

NB2304A

3.3 V Zero Delay Clock Buffer

The NB2304A is a versatile, 3.3 V zero delay buffer designed to distribute high-speed clocks in PC, workstation, datacom, telecom and other high-performance applications. It is available in an 8 pin package. The part has an on-chip PLL which locks to an input clock presented on the REF pin. The PLL feedback is required to be driven to FBK pin, and can be obtained from one of the outputs. The input-to-output propagation delay is guaranteed to be less than 250 ps, and the output-to-output skew is guaranteed to be less than 200 ps.

The NB2304A has two Banks of two outputs each. Multiple NB2304A devices can accept the same input clock and distribute it. In this case, the skew between the outputs of the two devices is guaranteed to be less than 500 ps.

The NB2304A is available in two different configurations (Refer to NB2304A Configurations Table). The NB2304AI1 is the base part, where the output frequencies equal the reference if there is no counter in the feedback path. The NB2304AI1H is the high-drive version of the -1 and the rise and fall times on this device are much faster.

The NB2304AI2 allows the user to obtain REF, 1/2 X and 2X frequencies on each output Bank. The exact configuration and output frequencies depend on which output drives the feedback pin.

Features

- Zero Input - Output Propagation Delay, Adjustable by Capacitive Load on FBK Input
- Multiple Configurations - Refer to NB2304A Configurations Table
- Input Frequency Range: 15 MHz to 133 MHz
- Multiple Low-Skew Outputs
- Output-Output Skew < 200 ps
- Device-Device Skew < 500 ps
- Two Banks of Four Outputs
- Less than 200 ps Cycle-to-Cycle Jitter (-1, -1H, -5H)
- Available in Space Saving, 8 pin 150 mil SOIC Package
- 3.3 V Operation
- Advanced 0.35 μ CMOS Technology
- Guaranteed Across Commercial and Industrial Temperature Ranges
- These are Pb-Free Devices

Zero Delay and Skew Control

For applications requiring zero input-output delay, all outputs must be equally loaded.

Figure 3. REF Input to CLKA/CLKB Delay vs. Difference in Loading between FBK Pin and CLKA/CLKB Pins

To close the feedback loop of the NB2304A, the FBK pin can be driven from any of the four available output pins. The output driving the FBK pin will be driving a total load of 7 pF plus any additional load that it drives. The relative loading of this output (with respect to the remaining outputs) can adjust the input output delay. This is shown in Figure 3.

For applications requiring zero input-output delay, all outputs including the one providing feedback should be equally loaded. If input-output delay adjustments are required, use Figure 3 to calculate loading differences between the feedback output and remaining outputs. For zero output-output skew, be sure to load outputs equally.
