512MB- 64Mx72 DDR SDRAM REGISTERED w/PLL

FEATURES

- Double-data-rate architecture
- Clock Speeds: 100MHz, 133MHz and 166MHz
- Bi-directional data strobes (DQS)
- Differential clock inputs (CK & CK#)
- Programmable Read Latency 2,2,5 (clock)
- Programmable Burst Length (2,4,8)
- Programmable Burst type (sequential & interleave)
- Edge aligned data output, center aligned data input
- Auto and self refresh
- Serial presence detect
- Power supply: V_{CC}: 2.5V ± 0.2V
- JEDEC standard 184 pin DIMM package
  - Package height options:
    JD3: 30.48mm (1.20") and
    AJD3: 28.70mm (1.13")

DESCRIPTION

The W3EG7263S is a 64Mx72 Double Data Rate SDRAM memory module based on 256Mb DDR SDRAM component. The module consists of eighteen 64Mx4 DDR SDRAMs in 66 pin TSOP package mounted on a 184 Pin FR4 substrate.

Synchronous design allows precise cycle control with the use of system clock. Data I/O transactions are possible on both edges and Burst Lenths allow the same device to be useful for a variety of high bandwidth, high performance memory system applications.

This product is under development, is not qualified or characterized and is subject to change without notice.

Notes:

1. DQ-to-I/O wiring is shown as recommended but may be changed.
2. DQ/DQS/DM/CKE/S relationships must be maintained as shown.
3. DQ, DQSresistors: 22 Ohms

ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Value	Units
Voltage on any pin relative to V_{SS}	V_{IN}, V_{OUT}	-0.5 - 3.6	V
Voltage on V_{CC} supply relative to V_{SS}	V_{CC}, V_{CCQ}	-1.0 - 3.6	V
Storage Temperature	T_{STG}	-55 - +150	°C
Power Dissipation	P_D	27	W
Short Circuit Current	I_{0S}	50	mA

Note: Permanent device damage may occur if 'ABSOLUTE MAXIMUM RATINGS' are exceeded.
Functional operation should be restricted to recommended operating condition.
Exposure to higher than recommended voltage for extended periods of time could affect device reliability

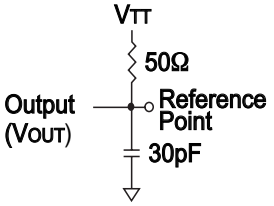
Notes

1. All voltages referenced to V_{SS}
2. Tests for AC timing, I_{DD}, and electrical AC and DC characteristics may be conducted at normal reference / supply voltage levels, but the related specifications and device operations are guaranteed for the full voltage range specified.
3. Outputs are measured with equivalent load:



4. AC timing and I_{DD} tests may use a V_{IL}-to-V_{IH} swing of up to 1.5V in the test environment, but input timing is still referenced to V_{REF} (or to the crossing point for CK/CK#), and parameter specifications are guaranteed for the specified AC input levels under normal use conditions. The minimum slew rate for the input signals used to test the device is 1V/ns in the range between V_{IL}(AC) and V_{IH}(AC).
5. The AC and DC input level specifications are defined in the SSTL_ 2 standard (i.e., the receiver will effectively switch as a result of the signal crossing the AC input level, and will remain in that state as long as the signal does not ring back above [below] the DC input LOW [high] level).
6. Command/Address input slew rate = 0.5V/ns. For -75 with slew rates 1V/ns and faster, t_{IS} and t_{IH} are reduced to 900ps. If the slew rate is less than 0.5V/ns, timing must be derated: t_{IS} has an additional 50ps per each 100mV/ns reduction in slew rate from the 500mV/ns. t_{IH} has 0ps added, that is, it remains constant. If the slew rate exceeds 4.5V/ns, functionality is uncertain.
7. Inputs are not recognized as valid until V_{REF} stabilizes. Exception: during the period before V_{REF} stabilizes, CKE £ 0.3 x V_{CCQ} is recognized as LOW.
8. t_{HZ} and t_{LZ} transitions occur in the same access time windows as valid data transitions. These parameters are not referenced to a specific voltage level, but specify when the device output is no longer driving (HZ) and begins driving (LZ).
9. The maximum limit for this parameter is not a device limit. The device will operate with a greater value for this parameter, but system performance (bus turnaround) will degrade accordingly.
10. This is not a device limit. The device will operate with a negative value, but system performance could be degraded due to bus turnaround.
11. It is recommended that DQS be valid (HIGH or LOW) on or before the WRITE command. The case shown (DQS going from High-Z to logic LOW) applies when no WRITEs were previously in progress on the bus. If a previous WRITE was in progress, DQS could be high during this time, depending on t_{DQSS}.
12. The refresh period is 64ms. This equates to an average refresh rate of 15.625µs (256Mb component) or 7.8125µs (512 Mb component). However, an AUTO REFRESH command must be asserted at least once every 140.6µs (256 Mb component) or 70.3µs (512Mb component); burst refreshing or posting by the DRAM controller greater than eight refresh cycles is not allowed.
13. The valid data window is derived by achieving other specifications - t_{HP} ($t_{CK/2}$), t_{DQSQ}, and t_{QH} (t_{QH} = t_{HP} - t_{QHS}). The data valid window derates directly proportional with the clock duty cycle and a practical data valid window can be derived. The clock is allowed a maximum duty cycled variation of 45/55. Functionality is uncertain when operating beyond a 45/55 ratio. The data valid window derating curves are provided below for duty cycles ranging between 50/50 and 45/55.
14. Referenced to each output group: x4 = DQS with DQ0-DQ4.
15. READs and WRITEs with auto precharge are not allowed to be issued until t_{RAS} (MIN) can be satisfied prior to the internal precharge command being issued.
16. JEDEC specifies CK and CK# input slew rate must be ≥ 1V/ns (2V/ns differentially).
17. DQ and DM input slew rates must not deviate from DQS by more than 10%. If the DQ/DM/DQS slew rate is less than 0.5V/ns, timing must be derated: 50ps must be added to t_{DS} and t_{DH} for each 100mV/ns reduction in slew rate. If slew rates exceed 4V/ns, functionality is uncertain.
18. t_{HP} min is the lesser of t_{CL} min and t_{CH} min actually applied to the device CK and CK# inputs, collectively during bank active.
19. This maximum value is derived from the referenced test load. In practice, the values obtained in a typical terminated design may reflect up to 310ps less for t_{HZ} (MAX) and last DVW. t_{HZ} (MAX) will prevail over the t_{DQSCK} (MAX) + t_{RPST} (MAX) condition. t_{LZ} (MIN) will prevail over t_{DQSCK} (MIN) + PRE (MAX) condition.
20. For slew rates greater than 1V/ns the (LZ) transition will start about 310ps earlier.
21. CKE must be active (High) during the entire time a refresh command is executed. That is, from the time the AUTO REFRESH command is registered, CKE must be active at each rising clock edge, until t_{REF} later.
22. Whenever the operating frequency is altered, not including jitter, the DLL is required to be reset. This is followed by 200 clock cycles (before READ commands).
