16M × 72-Bit Dynamic RAM Module (ECC - Module)

HYM 72V1620GS-50/-60
HYM 72V1630GS-50/-60

- 168 Pin JEDEC Standard, Buffered 8 Byte Dual In-Line Memory Module for PC main memory applications
- 1 bank 16M x 72 organisation
- Optimized for ECC applications
- Fast Page Mode Operation
- Performance::

		-50	-60	
t _{RAC}	$\overline{\text{RAS}}$ access time	50	60	ns
t _{CAC}	$\overline{\text{CAS}}$ access time	18	20	ns
t _{AA}	Access time from address	30	35	ns
t _{RC}	Read/Write cycle time	90	110	ns
t _{PC}	Fast page mode cycle time	35	40	ns

- Single + 3.3V (± 0.3V) supply
- $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh, $\overline{\text{RAS}}$ -only-refresh
- Decoupling capacitors mounted on substrate
- All inputs, outputs and clock fully LVTTTL & LVCMOS compatible
- 4 Byte interleave enabled, Dual Address inputs (A0/B0)
- Buffered inputs excepts $\overline{\text{RAS}}$ and DQ
- Parallel Presence Detects
- Utilizes eighteen 16M × 4 -DRAMs and four BiCMOS buffers/line drivers
- Two versions : HYM 72V1620GS with TSOPII-components (4 mm thickness)
HYM 72V1630GS with SOJ-components (9 mm thickness)
- 8192 refresh cycles / 128 ms with 13 / 11 addressing
- Gold contact pad
- Double sided module with 38.0 mm (1500 mil) height

The HYM 72V1600/10GS-50/-60 is a 128 MByte DRAM module organized as 16 777 216 words by 72-bit in a 168-pin, dual read-out, single-in-line package comprising eighteen HYB 3164400AT/AJ 16M × 4 DRAMs in 400 mil wide TSOPII or SOJ- packages mounted together with ceramic decoupling capacitors on a PC board. All inputs except $\overline{\text{RAS}}$ and DQ are buffered by using BiCMOS buffers/line drivers.

Each HYB 3164400AT/AJ is described in the data sheet and is fully electrically tested and processed according to Siemens standard quality procedure prior to module assembly. After assembly onto the board, a further set of electrical tests is performed.

The density and speed of the module can be detected by the use of presence detect pins.

Absolute Maximum Ratings

Operating temperature range	0 to + 70 °C
Storage temperature range.....	- 55 to + 125 °C
Input/output voltage	-0.5 to min (V _{CC} +0.5, 4.6) V
Power supply voltage.....	- 1.0 V to + 4.6 V
Power dissipation.....	8.3 W
Data out current (short circuit)	50 mA

Note: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Notes:

- 1) All voltages are referenced to VSS.
- 2) ICC1, ICC3, ICC4 and ICC6 depend on cycle rate.
- 3) ICC1 and ICC4 depend on output loading. Specified values are measured with the output open.
- 4) Address can be changed once or less while $\overline{RAS} = \text{Vil}$. In the case of ICC4 it can be changed once or less during a fast page mode cycle (tpc).
- 5) An initial pause of 100 μs is required after power-up followed by 8 RAS-only-refresh cycles, before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 \overline{CAS} -before- \overline{RAS} initialization cycles instead of 8 \overline{RAS} cycles are required.
- 6) AC measurements assume $t_T = 5 \text{ ns}$.
- 7) VIH (min.) and VIL (max.) are reference levels for measuring timing of input signals. Also, transition times are measured between VIH and VIL.
- 8) The specified timings include buffer, loading and skew delay adders: 2ns minimum, 5ns (\overline{CAS} , \overline{WE} , \overline{OE} , addresses) maximum delay, no pulse shrinkage to the DRAM device timings. The data and RAS signals are not buffered, which preserves the DRAMs access specification of 50ns and 60ns.
- 9) A +5ns timing skew from the DRAM to the module resulted from the addition of line drivers.
- 10) A -2ns timing skew from the DRAM to the module resulted from the addition of line drivers.
- 11) A +2ns timing skew from the DRAM to the module resulted from the addition of line drivers.
- 12) A -2ns (min.) and a -5ns (max.) timing skew from the DRAM to the module resulted from the addition of line drivers.
- 13) Measured with the specified current load and 100 pF at $V_{oh} = 2.0 \text{ V}$ and $V_{ol} = 0.8 \text{ V}$.
- 14) Operation within the tRCD (max.) limit ensures that tRAC (max.) can be met. tRCD (max.) is specified as a reference point only: If tRCD is greater than the specified tRCD (max.) limit, then access time is controlled by tCAC.
- 15) Operation within the tRAD (max.) limit ensures that tRAC (max.) can be met. tRAD (max.) is specified as a reference point only: If tRAD is greater than the specified tRAD (max.) limit, then access time is controlled by tAA.
- 16) Either tRCH or tRRH must be satisfied for a read cycle.
- 17) tOFF (max.) and tOEZ (max.) define the time at which the outputs achieve the open-circuit condition and are not referenced to output voltage levels.
- 18) Either tDZC or tDZO must be satisfied.
- 19) Either tCDD or tODD must be satisfied.
- 20) tWCS, tRWD, tCWD, tAWD and tCPWD are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only. If $tWCS > tWCS(\text{min.})$, the cycle is an early write cycle and the I/O pin will remain open-circuit (high impedance) through the entire cycle; if $tRWD > tRWD(\text{min.})$, $tCWD > tCWD(\text{min.})$, $tAWD > tAWD(\text{min.})$ and $tCPWD > tCPWD(\text{min.})$, the cycle is a read-write cycle and I/O pins will contain data read from the selected cells. If neither of the above sets of conditions is satisfied, the condition of the I/O pins (at access time) is indeterminate.
- 21) These parameters are referenced to \overline{CAS} leading edge in early write cycles and to \overline{WE} leading edge in Read-Modify-Write cycles.
