SOUND CONTROLLER WITH 48K-BYTE ROM

1. GENERAL DESCRIPTION

The GPC10048A, a speech/wavetable synthesizer, equips an 8-bit CMOS microprocessor, and 48K-byte Working ROM, 128-byte working SRAM. Other primary features include two 8-bit Timer/Counters and can cascade to one 16-bit timer/counter, 8 Software Selectable I/Os, One 8-bit DAC and a pair of PWM output. It operates at a wide voltage range of 2.4V - 5.5V. Plus, a Clock Stop mode is built in for power savings. The unique power saving mode saves the RAM contents, but freezes the oscillator to stop executing other functions. The maximum CPU frequency can run up to 8MHz and the instruction cycle is two clock cycles (min.) ~ six clock cycles (max.). The GPC10048A loads, not only the latest technology, but also the full commitment and technical support of Generalplus.

5.1. PAD Assignment

The IC substrate should be connected to VSS

Note1: To ensure that the IC functions properly, please bond all of VDD and VSS pins.

Note2: The 0.1μF capacitor between VDD and VSS should be placed to IC as close as possible.

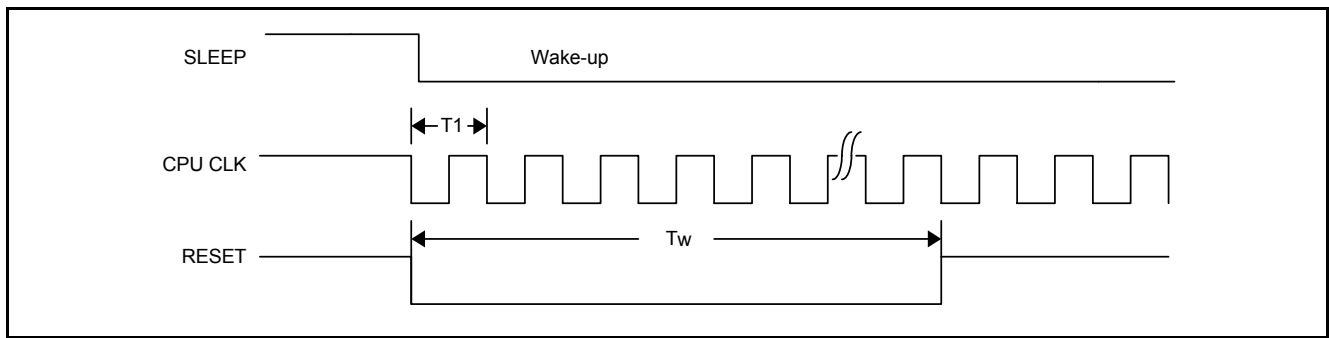

FIG. 1

$$T1 = 1 / (F_{CPU}), Tw \geq 64 \times T1$$

6.7. Low Voltage Reset

The GPC10048A has a Low Voltage Reset (LVR) function. In general, the CPU becomes unstable and malfunctions when the power voltage drops below certain operating voltage. With the

unique design of Low Voltage Reset in GPC10048A, it is able to reset all functions to the initial operational (stable) state if the VDD power-supply voltage drops below 1.8V.

(The LVR function is the same as Power ON Reset or External Reset.)

6.8. Timer/Counter

The GPC10048A has two 8-bit timer/counters, TMA and TMB respectively. TMA can be specified as a timer, but TMB can be used as a timer or a counter. In the timer mode, TMA and TMB are re-loaded up-counters. When timer rollovers from \$FF to \$00, the carry (overflow) signal will make the user's preset value to be loaded into timer automatically and up-count again. At the same

time, the carry signal will generate an INT signal if the corresponding bit is enabled in the INT ENABLE Register. Suppose TMB is specified as a counter, users can reset it by loading #0 into the counter. After the counter has been activated, the value in the counter can also be read at the same time. The read instruction will not affect the value of the counter nor reset it.

Clock source of Timer/Counter can be selected as follows:

| Timer/Counter | | Clock Source |
|---------------|-------------|--|
| TMA | 8-BIT TIMER | CPU CLOCK (T) or T/8, T/64, TMB overflow |
| TMB | 8-BIT TIMER | T, T/65536, EXTCLK, 0, 1 |

6.9. Speech and Melody

In speech synthesis, the GPC10048A can use NMI for accurate sampling frequency. The user can store the speech data in ROM and play it back with realistic sound quality. Several algorithms

are recommended for high fidelity and compression of sound: PCM, LOG PCM, ADPCM and SACMA3400.

9. PCB LAYOUT GUIDE

To avoid the unexpected noises to end up with abnormal CPU operations, the following cares must be exercised while doing the PCB layout:

1. Bond all VDD and VSS pins out.
2. The 0.1 μ F capacitor (C1-C3) placed between VDD and VSS must be as closed as possible to IC itself.
3. The ROsc resistor R1 must be as closed as possible to IC itself.

The PCB layout examples are given as follows:
