Miniature-sized and still mountable with M3 screws

Miniaturization by using single chip optical IC

The beam-receiving photodiode and the A/D conversion circuit have been fabricated on a single chip optical IC (full custom). Hence, in spite of its miniature size, it has a performance and reliability which is equal to or better than the conventional product.

Incorporates a sensitivity adjuster even in this size

The sensor incorporates a sensitivity adjuster in spite of its miniature size. It is convenient when you need fine adjustment. Further, the receiver of the thru-beam, side sensing type sensor incorporates an operation mode switch which can change the output operation.

BASIC PERFORMANCE

Long sensing range

The EX-20 series achieves long distance sensing [thru-beam type: 2 m 6.562 ft, retroreflective type: 200 mm 7.874 in (when using the attached reflector), diffuse reflective type: 160 mm 6.299 in], despite its miniature size.

Hence, it is usable even on a wide conveyor.

Thru-beam type

Retroreflective type

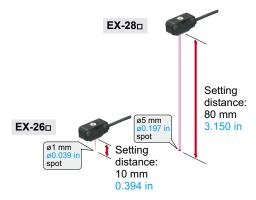

Diffuse reflective type

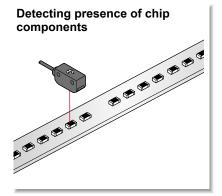

Clear beam spot using red LED dot light source

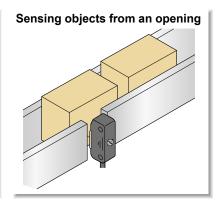

The emission area of a dot light source is smaller than that of a conventional LED flat light source, and it is possible to design a high power, narrow beam. Since a red LED dot light source is used, the red beam spot is clear even at a far place, so that alignment and confirmation of sensing position is easy. Further, since the thru-beam type, too, incorporates a visible narrow beam, it can also reliably detect small parts, such as, chip components, lead frames, etc.

APPLICATIONS

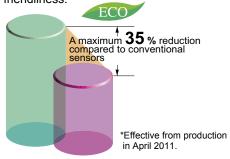

BASIC PERFORMANCE

Electric power saving*

The **EX-20** series achieves reductions in power consumption of up to 65 %. These sensors contribute to environmental friendliness.

ENVIRONMENTAL RESISTANCE

Waterproof IP67 (IEC)

The sensors features an IP67 rating to allow their use in process lines where water is used or splashed. Rust-resistant stainless steel sensor mounting brackets are available.

Note: If water splashes on the sensor during sensing operation, it may sense water as an object.

Incorporated an inverter countermeasure circuit*

The **EX-20** series become significantly stronger against inverter light and other extraneous light.

*Effective from production in April 2011.

MOUNTING

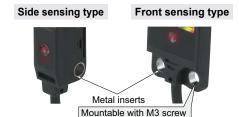

Identical size

Front sensing type of thru-beam type and diffuse reflective type sensors have identical appearance. Moreover, since the mounting holes are symmetrical with respect to the beam axis center, the design becomes easy.

Mounting section reinforced

It can be tightened with M3 screws. Moreover, metal inserts have been provided in the mounting holes so that the product is not damaged even in case of excess tightening.

OPTIONS

Universal sensor mounting bracket is available

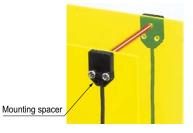

Universal sensor mounting bracket MS-EXL2-4 (for EX-22/23/26/28/29) and MS-EX20-5 (for EX-23 only) which can freely adjust the height and the angle of the sensor is available.

Mounting spacer for front sensing type is available

Mounting of the front sensing type is possible from the rear side by using the mounting spacer.

Slit mask is available

 $\emptyset 0.5$ mm $\emptyset 0.020$ in round slit mask and 0.5×3 mm 0.020×0.118 in rectangular slit mask are available for both side sensing type and front sensing type sensors.

FUNCTIONS

Bright 2-color indicator

A bright 2-color indicator has been incorporated in all types. (Orange LED: Operation indicator, Green LED: Stability indicator)

VARIETIES

Two types for suitable mounting

Two types, side sensing type and front sensing type sensors are available. Select depending on the place of mounting.

Side sensing type

(With sensitivity adjuster)

(Without sensitivity adjuster)

NOTE: Mounting bracket is not supplied with the sensor. Please select from the range of optional sensor mounting brackets (four types) or universal sensor mounting bracket. (Refer to p.297)

Notes: 1) The sensing range of the retroreflective type sensor is specified for the **RF-200** reflector. Further, the sensing range is the possible setting range for the reflector. The sensor can detect an object less than 30 mm 1.181 in away. However, if the reflector is set 100 mm 3.937 in or less away, the sensing object should be opaque.

- in case of using this product at a sensing range of 50 mm 1.969 in or less, take care that the sensitivity adjustment range becomes extremely narrow.
- 3) The model No. with "P" shown on the label affixed to the thru-beam type sensor is the emitter, "D" shown on the label is the receiver.

ORDER GUIDE

Package without reflector

Retroreflective type is also available without the reflector **RF-200**. When ordering this type, suffix "-**Y**" to the model No. (e.g.) Without reflector type of **EX-29A-PN** is "**EX-29A-PN-Y**".

5 m 16.404 ft cable length type

5 m 16.404 ft cable length type (standard: 2 m 6.562 ft) is also available for NPN output type (including package without reflector of retroreflective type sensor). When ordering this type, suffix "-C5" to the model No. (e.g.) 5 m 16.404 ft cable length type of **EX-29A-Y-C5**".

Nister ANNAUL :										

Notes: 1) Where measurement conditions have not been specified precisely, the conditions used were an ambient temperature of +23 °C +73.4 °F.

- 2) Model Nos. having the suffix "-PN" are PNP output type.
- 3) Either Light-ON or Dark-ON can be selected by the operation mode switch (located on the receiver).
- 4) The sensing range and the sensing object of the retroreflective type sensor are specified for the RF-200 reflector. Further, the sensing range is the possible setting range for the reflector. The sensor can detect an object less than 30 mm 1.181 in away. However, if the reflector is set 100 mm 3.937 in or less away, the sensing object should be opaque.
- 5) In case of using this product at a sensing range of 50 mm 1.969 in or less, take care that the sensitivity adjustment range becomes extremely narrow.
- 6) Make sure to confirm detection with an actual sensor before use.

Sensing field

Correlation between sensing object size and sensing range

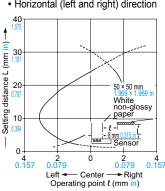

As the sensing object size becomes smaller than the standard size (white non-glossy paper 200 × 200 mm 7.874 × 7.874 in), the sensing range shortens, as shown in the left graph.

SENSING CHARACTERISTICS (TYPICAL)

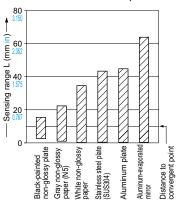

EX-24□

The sensing region (typical) is represented by oblique lines in the left figure. However, the sensitivity should be set with enough margin because of slight variation in products.

Lightness shown on the left may differ slightly from the actual object condition.

Correlation between material (50 × 50 mm 1.969 × 1.969 in) and sensing range

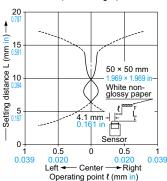

The bars in the graph indicate the sensing range (typical) for the respective material. However, there is a slight variation in the sensing range depending on the product. Further, if there is a reflective object (conveyor, etc.) in the background of the sensing object, since it affects the sensing, separate it by more than twice the sensing range shown in the left graph.

Convergent reflective type

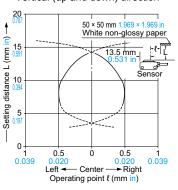

EX-26□ Convergent reflective type

Sensing fields

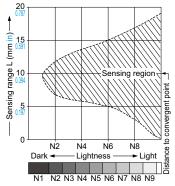

· Horizontal (left and right) direction

· Vertical (up and down) direction

Correlation between lightness and sensing range

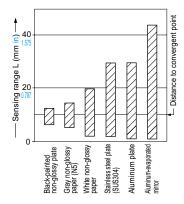

The sensing region (typical) is represented by oblique lines in the left figure. However, the sensitivity should be set with enough margin because of slight variation in products.

The graph is drawn for the maximum sensitivity setting.

Lightness shown on the left may differ slightly from the actual object condition.

Correlation between material (50 × 50 mm 1.969 × 1.969 in) and sensing range

The bars in the graph indicate the sensing range (typical) for the respective material. However, there is a slight variation in the sensing range depending on the product. Further, if there is a reflective object (conveyor, etc.) in the background of the sensing object, since it affects the sensing, separate it by more than twice the sensing range shown in the left graph, or adjust the sensitivity adjuster.

The graph is drawn for the maximum sensitivity setting.

Correlation between sensing object size and sensing range

As the sensing object size becomes smaller than the standard size (white non-glossy paper 100 × 100 mm 3.937×3.937 in), the sensing range shortens, as shown in the left graph.

PRECAUTIONS FOR PROPER USE

Refer to p.1552~ for general precautions.

 Never use this product as a sensing device for personnel protection.

· In case of using sensing devices for personnel protection, use products which meet laws and standards, such as OSHA, ANSI or IEC etc., for personnel protection applicable in each region or country.

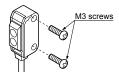

Mounting

 Mount using M3 screws. The tightening torque should be 0.5 N·m or less.

Front sensing

Side sensing

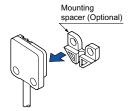

Note: When mounting the front sensing type sensor, use M3 pan head screws without washers etc.

• When mounting the front sensing type from the backside. fit the mounting spacer (MS-EX20-FS) and fix with screws.

Mounting method

1) Fit the mounting spacer on the sensor.

2 Align the mounting holes of the mounting spacer and the sensor and mount with M3 screws. The tightening torque should be 0.5 N·m or less.

Sensitivity adjustment (side sensing type only)

Step	Sensitivity adjuster	Description			
1	MAX	Turn the sensitivity adjuster fully counterclockwise to the minimum sensitivity position (• mark).			
2	(A) MAX	In the light received condition, turn the sensitivity adjuster slowly clockwise and confirm the point (A) where the sensor enters the "Light" state operation.			
3	B MAX	In the dark condition, turn the sensitivity adjuster further clockwise until the sensor enters the "Light" state operation and then bring it back to confirm point (a) where the sensor just returns to the "Dark" state operation. (If the sensor does not enter the "Light" state operation even when the sensitivity adjuster is turned fully clockwise, this extreme position is point (a).			
4	B MAX	The position at the middle of points ${\widehat{\mathbb A}}$ and ${\widehat{\mathbb B}}$ is the optimum sensing position.			

Notes: 1) Use the attached adjusting screwdriver to turn the adjuster slowly. Turning with excessive strength will damage the adjuster.

2) In case of using EX-22 at a sensing distance of 50 mm 1.969 in or less, take care that the sensitivity adjustment range becomes extremely narrow.

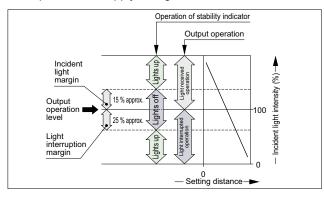

Operation mode switch (EX-23 only)

Switch position	Description
	Light-ON mode is obtained when the operation mode switch (located on the receiver) is turned fully clockwise (L side).
	Dark-ON mode is obtained when the operation mode switch (located on the receiver) is turned fully counterclockwise (D side).

Stability indicator

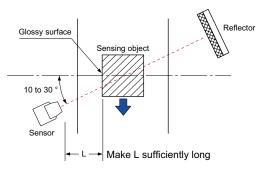

• The stability indicator (green) lights up when the incident light intensity has sufficient margin with respect to the operation level.

If the incident light intensity level is such that the stability indicator lights up, stable sensing can be done without the light received operation and the light interrupted operation being affected by a change in ambient temperature or supply voltage.

Glossy object sensing (EX-29₋)

 Please take care of the following points when detecting materials having a gloss.

Wiring

 Excess bending of the cable or stress applied to the cable may disconnect the internal lead wire.

Others

- Do not use during the initial transient time (50 ms) after the power supply is switched on.
- · If sensors are mounted close together and the ambient temperature is near the maximum rated value, provide for enough heat radiation / ventilation.
- If a reflective object is present in the background, the sensing of EX-28□ may be affected. When setting the sensor, make sure to confirm that the reflective object has no effect. In case the reflective object affects the sensing, take measures such as removing the reflective object or coloring it in black, etc.
