High-Performance, 25 A/40 A Peak, DC-DC Converter

General Description

The DA9141 is a high efficiency, 25 A continuous and 40 A peak, four-phase, DC-DC stepdown converter (buck). It is also available as fully AEC-Q100 qualified.

With remote sensing, the DA9141 improves output voltage regulation at the point of load.

Fully integrated switching FETs means no external FETs or Schottky diodes are needed.

A programmable soft startup can be enabled, which limits the inrush current from the input node and secures a slope-controlled rail activation.

The dynamic voltage control (DVC) supports adaptive adjustment of the supply voltage dependent on the processor load, via either a direct register write using the communication interface (I^2C compatible) or with a programmable input pin.

A configurable GPI allows multiple I^2C address selection for multiple instances of DA9141 in the same application.

DA9141 has integrated over-temperature and over-current protection for increased system reliability, without the need for external sensing components.

Key Features

- 2.8 V to 5.5 V input voltage
- 0.3 V to 1.3 V output voltage
- Up to 40 A peak output current, 25 A continuous output current
- 4 MHz nominal switching frequency
- Quad-phase operation
- 110 nH inductor per phase
- 220 µF output capacitor
- 400 mA (typ) output capacitor ripple current @ 3.3 V input, 0.968 V output, 25 A load
- Maximum 15 mV output voltage ripple
- ±1 % accuracy (static)
- ±5 % load transient
- I^2C-compatible interface (FM+)
- Programmable GPIOs
- Programmable soft startup
- Voltage, current, and temperature supervision
- 60 FC-BGA 4.5 mm x 7 mm (0.65 mm pitch)
- 180 mm^2 total solution area
- Automotive AEC-Q100 qualified also available

Applications

- Navigation systems
- Telematics
- AI engines
- Automotive infotainment
- Advanced driver assistance systems (ADAS)
- SiPP modules

4 Characteristics

4.1 Absolute Maximum Ratings

Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, so functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specification are not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

Note: Values are preliminary, pending final silicon characterization results.

Table 3: Absolute Maximum Ratings

Parameter	Description	Conditions	Min	Max	Unit
T_{STG}	Storage temperature		-65	150	°C
T_J	Junction temperature		-40	150	°C
V_{SYS}	System supply voltage		-0.3	6.0	V
V_{PIN}	Voltage on pins		-0.3	6.0	V

4.2 Electrostatic Discharge Ratings

Note: Values are preliminary, pending final silicon characterization results.

Table 4: Electrostatic Discharge Ratings

Parameter	Description	Conditions	Value	Unit
ESD_{HBM}	Maximum ESD protection	Human body model (HBM) All exposed pins	2	kV
ESD_{CDM}	Maximum ESD protection	Charged device model (CDM)	500 (Note 1)	V

Note 1 Increased to 750 V for corner balls.

4.3 Recommended Operating Conditions

Note: Values are preliminary, pending final silicon characterization results.

Table 5: Recommended Operating Conditions

Parameter	Description	Conditions	Min	Typ	Max	Unit
V_{SYS}	System supply voltage		2.8		5.5	V
V_{PIN}	Voltage on pins		-0.3		V_{SYS} + 0.3	V
T_J	Junction temperature		-40		125	°C

Parameter	Description	Conditions	Min	Typ	Max	Unit
R_{PD}	GPIO pull-down resistor		2	10	120	kΩ
R_{PU}	GPIO pull-up resistor		2	10	120	kΩ

4.8 Timing Characteristics

Note: Values are preliminary, pending final silicon characterization results.

Table 10: I2C Electrical Characteristics

Parameter	Description	Conditions	Min	Typ	Max	Unit
Electrical Performance						
t_{BUS}	Bus free time between a STOP and START condition		0.5			µs
C_{BUS}	Bus line capacitive load				150	pF
f_{SCL}	SCL clock frequency		20 Note 1		1000	kHz
t_{LO_SCL}	SCL low time		0.5			µs
t_{HI_SCL}	SCL high time		0.26			µs
t_{RISE}	SCL and SDA rise time	Requirement for input			1000	ns
t_{FALL}	SCL and SDA fall time	Requirement for input			300	ns
t_{SETUP_START}	Start condition setup time		0.26			µs
t_{HOLD_START}	Start condition hold time		0.26			µs
t_{SETUP_STOP}	Stop condition setup time		0.26			µs
t_{DATA}	Data valid time				0.45	µs
t_{DATA_ACK}	Data valid acknowledge time				0.45	µs
t_{SETUP_DATA}	Data setup time		50			ns
t_{HOLD_DATA}	Data hold time		0			ns

Note 1 Minimum clock frequency is limited to 20 kHz if I2C_TIMEOUT is enabled

© 2021 Dialog Semiconductor

5 Functional Description

5.1 Operating Modes

5.1.1 ON

DA9141 is ON when the IC_EN pin is higher than V_{IH_EN} and the supply voltage is higher than V_{THR_POR}. Once enabled, the host processor can start communicating with DA9141 using the control interface, after the t_{IC_EN} delay.

5.1.2 OFF

DA9141 is OFF when the IC_EN pin is lower than V_{IL_EN}. In OFF, the buck is always disabled and the LX nodes are pulled down by a (typically 150 Ω) internal pull-down resistor.

5.2 DC-DC Buck Converter

DA9141 operates as a single-channel, quad-phase buck converter which delivers up to 40 A output current at a 0.3 V to 1.3 V output voltage range.

The buck converter has two configurable output voltage settings. One is the normal output voltage (A), the other offers an alternative retention voltage (B). The bits used to configure the outputs are CH1_A_VOUT and CH1_B_VOUT. In this way, different application power modes are supported. The target output voltage (either A or B) is toggled by either GPI or I^2C control interface, providing maximum flexibility for the application's host processor.

When the buck is enabled, its output voltage is monitored and a power-good signal indicates that the buck output voltage has reached a level higher than the $V_{THR_PG_RISE}$ threshold. The power-good status is lost when the voltage drops below $V_{THR_PG_FALL}$ or increases above $V_{THR_PG_RISE}$. The status of the power-good indicator is read back via I^2C from the PG1 status bit. Alternatively, it can be assigned to any of the GPIOs by setting the GPIO<x>_MODE bits to PG1 output.

The buck converter is capable of supporting DVC transitions that occur when:

- the active and selected A- or B-voltage is updated to a new target value, using bits CH1_A_VOUT and CH1_B_VOUT
- the voltage selection is toggled from the A- to B-voltage (or B- to A-voltage), using bit CH1_VSEL or via GPI control

The DVC operates in pulse-width-modulation (PWM) mode with synchronous rectification. The slew rate of the DVC ramp up and ramp down transitions is programmed at 10 mV per (8, 4, 2, 1, or 0.5) µs in register bits CH1_SR_DVC_DWN and CH1_SR_DVC_UP.

A pull-down resistor (typically 150 Ω) for each phase is always activated when the buck is disabled, unless it is disabled by setting register bits CH1_PD_DIS to 0x1.

5.2.1 Switching Frequency

The buck switching frequency is tuned using register bit OSC_TUNE. The internal 8 MHz oscillator frequency is tuned in ±160 kHz steps. This impacts the buck converter frequency in steps of 80 kHz and helps to mitigate possible disturbances to other high frequency systems in the application.

5.2.2 Operation Modes and Phase Selection

The buck converter operates in PWM or PFM modes. The operating mode is selected using register bits CH1_A_MODE and CH1_B_MODE.

Phase shedding automatically changes between 1- and 4-phase operation at a typical current of 4 A.

If the automatic operation mode (Auto mode) is selected , the buck converter automatically changes between synchronous PWM mode and PFM mode depending on the load current. This improves the efficiency across the range of output load currents.

 © 2021 Dialog Semiconductor

5.2.3 Output Voltage Selection

The switching converter is configured using the I²C interface.

Two output voltages (Value A and Value B in Figure 3) are pre-configured in registers CH1_A_VOUT and CH1_B_VOUT. The output voltage (VBUCK in Figure 3) is selected by toggling register bit CH1_VSEL, by re-programming the selected voltage control register, or by toggling a GPI if configured to do so. Any of these options will result in ramped voltage transitions.

After being enabled, the buck converter uses, by default, the register settings in CH1_A_VOUT (Value A) unless the output voltage selection is configured via the GPI port to be CH1_B_VOUT.

Register bits CH1_VMAX limit the output voltage that can be set.

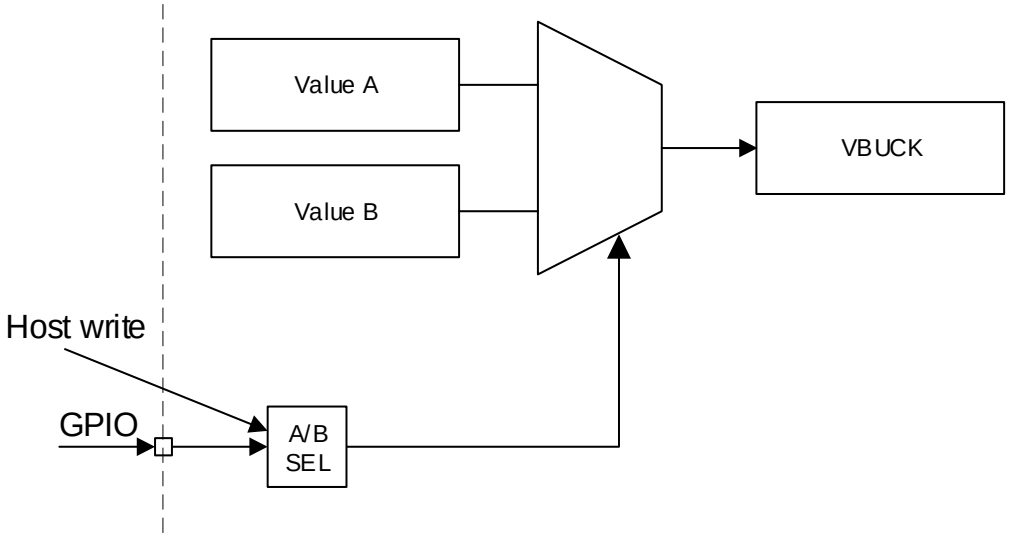

Figure 3: Buck Output Voltage Control Concept

5.2.4 Soft Startup and Shutdown

To limit in-rush current from VSYS, the buck converter performs a soft-start after being enabled. The startup behavior is a compromise between acceptable inrush current from the battery and turn-on time. Ramp times are configured in register CH1_SR_STARTUP. **Note**: rates higher than 5 mV/µs may produce overshoot during the startup phase.

A ramped power down is selected in register bits CH1_SR_SHDN. When no ramp is selected (immediate power down), the output node is discharged only by the pull-down resistor, if enabled, in register CH1_PD_DIS.

5.2.5 Current Limit

The integrated current limit protects the power stages and external coil from excessive current. Configure the buck current limit to at least 40 % higher than the required maximum output current.

When the current limit is reached, the buck converter generates an event and an interrupt to the host processor unless the interrupt has been masked using bit M_OC1 in SYS_MASK_1. Register bit OC_DVC_MASK masks over-current events during DVC transitions.

© 2021 Dialog Semiconductor

5.2.6 Temperature Protection

DA9141 is protected from internal overheating by temperature-triggered shutdown.

There are two kinds of flags concerning temperature protection: temperature warning and temperature critical. The warning flag asserts when $T_J > T_{WARN}$ and the critical flag asserts when $T_J > T_{CRIT}$. When the critical flag asserts, Buck1 shuts down immediately.

Table 11: Temperature Protection Control Registers

Category	Register name	Description
Status	TEMP_WARN	Asserts when the temperature warning threshold is reached
	TEMP_CRIT	Asserts when the temperature shutdown threshold is reached
IRQ event	E_TEMP_WARN	TEMP_WARN caused event
	E_TEMP_CRIT	TEMP_CRIT caused event
IRQ mask	M_TEMP_WARN	TEMP_WARN event IRQ mask
	M_TEMP_CRIT	TEMP_CRIT event IRQ mask
	M_VR_HOT	TEMP_WARN status IRQ mask

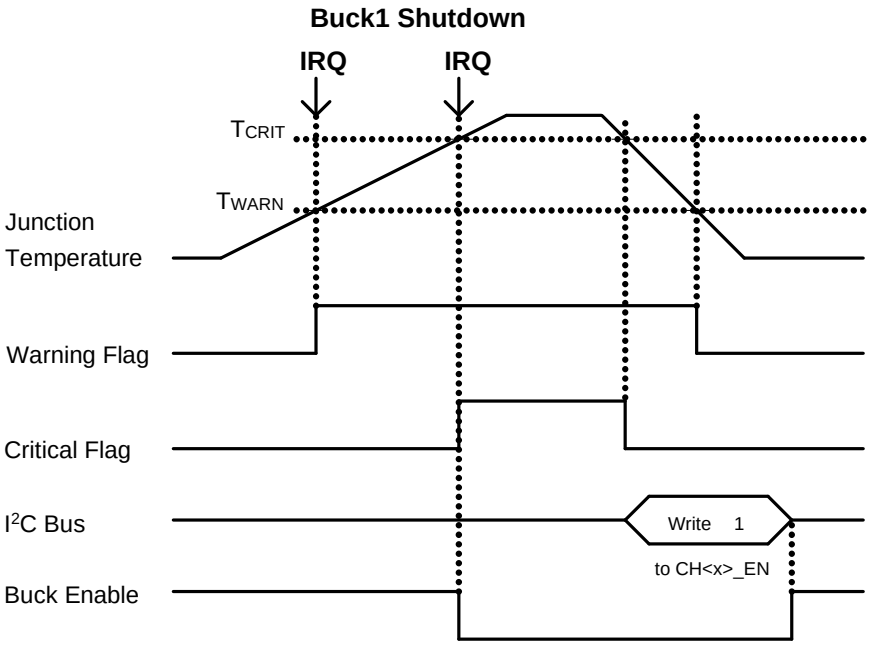

Figure 4: Temperature Protection Operation

5.3 Control Circuits

5.3.1 Chip Enable and Disable

The IC_EN pin enables and disables the IC. When IC_EN = 0 all blocks, except for low I_Q POR, powerdown and the buck output is pulled down.

© 2021 Dialog Semiconductor

5.3.2 GPIO

5.3.2.1 GPIO Pin Assignment

The DA9141 provides up to five GPIO pins, three if the I²C is enabled, see Table 12. The registers that configure the GPIO pin assignments are OTP programmable.

GPIO0 can be programmed (OTP option) to function as chip configuration (CONF), see Section 5.3.2.3. When the I²C interface is enabled (OTP option) any register settings for GPIO3 and GPIO4 are ignored and GPIO3 and GPIO4 function as SCL and SDA respectively.

Table 12: GPIO Pin Assignment

OTP Option		GPIO Pin					Available GPIOs
I2C	CONF	CONF/ GPIO0	GPIO1	GPIO2	SCL/ GPIO3	SDA/ GPIO4	
Disabled	Disabled	GPIO0	GPIO1	GPIO2	GPIO3	GPIO4	5
	Enabled	CONF	GPIO1	GPIO2	GPIO3	GPIO4	4
Enabled	Disabled	GPIO0	GPIO1	GPIO2	SCL	SDA	3
	Enabled	CONF	GPIO1	GPIO2	SCL	SDA	2

5.3.2.2 GPIO Function

The GPIO pins are configurable as the following functions in register GPIO<x>_MODE (x = 0 to 4):

- Buck1 enable input (EN1)
- Buck1 DVC control input (DVC1)
- Buck1 OTP setting reload input (RELOAD)
- Buck1 power-good output (PG1)
- Interrupt output (nIRQ)

5.3.2.3 Chip Configuration Select

GPIO0 functions as chip configuration select (CONF) input when enabled as an OTP setting.

Three different chip configurations can be selected according to the CONF pin level (high, low, or Hi-Z).

Table 13: GPIO0 Configurable Registers when CONF Enabled

Register Name	Description
IF_SLAVE_ADDR[6:0]	I2C slave address
CH1_A_MODE[1:0]	CH1_A Operation mode select
CH1_B_MODE[1:0]	CH1_B Operation mode select
CH1_VSEL	CH1 output voltage and operation selection
CH1_EN	CH1 enable
CH1_A_VOUT[7:0]	CH1 output voltage setting A
CH1_B_VOUT[7:0]	CH1 output voltage setting B
M_PG1_STAT	IRQ mask setting for CH1 power-good status
M_VR_HOT	IRQ mask setting for temp warning status
GPIO1_MODE[3:0]	GPIO1 mode setting
GPIO2_MODE[3:0]	GPIO2 mode setting
GPIO1_OBUF	GPIO1 output buffer select

© 2021 Dialog Semiconductor

Register Name	Description
GPIO2_OBUF	GPIO2 output buffer select
GPIO1_TRIG[1:0]	GPIO1 input trigger select
GPIO1_POL	GPIO1 polarity select
GPIO1_PUPD	GPIO1 pull-up/pull-down enable
GPIO1_DEB[1:0]	GPIO1 input debounce time setting
GPIO1_DEB_RISE	GPIO1 input debounce rising edge enable
GPIO1_DEB_FALL	GPIO1 input debounce falling edge enable
GPIO2_TRIG[1:0]	GPIO2 input trigger select
GPIO2_POL	GPIO2 polarity select
GPIO2_PUPD	GPIO2 pull-up/pull-down enable
GPIO2_DEB[1:0]	GPIO2 input debounce time setting
GPIO2_DEB_RISE	GPIO2 input debounce rising edge enable
GPIO2_DEB_FALL	GPIO2 input debounce falling edge enable

5.3.3 Interrupt

When an event is triggered, the nIRQ interrupt flag is asserted. Trigger conditions and control registers for each interrupt event are listed in Table 14.

Some of these events are categorized as fault events and affect device operation (for example, buck disable), see Section 5.2.6.

Table 14: Interrupt List

Name	Polarity (Note 1)	Trigger	IRQ Status Register	IRQ Mask Register	Deglitch Period
Temperature warning (event)	N	T_J rising above T_{WARN}	E_TEMP_WARN	M_TEMP_WARN	0 s
Temperature critical (event)	N	T_J rising above T_{CRIT}	E_TEMP_CRIT	M_TEMP_CRIT	0 s
Buck1 power-good (event)	P	Buck1 V_{OUT} is in power-good voltage range (not under- or over-voltage)	E_PG1	M_PG1	0 s
Buck1 over-voltage (event)	N	Buck1 V_{OUT} rising above over-voltage threshold (target voltage + 150 mV)	E_OV1	M_OV1	Rise: 8 µs Fall: 8 µs
Buck1 under-voltage (event)	N	Buck1 V_{OUT} falling below under-voltage threshold (target voltage - $V_{TH_PG_FALL}$)	E_UV1	M_UV1	0 s
Buck1 over-current (event)	N	Buck1 current rising above over-current threshold	E_OC1	M_OC1	0 s
Buck1 power-good (status) (Note 2)	P	Buck1 V_{OUT} is in power-good voltage range (not under- or over-voltage)	PG1	M_PG1_STAT (Note 3)	0 s
Temperature warning (status) (Note 2)	N	T_J rising above T_{WARN}	TEMP_WARN	M_VR_HOT (Note 3)	0 s
GPIO0 change (event)	N	Detect GPIO0 change for active trigger selected by GPIO0_TRIG register	E_GPIO0	M_GPIO0	100 µs, 1 ms, or 10 ms 100 ms
GPIO1 change (event)	N	Detect GPIO1 change for active trigger selected by GPIO1_TRIG register	E_GPIO1	M_GPIO1	
GPIO2 change (event)	N	Detect GPIO2 change for active trigger selected by GPIO2_TRIG register	E_GPIO2	M_GPIO2	

Note 1 Polarity at the source of the flag: P = active high, N = active low.
General rule is: normal system state is high, and abnormal system state is low (for example, PG = high means power-good, TEMP_CRIT = low when in temperature critical state).

Note 2 Interrupt outputs the status as is. I^2C write is not required for interrupt clear.

Note 3 OTP load value defined by CONF pin setting (if CONF pin enabled).

Table 15: Interrupt Registers Except for Power-Good Status

Register	Description
E_<name>	Read-only interrupt event register 0: No interrupt 1: Interrupt occurred **Cleared after being written to I²C**. Set until IRQ is removed.
M_<name>	Interrupt mask register 0: Not masked 1: Masked. No IRQ signal sent. Event register (E_<name>) is updated.

Table 16: Interrupt Registers for Power-Good and Temperature Warning Status

Register	Description
PG1	Buck1 power-good status. Asserted as long as Buck1 output voltage is in range (under-voltage threshold < buck output voltage < over-voltage threshold) 0: Not power-good 1: Power-good
M_PG1_STAT	Power-good status interrupt mask register 0: Not masked 1: Masked. No IRQ signal sent. Power-good status register (PG1) is updated
TEMP_WARN	Asserted as long as the temperature warning threshold (T_{WARN}) is reached 0: Junction temperature is below T_{WARN} 1: Junction temperature is above T_{WARN}
M_VR_HOT	Temperature warning status (TEMP_WARN) interrupt mask register 0: Not masked 1: Masked. No IRQ signal sent. Temperature warning status register (TEMP_WARN) is updated

5.4 I²C Communication

All features of DA9141 can be controlled with the I²C interface, which is enabled or disabled as an OTP setting.

I2C	Description
Disabled	SCL/GPIO3 and SDA/GPIO4 pins can be used as GPIO
Enabled	SCL/GPIO3 and SDA/GPIO4 pins are used as I²C clock input and I²C data input/output.

GPIO3 functions as the I²C clock (SCL) and GPIO4 carries all the power manager bidirectional I²C data (SDA). The I²C interface is open drain supporting multiple devices on a single line. The bus lines have to be pulled high by external pull-up resistors (2 kΩ to 20 kΩ). The standard frequency of the I²C bus is 1 MHz in fast-mode plus (FM+), 400 kHz in fast-mode, or 100 kHz in standard mode.

5.4.1 I²C Protocol

All data is transmitted across the I²C bus in eight-bit groups. To send a bit, the SDA line is driven towards the intended state while the SCL is low (a low SDA indicates a zero bit). Once the SDA has settled, the SCL line is brought high and then low. This pulse on SCL clocks the SDA bit into the receiver's shift register.

A two-byte serial protocol is used containing one byte for address and one byte for data. Data and address transfer are transmitted MSB first for both read and write operations. All transmissions begin with the START condition from the master while the bus is in idle state (the bus is free). It is initiated by a high to low transition on the SDA line while the SCL is in the high state (a STOP condition is indicated by a low to high transition on the SDA line while the SCL is in the high state).

Figure 6: I²C START and STOP Condition Timing

The I²C bus is monitored for a valid slave address whenever the interface is enabled. It responds immediately when it receives its own slave address. The acknowledge is done by pulling the SDA line low during the following clock cycle (white blocks marked with A in Figure 7 and Figure 8).

The protocol for a register write from master to slave consists of a START condition, a slave address with read/write bit, and the eight-bit register address followed by eight bits of data, terminated by a STOP condition. DA9141 responds to all bytes with acknowledge (A), see Figure 7.

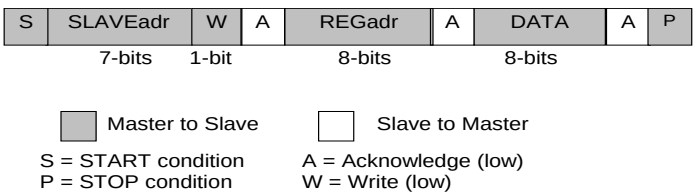

Figure 7: I²C Byte Write (SDA Line)

© 2021 Dialog Semiconductor

When the host reads data from a register it first has to write to DA9141 with the target register address and then read from DA9141

with a repeated START, or alternatively a second START, condition. After receiving the data, the host sends no acknowledge (A*) and terminates the transmission with a STOP condition, see Figure 8.

6.2 Register Descriptions

Table 18: SYS_STATUS_0 (0x0001)

Bit	Type	Field Name	Description	Reset
[1]	R	TEMP_CRIT	Asserted when the thermal shutdown threshold is reached	0x0
[0]	R	TEMP_WARN	Asserted when the thermal warning threshold is reached	0x0

Table 19: SYS_STATUS_1 (0x0002)

Bit	Type	Field Name	Description	Reset
[3]	R	PG1	Asserted when the buck output voltage is in range	0x0
[2]	R	OV1	Asserted when the buck exceeds the over-voltage threshold	0x0
[1]	R	UV1	Asserted when the buck exceeds the under-voltage threshold	0x0
[0]	R	OC1	Asserted when the buck exceeds the over-current threshold	0x0

Table 20: SYS_STATUS_2 (0x0003)

Bit	Type	Field Name	Description	Reset
[2]	R	GPIO2	GPIO2 input readback status - asserted if the input on GPIO is seen as logic high	0x0
[1]	R	GPIO1	GPIO1 input readback status - asserted if the input on GPIO is seen as logic high	0x0
[0]	R	GPIO0	GPIO0 input readback status - asserted if the input on GPIO is seen as logic high	0x0

Table 21: SYS_EVENT_0 (0x0004)

Bit	Type	Field Name	Description	Reset
[1]	RW1C	E_TEMP_CRIT	An over-temperature event has occurred. Write 0x1 to reset this bit to 0x0 when the event source has been released.	0x0
[0]	RW1C	E_TEMP_WARN	A temperature warning event has occurred. Write 0x1 to reset this bit to 0x0 when the event source has been released.	0x0

Table 22: SYS_EVENT_1 (0x0005)

Bit	Type	Field Name	Description	Reset
[3]	RW1C	E_PG1	PG1 caused event. Write 0x1 to reset this bit to 0x0 when the event source has been released.	0x0
[2]	RW1C	E_OV1	OV1 caused event. Write 0x1 to reset this bit to 0x0 when the event source has been released.	0x0
[1]	RW1C	E_UV1	UV1 caused event. Write 0x1 to reset this bit to 0x0 when the event source has been released.	0x0
[0]	RW1C	E_OC1	OC1 caused event. Write 0x1 to reset this bit to 0x0 when the event source has been released.	0x0

7.2 Moisture Sensitivity Level

The Moisture Sensitivity Level (MSL) is an indicator for the maximum allowable time period (floor lifetime) in which a moisture sensitive plastic device, once removed from the dry bag, can be exposed to an environment with a specified maximum temperature and a maximum relative humidity before the solder reflow process. The MSL classification is defined in Table 53.

For detailed information on MSL levels refer to the IPC/JEDEC standard J-STD-020, which can be downloaded from http://www.jedec.org.

The DA9141 package is qualified for MSL <TBD>.

Table 53: MSL Classification

MSL Level	Floor Lifetime	Conditions
MSL 4	72 hours	30 °C / 60 % RH
MSL 3	168 hours	30 °C / 60 % RH
MSL 2A	4 weeks	30 °C / 60 % RH
MSL 2	1 year	30 °C / 60 % RH
MSL 1	Unlimited	30 °C / 85 % RH

7.3 Soldering Information

Refer to the IPC/JEDEC standard J-STD-020 for relevant soldering information. This document can be downloaded from http://www.jedec.org.

8 Ordering Information

The ordering number consists of the part number followed by a suffix indicating the packing method. For details and availability, please consult your Dialog Semiconductor local sales representative.

Table 54: Ordering Information for Consumer / Industrial Applications

Part Number	Package	Size (mm)	Shipment Form	Pack Quantity
DA9141-xxF71	60 FCBGA	4.5 x 7 x 1.01 0.65 mm pitch	Tray	364
DA9141-xxF72	60 FCBGA	4.5 x 7 x 1.01 0.65 mm pitch	Reel	2600

Table 55: Ordering Information for Automotive Applications

Part Number	Package	Size (mm)	Shipment Form	Pack Quantity
DA9141-xxF71-A	60 FCBGA	4.5 x 7 x 1.01 0.65 mm pitch	Tray	364
DA9141-xxF72-A	60 FCBGA	4.5 x 7 x 1.01 0.65 mm pitch	Reel	2600

Status Definitions

Revision	Datasheet Status	Product Status	Definition
1.<n>	Target	Development	This datasheet contains the design specifications for product development. Specifications may be changed in any manner without notice.
2.<n>	Preliminary	Qualification	This datasheet contains the specifications and preliminary characterization data for products in pre-production. Specifications may be changed at any time without notice in order to improve the design.
3.<n>	Final	Production	This datasheet contains the final specifications for products in volume production. The specifications may be changed at any time in order to improve the design, manufacturing and supply. Major specification changes are communicated via Customer Product Notifications. Datasheet changes are communicated via www.dialog-semiconductor.com.
4.<n>	Obsolete	Archived	This datasheet contains the specifications for discontinued products. The information is provided for reference only.

Disclaimer

Unless otherwise agreed in writing, the Dialog Semiconductor products (and any associated software) referred to in this document are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of a Dialog Semiconductor product (or associated software) can reasonably be expected to result in personal injury, death or severe property or environmental damage. Dialog Semiconductor and its suppliers accept no liability for inclusion and/or use of Dialog Semiconductor products (and any associated software) in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Information in this document is believed to be accurate and reliable. However, Dialog Semiconductor does not give any representations or warranties, express or implied, as to the accuracy or completeness of such information. Dialog Semiconductor furthermore takes no responsibility whatsoever for the content in this document if provided by any information source outside of Dialog Semiconductor.

Dialog Semiconductor reserves the right to change without notice the information published in this document, including, without limitation, the specification and the design of the related semiconductor products, software and applications. Notwithstanding the foregoing, for any automotive grade version of the device, Dialog Semiconductor reserves the right to change the information published in this document, including, without limitation, the specification and the design of the related semiconductor products, software and applications, in accordance with its standard automotive change notification process.

Applications, software, and semiconductor products described in this document are for illustrative purposes only. Dialog Semiconductor makes no representation or warranty that such applications, software and semiconductor products will be suitable for the specified use without further testing or modification. Unless otherwise agreed in writing, such testing or modification is the sole responsibility of the customer and Dialog Semiconductor excludes all liability in this respect.

Nothing in this document may be construed as a license for customer to use the Dialog Semiconductor products, software and applications referred to in this document. Such license must be separately sought by customer with Dialog Semiconductor.

All use of Dialog Semiconductor products, software and applications referred to in this document is subject to Dialog Semiconductor's Standard Terms and Conditions of Sale, available on the company website (www.dialog-semiconductor.com) unless otherwise stated.

RoHS Compliance

Dialog Semiconductor's suppliers certify that its products are in compliance with the requirements of Directive 2011/65/EU of the European Parliament on the restriction of the use of certain hazardous substances in electrical and electronic equipment. RoHS certificates from our suppliers are available on request.
