Rev.3.2_00

The S-1167 Series is a positive voltage regulator with ultra low current consumption, high ripple rejection, low dropout voltage and high-accuracy output voltage developed based on CMOS technology.

Although current consumption is very small with 9 μA typ., the S-1167 Series realized the 70 dB of high ripple rejection rate. Besides, a ceramic capacitor of 1.0 μF can be used as the input and output capacitors.

Moreover, dropout voltage is also small since output voltage accuracy realizes $\pm 1.0\%$ of high accuracy, and the low-on-resistance transistor is built-in. A built-in overcurrent protection circuit prevents that the load current from exceeding the current capacity of the output transistor. The ON / OFF circuit ensures long battery life.

Two packages, SOT-23-5 and SNT-6A(H) are available.

Compared with the voltage regulators using the conventional CMOS technology, the S-1167 Series is the most suitable for the portable equipments with ultra low current consumption and corresponding to the small package.

■ Features

- | | |
|--|---|
| • Output voltage: | 1.5 V to 5.5 V, selectable in 0.1 V step |
| • Input voltage: | 2.0 V to 6.5 V |
| • Output voltage accuracy: | $\pm 1.0\%$ |
| • Dropout voltage: | 150 mV typ. (3.0 V output product, $I_{\text{OUT}} = 100 \text{ mA}$) |
| • Current consumption: | During operation: 9 μA typ., 16 μA max.
During power-off: 0.1 μA typ., 0.9 μA max. |
| • Output current: | Possible to output 150 mA ($V_{\text{IN}} \geq V_{\text{OUT(S)}} + 1.0 \text{ V}$)* ¹ |
| • Input and output capacitors: | A ceramic capacitor of 1.0 μF or more can be used. |
| • Ripple rejection: | 70 dB typ. (3.0 V output product, $f = 1.0 \text{ kHz}$) |
| • Built-in overcurrent protection circuit: | Limits overcurrent of output transistor. |
| • Built-in ON / OFF circuit: | Ensures long battery life. |
| • Operation temperature range: | $T_a = -40^\circ\text{C}$ to $+85^\circ\text{C}$ |
| • Lead-free, Sn 100%, halogen-free* ² | |

*1. V_{OUT(S)} : Set output voltage

V_{OUT(E)} : Actual output voltage

Output voltage when fixing I_{OUT} (= 30 mA) and inputting V_{OUT(S)} + 1.0 V

*2. The output current at which the output voltage becomes 95% of V_{OUT(E)} after gradually increasing the output current.

*3. V_{drop} = V_{IN1} - (V_{OUT3} × 0.98)

V_{OUT3} is the output voltage when V_{IN} = V_{OUT(S)} + 1.0 V and I_{OUT} = 100 mA.

V_{IN1} is the input voltage at which the output voltage becomes 98% of V_{OUT3} after gradually decreasing the input voltage.

*4. A change in the temperature of the output voltage [mV/°C] is calculated using the following equation.

$$\frac{\Delta V_{OUT}}{\Delta T_a} [\text{mV}/^\circ\text{C}]^{*1} = V_{OUT(S)} [\text{V}]^{*2} \times \frac{\Delta V_{OUT}}{\Delta T_a \cdot V_{OUT}} [\text{ppm}/^\circ\text{C}]^{*3} \div 1000$$

*1. Change in temperature of the output voltage

*2. Set output voltage

*3. Output voltage temperature coefficient

*5. The output current can be at least this value.

Due to restrictions on the package power dissipation, this value may not be satisfied. Attention should be paid to the power dissipation of the package when the output current is large.

This specification is guaranteed by design.

■ Standard Circuit

*1. A capacitor for stabilizing the input.

*2. A ceramic capacitor of 1.0 μF or more can be used.

Figure 10

Caution The above connection diagram and constant will not guarantee successful operation. Perform thorough evaluation using the actual application to set the constant.

■ Condition of Application

Input capacitor (C_{IN}): 1.0 μF or more

Output capacitor (C_L): 1.0 μF or more

Equivalent series resistance (R_{ESR}) of output capacitor: 1.0 Ω or less

Caution Generally a series regulator may cause oscillation, depending on the selection of external parts. Check that no oscillation occurs with the application using the above capacitor.

■ Selection of Input Capacitor (C_{IN}) and Output Capacitor (C_L)

The S-1167 Series requires an output capacitor between the VOUT pin and the VSS pin for phase compensation. Operation is stabilized by a ceramic capacitor with an output capacitance of 1.0 μF or more in the entire temperature range. When using an OS capacitor, a tantalum capacitor, or an aluminum electrolytic capacitor, the capacitance must be 1.0 μF or more, and an equivalent series resistance (R_{ESR}) must be 1.0 Ω or less.

The value of the output overshoot or undershoot transient response varies depending on the value of the output capacitor. The required capacitance of the input capacitor differs depending on the application.

The recommended value for an application is $C_{IN} \geq 1.0 \mu\text{F}$, $C_L \geq 1.0 \mu\text{F}$; however, when selecting the output capacitor, perform sufficient evaluation, including evaluation of temperature characteristics, on the actual device.

■ Explanation of Terms

1. Low Dropout Voltage Regulator

This voltage regulator has the low dropout voltage due to its built-in low on-resistance transistor.

2. Low Equivalent Series Resistance

A capacitor whose equivalent series resistance (R_{ESR}) is low. The S-1167 Series enables use of a low equivalent series resistance capacitor, such as a ceramic capacitor, for the output-side capacitor (C_L). A capacitor whose R_{ESR} is 1.0 Ω or less can be used.

3. Output Voltage (V_{OUT})

The accuracy of the output voltage is ensured at $\pm 1.0\%$ under the specified conditions of fixed input voltage^{*1}, fixed output current, and fixed temperature.

*1. Differs depending on the product.

Caution If the above conditions change, the output voltage value may vary and exceed the accuracy range of the output voltage. Refer to “■ Electrical Characteristics” and “■ Characteristics (Typical Data)” for details.

4. Line Regulation $\left(\frac{\Delta V_{OUT1}}{\Delta V_{IN} \bullet V_{OUT}} \right)$

Indicates the dependency of the output voltage on the input voltage. That is, the values show how much the output voltage changes due to a change in the input voltage with the output current remaining unchanged.

5. Load Regulation (ΔV_{OUT2})

Indicates the dependency of the output voltage on the output current. That is, the values show how much the output voltage changes due to a change in the output current with the input voltage remaining unchanged.

6. Dropout Voltage (V_{drop})

Indicates the difference between input voltage (V_{IN1}) and the output voltage when; decreasing input voltage (V_{IN}) gradually until the output voltage has dropped out to the value of 98% of output voltage (V_{OUT3}), which is at $V_{IN} = V_{OUT(S)} + 1.0 \text{ V}$.

$$V_{drop} = V_{IN1} - (V_{OUT3} \times 0.98)$$

7. Output Voltage Temperature Coefficient $\left(\frac{\Delta V_{OUT}}{\Delta T_a \bullet V_{OUT}} \right)$

The shaded area in **Figure 11** is the range where V_{OUT} varies in the operation temperature range when the output voltage temperature coefficient is ± 100 ppm/ $^{\circ}\text{C}$.

Figure 11

A change in the temperature of the output voltage [mV/ $^{\circ}\text{C}$] is calculated using the following equation.

$$\frac{\Delta V_{OUT}}{\Delta T_a} [\text{mV}/^{\circ}\text{C}]^{*1} = V_{OUT(S)} [\text{V}]^{*2} \times \frac{\Delta V_{OUT}}{\Delta T_a \bullet V_{OUT}} [\text{ppm}/^{\circ}\text{C}]^{*3} \div 1000$$

- *1. Change in temperature of the output voltage
- *2. Set output voltage
- *3. Output voltage temperature coefficient

■ Operation

1. Basic Operation

Figure 12 shows the block diagram of the S-1167 Series.

The error amplifier compares the reference voltage (V_{ref}) with feedback voltage (V_{fb}), which is the output voltage resistance-divided by feedback resistors (R_s and R_f). It supplies the gate voltage necessary to maintain the constant output voltage which is not influenced by the input voltage and temperature change, to the output transistor.

*1. Parasitic diode

Figure 12

2. Output Transistor

In the S-1167 Series, a low on-resistance P-channel MOS FET is used as the output transistor.

Be sure that V_{OUT} does not exceed $V_{IN} + 0.3$ V to prevent the voltage regulator from being damaged due to reverse current flowing from the V_{OUT} pin through a parasitic diode to the V_{IN} pin, when the potential of V_{OUT} became higher than V_{IN} .

3. ON / OFF Pin

This pin starts and stops the regulator.

When the ON / OFF pin is set to OFF level, the entire internal circuit stops operating, and the built-in P-channel MOS FET output transistor between the VIN pin and the VOUT pin is turned off, reducing current consumption significantly. The VOUT pin becomes the V_{SS} level due to the internally divided resistance of several $M\Omega$ between the VOUT pin and the VSS pin.

Note that the current consumption increases if a voltage of 0.3 V to $V_{IN} - 0.3$ V is applied to the ON / OFF pin.

The structure of the ON / OFF pin is as shown in **Figure 13**. Since the ON / OFF pin is neither pulled down nor pulled up internally, do not use it in the floating status. When not using the ON / OFF pin, connect it to the VSS pin in the product A type, and connect it to the VIN pin in B type.

Table 7

Product Type	ON / OFF Pin	Internal Circuit	VOUT Pin Voltage	Current Consumption
A	"L": ON	Operate	Set value	I_{SS1}
A	"H": OFF	Stop	V_{SS} level	I_{SS2}
B	"L": OFF	Stop	V_{SS} level	I_{SS2}
B	"H": ON	Operate	Set value	I_{SS1}

Figure 13

■ Precautions

- Wiring patterns for the VIN pin, the VOUT pin and GND should be designed so that the impedance is low. When mounting an output capacitor between the VOUT pin and the VSS pin (C_L) and a capacitor for stabilizing the input between the VIN pin and the VSS pin (C_{IN}), the distance from the capacitors to these pins should be as short as possible.
- Note that generally the output voltage may increase when a series regulator is used at low load current (10 μ A or less).
- Note that generally the output voltage may increase due to the leakage current from an output driver when a series regulator is used at high temperature.
- Generally a series regulator may cause oscillation, depending on the selection of external parts. The following conditions are recommended for the S-1167 Series. However, be sure to perform sufficient evaluation under the actual usage conditions for selection, including evaluation of temperature characteristics.

Input capacitor (C_{IN}): 1.0 μ F or more
Output capacitor (C_L): 1.0 μ F or more
Equivalent series resistance (R_{ESR}): 1.0 Ω or less

- The voltage regulator may oscillate when the impedance of the power supply is high and the input capacitance is small or an input capacitor is not connected.
- It is important to sufficiently evaluate the output voltage fluctuation due to the power supply fluctuation and load fluctuation characteristics in the actual equipment.
- Overshoot may occur in the output voltage momentarily if the voltage is rapidly raised at power-on or when the power supply fluctuates. Sufficiently evaluate the output voltage at power-on with the actual device.
- The application conditions for the input voltage, the output voltage, and the load current should not exceed the package power dissipation.
- Do not apply an electrostatic discharge to this IC that exceeds the performance ratings of the built-in electrostatic protection circuit.
- In determining the output current, attention should be paid to the output current value specified in **Table 6** in “■ **Electrical Characteristics**” and footnote *5 of the table.
- SII claims no responsibility for any disputes arising out of or in connection with any infringement by products including this IC of patents owned by a third party.

※1. ランドパターンの幅に注意してください (0.25 mm min. / 0.30 mm typ.).

※2. パッケージ中央にランドパターンを広げないでください (1.30 mm ~ 1.40 mm)。

- 注意
1. パッケージのモールド樹脂下にシルク印刷やハンダ印刷などしないでください。
 2. パッケージ下の配線上のソルダーレジストなどの厚みをランドパターン表面から0.03 mm以下にしてください。
 3. マスク開口サイズと開口位置はランドパターンと合わせてください。
 4. 詳細は“SNTパッケージ活用の手引き”を参照してください。

※1. Pay attention to the land pattern width (0.25 mm min. / 0.30 mm typ.).

※2. Do not widen the land pattern to the center of the package (1.30 mm to 1.40 mm).

- Caution**
1. Do not do silkscreen printing and solder printing under the mold resin of the package.
 2. The thickness of the solder resist on the wire pattern under the package should be 0.03 mm or less from the land pattern surface.
 3. Match the mask aperture size and aperture position with the land pattern.
 4. Refer to "SNT Package User's Guide" for details.

※1. 请注意焊盘模式的宽度 (0.25 mm min. / 0.30 mm typ.).

※2. 请勿向封装中间扩展焊盘模式 (1.30 mm ~ 1.40 mm)。

- 注意
1. 请勿在树脂型封装的下面印刷丝网、焊锡。
 2. 在封装下、布线上的阻焊膜厚度 (从焊盘模式表面起) 请控制在 0.03 mm 以下。
 3. 钢网的开口尺寸和开口位置请与焊盘模式对齐。
 4. 详细内容请参阅 "SNT 封装的应用指南"。
