

16-Mbit (1 M × 16) Static RAM

Features

- High speed
 - $t_{AA} = 10 \text{ ns}$
- Low active power
 - 990 mW (max)
- Operating voltages of $3.3 \pm 0.3 \text{ V}$
- 2.0 V data retention
- Automatic power down when deselected
- TTL compatible inputs and outputs
- Easy memory expansion with $\overline{CE}_1$ and CE_2 features
- Available in Pb-free and non Pb-free 54-pin TSOP II package and non Pb-free 60-ball fine-pitch ball grid array (FBGA) package

Functional Description

The CY7C1061AV33 is a high performance CMOS Static RAM organized as 1,048,576 words by 16 bits.

To write to the device, enable the chip ($\overline{CE}_1$ LOW and CE_2 HIGH) while forcing the Write Enable ($\overline{WE}$) input LOW. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from I/O pins (I/O_0 through I/O_7), is written into the location specified on the address pins (A_0 through A_{19}). If Byte High Enable ($\overline{BHE}$) is LOW, then data from I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{19}).

To read from the device, enable the chip by taking $\overline{CE}_1$ LOW and CE_2 HIGH while forcing the Output Enable ($\overline{OE}$) LOW and the Write Enable ($\overline{WE}$) HIGH. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from the memory location specified by the address pins will appear on I/O_0 to I/O_7 . If Byte High Enable ($\overline{BHE}$) is LOW, then data from memory will appear on I/O_8 to I/O_{15} . See [Truth Table on page 8](#) for a complete description of Read and Write modes.

The input/output pins (I/O_0 through I/O_{15}) are placed in a high-impedance state when the device is deselected ($\overline{CE}_1$ HIGH/ CE_2 LOW), the outputs are disabled ($\overline{OE}$ HIGH), the $\overline{BHE}$ and $\overline{BLE}$ are disabled ($\overline{BHE}$, $\overline{BLE}$ HIGH), or a Write operation is in progress ($\overline{CE}_1$ LOW, CE_2 HIGH, and $\overline{WE}$ LOW).

Notes

1. NC pins are not connected on the die.
2. DNU (Do Not Use) pins have to be left floating or tied to VSS to ensure proper operation.

Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. These user guidelines are not tested.

AC Test Loads and Waveforms ^[5]

Notes

- V_{IL} (min) = -2.0 V for pulse durations of less than 20 ns.
- Tested initially and after any design or process changes that may affect these parameters.
- Valid SRAM operation does not occur until the power supplies have reached the minimum operating V_{DD} (3.0 V). As soon as 1 ms (T_{power}) after reaching the minimum operating V_{DD} , normal SRAM operation can begin including reduction in V_{DD} to the data retention (V_{CCDR} , 2.0 V) voltage.

Notes

- Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, input pulse levels of 0 to 3.0 V, and output loading of the specified $I_{\text{OL}}/I_{\text{OH}}$ and specified transmission line loads. Test conditions for the Read cycle use output loading shown in (a) of the [AC Test Loads and Waveforms](#) ^[5] on page 4, unless specified otherwise.
- This part has a voltage regulator that steps down the voltage from 3 V to 2 V internally. t_{power} time must be provided initially before a Read/Write operation is started.
- t_{HZOE} , t_{HZCE} , t_{HZWE} , t_{HZBE} and t_{LZOE} , t_{LZCE} , t_{LZWE} , t_{LZBE} are specified with a load capacitance of 5 pF as in (b) of [AC Test Loads and Waveforms](#) ^[5] on page 4. Transition is measured ± 200 mV from steady-state voltage.
- These parameters are guaranteed by design and are not tested.
- The internal Write time of the memory is defined by the overlap of $\overline{\text{CE}}_1$ LOW (CE_2 HIGH) and $\overline{\text{WE}}$ LOW. Chip enables must be active and $\overline{\text{WE}}$ and byte enables must be LOW to initiate a Write, and the transition of any of these signals can terminate the Write. The input data setup and hold timing should be referenced to the leading edge of the signal that terminates the Write.
- The minimum Write cycle time for Write Cycle No. 2 ($\overline{\text{WE}}$ controlled, $\overline{\text{OE}}$ LOW) is the sum of t_{HZWE} and t_{SD} .

Switching Waveforms

Read Cycle No. 1 (Address Transition Controlled) [12, 13]

Read Cycle No. 2 ($\overline{OE}$ Controlled) [13, 14]

Notes

12. Device is continuously selected. $\overline{OE}$, $\overline{CE}$, $\overline{BHE}$ or $\overline{BLE}$, or both = V_{IL} . $CE_2 = V_{IH}$.

13. $\overline{WE}$ is HIGH for Read cycle.

14. Address valid prior to or coincident with $\overline{CE}_1$ transition LOW and CE_2 transition HIGH.

Switching Waveforms (continued)
Write Cycle No. 1 ($\overline{CE}_1$ or CE_2 Controlled) [15, 16]

Write Cycle No. 2 ($\overline{WE}$ Controlled, $\overline{OE}$ LOW) [15, 16]

Notes

15. Data IO is high impedance if $\overline{OE}$, or $\overline{BHE}$ or $\overline{BLE}$ or both = V_{IH} .

16. If $\overline{CE}_1$ goes HIGH simultaneously with $\overline{WE}$ going HIGH, the output remains in a high impedance state.

17. During this period, the IOs are in output state and input signals should not be applied.
