Features

- ☐ Processed with HVCMOS® technology
- ☐ 32 push-pull CMOS output up to 60V
- ☐ Low power level shifting
- ☐ Source/sink current minimum 5mA
- ☐ Shift register speed 5MHz
- ☐ Latched data outputs
- ☐ Bidirectional shift register (DIR)
- ☐ Backplane output

General Description

The HV65 is a low-voltage serial to high-voltage parallel converter with push-pull outputs. This device has been designed for use as a driver circuit for LCD displays. It can also be used in any application requiring multiple output high-voltage current sourcing and sinking capabilities. The inputs are fully CMOS compatible.

The device consists of a 32-bit shift register, 32 latches, and control logic to perform the polarity select of the outputs. HVout1 is connected to the first stage of the shift register through the polarity logic. Data is shifted through the shift register on the logic low to high transition of the clock. A DIR pin causes data shifting counterclockwise when grounded and clockwise when connected to V_{DD}. A data output buffer is provided for cascading devices. This output reflects the current status of the last bit of the shift register. Operation of the shift register is not affected by the LE (latch enable) or the POL (polarity) inputs. Transfer of data from the shift register to the latch occurs when the LE (latch enable) input is high. The data in the latch is stored after LE transition from high to low.

Absolute Maximum Ratings[1]

Supply voltage, V_{DD}[2]	-0.5V to +7.0V
Output voltage, V_{PP}[2]	-0.5V to +80V
Logic input levels[2]	-0.5V to V_{DD} + 0.5V
Ground current[3]	1.5A
Continuous total power dissipation[4]	1200mW
Operating temperature range	-40°C to +85°C
Storage temperature range	-65°C to +125°C
Lead temperature 1.6mm (1/16 inch) from case for 10 seconds	260°C

Notes:

1. Device will survive (but operation may not be specified or guaranteed) at these extremes.
2. All voltages are referenced to V_{SS}.
3. Duty cycle is limited by the total power dissipated in the package.
4. For operation above 25°C ambient derate linearly to 85°C at 20mW/°C.

Electrical Characteristics (over recommended operating conditions unless noted)

DC Characteristics (V_{DD} = 5V, V_{PP} = 60V, V_{SS} = GND)

Symbol	Parameter		Min	Max	Units	Conditions
I_{DD}	V_{DD} supply current			15	mA	$V_{DD} = V_{DD}$ max f_{CLK} = 5MHz
I_{PP}	High voltage supply current			0.5	mA	Outputs high

Recommended Operating Conditions

Symbol	Parameter	Min	Max	Units
V_{DD}	Logic supply voltage	4.5	5.5	V
V_{PP}	Output off voltage	0	60	V
V_{IH}	High-level input voltage	3.5	V_{DD}	V
V_{IL}	Low-level input voltage	0	0.8	V
f_{CLK}	Clock frequency		5	MHz
T_A	Operating free-air temperature	-40	+85	°C
I_{OD}	Allowable current through output diodes		200	mA

Notes:

1. Power-up sequence should be the following:
   1. Connect ground.
   2. Apply V_{DD}.
   3. Set all inputs (Data, CLK, Enable, etc.) to a known state.
   4. Apply V_{PP}.
2. Power-down sequence should be the reverse of the above.
3. The V_{PP} should not drop below 0V during operation.
