SNOSD09-SEPTEMBER 2015

LMV7275-Q1 Automotive Single 1.8-V Low Power Comparator With Rail-to-Rail Input

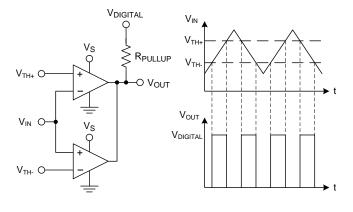

Features

- **Qualified for Automotive Applications**
- AEC-Q100 Qualified With the Following Results:
 - Device Temperature Grade 3: -40°C to 85°C Ambient Operating Temperature Range
 - Device HBM ESD Classification Level 2
 - Device CDM ESD Classification Level C6
- $(V_S = 1.8 \text{ V}, T_A = 25^{\circ}\text{C}, \text{Typical Values Unless})$ Specified).
- Single or Dual Supplies
- Open Drain Output
- Ultra Low Supply Current 9 µA Per Channel
- Low Input Bias Current 10 nA
- Low Input Offset Current 200 pA
- Low Ensured Vos 4 mV
- Propagation Delay 880 ns (20-mV Overdrive)
- Input Common Mode Voltage Range 0.1 V **Beyond Rails**

Applications

- Wearable Devices
- Mobile Phones and Tablets
- **Battery-Powered Electronics**
- General Purpose Low Voltage Applications

LMV7275-Q1 as a Window Comparator

3 Description

The LMV7275-Q1 is a single rail-to-rail input low power comparator, characterized at supply voltages of 1.8 V, 2.7 V, and 5 V. It consumes as little as 9-uA supply current per channel while achieving a 800-ns propagation delay.

The LMV7275-Q1 is available in a SC-70 package. With these tiny packages, the PCB area can be significantly reduced. They are ideal for low voltage, low power, and space-critical designs.

The LMV7275-Q1 features an open-drain output stage that allows for wired-OR configurations. The open-drain output also offers the advantage of allowing the output to be pulled to any voltage up to 5.5 V, regardless of the supply voltage of the LMV7275-Q1, which is useful for level-shifting applications.

The LMV7275-Q1 is built with Texas Instruments' advance submicron silicon-gate BiCMOS process. It has bipolar inputs for improved noise performance, and CMOS outputs for lowest negative output swing.

7 Detailed Description

7.1 Overview

A comparator is often used to convert an analog signal to a digital signal. As shown in Figure 18, the comparator compares an input voltage (V_{IN}) to a reference voltage (V_{REF}). If V_{IN} is less than V_{REF} , the output transistor turns on and pulls the output to V-, and thus the output (V_O) goes low.

However, if V_{IN} is greater than V_{REF} , the output transistor turns off and the voltage (V_O) is pulled high by the external pull-up resistor.

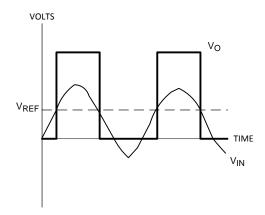

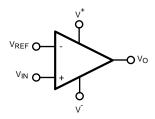

Figure 18. Basic Comparator

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Rail-to-Rail Input Stage

The LMV7275-Q1 has an input common mode voltage range (V_{CM}) of -0.1V below the V^- to 0.1 V above V⁺. This is achieved by using paralleled PNP and NPN differential input pairs. When the V_{CM} is near V⁺, the NPN pair is off and the PNP pair is off. When the V_{CM} is near V⁻, the NPN pair is off and the PNP pair is on. The crossover point between the NPN and PNP input stages is around 950mV from V⁺. Because each input stage has its own offset voltage (V_{OS}), the V_{OS} of the comparator becomes a function of the V_{CM} . See curves for V_{OS} vs. V_{CM} in the *Typical Characteristics* section. In application design, it is recommended to keep the V_{CM} away from the crossover point to avoid problems. The wide input voltage range makes LMV7275-Q1 ideal in power supply monitoring circuits, where the comparators are used to sense signals close to ground and power supplies.

Submit Documentation Feedback

Copyright © 2015, Texas Instruments Incorporated

Feature Description (continued)

7.3.2 Output Stage

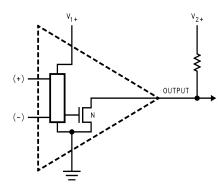

Figure 19. LMV7275-Q1 Open-Drain Output

The LMV7275-Q1 has an open-drain output that requires a pull-up resistor to a positive supply voltage for the output to operate properly. When the internal output transistor is off, the output voltage will be pulled up to the external positive voltage (V_{2+}) by the external pull-up resistor. This allows the output to be OR'ed with other open-drain outputs on the same bus.

The output pull-up resistor may be connected to any voltage level between V- and V+ for level shifting applications.

7.4 Device Functional Modes

7.4.1 Capacitive and Resistive Loads

The propagation delay on the rising edge of the LMV7275-Q1 depends on the load resistance and capacitance values.

7.4.2 Noise

Most comparators have rather low gain. This allows the output to alternate between high and low when the input signal changes slowly. The result is the output may oscillate between high and low when the differential input is near zero and triggers on noise. The high gain of this comparator eliminates this problem. Less than 1 μ V of change on the input will drive the output from one rail to the other rail. If the input signal is noisy, the output cannot ignore the noise unless some hysteresis is provided by positive feedback. (See *Hysteresis*.)

7.4.3 Hysteresis

It is a standard procedure to use hysteresis (positive feedback) around a comparator to prevent oscillation due to the comparator triggering its own noise on slowly ramping signals. The following sections will describe various ways to apply hysteresis.

7.4.3.1 Non-inverting Comparator With Hysteresis

Non-inverting comparator with hysteresis requires a two resistor network, and a voltage reference (V_{ref}) at the inverting input. When V_{in} is low, the output is also low. For the output to switch from low to high, V_{in} must rise up to V_{in1} where V_{in1} is calculated by:

$$V_{in1} = \frac{V_{ref}(R_1 + R_2)}{R_2}$$
 (1)

When V_{in} is high, the output is also high. To make the comparator switch back to its low state, V_{in} must equal V_{ref} before V_A will again equal V_{ref} . V_{in} can be calculated by:

$$V_{in2} = \frac{V_{ref}(R_1 + R_2) - V_{CC}R_1}{R_2}$$
 (2)

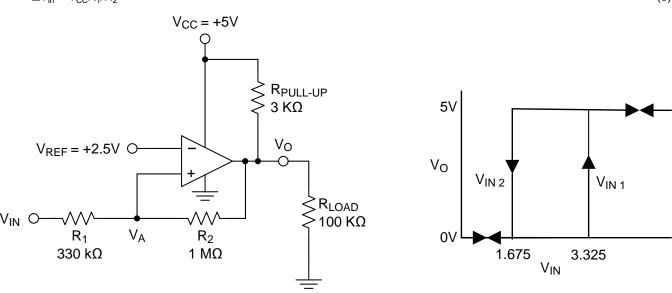

The hysteresis of this circuit is the difference between V_{in1} and V_{in2}.

The hydrorodic of the direction and ameronice between Vint and V

www.ti.com

SNOSD09-SEPTEMBER 2015

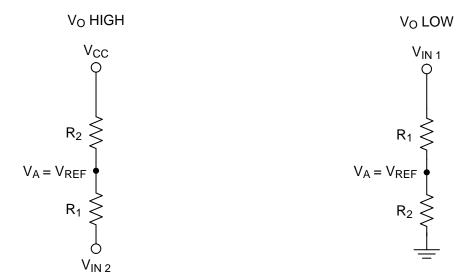

Figure 20. Non-Inverting Comparator With Hysteresis

7.4.3.2 Inverting Comparator With Hysteresis

The inverting comparator with hysteresis requires a three resistor network that are referenced to the supply voltage V_{CC} of the comparator. When V_{in} at the inverting input is less than V_a , the voltage at the non-inverting node of the comparator ($V_{in} < V_a$), the output voltage is high (for simplicity assume V_O switches as high as V_{CC}). The three network resistors can be represented as $R_1/\!/R_3$ in series with R_2 . The lower input trip voltage V_{a1} is

$$V_{a_1} = \frac{V_{CC} R_2}{(R_1 || R_3) + R_2}$$
(4)

When V_{in} is greater than V_a ($V_{in} > V_a$), the output voltage is low very close to ground. In this case the three network resistors can be presented as $R_2/\!/R_3$ in series with R_1 . The upper trip voltage V_{a2} is defined as:

Submit Documentation Feedback

NSTRUMENTS

$$V_{a2} = \frac{V_{CC}(R_2//R_3)}{R_1 + (R_2//R_3)}$$
(5)

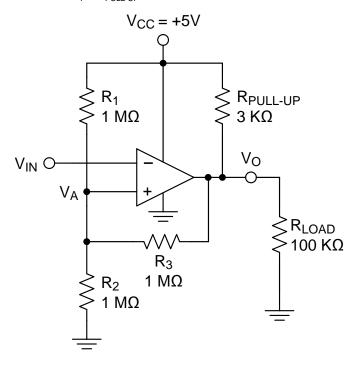

The total hysteresis provided by the network is defined as:

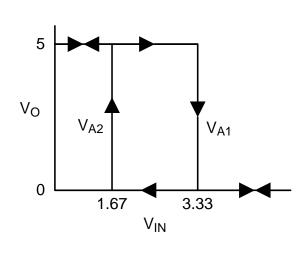

$$\Delta V_a = V_{a1} - V_{a2} \tag{6}$$

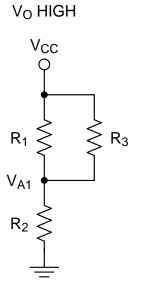

To assure that the comparator will always switch fully to V_{CC} and not be pulled down by the load the resistors values should be chosen as follow:

$$R_{PULL-UP} \ll R_{LOAD} \tag{7}$$

and
$$R_1 > R_{PULL-UP}$$
. (8)

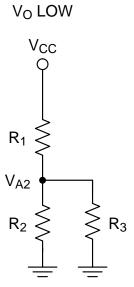

Figure 21. Inverting Comparator With Hysteresis

Copyright © 2015, Texas Instruments Incorporated

7.4.4 Zero Crossing Detector

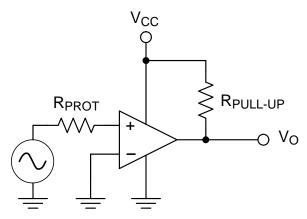

Figure 22. Simple Zero Crossing Detector

In a zero crossing detector circuit, the inverting input is connected to ground and the Non-Inverting input is connected to a 100 mV $_{PP}$ AC signal. As the signal at the Non-Inverting input crosses 0 V, the output of the comparator changes state.

 R_{PROT} is an optional input protection resistor to limit the current should the input voltage exceed the supply rails. R_{PROT} should be a minimum of 1 k Ω per volt of expected over-voltage and limit the current to less than ± 1 mA under worst case fault conditions.

7.4.4.1 Zero Crossing Detector With Hysteresis

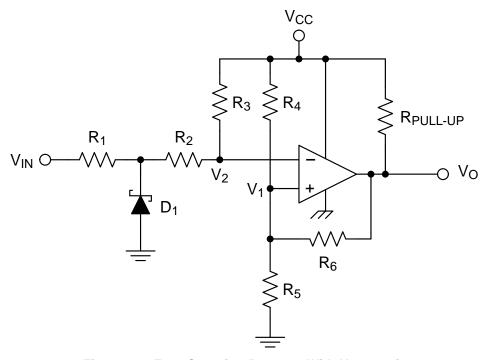

Figure 23. Zero Crossing Detector With Hysteresis

To improve switching times and centering the input threshold to ground a small amount of positive feedback is added to the circuit. Voltage divider R_4 and R_5 establishes a reference voltage, V_1 , at the positive input. By making the series resistance, R_1 plus R_2 equal to R_5 , the switching condition, $V_1 = V_2$, will be satisfied when $V_{IN} = 0$.

The positive feedback resistor, R_6 , is made very large (with respect to $R_5 \parallel R_6 = 2000 R_5$). The resultant hysteresis established by this network is very small ($\Delta V_1 < 10$ mV) but it is sufficient to insure rapid output voltage transitions.

Diode D_1 is used to insure that the inverting input terminal of the comparator never goes below approximately –100 mV. As the input terminal goes negative, D_1 will forward bias, clamping the node between R_1 and R_2 to approximately –300 mV. This sets up a voltage divider with R_2 and R_3 preventing V_2 from going below ground. The maximum negative input overdrive is limited by the current handling ability of D_1 .

7.4.5 Threshold Detector

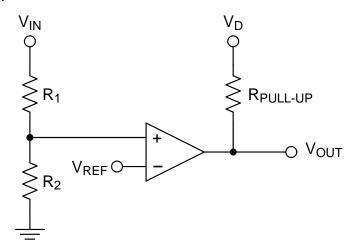

Figure 24. Threshold Detector

Instead of tying the inverting input to 0 V, the inverting input can be tied to a reference voltage. As the input on the Non-Inverting input passes the V_{REF} threshold, the output of the comparator changes state. It is important to use a stable reference voltage to ensure a consistent switching point.

7.4.6 Universal Logic Level Shifter

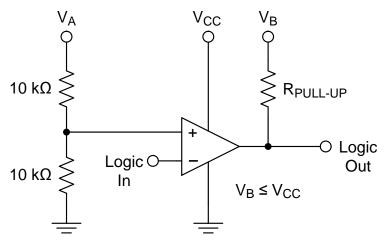

Figure 25. Logic Level Shifter

The output of LMV7275-Q1 is an unconnected drain of an NMOS device, which can be pulled up, through a resistor, to any desired output level below the comparators power supply voltage ($V_B \le V_{CC}$). Hence, the following simple circuit works as a universal logic level shifter, pulling up the signal to the desired level.

Product Folder Links: LMV7275-Q1

SNOSD09 – SEPTEMBER 2015 www.ti.com

TEXAS INSTRUMENTS

Device Functional Modes (continued)

For example, V_A could be the 5-V analog supply voltage, where V_B could be the 3.3-V supply of the processor. The output will now be compatible with the 3.3-V logic.

7.4.7 OR'ING the Output

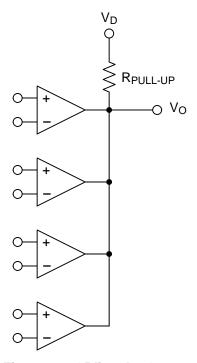

Figure 26. OR'ing the Outputs

Open-drain outputs may be tied together, pulled up to V_D by a common resistor to provide an output OR'ing function. If any of the comparator outputs goes low, the output V_D goes low.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The LMV7275-Q1 is a single-supply comparator with 880 ns of propagation delay and only 12 μ A of supply current.

8.2 Typical Applications

8.2.1 Square Wave Oscillator

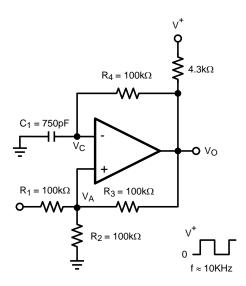

Figure 27. Square Wave Oscillator Application

8.2.1.1 Design Requirements

A typical application for a comparator is as a square wave oscillator. Figure 27 generates a square wave whose period is set by the RC time constant of the capacitor C_1 and resistor R_4 . The maximum frequency is limited by the large signal propagation delay of the comparator, and by the capacitive loading at the output, which limits the output slew rate.

8.2.1.2 Detailed Design Procedure

To analyze the circuit, consider it when the output is high. That implies that the inverted input (V_C) is lower than the Non-Inverting input (V_A) .

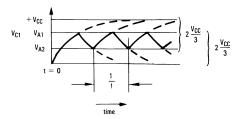

Figure 28. Squarewave Oscillator Timing Thresholds

www.ti.com

Typical Applications (continued)

This causes the C_1 to get charged through $R_{4,}$ and the voltage V_C increases till it is equal to the Non-Inverting input. The value of V_A at this point is

$$V_{A1} = \frac{V_{CC}.R_2}{R_2 + R_1||R_3} \tag{9}$$

If
$$R_1 = R_2 = R_3$$
, then $V_{A1} = 2V_{CC}/3$

At this point the comparator switches pulling down the output to the negative rail. The value of VA at this point is

$$V_{A2} = \frac{V_{CC}(R_2||R_3)}{R_1 + (R_2||R_3)}$$
(10)

If
$$R_1 = R_2 = R_3$$
, then $V_{A2} = V_{CC}/3$

The capacitor C_1 now discharges through R_4 , and the voltage V_C decreases till it is equal to V_{A2} , at which point the comparator switches again, bringing it back to the initial stage. The time period is equal to twice the time it takes to discharge C_1 from $2V_{CC}/3$ to $V_{CC}/3$, which is given by R_4C_1 .In2. Hence the formula for the frequency is:

$$F = 1/(2 \cdot R_4 \cdot C_1 \cdot ln2)$$

8.2.1.3 Application Curve

Figure 29 shows the simulated results of an oscillator using the following values:

- 1. $R_1 = R_2 = R_3 = R_4 = 100 \text{ k}\Omega$
- 2. $C_1 = 750 \text{ pF}, C_1 = 20 \text{ pF}$
- 3. V+ = 5 V, V- = GND
- 4. C_{STRAY} (not shown) from Va to GND = 10 pF

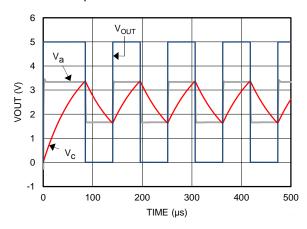

Figure 29. Square Wave Oscillator Output Waveforms

Typical Applications (continued)

8.2.2 Positive Peak Detector

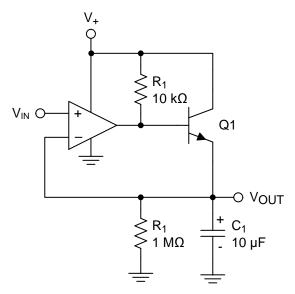

Figure 30. Positive Peak Detector

The positive peak detector is basically the comparator operated as a unity gain follower with a large holding capacitor from the output to ground. A transistor is added to the output to provide a low impedance current source. The upper output swing is limited by the emitter-base forward voltage. This allows capture of the most positive input signal between 0 V and (V+) - 0.7V.

When the output of the comparator goes high, current is passed through the transistor to charge up the capacitor. The only discharge path will be the 1-M Ω resistor shunting C1 and any load that is connected to the output. The decay time can be altered simply by changing the 1-M Ω resistor.

8.2.3 Negative Peak Detector

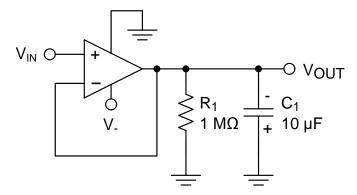

Figure 31. Negative Peak Detector for Negative Supply

The Negative Peak Detector circuit will store the peak negative voltage below ground (0 V to V-). For the negative detector, the output transistor acts as a low-impedance current sink.

When V_{IN} is more negative than V_{OUT} , the output transistor will conduct and pull the output to $-V_{CC}$, charging C1. Charging stops when C_1 reaches the same level as V_{IN} . Because there is no pull-up resistor, the only discharge path will be the 1-M Ω resistor and any load impedance applied. Therefore, the decay time is set by varying the 1-M Ω resistor. Be sure to observe the polarity of C_1 !

TEXAS INSTRUMENTS

Typical Applications (continued)

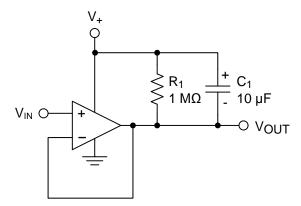

Figure 32. Negative Peak Detector for Positive Supply

An alternate positive supply version is shown in Figure 32 that will capture the lowest applied V_{IN} value between V+ and ground (V+ to 0V).

The output of either version should be buffered by a high-impedance follower stage to prevent loading of the RC circuit.

8.2.4 Window Detector

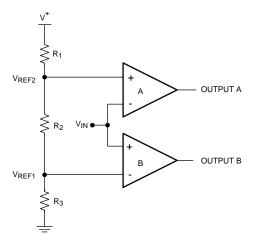

Figure 33. Window Detector

A window detector monitors the input signal to determine if it falls between two voltage levels. Both outputs are true (high) when $V_{REF1} < V_{IN} < V_{REF2}$

Typical Applications (continued)

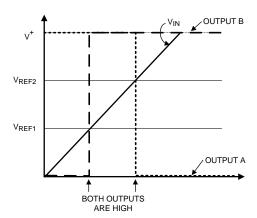

Figure 34. Window Detector Output Signal

The comparator outputs A and B are high only when $V_{REF1} < V_{IN} < V_{REF2}$, or within the window, where these are defined as:

$$V_{REF1} = R_3 / (R_1 + R_2 + R_3) \times V+$$
 (11)

$$V_{REF2} = (R_2 + R_3) / (R_1 + R_2 + R_3) \times V + \tag{12}$$

To determine if the input signal falls outside of the two voltage levels, both inputs on each comparators can be reversed to invert the logic.

The outputs should be tied together and use a shared pull-up resistor for a common logic output. If individual limit outputs are needed, then each output will require it's own pull-up resistor.

Other names for window detectors are: threshold detector, level detector, and amplitude trigger or detector.

9 Power Supply Recommendations

To minimize supply noise, power supplies should be decoupled by a 0.01-μF ceramic capacitor in parallel with a 10-μF capacitor.

Due to the nanosecond edges on the output transition, peak supply currents will be drawn during the time the output is transitioning. Peak current depends on the capacitive loading on the output. The output transition can cause transients on poorly bypassed power supplies. These transients can cause a poorly bypassed power supply to *ring* due to trace inductance and low self-resonance frequency of high ESR bypass capacitors.

Treat the LMV7275-Q1 as a high-speed device. Keep the ground paths short and place small (low-ESR ceramic) bypass capacitors directly between the V+ and V- pins.

Output capacitive loading and output toggle rate will cause the average supply current to rise over the quiescent current.

10 Layout

10.1 Layout Guidelines

10.1.1 Circuit Techniques for Avoiding Oscillations in Comparator Applications

Feedback to almost any pin of a comparator can result in oscillation. In addition, when the input signal is a slow voltage ramp or sine wave, the comparator may also burst into oscillation near the crossing point. To avoid oscillation or instability, PCB layout should be engineered thoughtfully. Several precautions are recommended:

- 1. Power supply bypassing is critical, and will improve stability and response time. Resistance and inductance from power supply wires and board traces increase power supply line impedance. When supply current changes, the power supply line will move due to its impedance. Large enough supply line shift will cause the comparator to malfunction. To avoid problems, a small bypass capacitor, such as 0.1-µF ceramic, should be placed immediately adjacent to the supply pins. An additional 6.8 µF or greater tantalum capacitor should be placed at the point where the power supply for the comparator is introduced onto the board. These capacitors act as an energy reservoir and keep the supply impedance low. In a dual-supply application, a 0.1-µF capacitor is recommended to be placed across V⁺ and V⁻ pins.
- 2. Keep all leads short to reduce stray capacitance and lead inductance. It will also minimize any unwanted coupling from any high-level signals (such as the output). The comparators can easily oscillate if the output lead is inadvertently allowed to capacitively couple to the inputs through stray capacitance. This shows up only during the output voltage transition intervals as the comparator changes states. Try to avoid a long loop which could act as an inductor (coil).
- 3. It is a good practice to use an unbroken ground plane on a printed-circuit-board to provide all components with a low inductive ground connection. Make sure ground paths are low-impedance where heavier currents are flowing to avoid ground level shift. Preferably there should be a ground plane under the component.
- 4. The output trace should be routed away from inputs. The ground plane should extend between the output and inputs to act as a guard. This can be achieved by running a topside ground plane between the output and inputs. A typical PCB layout is shown in Figure 35.
- 5. When the signal source is applied through a resistive network to one input of the comparator, it is usually advantageous to connect the other input with a resistor with the same value, for both DC and AC consideration. Input traces should be laid out symmetrically if possible.

SLYZ022 — TI Glossary.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGE OPTION ADDENDUM

17-Sep-2015

PACKAGING INFORMATION

| Orderable Device | Status | Package Type | Package Drawing | Pins | Package Qty | Eco Plan | Lead/Ball Finish | MSL Peak Temp | Op Temp (°C) | Device Marking (4/5) | Samples |
|------------------|--------|--------------|--------------------|------|----------------|----------------------------|------------------|--------------------|--------------|----------------------|---------|
| LMV7275IDCKRQ1 | ACTIVE | SC70 | DCK | 5 | 3000 | Green (RoHS & no Sb/Br) | CU SN | Level-1-260C-UNLIM | -40 to 125 | SKA | Samples |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes. **Pb-Free** (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

- (3) MSL, Peak Temp. The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead/Ball Finish Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

DCK (R-PDSO-G5)

PLASTIC SMALL-OUTLINE PACKAGE

NOTES: A. All linear dimensions are in millimeters.

- B. This drawing is subject to change without notice.
- C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
- D. Falls within JEDEC MO-203 variation AA.

DCK (R-PDSO-G5)

PLASTIC SMALL OUTLINE

NOTES:

- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
- D. Publication IPC-7351 is recommended for alternate designs.
- E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have not been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
