Monolithic Linear IC

SANYO No. 2611B

LA9200NM, LA9201M

Analog Signal Processors for Compact Disc Players

OVERVIEW

The LA9200NM and LA9201M are bipolar, analog signal processors for use in compact disc players. They incorporate all focusing and tracking control circuits for a complete servo-controlled, three-beam tracking system.

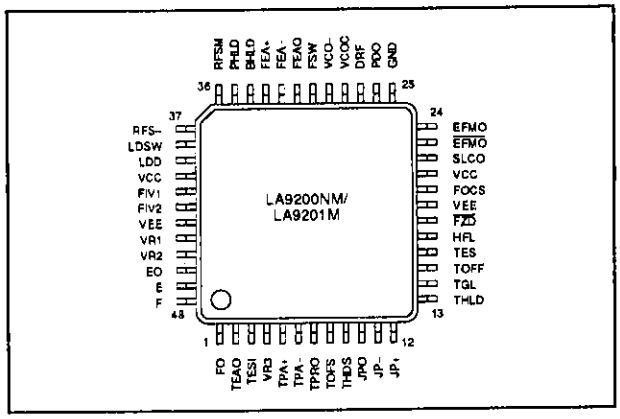

The LA9200NM and LA9201M can be combined with either an LC7860K or LC7863K digital signal processor, an LC7881 serial input digital-to-analog converter and a minimum of external components to form a complete compact disc player.

The LA9200NM and LA9201M operate either from a 5 V single-ended supply or from a ±5 V dual supply, and are available in 48-pin QIPs.

FEATURES

- Complete compact disc player system with either an LC7860K or LC7863K digital signal processor and an LC7881 digital-to-analog converter
- Photodiode current-to-voltage converters
- Focusing control
- Tracking control
- VCO control
- Slice level control
- Laser ON/OFF switch
- Bipolar process
- 5 V supply or ±5 V dual supply
- 48-pin long-lead QIP and 48-pin short-lead QIP

BLOCK DIAGRAM

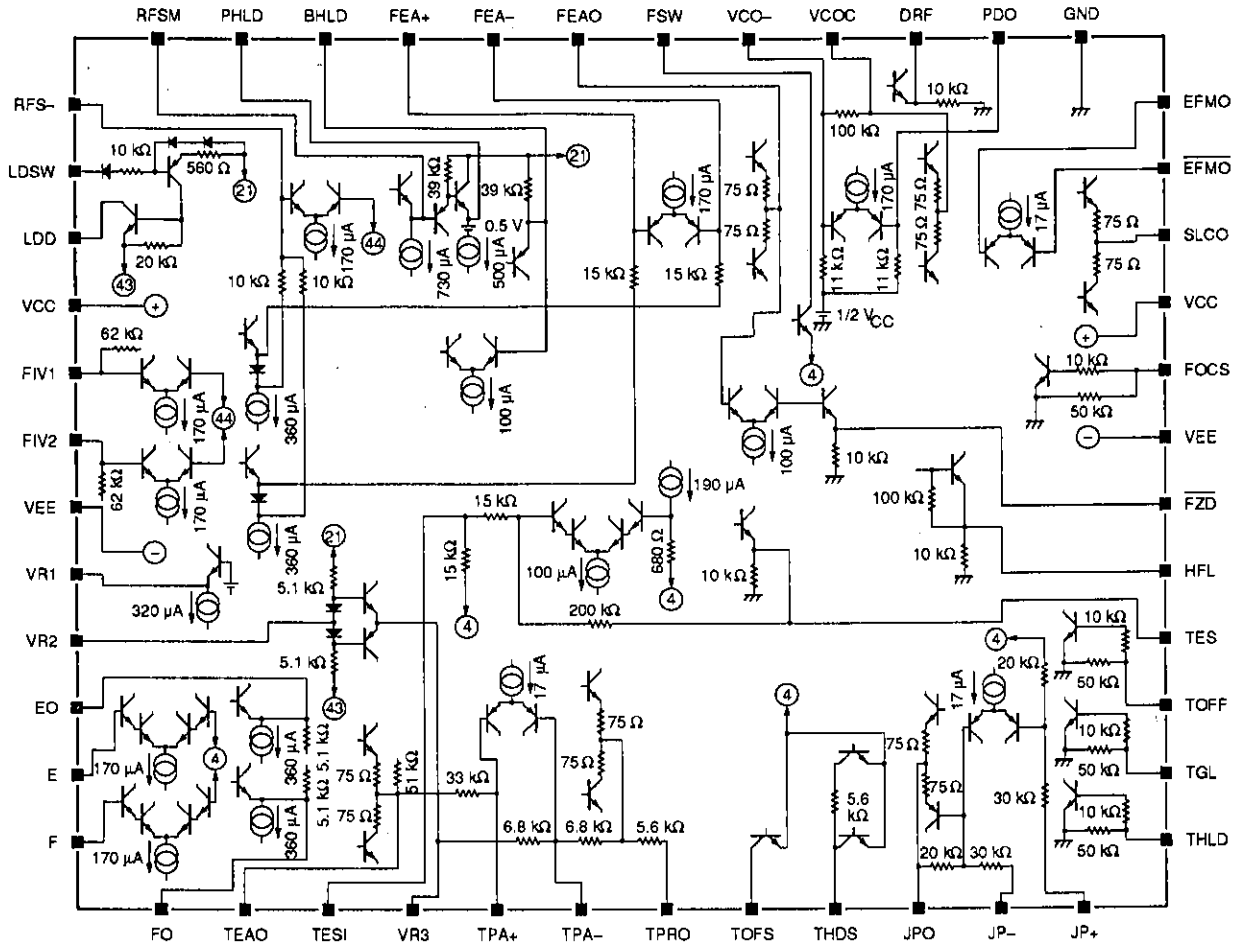

PIN DESCRIPTION

Number	Pin	Description
1	FO	Photodiode F current-to-voltage converter output
2	TEAO	Tracking error amplifier output
3	TESI	Tracking error slice comparator input
4	VR3	Reference voltage
5	TPA+	Tracking error preamplifier non-inverting input
6	TPA–	Tracking error preamplifier inverting input
7	TPRO	Tracking error preamplifier output
8	TOFS	Tracking OFF switch
9	THDS	Tracking hold switch
10	JPO	Jump pulse amplifier output
11	JP–	Jump pulse amplifier inverting input
12	JP+	Jump pulse amplifier non-inverting input
13	THLD	Tracking hold control
14	TGL	Tracking servocontroller gain control
15	TOFF	Tracking OFF control

Number	Pin	Description
16	TES	Tracking error slice comparator output
17	HFL	High-frequency level comparator
18	$\overline{FZD}$	Focus zero-crossing detector output
19	VEE	Supply voltage
20	FOCS	Focus switch control
21	VCC	Supply voltage
22	SLCO	Slice level control output
23	$\overline{EFMO}$	Eight-to-fourteen modulation control non-inverting input
24	EFMO	Eight-to-fourteen modulation control inverting input
25	GND	Ground
26	PDO	Phase detector input
27	DRF	Focus detect RF comparator output
28	VCOC	VCO control amplifier output
29	VCO–	VCO control amplifier inverting input
30	FSW	Focus switch
31	FEAO	Focus error amplifier output
32	FEA–	Focus error amplifier inverting input
33	FEA+	Focus error amplifier non-inverting input
34	BHLD	Negative-peak (bottom) hold output
35	PHLD	Peak hold output
36	RFSM	RF summing amplifier output
37	RFS–	RF summing amplifier inverting input
38	LDSW	Laser-diode switch
39	LDD	Laser-diode driver
40	VCC	Supply voltage
41	FIV1	Photodiodes A and C current-to-voltage converter input
42	FIV2	Photodiodes B and D current-to-voltage converter input
43	VEE	Supply voltage
44	VR1	Reference voltage
45	VR2	Reference voltage
46	EO	Photodiode E current-to-voltage converter output
47	E	Photodiode E current-to-voltage converter input
48	F	Photodiode F current-to-voltage converter input

FUNCTIONAL DESCRIPTION

RF Summing Amplifier

The combined current from photodiodes A and C, (A + C), is input on FIV1, and the combined current from B and D, (B + D), on FIV2. These signals are current-to-voltage converted and then input to the RF summing amplifier as shown in figures 1 and 2. The summing amplifier output, (A + C) + (B + D) on RFSM, is filtered externally to generate the HF (eye pattern) signal. Note that the output voltage on RFSM should be between 1 and 2 $V_{P\text{-}P}$.

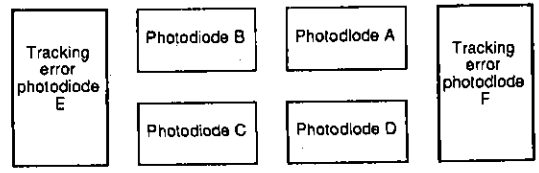

Figure 1. Photodiodes

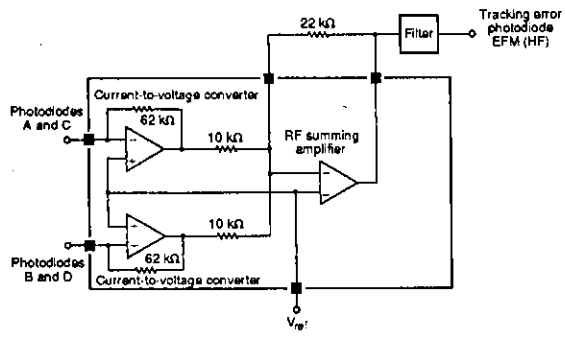

Figure 2. RF summing amplifier

Focusing

Focusing is started when pin FST of the digital signal processor, the LC7860K for example, goes LOW and the objective lens is lowered. The lens is then raised gradually while FOCS is HIGH. When the lens reaches the in-focus position and FEAO is less than VR3 – 0.5 V, $\overline{FZD}$ goes LOW. The FOCS signal is reset and FSW is open circuited. The focusing servocontroller then turns ON and if DRF is HIGH, focusing servocontroller operation continues.

Focusing Servocontroller

Focusing is controlled by monitoring the difference in luminance received by the pickup photodiodes.

Focus error amplifier

The signals from the photodiode current-to-voltage converters are subtracted to provide a measure of the differential, or focus, error. The focus error amplifier output, is (B + D) – (A + C) on FEAO. A typical output is shown in figure 3.

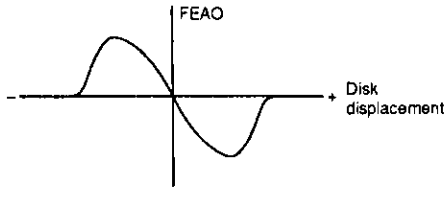

Figure 3. Focus error amplifier output

Focus detect RF comparator

The RF comparator output on DRF goes HIGH when the peak RF summing amplifier input signal, (A + C) + (B + D), exceeds the reference voltage, V_{R1}, as shown in figure 4.

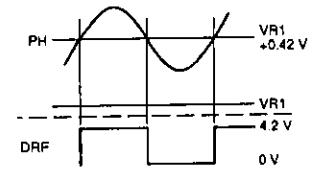

Figure 4. RF detector output

Focus zero-crossing comparator

This detects the zero-crossing points of the focus error amplifier output. The zero-crossing comparator output on $\overline{FZD}$ goes HIGH when the focus error amplifier exceeds (V_{R3} – 0.5 V) as shown in figure 5.

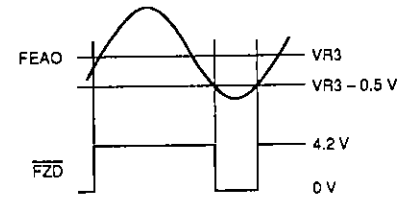

Figure 5. Zero-crossing comparator output

Focus switch

The focus switch is used to hold the focus lens at the reference position during startup. When FOCS goes HIGH, FSW is connected to VR3, temporarily overriding the focus error amplifier output as shown in figure 6.

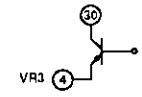

Figure 6. Focus switch

Tracking Servocontroller

The tracking servocontroller is applied to three beams—the main beam and two sub-beams—to maintain tracking accuracy as shown in figure 7.

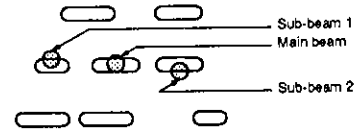

Figure 7. Tracking beams

The reflected light from sub-beams 1 and 2 is received by photodiodes E and F, respectively. When the tracking drifts laterally, the reflected light received from each beam is different. This differential is used to realign tracking.

Tracking error amplifier

The current from pickup photodiode E is input on E (pin 47), and from photodiode F, on F (pin 48). These signals are current-to-voltage converted and then input to the tracking error amplifier. The tracking error amplifier is a difference amplifier and its output, (F – E) on TEAO, is shown in figure 8.

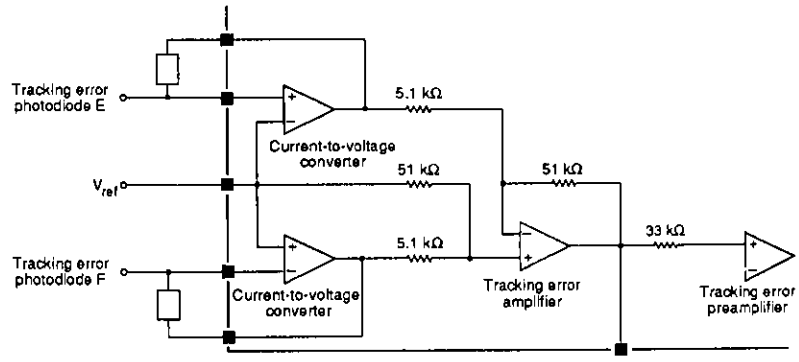

Figure 8. Tracking error amplifier

Tracking error preamplifier

This amplifier compensates the gain and phase responses of the tracking servocontroller loop.

Jump pulse amplifier

This amplifier is used to jump tracks when selecting a required track or when braking.

High-frequency level comparator

The comparator output on HFL is used to detect the off-track condition. It is also used with the output on TES to provide the digital signal processor, the LC7860K for example, with brake timing control information as shown in figures 9 and 10.

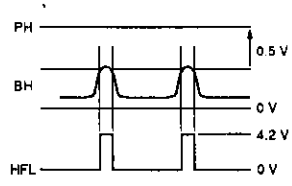

Figure 9. High-frequency level comparator signal

Tracking error slice comparator

This detects the zero crossing of the tracking error signal to provide the digital signal processor, the LC7860K for example, with the number of tracks crossed while in jump mode or the brake timing control information using the phase difference between HFL and TES as shown in figure 10.

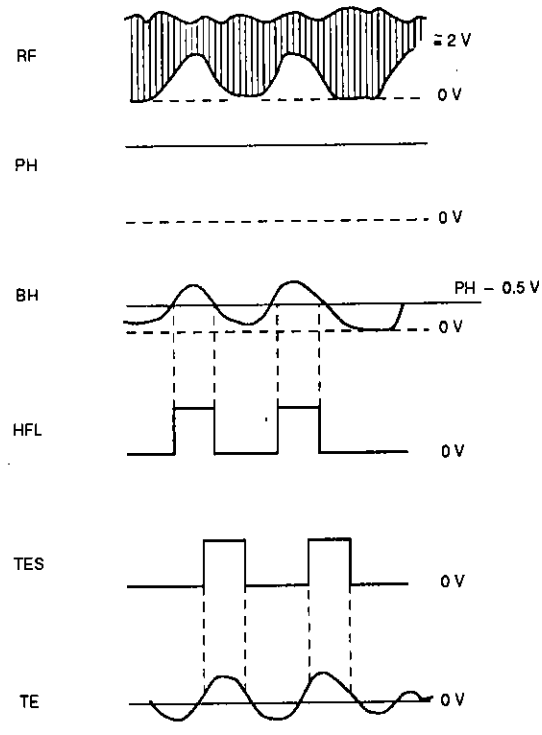

Figure 10. Tracking error signals

The tracking error slice comparator has a Schmitt-trigger input to eliminate incorrect operation caused by noise.

Servocontroller OFF switch

When TOFF goes HIGH, TOFS is connected to VR3 turning OFF the tracking servocontroller as shown in figure 11.

Servocontroller gain control switch

When TGL goes HIGH, THDS is connected to VR3 through a 5.6 kΩ resistor reducing the servocontroller loop gain as shown in figure 11.

Servocontroller hold control switch

When THLD goes HIGH, THDS is connected to VR3 holding the servocontroller output voltage as shown in figure 11.

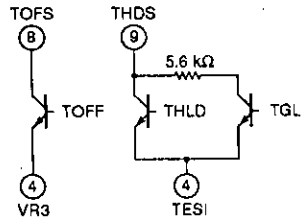

Figure 11. Control switches

Voltage-controlled-oscillator Control Amplifier

The output signal from the PDO pin of the digital signal processor, the LC7860K for example, is input to the amplifier on PDO. The amplifier output voltage on VCOC controls the oscillator in the phase-locked loop to maintain synchronicity with the EFM signal (channel bit rate of 4.3218 Mb/s).

Slice Level Control Amplifier

This maintains the duty ratio of the HF (eye pattern) signal constant at 50%. When the HF signal is input to the digital signal processor, the LC7860K for example, on pin EFMIN, an amplitude limited, in-phase signal is input on EFMO, and an amplitude limited, opposite-phase signal, on $\overline{\text{EFMO}}$. The slice level control amplifier output on SLCO is fed back to EFMIN which automatically maintains the duty ratio at 50%.

Laser-diode Switch

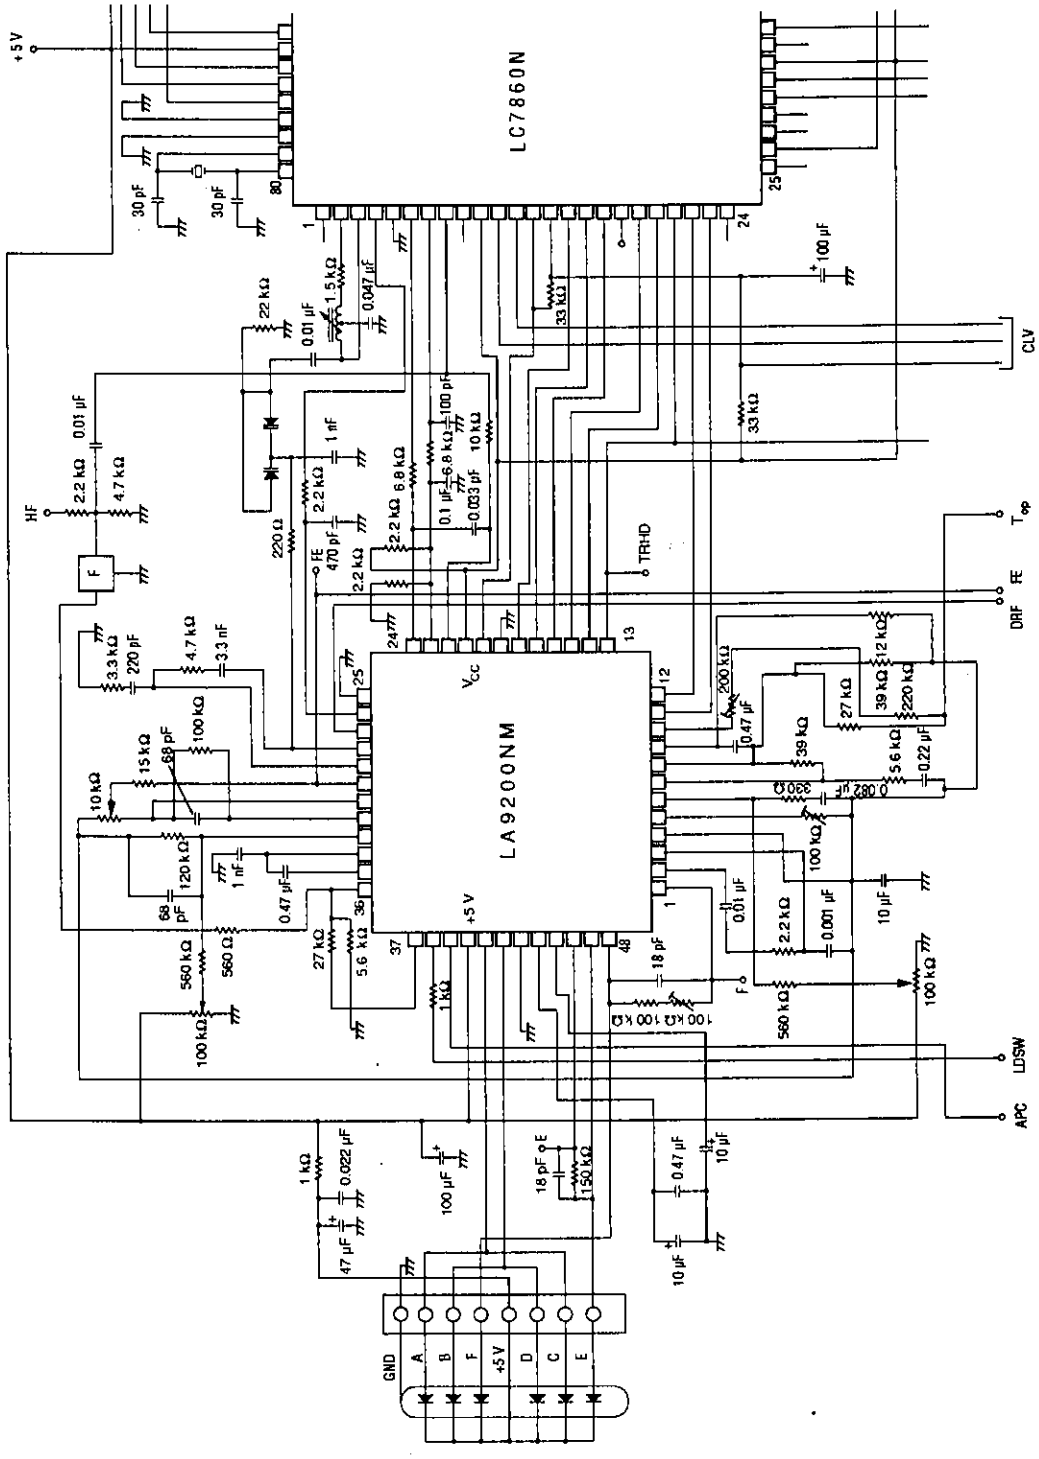

The current drive for the pickup laser on LDD is switched ON when LDSW is LOW, and OFF, when HIGH.

Reference Voltages

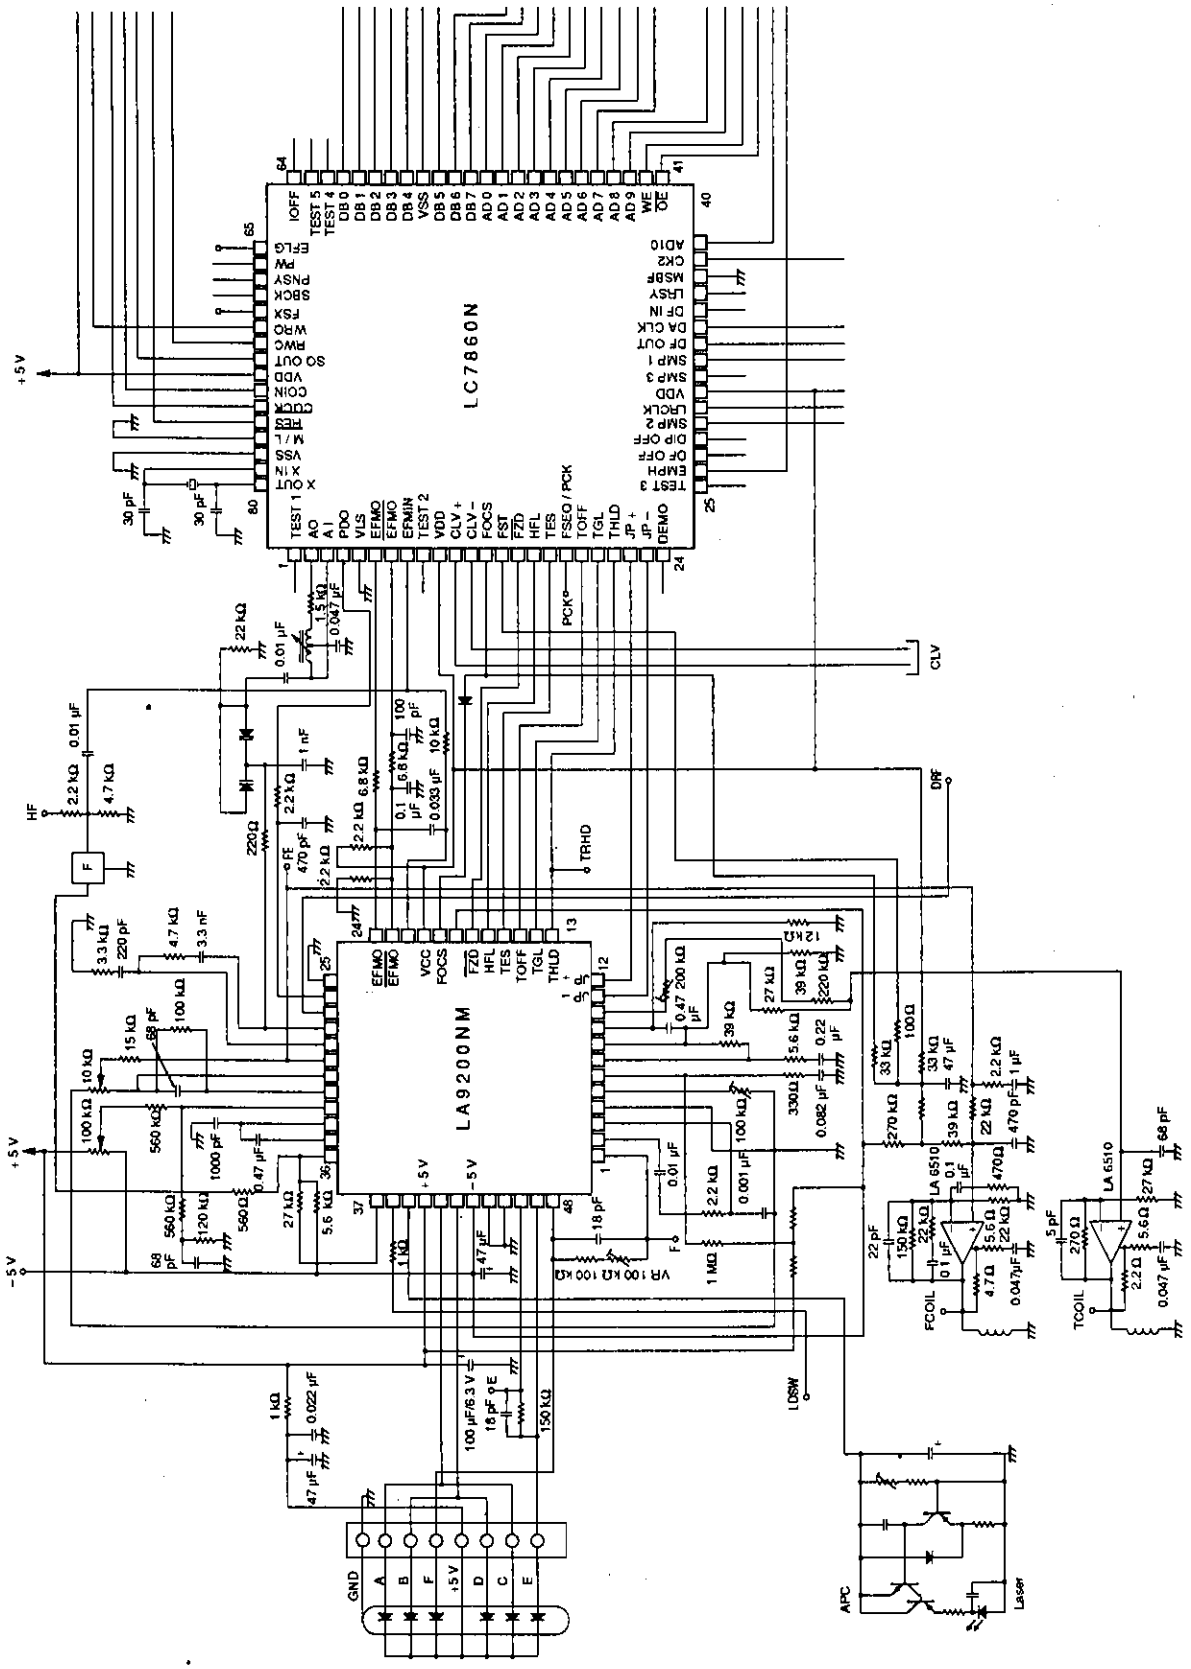

The voltage source, V_{ref}, generates the reference voltages required for single- and dual-supply voltage operation. These voltages are $V_{R2} = V_{R3} = 2.5$ V and $V_{R1} = 1.5$ V for single supply operation, and $V_{R1} = V_{R2} = V_{R3} = 0$ V for dual supply operation.

TYPICAL APPLICATIONS

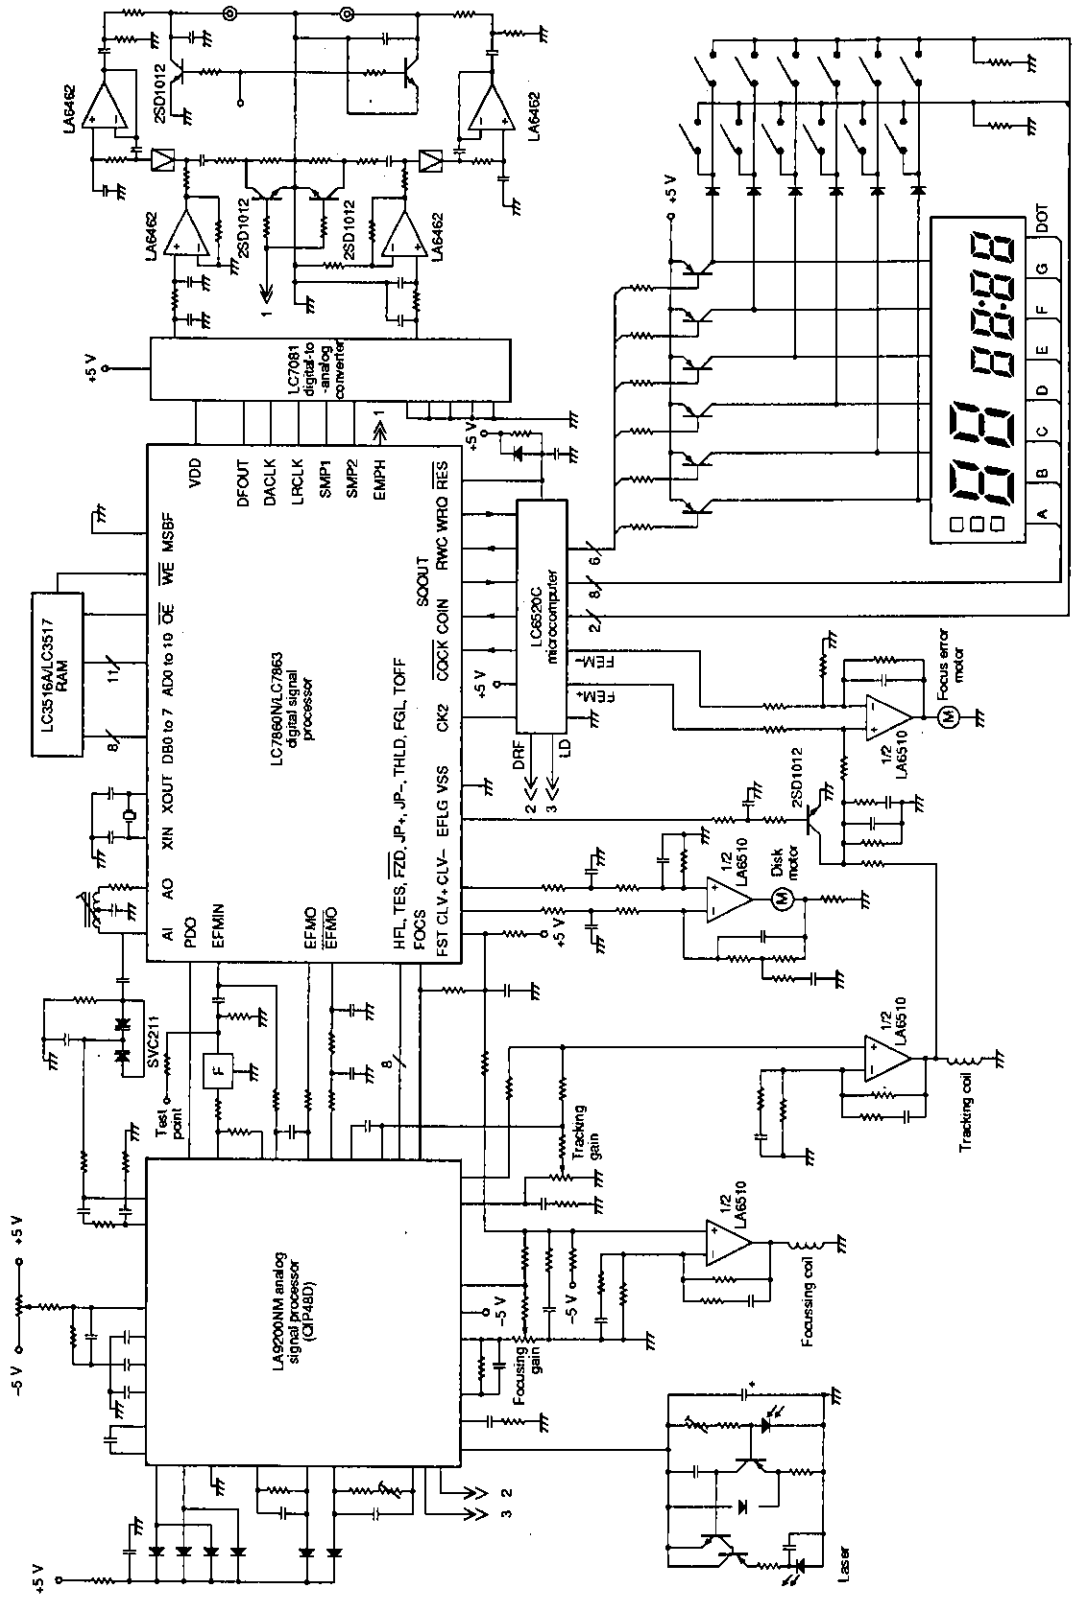

Single-ended Power Supply Operation

Dual Power Supply Operation

Compact Disc Player
