
HIGH-EFFICIENCY STEP-DOWN LOW POWER DC-DC CONVERTER

FEATURES

- High-Efficiency Synchronous Step-Down Converter With Greater Than 95% Efficiency
- 2 V to 5.5 V Operating Input Voltage Range
- Adjustable Output Voltage Range From 0.8 V to V_I
- Synchronizable to External Clock Signal up to 1 MHz
- Up to 300 mA Output Current
- Pin-Programmable Current Limit
- High Efficiency Over a Wide Load Current Range in Power Save Mode
- 100% Maximum Duty Cycle for Lowest Dropout
- Low-Noise Operation Antiringing Switch and PFM/PWM Operation Mode
- Internal Softstart
- 50- μ A Quiescent Current (TYP)
- Evaluation Module Available for Commercial Temperature Range

APPLICATIONS

- Down-Hole Drilling
- High Temperature Environments

SUPPORTS EXTREME TEMPERATURE APPLICATIONS

- Controlled Baseline
- One Assembly/Test Site
- One Fabrication Site
- Available in Extreme ($-55^{\circ}\text{C}/210^{\circ}\text{C}$) Temperature Range⁽¹⁾
- Extended Product Life Cycle
- Extended Product-Change Notification
- Product Traceability
- Texas Instruments high temperature products utilize highly optimized silicon (die) solutions with design and process enhancements to maximize performance over extended temperatures.

(1) Custom temperature ranges available

DESCRIPTION

The TPS62000 device is a low-noise synchronous step-down dc-dc converter that is ideally suited for systems powered from a 1-cell Li-ion battery or from a 2- to 3-cell NiCd, NiMH, or alkaline battery. The TPS62000 operates typically down to an input voltage of 1.8 V, with a specified minimum input voltage of 2 V.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Figure 1.

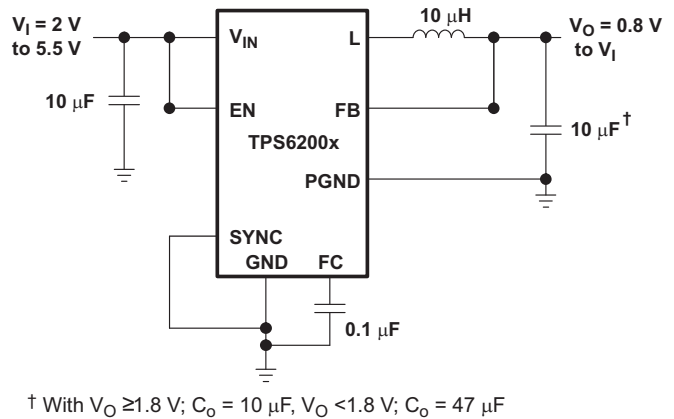

Figure 2. Typical Application Circuit for Fixed Output Voltage Option

DESCRIPTION (CONTINUED)

The TPS62000 is a synchronous current-mode PWM converter with integrated N- and P-channel power MOSFET switches. Synchronous rectification is used to increase efficiency and to reduce external component count. To achieve the highest efficiency over a wide load current range, the converter enters a power-saving pulse-frequency modulation (PFM) mode at light load currents. Operating frequency is typically 750 kHz, allowing the use of small inductor and capacitor values. The device can be synchronized to an external clock signal in the range of 500 kHz to 1 MHz. For low-noise operation, the converter can be operated in the PWM mode and the internal antiringing switch reduces noise and EMI. In the shutdown mode, the current consumption is reduced to less than 1 µA. The TPS62000-HT is available in the 10-pin (HKK). The device operates a free-air temperature range of -55°C to 210°C.

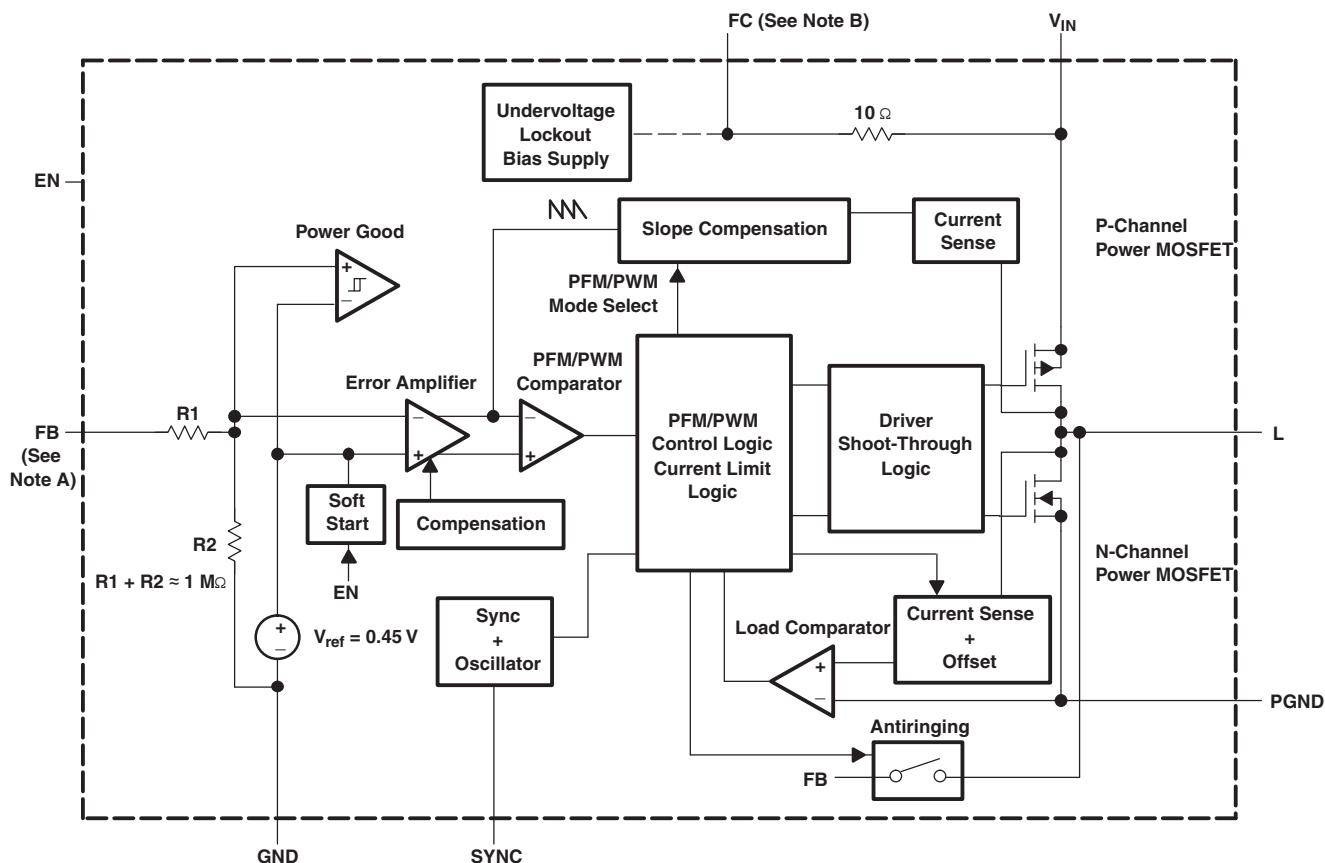

AVAILABLE OPTIONS⁽¹⁾

T _A	VOLTAGE OPTIONS	PACKAGE ⁽²⁾	ORDERING PART NUMBER

FUNCTIONAL BLOCK DIAGRAM

- A. The adjustable output voltage version does not use the internal feedback resistor divider. The FB pin is directly connected to the error amplifier.
- B. Do not connect the FC pin to an external power source

PIN FUNCTIONS

PIN NAME	I/O	DESCRIPTION
EN	I	Enable. A logic high enables the converter, logic low forces the device into shutdown mode reducing the supply current to less than 1 μA.
FB	I	An external resistive divider is connected to FB. The internal voltage divider is disabled.
FC		Supply bypass pin. A 0.1 μF coupling capacitor should be connected as close as possible to this pin for good high frequency input voltage supply filtering.
GND		Ground.
L	I/O	Connect the inductor to this pin. L is the switch pin connected to the drain of the internal power MOSFETS.
PGND		Power ground. Connect all power grounds to PGND.
SYNC	I	Input for synchronization to external clock signal. Synchronizes the converter switching frequency to an external clock signal with CMOS level: SYNC = HIGH: Low-noise mode enabled, fixed frequency PWM operation is forced. SYNC = LOW (GND): Power save mode enabled, PFM/PWM mode enabled.
V _{IN}	I	Supply voltage input.

DETAILED DESCRIPTION

Operation

The TPS62000 is a step down converter operating in a current mode PFM/PWM scheme with a typical switching frequency of 750 kHz.

At moderate to heavy loads, the converter operates in the pulse width modulation (PWM) and at light loads the converter enters a power save mode (pulse frequency modulation) to keep the efficiency high.

In the PWM mode operation, the part operates at a fixed frequency of 750 kHz. At the beginning of each clock cycle, the high side P-channel MOSFET is turned on. The current in the inductor ramps up and is sensed via an internal circuit. The high side switch is turned off when the sensed current causes the PFM/PWM comparator to trip when the output voltage is in regulation or when the inductor current reaches the current limit (set by ILIM). After a minimum dead time preventing shoot through current, the low side N-channel MOSFET is turned on and the current ramps down again. As the clock cycle is completed, the low side switch is turned off and the next clock cycle starts.

In discontinuous conduction mode (DCM), the inductor current ramps to zero before the end of each clock cycle. In order to increase the efficiency the load comparator turns off the low side MOSFET before the inductor current becomes negative. This prevents reverse current flowing from the output capacitor through the inductor and low side MOSFET to ground that would cause additional losses.

As the load current decreases and the peak inductor current does not reach the power save mode threshold of typically 120 mA for more than 15 clock cycles, the converter enters a pulse frequency modulation (PFM) mode.

In the PFM mode, the converter operates with:

- Variable frequency
- Constant peak current that reduces switching losses
- Quiescent current at a minimum

Thus maintaining the highest efficiency at light load currents. In this mode, the output voltage is monitored with the error amplifier. As soon as the output voltage falls below the nominal value, the high side switch is turned on and the inductor current ramps up. When the inductor current reaches the peak current of typical: $150 \text{ mA} + 50 \text{ mA/V} \times (V_I - V_O)$, the high side switch turns off and the low side switch turns on. As the inductor current ramps down, the low side switch is turned off before the inductor current becomes negative which completes the cycle. When the output voltage falls below the nominal voltage again, the next cycle is started.

The converter enters the PWM mode again as soon as the output voltage can not be maintained with the typical peak inductor current in the PFM mode.

The control loop is internally compensated reducing the amount of external components.

The switch current is internally sensed and the maximum current limit can be set to typical 600 mA by connecting ILIM to ground; or, to typically 1.2 A by connecting ILIM to V_{IN} .

100% Duty Cycle Operation

As the input voltage approaches the output voltage and the duty cycle exceeds typical 95%, the converter turns the P-channel high side switch continuously on. In this mode, the output voltage is equal to the input voltage minus the voltage drop across the P-channel MOSFET.

Synchronization, Power Save Mode and Forced PWM Mode

If no clock signal is applied, the converter operates with a typical switching frequency of 750 kHz. It is possible to synchronize the converter to an external clock within a frequency range from 500 kHz to 1000 kHz. The device automatically detects the rising edge of the first clock and is synchronizes immediately to the external clock. If the clock signal is stopped, the converter automatically switches back to the internal clock and continues operation without interruption. The switch over is initiated if no rising edge on the SYNC pin is detected for a duration of four clock cycles. Therefore, the maximum delay time can be 8 μs in case the internal clock has a minimum frequency of 500 kHz.

In case the device is synchronized to an external clock, the power save mode is disabled and the device stays in forced PWM mode.

Connecting the SYNC pin to the GND pin enables the power save mode. The converter operates in the PWM mode at moderate to heavy loads and in the PFM mode during light loads maintaining high efficiency over a wide load current range.

Connecting the SYNC pin to the V_{IN} pin forces the converter to operate permanently in the PWM mode even at light or no load currents. The advantage is the converter operates with a fixed switching frequency that allows simple filtering of the switching frequency for noise sensitive applications. In this mode, the efficiency is lower compared to the power save mode during light loads (see [Figure 1](#)).

It is possible to switch from forced PWM mode to the power save mode during operation.

The flexible configuration of the SYNC pin during operation of the device allows efficient power management by adjusting the operation of the TPS62000 to the specific system requirements.

Low Noise Antiringing Switch

An *antiringing* switch is implemented in order to reduce the EMI radiated from the converter during discontinuous conduction mode (DCM). In DCM, the inductor current ramps to zero before the end of each switching period. The internal load comparator turns off the low side switch at that instant thus preventing the current flowing backward through the inductance which increases the efficiency. An antiringing switch across the inductor prevents parasitic oscillation caused by the residual energy stored in the inductance (see [Figure 12](#)).

NOTE:

The *antiringing* switch is only activated in the fixed output voltage versions. It is not enabled for the adjustable output voltage version TPS62000.

Soft Start

As the enable pin (EN) goes high, the soft-start function generates an internal voltage ramp. This causes the start-up current to slowly rise preventing output voltage overshoot and high inrush currents. The soft-start duration is typical 1 ms (see [Figure 13](#)). When the soft-start function is completed, the error amplifier is connected directly to the internal voltage reference.

Enable

Logic low on EN forces the TPS62000 into shutdown. In shutdown, the power switch, drivers, voltage reference, oscillator, and all other functions are turned off. The supply current is reduced to less than 1 μ A in the shutdown mode.

Undervoltage Lockout

An undervoltage lockout circuit provides the save operation of the device. It prevents the converter from turning on when the voltage on V_{IN} is less than typically 1.6 V.

No Load Operation

In case the converter operates in the forced PWM mode and there is no load connected to the output, the converter will regulate the output voltage by allowing the inductor current to reverse for a short period of time.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

	VALUE	UNIT
Supply voltages on pin VIN and FC ⁽²⁾	–0.3 to 6	V
Voltages on pins EN, SYNC, FB, L ⁽²⁾	–0.3 to V _{IN} + 0.3	V
Peak switch current	1.6	A

APPLICATION INFORMATION⁽¹⁾

ADJUSTABLE OUTPUT VOLTAGE VERSION

When the adjustable output voltage version (TPS62000DGS) is used, the output voltage is set by the external resistor divider (see [Figure 15](#)).

The output voltage is calculated as:

$$V_O = 0.45 \text{ V} \times \left(1 + \frac{R_1}{R_2} \right) \quad (1)$$

With $R_1 + R_2 \leq 1 \text{ M}\Omega$

$R_1 + R_2$ should not be greater than 1 MW because of stability reasons.

For stability reasons, a small bypass capacitor ($C_{(ff)}$) is required in parallel to the upper feedback resistor, refer to [Figure 15](#). The bypass capacitor value can be calculated as:

$$C_{(ff)} = \frac{1}{2\pi \times 30000 \times R_1} \text{ for } C_o < 47 \mu\text{F} \quad (2)$$

$$C_{(ff)} = \frac{1}{2\pi \times 5000 \times R_1} \text{ for } C_o \geq 47 \mu\text{F} \quad (3)$$

R_1 is the upper resistor of the voltage divider. For $C_{(ff)}$, choose a value which comes closest to the computed result.

Figure 15. Typical Application Circuit for Adjustable Output Voltage Option

INDUCTOR SELECTION

A 10-µH minimum output inductor is used with the TPS62000. Values larger than 22 µH or smaller than 10 µH may cause stability problems because of the internal compensation of the regulator.

For output voltages greater than 1.8 V, a 22-µH inductance might be used in order to improve the efficiency of the converter.

After choosing the inductor value of typically 10 µH, two additional inductor parameters should be considered: first the current rating of the inductor and second the dc resistance.

The dc resistance of the inductance influences directly the efficiency of the converter. Therefore, an inductor with lowest dc resistance should be selected for highest efficiency.

In order to avoid saturation of the inductor, the inductor should be rated at least for the maximum output current plus the inductor ripple current which is calculated as:

(1) Application information is provided for commercial temperature as a reference and not for high temperature.

$$\Delta I_L = V_O \times \frac{1 - \frac{V_O}{V_I}}{L \times f} \quad I_{L(max)} = I_{O(max)} + \frac{\Delta I_L}{2} \tag{4}$$

Where:

- f = Switching frequency (750 kHz typical)
- L = Inductor value
- ΔI_L = Peak-to-peak inductor ripple current
- $I_{L(max)}$ = Maximum inductor current

The highest inductor current occurs at maximum V_I .

A more conservative approach is to select the inductor current rating just for the maximum switch current of the TPS62000 which is 1.6 A with $I_{LIM} = V_{IN}$ and 900 mA with $I_{LIM} = GND$. See [Table 1](#) for recommended inductors.

Table 1. Tested Inductors⁽¹⁾

OUTPUT CURRENT	INDUCTOR VALUE	COMPONENT SUPPLIER	COMMENTS
0 mA to 600 mA	10 μ H	Coilcraft DO3316P-103 Coilcraft DT3316P-103 Sumida CDR63B-100 Sumida CDRH5D28-100	High efficiency
		Coilcraft DO1608C-103 Sumida CDRH4D28-100	Smallest solution
0 mA to 300 mA	10 μ H	Coilcraft DO1608C-103	High efficiency
		Murata LQH4C100K04	Smallest solution

(1) Parts are valid for -40°C to 85°C .

OUTPUT CAPACITOR SELECTION

For best performance, a low ESR output capacitor is needed. At output voltages greater than 1.8 V, ceramic output capacitors can be used to show the best performance. Output voltages below 1.8 V require a larger output capacitor and ESR value to improve the performance and stability of the converter.

Table 2. Capacitor Selection

OUTPUT VOLTAGE RANGE	OUTPUT CAPACITOR	OUTPUT CAPACITOR ESR
$1.8\text{ V} \leq V_I \leq 5.5\text{ V}$	$C_o \geq 10\ \mu\text{F}$	$\text{ESR} \leq 120\ \text{m}\Omega$
$0.8\text{ V} \leq V_I < 1.8\text{ V}$	$C_o \geq 47\ \mu\text{F}$	$\text{ESR} > 50\ \text{m}\Omega$

See [Table 3](#) for recommended capacitors.

If an output capacitor is selected with an ESR value $\leq 120\ \text{m}\Omega$, its RMS ripple current rating always meets the application requirements. Just for completeness, the RMS ripple current is calculated as:

$$I_{RMS(C_o)} = V_O \times \frac{1 - \frac{V_O}{V_I}}{L \times f} \times \frac{1}{2 \times \sqrt{3}} \tag{5}$$

The overall output ripple voltage is the sum of the voltage spike caused by the output capacitor ESR plus the voltage ripple caused by charge and discharging the output capacitor:

$$\Delta V_O = V_O \times \frac{1 - \frac{V_O}{V_I}}{L \times f} \times \left(\frac{1}{8 \times C_o \times f} + \text{ESR} \right) \tag{6}$$

Where the highest output voltage ripple occurs at the highest input voltage V_I .

Table 3. Tested Capacitors⁽¹⁾

CAPACITOR VALUE	ESR/mΩ	COMPONENT SUPPLIER	COMMENTS
10 μF	50	Taiyo Yuden JMK316BJ106KL	Ceramic
47 μF	100	Sanyo 6TPA47M	POSCAP
68 μF	100	Sprague 594D686X0010C2T	Tantalum

(1) Parts are valid for –40°C to 85°C.

INPUT CAPACITOR SELECTION

Because of the nature of the buck converter having a pulsating input current, a low ESR input capacitor is required for best input voltage filtering and minimizing the interference with other circuits caused by high input voltage spikes.

The input capacitor should have a minimum value of 10 μF and can be increased without any limit for better input voltage filtering.

The input capacitor should be rated for the maximum input ripple current calculated as:

$$I_{RMS} = I_{O(max)} \times \sqrt{\frac{V_O}{V_I} \times \left(1 - \frac{V_O}{V_I}\right)} \quad (7)$$

The worst case RMS ripple current occurs at $D = 0.5$ and is calculated as: $I_{RMS} = \frac{I_O}{2}$

Ceramic capacitor show a good performance because of their low ESR value, and they are less sensitive against voltage transients compared to tantalum capacitors.

Place the input capacitor as close as possible to the input pin of the IC for best performance.

LAYOUT CONSIDERATIONS

As for all switching power supplies, the layout is an important step in the design especially at high peak currents and switching frequencies. If the layout is not carefully done, the regulator might show stability problems as well as EMI problems.

Therefore, use wide and short traces for the main current paths as indicted in bold in [Figure 16](#). The input capacitor should be placed as close as possible to the IC pins as well as the inductor and output capacitor. Place the bypass capacitor, C3, as close as possible to the FC pin. The analog ground, GND, and the power ground, PGND, need to be separated. Use a common ground node as shown in [Figure 16](#) to minimize the effects of ground noise.

Figure 16. Layout Diagram

TYPICAL APPLICATION

- (1) Use a small R-C filter to filter wrong reset signals during output voltage transitions.
- (2) A large value is used for C(ff) to compensate for the parasitic capacitance introduced into the regulation loop by Q1.

Notes:

1. See data sheet for absolute maximum and minimum recommended operating conditions.
2. Silicon operating life design goal is 10 years at 105°C junction temperature (does not include package interconnect life).

PACKAGING INFORMATION

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/ Ball Finish	MSL Peak Temp ⁽³⁾	Samples (Requires Login)
TPS62000SHKK	ACTIVE	CFP	HKK	10	1	TBD	AU	N / A for Pkg Type	Contact TI Distributor or Sales Office
TPS62000SKGD1	ACTIVE	XCEPT	KGD	0	100	TBD	Call TI	N / A for Pkg Type	Contact TI Distributor or Sales Office

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

- NOTES:
- All linear dimensions are in inches (millimeters).
 - This drawing is subject to change without notice.
 - This drawing does not comply with Mil Std 1835. Do not use this package for compliant product.
 - The terminals will be gold plated.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
