

Description

The SE809 is a cost-effective system supervisor Integrated Circuit (IC) designed to monitor V_{CC} in digital and mixed signal systems and provide a warning signal when the system power supply is out of working range, and a reset signal to the host processor when necessary. No external components are required.

The reset output is driven active within 20 μ sec of V_{CC} falling through the reset voltage threshold. Reset is maintained active after V_{CC} rises above the reset threshold. The SE809 has an active-low RESET output. The output of the SE809 is guaranteed valid down to $V_{CC}=1V$.

The SE809 is optimized to reject fast transient glitches on the V_{CC} line. Low supply current of 18 μ A ($V_{CC}=3.3V$) makes these devices suitable for battery powered applications. The output voltages range from 1.7V to 4.5V in 100mV increments. Standard voltage versions are 2.30, 2.63, 2.93, 3.08, 4.0, 4.38, and 4.63V.

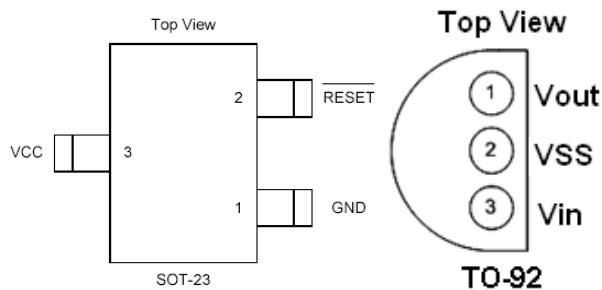

Features

- Precision V_{CC} Monitor for 2.8V, 3.0V, 3.3V, and 5.0V Supplies
- 200mSec typical RESET Output Delay.
- RESET Output Guaranteed to $V_{CC}=1.0V$
- Low 7 μ A Supply Current typical.
- V_{CC} Transient Immunity
- Small SOT-23 Package and TO-92 Package
- No External Components
- Wide Operating Temperature: 0°C to 85°C
- 100% Lead (Pb)-Free

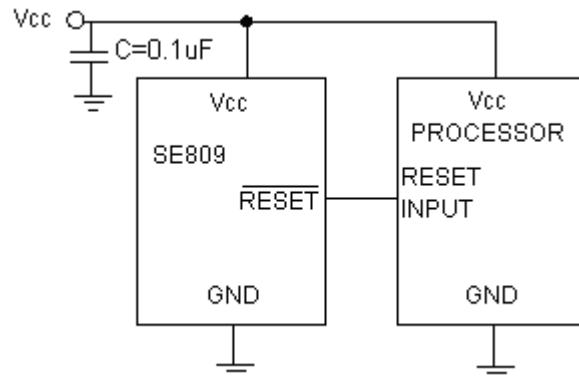

Application

- Computers
- Embedded systems
- Battery powered equipment
- Critical μ P power supply monitoring

PIN DESCRIPTION:

Pin No.	Symbol	Description
1	GND	Ground
2	RESET	RESET output remains low while V _{CC} is below the reset voltage threshold and for 200msec(typ) after V _{CC} rises above reset threshold
3	V _{CC}	Supply Voltage (typ.)

Note 1: Exceeding the absolute maximum rating may damage the device.

Note 2: The device is not guaranteed to function outside its operating rating.

Note 3: The maximum allowable power dissipation at any T_A (ambient temperature) is calculated using: P_{D(MAX)} = (T_{J(MAX)} - T_A)/θ_{JA}. Exceeding the maximum allowable power dissipation will result in excessive die temperature, and the regulator will go into thermal shutdown. See "Thermal Consideration" section for details

Note 4: RESET threshold temperature coefficient is the worst case voltage change divided by the total temperature range.
