL is enabled and D ≠ 0, the following conditions must be satisfied for PLL_CLKIN:

Copyright © 2009, Texas Instruments Incorporated

$$10\ \text{MHz} \le \frac{\text{PLL_CLKIN}}{\text{P}} \le 20\ \text{MHz} \quad (11)$$

The PLL can be powered up independently from the ADC and DAC blocks, and can also be used as a general-purpose PLL by routing its output to the GPIO output. After powering up the PLL, PLL_CLK is available typically after 10 ms.

The clocks for the codec and various signal processing blocks, CODEC_CLKIN, can be generated from the MCLK input, BCLK input, GPIO input, or PLL_CLK (page 0 / register 4, bits D1–D0).

If CODEC_CLKIN is derived from the PLL, then the PLL must be powered up first and powered down last.

Table 5-42 lists several example cases of typical PLL_CLKIN rates and how to program the PLL to achieve a sample rate f_S of either 44.1 kHz or 48 kHz.

Table 5-42. PLL Example Configurations

5.8 Digital Audio and Control Interface

5.8.1 Digital Audio Interface

Audio data is transferred between the host processor and the TLV320AIC3111 via the digital audio data serial interface, or audio bus. The audio bus on this device is very flexible, including left- or right-justified data options, support for I^2S or PCM protocols, programmable data length options, a TDM mode for multichannel operation, very flexible master/slave configurability for each bus-clock line, and the ability to communicate with multiple devices within a system directly.

The audio bus of the TLV320AIC3111 can be configured for left- or right-justified, I^2S, DSP, or TDM modes of operation, where communication with standard telephony PCM interfaces is supported within the TDM mode. These modes are all MSB-first, with data width programmable as 16, 20, 24, or 32 bits by configuring page 0 / register 27, bits D5–D4. In addition, the word clock and bit clock can be independently configured in either master or slave mode, for flexible connectivity to a wide variety of processors. The word clock is used to define the beginning of a frame, and may be programmed as either a pulse or a square-wave signal. The frequency of this clock corresponds to the maximum of the selected ADC and DAC sampling frequencies.

Copyright © 2009, Texas Instruments Incorporated

The bit clock is used to clock in and clock out the digital audio data across the serial bus. When in master mode, this signal can be programmed to generate variable clock pulses by controlling the bit-clock divider in page 0 / register 30 (see Figure 5-36). The number of bit-clock pulses in a frame may need adjustment to accommodate various word lengths as well as to support the case when multiple TLV320AIC3111s may share the same audio bus.

The TLV320AIC3111 also includes a feature to offset the position of start of data transfer with respect to the word clock. This offset can be controlled in terms of number of bit-clocks and can be programmed in page 0 / register 28.

The TLV320AIC3111 also has the feature of inverting the polarity of the bit clock used for transferring the audio data as compared to the default clock polarity used. This feature can be used independently of the mode of audio interface chosen. This can be configured via page 0 / register 29, bit D3.

The TLV320AIC3111 further includes programmability (page 0 / register 27, bit D0) to place the DOUT line in the high-impedance state during all bit clocks when valid data is not being sent. By combining this capability with the ability to program at what bit clock in a frame the audio data begins, time-division multiplexing (TDM) can be accomplished, enabling the use of multiple codecs on a single audio serial data bus. When the audio serial data bus is powered down while configured in master mode, the pins associated with the interface are put into a high-impedance output condition. Also, DOUT control on page 0 / register 53, bit D4 allows the bus-keeper feature to be enabled/disabled. When enabled, the last valid data on DOUT is held (weakly driven) during the non-data time. When disabled, DOUT is placed in a high-impeance state when page 0 / register 27, bit D0 is enabled (1).

By default, when the word clocks and bit clocks are generated by the TLV320AIC3111, these clocks are active only when the codecs (ADC, DAC or both) are powered up within the device. This is done to save power. However, it also supports a feature when both the word clocks and bit clocks can be active even when the codec in the device is powered down. This is useful when using the TDM mode with multiple codecs on the same bus, or when word clocks or bit clocks are used in the system as general-purpose clocks.

5.8.1.1 Right-Justified Mode

The audio interface of the TLV320AIC3111 can be put into the right-justified mode by programming page 0 / register 27, bits D7–D6 = 10. In right-justified mode, the LSB of the left channel is valid on the rising edge of the bit clock preceding the falling edge of the word clock. Similarly, the LSB of the right channel is valid on the rising edge of the bit clock preceding the rising edge of the word clock.

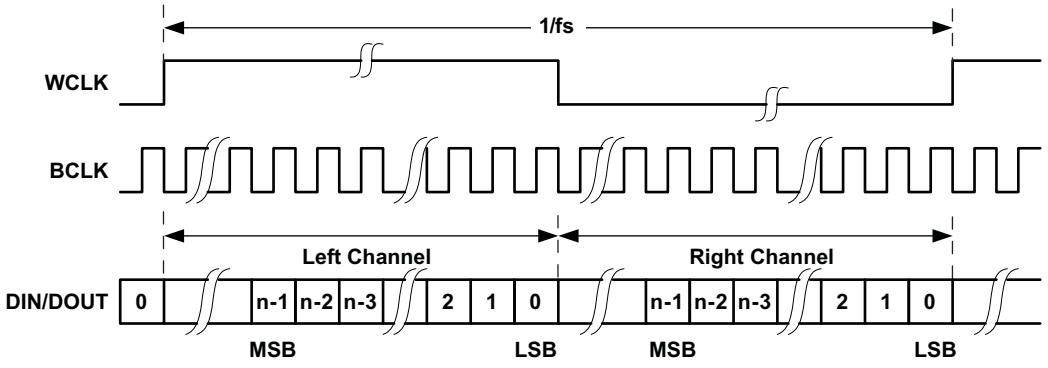

Figure 5-39. Timing Diagram for Right-Justified Mode

For the right-justified mode, the number of bit clocks per frame should be greater than or equal to twice the programmed word length of the data.

5.8.1.2 Left-Justified Mode

The audio interface of the TLV320AIC3111 can be put into left-justified mode by programming page 0 / register 27, bits D7–D6 = 11. In left-justified mode, the MSB of the right channel is valid on the rising edge of the bit clock following the falling edge of the word clock. Similarly, the MSB of the left channel is valid on the rising edge of the bit clock following the rising edge of the word clock.

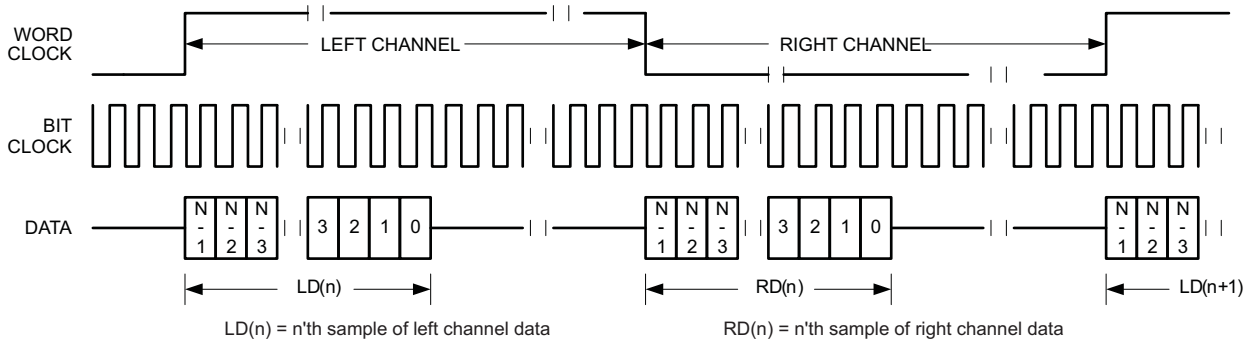

Figure 5-40. Timing Diagram for Left-Justified Mode

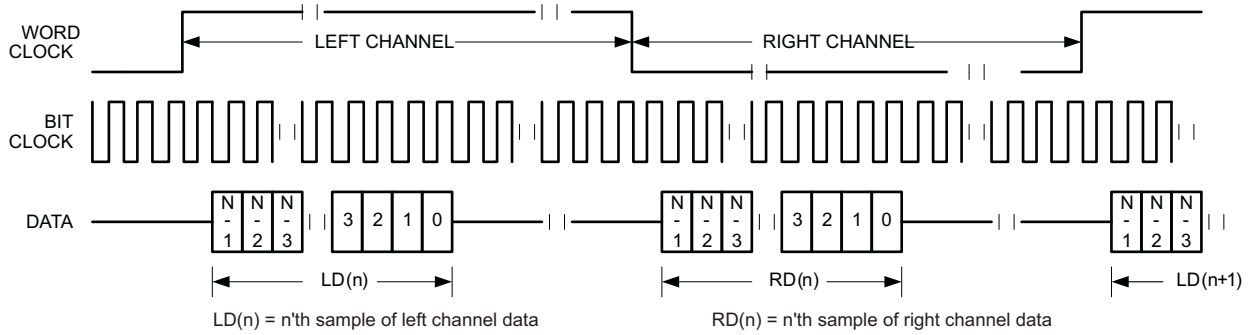

Figure 5-41. Timing Diagram for Left-Justified Mode With Offset = 1

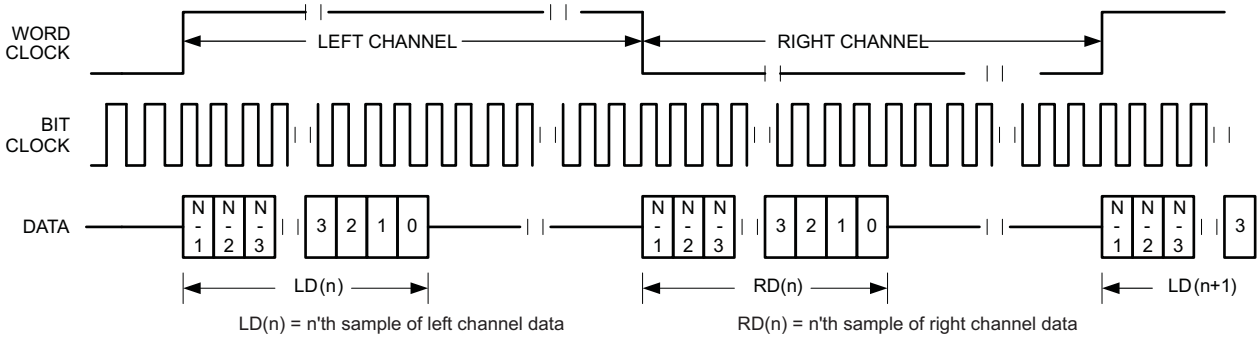

Figure 5-42. Timing Diagram for Left-Justified Mode With Offset = 0 and Inverted Bit Clock

For the left-justified mode, the number of bit clocks per frame should be greater than or equal to twice the programmed word length of the data. Also, the programmed offset value should be less than the number of bit clocks per frame by at least the programmed word length of the data.

Copyright © 2009, Texas Instruments Incorporated

5.8.1.3 I²S Mode

The audio interface of the TLV320AIC3111 can be put into I²S mode by programming page 0 / register 27, bits D7–D6 = to 00. In I²S mode, the MSB of the left channel is valid on the second rising edge of the bit clock after the falling edge of the word clock. Similarly, the MSB of the right channel is valid on the second rising edge of the bit clock after the rising edge of the word clock.

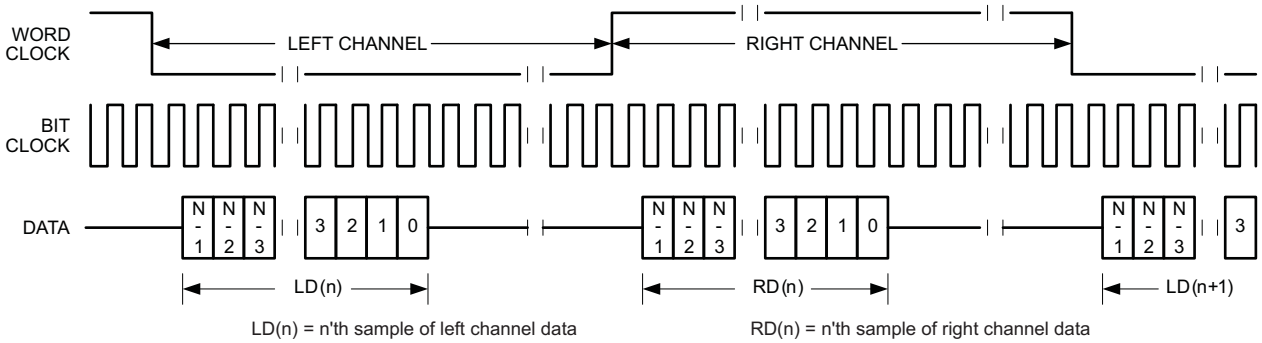

Figure 5-43. Timing Diagram for I²S Mode

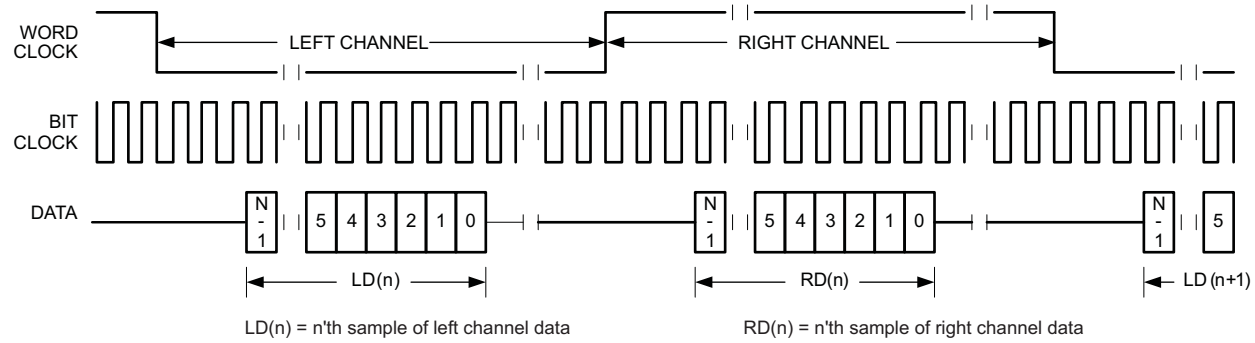

Figure 5-44. Timing Diagram for I²S Mode With Offset = 2

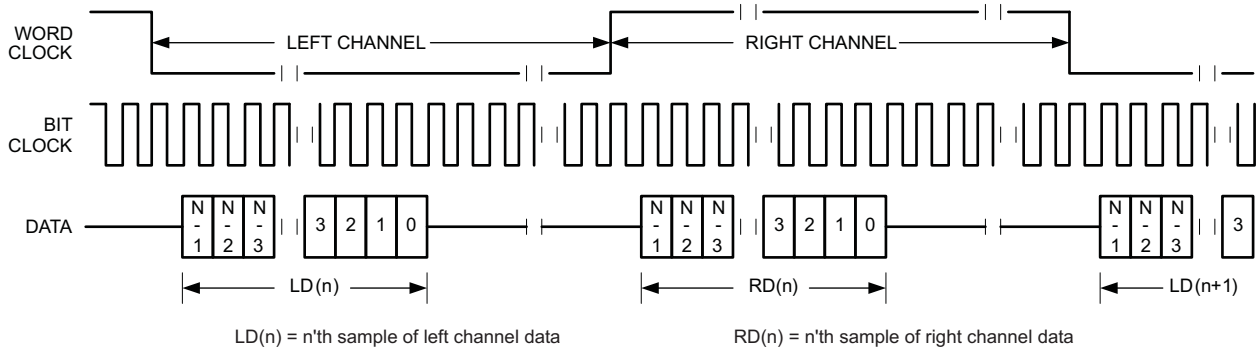

Figure 5-45. Timing Diagram for I²S Mode With Offset = 0 and Bit Clock Inverted

For I²S mode, the number of bit clocks per channel should be greater than or equal to the programmed word length of the data. Also, the programmed offset value should be less than the number of bit clocks per frame by at least the programmed word length of the data.

Figure 5-46 shows the timing diagram for I²S mode for the monoaural audio ADC.

Copyright © 2009, Texas Instruments Incorporated

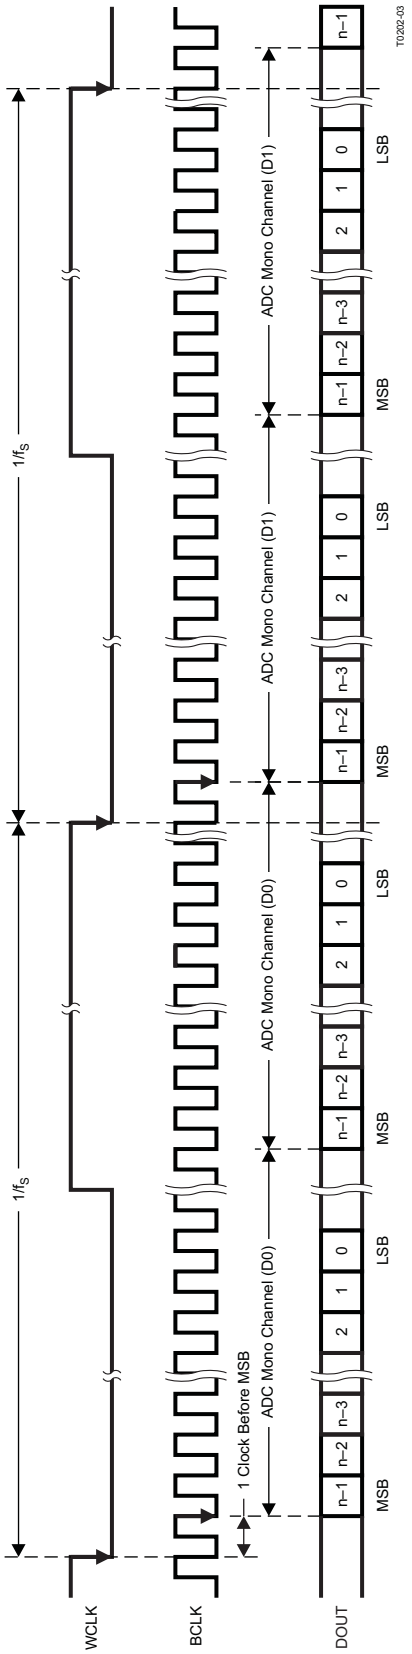

Figure 5-46. Timing Diagram for I²S Mode for Monaural Audio ADC

Copyright © 2009, Texas Instruments Incorporated

5.8.1.4 DSP Mode

The audio interface of the TLV320AIC3111 can be put into DSP mode by programming page 0 / register 27, bits D7–D6 = 01. In DSP mode, the falling edge of the word clock starts the data transfer with the left-channel data first and immediately followed by the right-channel data. Each data bit is valid on the falling edge of the bit clock.

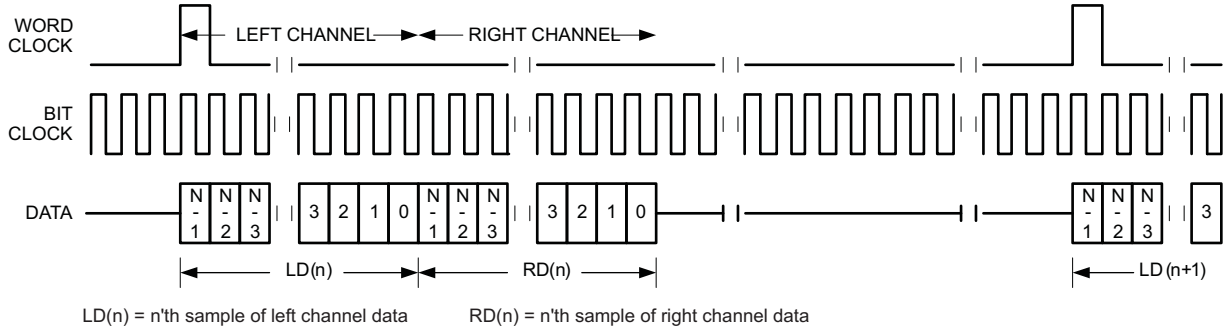

Figure 5-47. Timing Diagram for DSP Mode

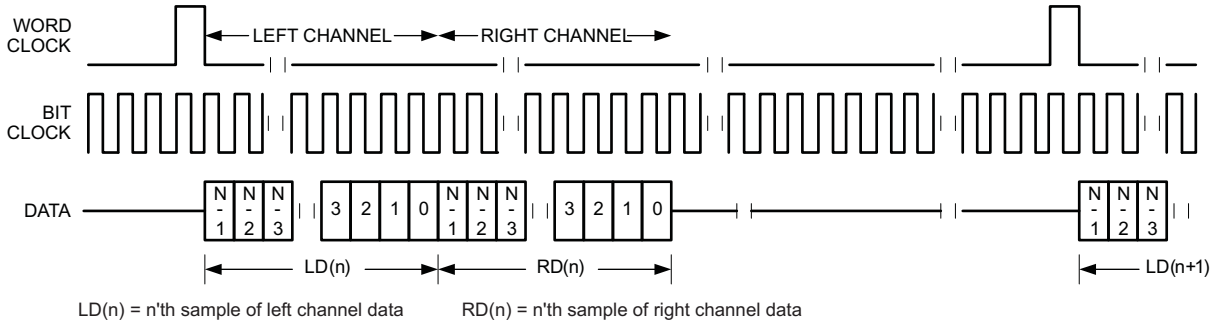

Figure 5-48. Timing Diagram for DSP Mode With Offset = 1

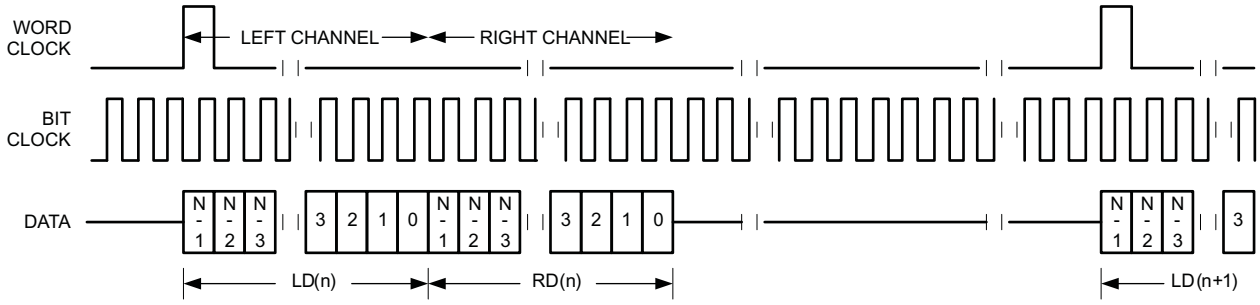

Figure 5-49. Timing Diagram for DSP Mode With Offset = 0 and Bit Clock Inverted

For the DSP mode, the number of bit clocks per frame should be greater than or equal to twice the programmed word length of the data. Also, the programmed offset value should be less than the number of bit clocks per frame by at least the programmed word length of the data.

5.8.2 Primary and Secondary Digital Audio Interface Selection

The audio serial interface on the TLV320AIC3111 has extensive I/O control to allow communication with two independent processors for audio data. The processors can communicate with the device one at a

time. This feature is enabled by register programming of the various pin selections. Table 5-43 shows the primary and secondary audio interface selection and registers. Table 5-44 shows the selection criteria for generating ADC_WCLK. Figure 5-50 is a high-level diagram showing the general signal flow and multiplexing for the primary and secondary audio interfaces. For detailed information, see Table 5-43, Table 5-44, and the register definitions.

Table 5-43. Primary and Secondary Audio Interface Selection

Desired Pin Function	Possible Pins	Page 0 Registers	Comment
Primary WCLK (OUT)	WCLK	R27/D2 = 1	Primary WCLK is output from codec
		R33/D5–D4	Select source of primary WCLK (DAC_fs, ADC_fs, or secondary WCLK)
Primary WCLK (IN)	WCLK	R27/D2 = 0	Primary WCLK is input to codec
Primary BCLK (OUT)	BCLK	R27/D3 = 1	Primary BCLK is output from codec
		R33/D7	Select source of primary WCLK (internal BCLK or secondary BCLK)
Primary BCLK (IN)	BCLK	R27/D3 = 0	Primary BCLK is input to codec
Primary DIN (IN)	DIN	R32/D0	Select DIN to internal interface (0 = primary DIN; 1 = secondary DIN)
Primary DOUT (OUT)	DOUT	R53/D3–D1 = 001	DOUT = primary DOUT for codec interface
		R33/D1	Select source for DOUT (0 = DOUT from interface block; 1 = secondary DIN)
Secondary WCLK (OUT)	GPIO1	R31/D4–D2 = 000	Secondary WCLK obtained from GPIO1 pin
		R51/D5–D2 = 1001	GPIO1 = secondary WCLK output
		R33/D3–D2	Select source of secondary WCLK (DAC_fs, ADC_fs, or primary WCLK)
	DOUT	R31/D4–D2 = 011	Secondary WCLK obtained from DOUT pin
		R53/D3–D1 = 111	DOUT = secondary WCLK output
		R33/D3–D2	Select source of secondary WCLK (DAC_fs, ADC_fs, or primary WCLK)
Secondary WCLK (IN)	GPIO1	R31/D4–D2 = 000	Secondary WCLK obtained from GPIO1 pin
		R51/D5–D2 = 0001	GPIO1 enabled as secondary input
Secondary BCLK (OUT)	GPIO1	R31/D7–D5 = 000	Secondary BCLK obtained from GPIO1 pin
		R51/D5–D2 = 1000	GPIO1 = secondary BCLK output
		R33/D6	Select source of secondary BCLK (primary BCLK or internal BCLK)
	DOUT	R31/D7–D5 = 011	Secondary BCLK obtained from DOUT pin
		R53/D3–D1 = 110	DOUT = secondary BCLK output
		R33/D6	Select source of secondary BCLK (primary BCLK or internal BCLK)
Secondary BCLK (IN)	GPIO1	R31/D7–D5 = 000	Secondary BCLK obtained from GPIO1 pin
		R51/D5–D2 = 0001	GPIO1 enabled as secondary input
Secondary DIN (IN)	GPIO1	R31/D1–D0 = 00	Secondary DIN obtained from GPIO1 pin
		R51/D5–D2 = 0001	GPIO1 enabled as secondary input
Secondary DOUT (OUT)	GPIO1	R51/D5–D2 = 1011	GPIO1 = secondary DOUT
		R33/D0	Select source for secondary DOUT (0 = primary DIN; 1 = DOUT from interface block)

5.8.3 Control Interface

The TLV320AIC3111 control interface supports the I²C communication protocol.

5.8.3.1 I²C Control Mode

The TLV320AIC3111 supports the I²C control protocol, and responds to the I²C address of 0011 000. I²C is a two-wire, open-drain interface supporting multiple devices and masters on a single bus. Devices on the I²C bus only drive the bus lines LOW by connecting them to ground; they never drive the bus lines HIGH. Instead, the bus wires are pulled HIGH by pullup resistors, so the bus wires are HIGH when no device is driving them LOW. This way, two devices cannot conflict; if two devices drive the bus simultaneously, there is no driver contention.

Communication on the I²C bus always takes place between two devices, one acting as the master and the other acting as the slave. Both masters and slaves can read and write, but slaves can only do so under the direction of the master. Some I²C devices can act as masters or slaves, but the TLV320AIC3111 can only act as a slave device.

An I²C bus consists of two lines, SDA and SCL. SDA carries data, and the SCL signal provides the clock. All data is transmitted across the I²C bus in groups of eight bits. To send a bit on the I²C bus, the SDA line is driven to the appropriate level while SCL is LOW (a LOW on SDA indicates the bit is zero, while a HIGH indicates the bit is one).

Once the SDA line has settled, the SCL line is brought HIGH, then LOW. This pulse on the SCL line clocks the SDA bit into the receiver shift register.

The I²C bus is bidirectional: the SDA line is used both for transmitting and receiving data. When a master reads from a slave, the slave drives the data line; when a master sends to a slave, the master drives the data line.

Most of the time the bus is idle, no communication is taking place, and both lines are HIGH. When communication is taking place, the bus is active. Only master devices can start communication on the bus. Normally, the data line is only allowed to change state while the clock line is LOW. If the data line changes state while the clock line is HIGH, it is either a START condition or its counterpart, a STOP condition. A START condition is when the clock line is HIGH and the data line goes from HIGH to LOW. A STOP condition is when the clock line is HIGH and the data line goes from LOW to HIGH.

After the master issues a START condition, it sends a byte that selects the slave device for communication. This byte is called the address byte. Each device on an I²C bus has a unique 7-bit address to which it responds. (Slaves can also have 10-bit addresses; see the I²C specification for details.) The master sends an address in the address byte, together with a bit that indicates whether it is to read from or write to the slave device.

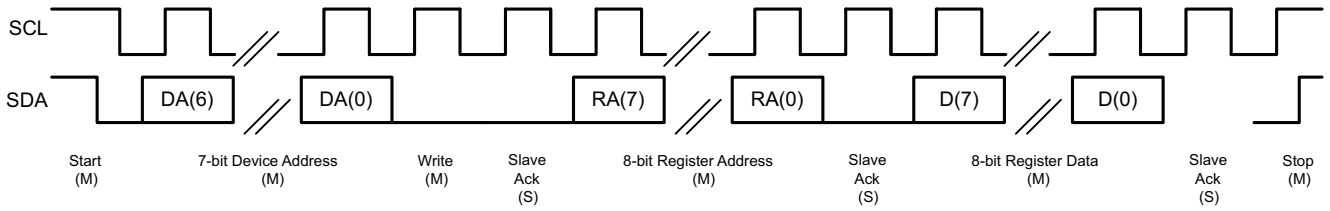

Every byte transmitted on the I²C bus, whether it is address or data, is acknowledged with an acknowledge bit. When a master has finished sending a byte (eight data bits) to a slave, it stops driving SDA and waits for the slave to acknowledge the byte. The slave acknowledges the byte by pulling SDA LOW. The master then sends a clock pulse to clock the acknowledge bit. Similarly, when a master has finished reading a byte, it pulls SDA LOW to acknowledge this to the slave. It then sends a clock pulse to clock the bit. (Remember that the master always drives the clock line.)

A not-acknowledge is performed by simply leaving SDA HIGH during an acknowledge cycle. If a device is not present on the bus, and the master attempts to address it, it receives a not-acknowledge because no device is present at that address to pull the line LOW.

When a master has finished communicating with a slave, it may issue a STOP condition. When a STOP condition is issued, the bus becomes idle again. A master may also issue another START condition. When a START condition is issued while the bus is active, it is called a repeated START condition.

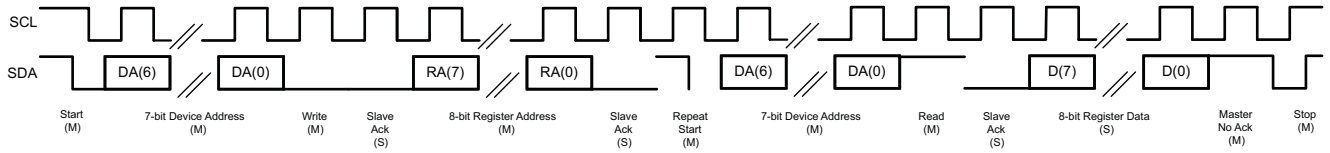

The TLV320AIC3111 can also respond to and acknowledge a general call, which consists of the master issuing a command with a slave address byte of 00h. This feature is disabled by default, but can be enabled via page 0 / register 34, bit D5.

(M) => SDA Controlled by Master
(S) => SDA Controlled by Slave

Figure 5-51. I²C Write

(M) => SDA Controlled by Master
(S) => SDA Controlled by Slave

Figure 5-52. I²C Read

In the case of an I²C register write, if the master does not issue a STOP condition, then the device enters auto-increment mode. So in the next eight clocks, the data on SDA is treated as data for the next incremental register.

Similarly, in the case of an I²C register read, after the device has sent out the 8-bit data from the addressed register, if the master issues a ACKNOWLEDGE, the slave takes over control of the SDA bus and transmits for the next eight clocks the data of the next incremental register.

6 REGISTER MAP

6.1 TLV320AIC3111 Register Map

All features on this device are addressed using the I^2C bus. All of the writable registers can be read back. However, some registers contain status information or data, and are available for reading only.

The TLV320AIC3111 contains several pages of 8-bit registers, and each page can contain up to 128 registers. The register pages are divided up based on functional blocks for this device. The pages defined for the TLV320AIC3111 are 0, 1, 3, 4–5 (ADC coefficient pages), 8–15 (DAC coefficient pages), 32–43 (ADC IRAM pages), and 64–95 (DAC IRAM pages). Page 0 is the default home page after $\overline{\text{RESET}}$. Page control is done by writing a new page value into register 0 of the current page.

The control registers for the TLV320AIC3111 are described in detail as follows. All registers are 8 bits in width, with D7 referring to the most-significant bit of each register, and D0 referring to the least-significant bit.

Pages 0, 1, 3, 4–5, 8–15, 32–43, and 64–95 are available for use; however, all other pages and registers are reserved. Do not read from or write to reserved pages and registers. Also, do not write other than the reset values for the reserved bits and read-only bits of non-reserved registers; otherwise, device functionality failure can occur.

Table 6-1. Summary of Register Map

Page Number	Description
0	Page 0 is the default page on power up. Configuration for serial interface, digital I/O, clocking, ADC, DAC miniDSP settings, etc.
1	Configuration for analog PGAs, ADC, DAC, output drivers, volume controls, etc.
3	Register 16 controls the MCLK divider that controls the interrupt pulse duration, debounce timing, and detection-block clock.
4–5	ADC, AGC, and filter coefficients, mini-DSP general purpose coefficient memory
8–11	DAC Buffer A filter and DRC coefficients, mini-DSP general purpose coefficient memory
12–15	DAC Buffer B filter and DRC coefficients, mini-DSP general purpose coefficient memory
32–43	ADC instruction RAM locations
64–95	DAC instruction RAM locations

Page 1 / Register 51 Through Page 1 / Register 127: Reserved

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D0	R/W	XXXX XXXX	Reserved. Write only the reset value to these bits.

6.4 Control Registers, Page 3: MCLK Divider for Programmable Delay Timer

Default values shown for this page only become valid 100 µs following a hardware or software reset.

Page 3 / Register 0: Page Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D0	R/W	0000 0000	0000 0000: Page 0 selected 0000 0001: Page 1 selected ... 1111 1110: Page 254 selected 1111 1111: Page 255 selected

The only register used in page 3 is register 16. The remaining page-3 registers are reserved and should not be written to.

Page 3 / Register 16: Timer Clock MCLK Divider

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7	R/W	1	0: Internal oscillator is used for programmable delay timer. 1: External MCLK(1) is used for programmable delay timer.
D6–D0	R/W	0000 0001	MCLK Divider to Generate 1-MHz Clock for the Programmable Delay Timer 000 0000: MCLK divider = 128 000 0001: MCLK divider = 1 000 0010: MCLK divider = 2 ... 111 1110: MCLK divider = 126 111 1111: MCLK divider = 127

(1) External clock is used only to control the delay programmed between the conversions and not used for doing the actual conversion. This feature is provided in case a more accurate delay is desired since the internal oscillator frequency varies from device to device.

6.5 Control Registers, Page 4: ADC Digital Filter Coefficients

Default values shown for this page only become valid 100 µs following a hardware or software reset.

Page 4 / Register 0: Page Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D0	R/W	0000 0000	0000 0000: Page 0 selected 0000 0001: Page 1 selected ... 1111 1110: Page 254 selected 1111 1111: Page 255 selected

The remaining page 4 registers are either reserved registers or are used for setting coefficients for the various filters in the TLV320AIC3111. Reserved registers should not be written to.

The filter coefficient registers are arranged in pairs, with two adjacent 8-bit registers containing the 16-bit coefficient for a single filter. The 16-bit integer contained in the MSB and LSB registers for a coefficient are interpreted as a 2s-complement integer, with possible values ranging from –32,768 to 32,767. When programming any coefficient value for a filter, the MSB register should always be written first, immediately followed by the LSB register. Even if only the MSB or LSB portion of the coefficient changes, both registers should be written in this sequence. Table 6-2 is a list of the page-4 registers, excepting the previously described register 0.

Copyright © 2009, Texas Instruments Incorporated

Table 6-2. Page-4 Registers

REGISTER NUMBER	RESET VALUE	REGISTER NAME
1	XXXX XXXX	Reserved. Do not write to this register.
2	0000 0001	Coefficient N0(15:8) for AGC LPF (first-order IIR) used as averager to detect level or coefficient C1(15:8) of ADC miniDSP
3	0001 0111	Coefficient N0(7:0) for AGC LPF (first-order IIR) used as averager to detect level or coefficient C1(7:0) of ADC miniDSP
4	0000 0001	Coefficient N1(15:8) for AGC LPF (first-order IIR) used as averager to detect level or coefficient C2(15:8) of ADC miniDSP
5	0001 0111	Coefficient N1(7:0) for AGC LPF (first-order IIR) used as averager to detect level or coefficient C2(7:0) of ADC miniDSP
6	0111 1101	Coefficient D1(15:8) for AGC LPF (first-order IIR) used as averager to detect level or coefficient C3(15:8) of ADC miniDSP
7	1101 0011	Coefficient D1(7:0) for AGC LPF (first-order IIR) used as averager to detect level or coefficient C3(7:0) of ADC miniDSP
8	0111 1111	Coefficient N0(15:8) for ADC-programmable first-order IIR or coefficient C4(15:8) of ADC miniDSP
9	1111 1111	Coefficient N0(7:0) for ADC-programmable first-order IIR or coefficient C4(7:0) of ADC miniDSP
10	0000 0000	Coefficient N1(15:8) for ADC-programmable first-order IIR or coefficient C5(15:8) of ADC miniDSP
11	0000 0000	Coefficient N1(7:0) for ADC-programmable first-order IIR or coefficient C5(7:0) of ADC miniDSP
12	0000 0000	Coefficient D1(15:8) for ADC-programmable first-order IIR or coefficient C6(15:8) of ADC miniDSP
13	0000 0000	Coefficient D1(7:0) for ADC-programmable first-order IIR or coefficient C6(7:0) of ADC miniDSP
14	0111 1111	Coefficient N0(15:8) for ADC Biquad A or coefficient FIR0(15:8) for ADC FIR filter or coefficient C7(15:8) of ADC miniDSP
15	1111 1111	Coefficient N0(7:0) for ADC Biquad A or coefficient FIR0(7:0) for ADC FIR filter or coefficient C7(7:0) of ADC miniDSP
16	0000 0000	Coefficient N1(15:8) for ADC Biquad A or coefficient FIR1(15:8) for ADC FIR filter or coefficient C8(15:8) of ADC miniDSP
17	0000 0000	Coefficient N1(7:0) for ADC Biquad A or coefficient FIR1(7:0) for ADC FIR filter or coefficient C8(7:0) of ADC miniDSP
18	0000 0000	Coefficient N2(15:8) for ADC Biquad A or coefficient FIR2(15:8) for ADC FIR filter or coefficient C9(15:8) of ADC miniDSP
19	0000 0000	Coefficient N2(7:0) for ADC Biquad A or coefficient FIR2(7:0) for ADC FIR filter or coefficient C9(7:0) of ADC miniDSP
20	0000 0000	Coefficient D1(15:8) for ADC Biquad A or coefficient FIR3(15:8) for ADC FIR filter or coefficient C10(15:8) of ADC miniDSP
21	0000 0000	Coefficient D1(7:0) for ADC Biquad A or coefficient FIR3(7:0) for ADC FIR filter or coefficient C10(7:0) of ADC miniDSP
22	0000 0000	Coefficient D2(15:8) for ADC Biquad A or coefficient FIR4(15:8) for ADC FIR filter or coefficient C11(15:8) of ADC miniDSP
23	0000 0000	Coefficient D2(7:0) for ADC Biquad A or coefficient FIR4(7:0) for ADC FIR filter or coefficient C11(7:0) of ADC miniDSP
24	0111 1111	Coefficient N0(15:8) for ADC Biquad B or coefficient FIR5(15:8) for ADC FIR filter or coefficient C12(15:8) of ADC miniDSP
25	1111 1111	Coefficient N0(7:0) for ADC Biquad B or coefficient FIR5(7:0) for ADC FIR filter or coefficient C12(7:0) of ADC miniDSP
26	0000 0000	Coefficient N1(15:8) for ADC Biquad B or coefficient FIR6(15:8) for ADC FIR filter or coefficient C13(15:8) of ADC miniDSP
27	0000 0000	Coefficient N1(7:0) for ADC Biquad B or coefficient FIR6(7:0) for ADC FIR filter or coefficient C13(7:0) of ADC miniDSP
28	0000 0000	Coefficient N2(15:8) for ADC Biquad B or coefficient FIR7(15:8) for ADC FIR filter or coefficient C14(15:8) of ADC miniDSP
29	0000 0000	Coefficient N2(7:0) for ADC Biquad B or coefficient FIR7(7:0) for ADC FIR filter or coefficient C14(7:0) of ADC miniDSP
30	0000 0000	Coefficient D1(15:8) for ADC Biquad B or coefficient FIR8(15:8) for ADC FIR filter or coefficient C15(15:8) of ADC miniDSP

Table 6-2. Page-4 Registers (continued)

REGISTER NUMBER	RESET VALUE	REGISTER NAME
31	0000 0000	Coefficient D1(7:0) for ADC Biquad B or coefficient FIR8(7:0) for ADC FIR filter or coefficient C15(7:0) of ADC miniDSP
32	0000 0000	Coefficient D2(15:8) for ADC Biquad B or coefficient FIR9(15:8) for ADC FIR filter or coefficient C16(15:8) of ADC miniDSP
33	0000 0000	Coefficient D2(7:0) for ADC Biquad B or coefficient FIR9(7:0) for ADC FIR filter or coefficient C16(7:0) of ADC miniDSP
34	0111 1111	Coefficient N0(15:8) for ADC Biquad C or coefficient FIR10(15:8) for ADC FIR filter or coefficient C17(15:8) of ADC miniDSP
35	1111 1111	Coefficient N0(7:0) for ADC Biquad C or coefficient FIR10(7:0) for ADC FIR filter or coefficient C17(7:0) of ADC miniDSP
36	0000 0000	Coefficient N1(15:8) for ADC Biquad C or coefficient FIR11(15:8) for ADC FIR filter or coefficient C18(15:8) of ADC miniDSP
37	0000 0000	Coefficient N1(7:0) for ADC Biquad C or coefficient FIR11(7:0) for ADC FIR filter or coefficient C18(7:0) of ADC miniDSP
38	0000 0000	Coefficient N2(15:8) for ADC Biquad C or coefficient FIR12(15:8) for ADC FIR filter or coefficient C19(15:8) of ADC miniDSP
39	0000 0000	Coefficient N2(7:0) for ADC Biquad C or coefficient FIR12(7:0) for ADC FIR filter or coefficient C19(7:0) of ADC miniDSP
40	0000 0000	Coefficient D1(15:8) for ADC Biquad C or coefficient FIR13(15:8) for ADC FIR filter or coefficient C20(15:8) of ADC miniDSP
41	0000 0000	Coefficient D1(7:0) for ADC Biquad C or coefficient FIR13(7:0) for ADC FIR filter or coefficient C20(7:0) of ADC miniDSP
42	0000 0000	Coefficient D2(15:8) for ADC Biquad C or coefficient FIR14(15:8) for ADC FIR filter or coefficient C21(15:8) of ADC miniDSP
43	0000 0000	Coefficient D2(7:0) for ADC Biquad C or coefficient FIR14(7:0) for ADC FIR filter or coefficient C21(7:0) of ADC miniDSP
44	0111 1111	Coefficient N0(15:8) for ADC Biquad D or coefficient FIR15(15:8) for ADC FIR filter or coefficient C22(15:8) of ADC miniDSP
45	1111 1111	Coefficient N0(7:0) for ADC Biquad D or coefficient FIR15(7:0) for ADC FIR filter or coefficient C22(7:0) of ADC miniDSP
46	0000 0000	Coefficient N1(15:8) for ADC Biquad D or coefficient FIR16(15:8) for ADC FIR filter or coefficient C23(15:8) of ADC miniDSP
47	0000 0000	Coefficient N1(7:0) for ADC Biquad D or coefficient FIR16(7:0) for ADC FIR filter or coefficient C23(7:0) of ADC miniDSP
48	0000 0000	Coefficient N2(15:8) for ADC Biquad D or coefficient FIR17(15:8) for ADC FIR filter or coefficient C24(15:8) of ADC miniDSP
49	0000 0000	Coefficient N2(7:0) for ADC Biquad D or coefficient FIR17(7:0) for ADC FIR filter or coefficient C24(7:0) of ADC miniDSP
50	0000 0000	Coefficient D1(15:8) for ADC Biquad D or coefficient FIR18(15:8) for ADC FIR filter or coefficient C25(15:8) of ADC miniDSP
51	0000 0000	Coefficient D1(7:0) for ADC Biquad D or coefficient FIR18(7:0) for ADC FIR filter or coefficient C25(7:0) of ADC miniDSP
52	0000 0000	Coefficient D2(15:8) for ADC Biquad D or coefficient FIR19(15:8) for ADC FIR filter or coefficient C26(15:8) of ADC miniDSP
53	0000 0000	Coefficient D2(7:0) for ADC Biquad D or coefficient FIR19(7:0) for ADC FIR filter or coefficient C26(7:0) of ADC miniDSP
54	0111 1111	Coefficient N0(15:8) for ADC Biquad E or coefficient FIR20(15:8) for ADC FIR filter or coefficient C27(15:8) of ADC miniDSP
55	1111 1111	Coefficient N0(7:0) for ADC Biquad E or coefficient FIR20(7:0) for ADC FIR filter or coefficient C27(7:0) of ADC miniDSP
56	0000 0000	Coefficient N1(15:8) for ADC Biquad E or coefficient FIR21(15:8) for ADC FIR filter or coefficient C28(15:8) of ADC miniDSP
57	0000 0000	Coefficient N1(7:0) for ADC Biquad E or coefficient FIR21(7:0) for ADC FIR filter or coefficient C28(7:0) of ADC miniDSP

6.7 Control Registers, Page 8: DAC Programmable Coefficients RAM Buffer A (1:63)

Default values shown for this page only become valid 100 µs following a hardware or software reset.

Page 8 / Register 0: Page Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D0	R/W	0000 0000	0000 0000: Page 0 selected 0000 0001: Page 1 selected ... 1111 1110: Page 254 selected 1111 1111: Page 255 selected

The remaining page-8 registers are either reserved registers or are used for setting coefficients for the various filters in the TLV320AIC3111. Reserved registers should not be written to.

The filter coefficient registers are arranged in pairs, with two adjacent 8-bit registers containing the 16-bit coefficient for a single filter. The 16-bit integer contained in the MSB and LSB registers for a coefficient are interpreted as a 2s-complement integer, with possible values ranging from –32,768 to 32,767. When programming any coefficient value for a filter, the MSB register should always be written first, immediately followed by the LSB register. Even if only the MSB or LSB portion of the coefficient changes, both registers should be written in this sequence. Table 6-4 is a list of the page-8 registers, excepting the previously described register 0.

Page 8 / Register 1: DAC Coefficient RAM Control

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D4	R/W	00000	Reserved. Write only the reset value.
D3	R	0	DAC miniDSP generated flag for toggling MSB of coefficient RAM address (only used in non-adaptive mode)
D2	R/W	0	DAC Adaptive Filtering Control 0: Adaptive filtering disabled in DAC miniDSP 1: Adaptive filtering enabled in DAC miniDSP
D1	R	0	DAC Adaptive Filter Buffer Control Flag 0: In adaptive filter mode, DAC miniDSP accesses DAC coefficient Buffer A and the external control interface accesses DAC coefficient Buffer B 1: In adaptive filter mode, DAC miniDSP accesses DAC coefficient Buffer B and the external control interface accesses DAC coefficient Buffer A
D0	R/W	0	DAC Adaptive Filter Buffer Switch Control 0: DAC coefficient buffers are not switched at the next frame boundary. 1: DAC coefficient buffers are switched at the next frame boundary, if adaptive filtering mode is enabled. This bit self-clears on switching.

Table 6-4. Page-8 Registers

REGISTER NUMBER	RESET VALUE	REGISTER NAME
2	0111 1111	Coefficient N0(15:8) for left DAC-programmable biquad A or coefficient C1(15:8) of DAC miniDSP (DAC buffer A)
3	1111 1111	Coefficient N0(7:0) for left DAC-programmable biquad A or coefficient C1(7:0) of DAC miniDSP (DAC buffer A)
4	0000 0000	Coefficient N1(15:8) for left DAC-programmable biquad A or coefficient C2(15:8) of DAC miniDSP (DAC buffer A)
5	0000 0000	Coefficient N1(7:0) for left DAC-programmable biquad A or coefficient C2(7:0) of DAC miniDSP (DAC buffer A)
6	0000 0000	Coefficient N2(15:8) for left DAC-programmable biquad A or coefficient C3(15:8) of DAC miniDSP (DAC buffer A)
7	0000 0000	Coefficient N2(7:0) for left DAC-programmable biquad A or coefficient C3(7:0) of DAC miniDSP (DAC buffer A)
8	0000 0000	Coefficient D1(15:8) for left DAC-programmable biquad A or coefficient C4(15:8) of DAC miniDSP (DAC buffer A)
9	0000 0000	Coefficient D1(7:0) for left DAC-programmable biquad A or coefficient C4(7:0) of DAC miniDSP (DAC buffer A)
10	0000 0000	Coefficient D2(15:8) for left DAC-programmable biquad A or coefficient C5(15:8) of DAC miniDSP (DAC buffer A)
11	0000 0000	Coefficient D2(7:0) for left DAC-programmable biquad A or coefficient C5(7:0) of DAC miniDSP (DAC buffer A)
12	0111 1111	Coefficient N0(15:8) for left DAC-programmable biquad B or coefficient C6(15:8) of DAC miniDSP (DAC buffer A)
13	1111 1111	Coefficient N0(7:0) for left DAC-programmable biquad B or coefficient C6(7:0) of DAC miniDSP (DAC buffer A)
14	0000 0000	Coefficient N1(15:8) for left DAC-programmable biquad B or coefficient C7(15:8) of DAC miniDSP (DAC buffer A)
15	0000 0000	Coefficient N1(7:0) for left DAC-programmable biquad B or coefficient C7(7:0) of DAC miniDSP (DAC buffer A)
16	0000 0000	Coefficient N2(15:8) for left DAC-programmable biquad B or coefficient C8(15:8) of DAC miniDSP (DAC buffer A)
17	0000 0000	Coefficient N2(7:0) for left DAC-programmable biquad B or coefficient C8(7:0) of DAC miniDSP (DAC buffer A)
18	0000 0000	Coefficient D1(15:8) for left DAC-programmable biquad B or coefficient C9(15:8) of DAC miniDSP (DAC buffer A)
19	0000 0000	Coefficient D1(7:0) for left DAC-programmable biquad B or coefficient C9(7:0) of DAC miniDSP (DAC buffer A)

6.8 Control Registers, Page 9: DAC Programmable Coefficients RAM Buffer A (65:127)

Default values shown for this page only become valid 100 µs following a hardware or software reset.

Page 9 / Register 0: Page Control Register

BIT	READ/ WRITE	RESET VALUE	DESCRIPTION
D7–D0	R/W	0000 0000	0000 0000: Page 0 selected 0000 0001: Page 1 selected ... 1111 1110: Page 254 selected 1111 1111: Page 255 selected

The remaining page-9 registers are either reserved registers or are used for setting coefficients for the various filters in the TLV320AIC3111. Reserved registers should not be written to.

The filter-coefficient registers are arranged in pairs, with two adjacent 8-bit registers containing the 16-bit coefficient for a single filter. The 16-bit integer contained in the MSB and LSB registers for a coefficient are interpreted as a 2s-complement integer, with possible values ranging from –32,768 to 32,767. When programming any coefficient value for a filter, the MSB register should always be written first, immediately followed by the LSB register. Even if only the MSB or LSB portion of the coefficient changes, both registers should be written in this sequence. Table 6-5 is a list of the page-9 registers, excepting the previously described register 0.

Table 6-5. Page-9 Registers

REGISTER NUMBER	RESET VALUE	REGISTER NAME
1	XXXX XXXX	Reserved. Do not write to this register.
2	0111 1111	Coefficient N0(15:8) for left DAC-programmable first-order IIR or coefficient C65(15:8) of DAC miniDSP (DAC buffer A)
3	1111 1111	Coefficient N0(7:0) for left DAC-programmable first-order IIR or coefficient C65(7:0) of DAC miniDSP (DAC buffer A)
4	0000 0000	Coefficient N1(15:8) for left DAC-programmable first-order IIR or coefficient C66(15:8) of DAC miniDSP (DAC buffer A)
5	0000 0000	Coefficient N1(7:0) for left DAC-programmable first-order IIR or coefficient C66(7:0) of DAC miniDSP (DAC buffer A)
6	0000 0000	Coefficient D1(15:8) for left DAC-programmable first-order IIR or coefficient C67(15:8) of DAC miniDSP (DAC buffer A)
7	0000 0000	Coefficient D1(7:0) for left DAC-programmable first-order IIR or coefficient C67(7:0) of DAC miniDSP (DAC buffer A)
8	0111 1111	Coefficient N0(15:8) for right DAC-programmable first-order IIR or coefficient C68(15:8) of DAC miniDSP (DAC buffer A)
9	1111 1111	Coefficient N0(7:0) for right DAC-programmable first-order IIR or coefficient C68(7:0) of DAC miniDSP (DAC buffer A)
10	0000 0000	Coefficient N1(15:8) for right DAC-programmable first-order IIR or coefficient C69(15:8) of DAC miniDSP (DAC buffer A)
11	0000 0000	Coefficient N1(7:0) for right DAC-programmable first-order IIR or coefficient C69(7:0) of DAC miniDSP (DAC buffer A)
12	0000 0000	Coefficient D1(15:8) for right DAC-programmable first-order IIR or coefficient C70(15:8) of DAC miniDSP (DAC buffer A)
13	0000 0000	Coefficient D1(7:0) for right DAC-programmable first-order IIR or coefficient C70(7:0) of DAC miniDSP (DAC buffer A)
14	0111 1111	Coefficient N0(15:8) for DRC first-order high-pass filter or coefficient C71(15:8) of DAC miniDSP (DAC buffer A)
15	1111 0111	Coefficient N0(7:0) for DRC first-order high-pass filter or coefficient C71(7:0) of DAC miniDSP (DAC buffer A)
16	1000 0000	Coefficient N1(15:8) for DRC first-order high-pass filter or coefficient C72(15:8) of DAC miniDSP (DAC buffer A)

Table 6-5. Page-9 Registers (continued)

REGISTER NUMBER	RESET VALUE	REGISTER NAME
17	0000 1001	Coefficient N1(7:0) for DRC first-order high-pass filter or coefficient C72(7:0) of DAC miniDSP (DAC buffer A)
18	0111 1111	Coefficient D1(15:8) for DRC first-order high-pass filter or coefficient C73(15:8) of DAC miniDSP (DAC buffer A)
19	1110 1111	Coefficient D1(7:0) for DRC first-order high-pass filter or coefficient C73(7:0) of DAC miniDSP (DAC buffer A)
20	0000 0000	Coefficient N0(15:8) for DRC first-order low-pass filter or coefficient C74(15:8) of DAC miniDSP (DAC buffer A)
21	0001 0001	Coefficient N0(7:0) for DRC first-order low-pass filter or coefficient C74(7:0) of DAC miniDSP (DAC buffer A)
22	0000 0000	Coefficient N1(15:8) for DRC first-order low-pass filter or coefficient C75(15:8) of DAC miniDSP (DAC buffer A)
23	0001 0001	Coefficient N1(7:0) for DRC first-order low-pass filter or coefficient C75(7:0) of DAC miniDSP (DAC buffer A)
24	0111 1111	Coefficient D1(15:8) for DRC first-order low-pass filter or coefficient C76(15:8) of DAC miniDSP (DAC buffer A)
25	1101 1110	Coefficient D1(7:0) for DRC first-order low-pass filter or coefficient C76(7:0) of DAC miniDSP (DAC buffer A)
26	0000 0000	Coefficient C77(15:8) of DAC miniDSP (DAC buffer A)
27	0000 0000	Coefficient C77(7:0) of DAC miniDSP (DAC buffer A)
28	0000 0000	Coefficient C78(15:8) of DAC miniDSP (DAC buffer A)
29	0000 0000	Coefficient C78(7:0) of DAC miniDSP (DAC buffer A)
30	0000 0000	Coefficient C79(15:8) of DAC miniDSP (DAC buffer A)
31	0000 0000	Coefficient C79(7:0) of DAC miniDSP (DAC buffer A)
32	0000 0000	Coefficient C80(15:8) of DAC miniDSP (DAC buffer A)
33	0000 0000	Coefficient C80(7:0) of DAC miniDSP (DAC buffer A)
34	0000 0000	Coefficient C81(15:8) of DAC miniDSP (DAC buffer A)
35	0000 0000	Coefficient C81(7:0) of DAC miniDSP (DAC buffer A)
36	0000 0000	Coefficient C82(15:8) of DAC miniDSP (DAC buffer A)
37	0000 0000	Coefficient C82(7:0) of DAC miniDSP (DAC buffer A)
38	0000 0000	Coefficient C83(15:8) of DAC miniDSP (DAC buffer A)
39	0000 0000	Coefficient C83(7:0) of DAC miniDSP (DAC buffer A)
40	0000 0000	Coefficient C84(15:8) of DAC miniDSP (DAC buffer A)
41	0000 0000	Coefficient C84(7:0) of DAC miniDSP (DAC buffer A)
42	0000 0000	Coefficient C85(15:8) of DAC miniDSP (DAC buffer A)
43	0000 0000	Coefficient C85(7:0) of DAC miniDSP (DAC buffer A)
44	0000 0000	Coefficient C86(15:8) of DAC miniDSP (DAC buffer A)
45	0000 0000	Coefficient C86(7:0) of DAC miniDSP (DAC buffer A)
46	0000 0000	Coefficient C87(15:8) of DAC miniDSP (DAC buffer A)
47	0000 0000	Coefficient C87(7:0) of DAC miniDSP (DAC buffer A)
48	0000 0000	Coefficient C88(15:8) of DAC miniDSP (DAC buffer A)
49	0000 0000	Coefficient C88(7:0) of DAC miniDSP (DAC buffer A)
50	0000 0000	Coefficient C89(15:8) of DAC miniDSP (DAC buffer A)
51	0000 0000	Coefficient C89(7:0) of DAC miniDSP (DAC buffer A)
52	0000 0000	Coefficient C90(15:8) of DAC miniDSP (DAC buffer A)
53	0000 0000	Coefficient C90(7:0) of DAC miniDSP (DAC buffer A)
54	0000 0000	Coefficient C91(15:8) of DAC miniDSP (DAC buffer A)
55	0000 0000	Coefficient C91(7:0) of DAC miniDSP (DAC buffer A)
56	0000 0000	Coefficient C92(15:8) of DAC miniDSP (DAC buffer A)

Table 6-8. Page-12 Registers (continued)

REGISTER NUMBER	RESET VALUE	REGISTER NAME
14	0000 0000	Coefficient N1(15:8) for left DAC-programmable biquad B or coefficient C7(15:8) of DAC miniDSP (DAC buffer B)
15	0000 0000	Coefficient N1(7:0) for left DAC-programmable biquad B or coefficient C7(7:0) of DAC miniDSP (DAC buffer B)
16	0000 0000	Coefficient N2(15:8) for left DAC-programmable biquad B or coefficient C8(15:8) of DAC miniDSP (DAC buffer B)
17	0000 0000	Coefficient N2(7:0) for left DAC-programmable biquad B or coefficient C8(7:0) of DAC miniDSP (DAC buffer B)
18	0000 0000	Coefficient D1(15:8) for left DAC-programmable biquad B or coefficient C9(15:8) of DAC miniDSP (DAC buffer B)
19	0000 0000	Coefficient D1(7:0) for left DAC-programmable biquad B or coefficient C9(7:0) of DAC miniDSP (DAC buffer B)
20	0000 0000	Coefficient D2(15:8) for left DAC-programmable biquad B or coefficient C10(15:8) of DAC miniDSP (DAC buffer B)
21	0000 0000	Coefficient D2(7:0) for left DAC-programmable biquad B or coefficient C10(7:0) of DAC miniDSP (DAC buffer B)
22	0111 1111	Coefficient NO(15:8) for left DAC-programmable biquad C or coefficient C11(15:8) of DAC miniDSP (DAC buffer B)
23	1111 1111	Coefficient NO(7:0) for left DAC-programmable biquad C or coefficient C11(7:0) of DAC miniDSP (DAC buffer B)
24	0000 0000	Coefficient N1(15:8) for left DAC-programmable biquad C or coefficient C12(15:8) of DAC miniDSP (DAC buffer B)
25	0000 0000	Coefficient N1(7:0) for left DAC-programmable biquad C or coefficient C12(7:0) of DAC miniDSP (DAC buffer B)
26	0000 0000	Coefficient N2(15:8) for left DAC-programmable biquad C or coefficient C13(15:8) of DAC miniDSP (DAC buffer B)
27	0000 0000	Coefficient N2(7:0) for left DAC-programmable biquad C or coefficient C13(7:0) of DAC miniDSP (DAC buffer B)
28	0000 0000	Coefficient D1(15:8) for left DAC-programmable biquad C or coefficient C14(15:8) of DAC miniDSP (DAC buffer B)
29	0000 0000	Coefficient D1(7:0) for left DAC-programmable biquad C or coefficient C14(7:0) of DAC miniDSP (DAC buffer B)
30	0000 0000	Coefficient D2(15:8) for left DAC-programmable biquad C or coefficient C15(15:8) of DAC miniDSP (DAC buffer B)
31	0000 0000	Coefficient D2(7:0) for left DAC-programmable biquad C or coefficient C15(7:0) of DAC miniDSP (DAC buffer B)
32	0111 1111	Coefficient NO(15:8) for left DAC-programmable biquad D or coefficient C16(15:8) of DAC miniDSP (DAC buffer B)
33	1111 1111	Coefficient NO(7:0) for left DAC-programmable biquad D or coefficient C16(7:0) of DAC miniDSP (DAC buffer B)
34	0000 0000	Coefficient N1(15:8) for left DAC-programmable biquad D or coefficient C17(15:8) of DAC miniDSP (DAC buffer B)
35	0000 0000	Coefficient N1(7:0) for left DAC-programmable biquad D or coefficient C17(7:0) of DAC miniDSP (DAC buffer B)
36	0000 0000	Coefficient N2(15:8) for left DAC-programmable biquad D or coefficient C18(15:8) of DAC miniDSP (DAC buffer B)
37	0000 0000	Coefficient N2(7:0) for left DAC-programmable biquad D or coefficient C18(7:0) of DAC miniDSP (DAC buffer B)
38	0000 0000	Coefficient D1(15:8) for left DAC-programmable biquad D or coefficient C19(15:8) of DAC miniDSP (DAC buffer B)
39	0000 0000	Coefficient D1(7:0) for left DAC-programmable biquad D or coefficient C19(7:0) of DAC miniDSP (DAC buffer B)
40	0000 0000	Coefficient D2(15:8) for left DAC-programmable biquad D or coefficient C20(15:8) of DAC miniDSP (DAC buffer B)

Table 6-8. Page-12 Registers (continued)

REGISTER NUMBER	RESET VALUE	REGISTER NAME
41	0000 0000	Coefficient D2(17:0) for left DAC-programmable biquad D or coefficient C20(7:0) of DAC miniDSP (DAC buffer B)
42	0111 1111	Coefficient NO(15:8) for left DAC-programmable biquad E or coefficient C21(15:8) of DAC miniDSP (DAC buffer B)
43	1111 1111	Coefficient NO(7:0) for left DAC-programmable biquad E or coefficient C21(7:0) of DAC miniDSP (DAC buffer B)
44	0000 0000	Coefficient N1(15:8) for left DAC-programmable biquad E or coefficient C22(15:8) of DAC miniDSP (DAC buffer B)
45	0000 0000	Coefficient N1(7:0) for left DAC-programmable biquad E or coefficient C22(7:0) of DAC miniDSP (DAC buffer B)
46	0000 0000	Coefficient N2(15:8) for left DAC-programmable biquad E or coefficient C23(15:8) of DAC miniDSP (DAC buffer B)
47	0000 0000	Coefficient N2(7:0) for left DAC-programmable biquad E or coefficient C23(7:0) of DAC miniDSP (DAC buffer B)
48	0000 0000	Coefficient D1(15:8) for left DAC-programmable biquad E or coefficient C24(15:8) of DAC miniDSP (DAC buffer B)
49	0000 0000	Coefficient D1(7:0) for left DAC-programmable biquad E or coefficient C24(7:0) of DAC miniDSP (DAC buffer B)
50	0000 0000	Coefficient D2(15:8) for left DAC-programmable biquad E or coefficient C25(15:8) of DAC miniDSP (DAC buffer B)
51	0000 0000	Coefficient D2(7:0) for left DAC-programmable biquad E or coefficient C25(7:0) of DAC miniDSP (DAC buffer B)
52	0111 1111	Coefficient NO(15:8) for left DAC-programmable biquad F or coefficient C26(15:8) of DAC miniDSP (DAC buffer B)
53	1111 1111	Coefficient NO(7:0) for left DAC-programmable biquad F or coefficient C26(7:0) of DAC miniDSP (DAC buffer B)
54	0000 0000	Coefficient N1(15:8) for left DAC-programmable biquad F or coefficient C27(15:8) of DAC miniDSP (DAC buffer B)
55	0000 0000	Coefficient N1(7:0) for left DAC-programmable biquad F or coefficient C27(7:0) of DAC miniDSP (DAC buffer B)
56	0000 0000	Coefficient N2(15:8) for left DAC-programmable biquad F or coefficient C28(15:8) of DAC miniDSP (DAC buffer B)
57	0000 0000	Coefficient N2(7:0) for left DAC-programmable biquad F or coefficient C28(7:0) of DAC miniDSP (DAC buffer B)
58	0000 0000	Coefficient D1(15:8) for left DAC-programmable biquad F or coefficient C29(15:8) of DAC miniDSP (DAC buffer B)
59	0000 0000	Coefficient D1(7:0) for left DAC-programmable biquad F or coefficient C29(7:0) of DAC miniDSP (DAC buffer B)
60	0000 0000	Coefficient D2(15:8) for left DAC-programmable biquad F or coefficient C30(15:8) of DAC miniDSP (DAC buffer B)
61	0000 0000	Coefficient D2(7:0) for left DAC-programmable biquad F or coefficient C30(7:0) of DAC miniDSP (DAC buffer B)
62	0000 0000	Coefficient C31(15:8) of DAC miniDSP (DAC buffer B)
63	0000 0000	Coefficient C31(7:0) of DAC miniDSP (DAC buffer B)
64	0000 0000	Coefficient C32(15:8) of DAC miniDSP (DAC buffer B)– also used for the 3D PGA for PRB_P23, PRB_P24 and PRB_P25
65	0000 0000	Coefficient C32(7:0) of DAC miniDSP (DAC buffer B) – also used for the 3D PGA for PRB_P23, PRB_P24 and PRB_P25
66	0111 1111	Coefficient NO(15:8) for right DAC-programmable biquad A or coefficient C33(15:8) of DAC miniDSP (DAC buffer B)
67	1111 1111	Coefficient NO(7:0) for right DAC-programmable biquad A or coefficient C33(7:0) of DAC miniDSP (DAC buffer B)
68	0000 0000	Coefficient N1(15:8) for right DAC-programmable biquad A or coefficient C34(15:8) of DAC miniDSP (DAC buffer B)

Table 6-8. Page-12 Registers (continued)

REGISTER NUMBER	RESET VALUE	REGISTER NAME
69	0000 0000	Coefficient N1(7:0) for right DAC-programmable biquad A or coefficient C34(7:0) of DAC miniDSP (DAC buffer B)
70	0000 0000	Coefficient N2(15:8) for right DAC-programmable biquad A or coefficient C35(15:8) of DAC miniDSP (DAC buffer B)
71	0000 0000	Coefficient N2(7:0) for right DAC-programmable biquad A or coefficient C35(7:0) of DAC miniDSP (DAC buffer B)
72	0000 0000	Coefficient D1(15:8) for right DAC-programmable biquad A or coefficient C36(15:8) of DAC miniDSP (DAC buffer B)
73	0000 0000	Coefficient D1(7:0) for right DAC-programmable biquad A or coefficient C36(7:0) of DAC miniDSP (DAC buffer B)
74	0000 0000	Coefficient D2(15:8) for right DAC-programmable biquad A or coefficient C37(15:8) of DAC miniDSP (DAC buffer B)
75	0000 0000	Coefficient D2(7:0) for right DAC-programmable biquad A or coefficient C37(7:0) of DAC miniDSP (DAC buffer B)
76	0111 1111	Coefficient NO(15:8) for right DAC-programmable biquad B or coefficient C38(15:8) of DAC miniDSP (DAC buffer B)
77	1111 1111	Coefficient NO(7:0) for right DAC-programmable biquad B or coefficient C38(7:0) of DAC miniDSP (DAC buffer B)
78	0000 0000	Coefficient N1(15:8) for right DAC-programmable biquad B or coefficient C39(15:8) of DAC miniDSP (DAC buffer B)
79	0000 0000	Coefficient N1(7:0) for right DAC-programmable biquad B or coefficient C39(7:0) of DAC miniDSP (DAC buffer B)
80	0000 0000	Coefficient N2(15:8) for right DAC-programmable biquad B or coefficient C40(15:8) of DAC miniDSP (DAC buffer B)
81	0000 0000	Coefficient N2(7:0) for right DAC-programmable biquad B or coefficient C40(7:0) of DAC miniDSP (DAC buffer B)
82	0000 0000	Coefficient D1(15:8) for right DAC-programmable biquad B or coefficient C41(15:8) of DAC miniDSP (DAC buffer B)
83	0000 0000	Coefficient D1(7:0) for right DAC-programmable biquad B or coefficient C41(7:0) of DAC miniDSP (DAC buffer B)
84	0000 0000	Coefficient D2(15:8) for right DAC-programmable biquad B or coefficient C42(15:8) of DAC miniDSP (DAC buffer B)
85	0000 0000	Coefficient D2(7:0) for right DAC-programmable biquad B or coefficient C42(7:0) of DAC miniDSP (DAC buffer B)
86	0111 1111	Coefficient NO(15:8) for right DAC-programmable biquad C or coefficient C43(15:8) of DAC miniDSP (DAC buffer B)
87	1111 1111	Coefficient NO(7:0) for right DAC-programmable biquad C or coefficient C43(7:0) of DAC miniDSP (DAC buffer B)
88	0000 0000	Coefficient N1(15:8) for right DAC-programmable biquad C or coefficient C44(15:8) of DAC miniDSP (DAC buffer B)
89	0000 0000	Coefficient N1(7:0) for right DAC-programmable biquad C or coefficient C44(7:0) of DAC miniDSP (DAC buffer B)
90	0000 0000	Coefficient N2(15:8) for right DAC-programmable biquad C or coefficient C45(15:8) of DAC miniDSP (DAC buffer B)
91	0000 0000	Coefficient N2(7:0) for right DAC-programmable biquad C or coefficient C45(7:0) of DAC miniDSP (DAC buffer B)
92	0000 0000	Coefficient D1(15:8) for right DAC-programmable biquad C or coefficient C46(15:8) of DAC miniDSP (DAC buffer B)
93	0000 0000	Coefficient D1(7:0) for right DAC-programmable biquad C or coefficient C46(7:0) of DAC miniDSP (DAC buffer B)
94	0000 0000	Coefficient D2(15:8) for right DAC-programmable biquad C or coefficient C47(15:8) of DAC miniDSP (DAC buffer B)
95	0000 0000	Coefficient D2(7:0) for right DAC-programmable biquad C or coefficient C47(7:0) of DAC miniDSP (DAC buffer B)

Table 6-8. Page-12 Registers (continued)

REGISTER NUMBER	RESET VALUE	REGISTER NAME
96	0111 1111	Coefficient NO(15:8) for right DAC-programmable biquad D or coefficient C48(15:8) of DAC miniDSP (DAC buffer B)
97	1111 1111	Coefficient NO(7:0) for right DAC-programmable biquad D or coefficient C48(7:0) of DAC miniDSP (DAC buffer B)
98	0000 0000	Coefficient N1(15:8) for right DAC-programmable biquad D or coefficient C49(15:8) of DAC miniDSP (DAC buffer B)
99	0000 0000	Coefficient N1(7:0) for right DAC-programmable biquad D or coefficient C49(7:0) of DAC miniDSP (DAC buffer B)
100	0000 0000	Coefficient N2(15:8) for right DAC-programmable biquad D or coefficient C50(15:8) of DAC miniDSP (DAC buffer B)
101	0000 0000	Coefficient N2(7:0) for right DAC-programmable biquad D or coefficient C50(7:0) of DAC miniDSP (DAC buffer B)
102	0000 0000	Coefficient D1(15:8) for right DAC-programmable biquad D or coefficient C51(15:8) of DAC miniDSP (DAC buffer B)
103	0000 0000	Coefficient D1(7:0) for right DAC-programmable biquad D or coefficient C51(7:0) of DAC miniDSP (DAC buffer B)
104	0000 0000	Coefficient D2(15:8) for right DAC-programmable biquad D or coefficient C52(15:8) of DAC miniDSP (DAC buffer B)
105	0000 0000	Coefficient D2(7:0) for right DAC-programmable biquad D or coefficient C52(7:0) of DAC miniDSP (DAC buffer B)
106	0111 1111	Coefficient NO(15:8) for right DAC-programmable biquad E or coefficient C53(15:8) of DAC miniDSP (DAC buffer B)
107	1111 1111	Coefficient NO(7:0) for right DAC-programmable biquad E or coefficient C53(7:0) of DAC miniDSP (DAC buffer B)
108	0000 0000	Coefficient N1(15:8) for right DAC-programmable biquad E or coefficient C54(15:8) of DAC miniDSP (DAC buffer B)
109	0000 0000	Coefficient N1(7:0) for right DAC-programmable biquad E or coefficient C54(7:0) of DAC miniDSP (DAC buffer B)
110	0000 0000	Coefficient N2(15:8) for right DAC-programmable biquad E or coefficient C55(15:8) of DAC miniDSP (DAC buffer B)
111	0000 0000	Coefficient N2(7:0) for right DAC-programmable biquad E or coefficient C55(7:0) of DAC miniDSP (DAC buffer B)
112	0000 0000	Coefficient D1(15:8) for right DAC-programmable biquad E or coefficient C56(15:8) of DAC miniDSP (DAC buffer B)
113	0000 0000	Coefficient D1(7:0) for right DAC-programmable biquad E or coefficient C56(7:0) of DAC miniDSP (DAC buffer B)
114	0000 0000	Coefficient ND2(15:8) for right DAC-programmable biquad E or coefficient C57(15:8) of DAC miniDSP (DAC buffer B)
115	0000 0000	Coefficient ND2(7:0) for right DAC-programmable biquad E or coefficient C57(7:0) of DAC miniDSP (DAC buffer B)
116	0111 1111	Coefficient NO(15:8) for right DAC-programmable biquad F or coefficient C58(15:8) of DAC miniDSP (DAC buffer B)
117	1111 1111	Coefficient NO(7:0) for right DAC-programmable biquad F or coefficient C58(7:0) of DAC miniDSP (DAC buffer B)
118	0000 0000	Coefficient N1(15:8) for right DAC-programmable biquad F or coefficient C59(15:8) of DAC miniDSP (DAC buffer B)
119	0000 0000	Coefficient N1(7:0) for right DAC-programmable biquad F or coefficient C59(7:0) of DAC miniDSP (DAC buffer B)
120	0000 0000	Coefficient N2(15:8) for right DAC-programmable biquad F or coefficient C60(15:8) of DAC miniDSP (DAC buffer B)
121	0000 0000	Coefficient N2(7:0) for right DAC-programmable biquad F or coefficient C60(7:0) of DAC miniDSP (DAC buffer B)
122	0000 0000	Coefficient D1(15:8) for right DAC-programmable biquad F or coefficient C61(15:8) of DAC miniDSP (DAC buffer B)

Table 6-9. Page-13 Registers

REGISTER NUMBER	RESET VALUE	REGISTER NAME
1	0000 0000	Reserved. Do not write to this register.
2	0111 1111	Coefficient N0(15:8) for left DAC-programmable first-order IIR or coefficient C65(15:8) of DAC miniDSP (DAC buffer B)
3	1111 1111	Coefficient N0(7:0) for left DAC-programmable first-order IIR or coefficient C65(7:0) of DAC miniDSP (DAC buffer B)
4	0000 0000	Coefficient N1(15:8) for left DAC-programmable first-order IIR or coefficient C66(15:8) of DAC miniDSP (DAC buffer B)
5	0000 0000	Coefficient N1(7:0) for left DAC-programmable first-order IIR or coefficient C66(7:0) of DAC miniDSP (DAC buffer B)
6	0000 0000	Coefficient D1(15:8) for left DAC-programmable first-order IIR or coefficient C67(15:8) of DAC miniDSP (DAC buffer B)
7	0000 0000	Coefficient D1(7:0) for left DAC-programmable first-order IIR or coefficient C67(7:0) of DAC miniDSP (DAC buffer B)
8	0111 1111	Coefficient N0(15:8) for right DAC-programmable first-order IIR or coefficient C68(15:8) of DAC miniDSP (DAC buffer B)
9	1111 1111	Coefficient N0(7:0) for right DAC-programmable first-order IIR or coefficient C68(7:0) of DAC miniDSP (DAC buffer B)
10	0000 0000	Coefficient N1(15:8) for right DAC-programmable first-order IIR or coefficient C69(15:8) of DAC miniDSP (DAC buffer B)
11	0000 0000	Coefficient N1(7:0) for right DAC-programmable first-order IIR or coefficient C69(7:0) of DAC miniDSP (DAC buffer B)
12	0000 0000	Coefficient D1(15:8) for right DAC-programmable first-order IIR or coefficient C70(15:8) of DAC miniDSP (DAC buffer B)
13	0000 0000	Coefficient D1(7:0) for right DAC-programmable first-order IIR or coefficient C70(7:0) of DAC miniDSP (DAC buffer B)
14	0111 1111	Coefficient N0(15:8) for DRC first-order high-pass filter or coefficient C71(15:8) of DAC miniDSP (DAC buffer B)
15	1111 0111	Coefficient N0(7:0) for DRC first-order high-pass filter or coefficient C71(7:0) of DAC miniDSP (DAC buffer B)
16	1000 0000	Coefficient N1(15:8) for DRC first-order high-pass filter or coefficient C72(15:8) of DAC miniDSP (DAC buffer B)
17	0000 1001	Coefficient N1(7:0) for DRC first-order high-pass filter or coefficient C72(7:0) of DAC miniDSP (DAC buffer B)
18	0111 1111	Coefficient D1(15:8) for DRC first-order high-pass filter or coefficient C73(15:8) of DAC miniDSP (DAC buffer B)
19	1110 1111	Coefficient D1(7:0) for DRC first-order high-pass filter or coefficient C73(7:0) of DAC miniDSP (DAC buffer B)

Table 6-9. Page-13 Registers (continued)

REGISTER NUMBER	RESET VALUE	REGISTER NAME
20	0000 0000	Coefficient N0(15:8) for DRC first-order low-pass filter or coefficient C74(15:8) of DAC miniDSP (DAC buffer B)
21	0001 0001	Coefficient N0(7:0) for DRC first-order low-pass filter or coefficient C74(7:0) of DAC miniDSP (DAC buffer B)
22	0000 0000	Coefficient N1(15:8) for DRC first-order low-pass filter or coefficient C75(15:8) of DAC miniDSP (DAC buffer B)
23	0001 0001	Coefficient N1(7:0) for DRC first-order low-pass filter or coefficient C75(7:0) of DAC miniDSP (DAC buffer B)
24	0111 1111	Coefficient D1(15:8) for DRC first-order low-pass filter or coefficient C76(15:8) of DAC miniDSP (DAC buffer B)
25	1101 1110	Coefficient D1(7:0) for DRC first-order low-pass filter or coefficient C76(7:0) of DAC miniDSP (DAC buffer B)
26	0000 0000	Coefficient C77(15:8) of DAC miniDSP (DAC buffer B)
27	0000 0000	Coefficient C77(7:0) of DAC miniDSP (DAC buffer B)
28	0000 0000	Coefficient C78(15:8) of DAC miniDSP (DAC buffer B)
29	0000 0000	Coefficient C78(7:0) of DAC miniDSP (DAC buffer B)
30	0000 0000	Coefficient C79(15:8) of DAC miniDSP (DAC buffer B)
31	0000 0000	Coefficient C79(7:0) of DAC miniDSP (DAC buffer B)
32	0000 0000	Coefficient C80(15:8) of DAC miniDSP (DAC buffer B)
33	0000 0000	Coefficient C80(7:0) of DAC miniDSP (DAC buffer B)
34	0000 0000	Coefficient C81(15:8) of DAC miniDSP (DAC buffer B)
35	0000 0000	Coefficient C81(7:0) of DAC miniDSP (DAC buffer B)
36	0000 0000	Coefficient C82(15:8) of DAC miniDSP (DAC buffer B)
37	0000 0000	Coefficient C82(7:0) of DAC miniDSP (DAC buffer B)
38	0000 0000	Coefficient C83(15:8) of DAC miniDSP (DAC buffer B)
39	0000 0000	Coefficient C83(7:0) of DAC miniDSP (DAC buffer B)
40	0000 0000	Coefficient C84(15:8) of DAC miniDSP (DAC buffer B)
41	0000 0000	Coefficient C84(7:0) of DAC miniDSP (DAC buffer B)
42	0000 0000	Coefficient C85(15:8) of DAC miniDSP (DAC buffer B)

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)
TLV320AIC3111IRHBR	ACTIVE	QFN	RHB	32	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR
TLV320AIC3111IRHBT	ACTIVE	QFN	RHB	32	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

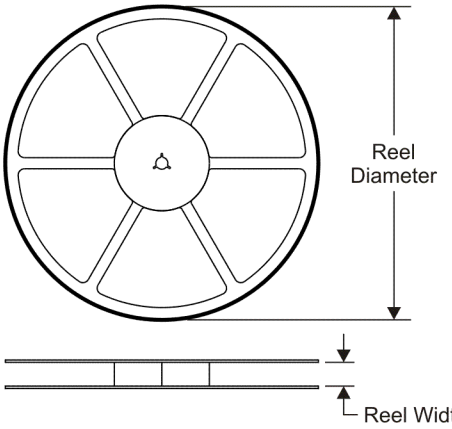

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

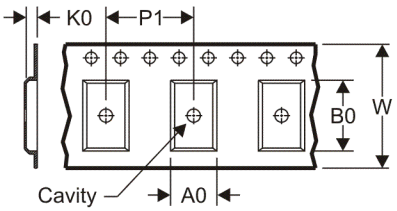

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

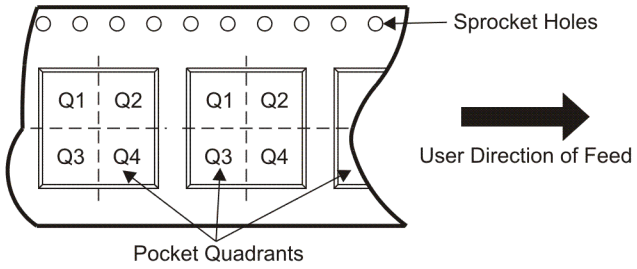

TAPE DIMENSIONS

A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

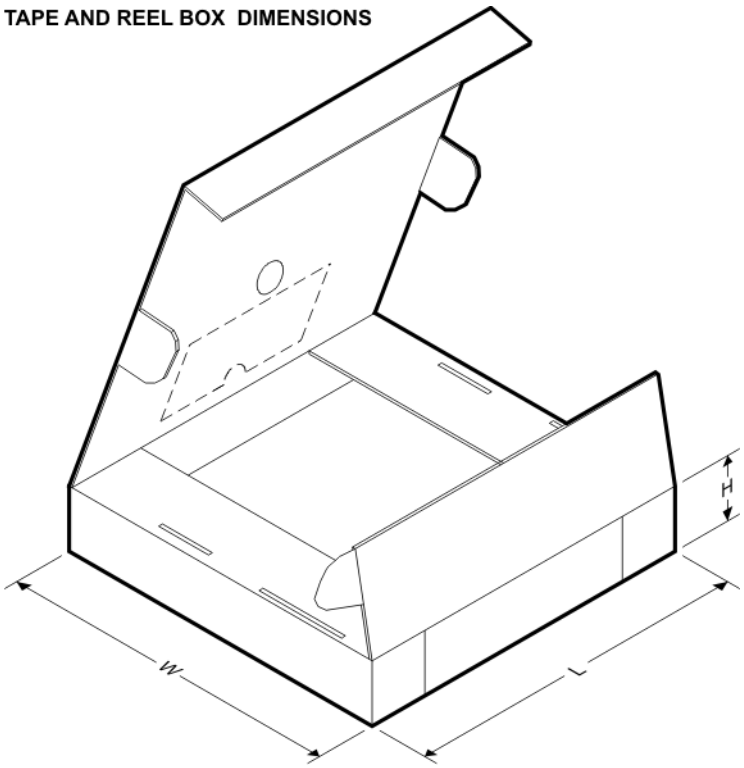

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

RHB (S–PQFP–N32) PLASTIC QUAD FLATPACK

4204326/C xx/04

NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. QFN (Quad Flatpack No–Lead) Package configuration.
D The Package thermal pad must be soldered to the board for thermal and mechanical performance. See product data sheet for details regarding the exposed thermal pad dimensions.
E. Falls within JEDEC MO–220.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
